### Resources managed by ESC REST

- Tenants
- Networks
- Subnets
- Flavors
- Images
- Volumes
- Routers
- Deployments

### Behavior of ESC REST operations

GET operations are synchronous the request/response parameters are described with an example of a request/response

POST, DELETE, and PUT operations are asynchronous. The asynchronous design use the “web hooks” approach using two independent “one-way” invocations - one to start a long-running operation (Client to ESC) and the other one to notify a requester that it is completed (ESC to client)

## ESC REST API Headers/Path/Body Parameters

### Callbacks

One of the header parameters of the operation request will contain a callback field, whose value is a URI where the client expects a callback. If this field is not present, no callback will be performed.

When the operation has completed (either successfully or unsuccessfully), ESC will perform a POST request to the callback URI, with an entity body containing the resource for this operation. The status will be returned in the HTTP header called esc-status-code and the status message will be returned in the HTTP header called esc-status-message.

ESC Clients can match a completion report back to the original request by comparing the value of the HTTP header called esc-transaction-id to the one returned in the initial status response.

ESC Clients are expected to provide a REST implementation for all the callbacks.

### Media Type

All POST, DELETE, and PUT operations that require request and/or response body must provide a header parameter for media type. Note, that ESC is currently tested to accept and return XML.

### Internal IDs

In some of the ESC REST API, there is a path parameter called “\*\_internal\_id” where the asterisk is replaced by the resource type. ESC Clients must provide an internal id for its resource it wants to create. The internal ids are enforced so the ESC Clients are able to refer to them in future operations such as GET, PUT, or DELETE requests.

It is recommended that the ESC Client generated internal ids within the scope of the ESC.

NOTE: Reusing (recycling) of internal ids is not recommended. This practice can lead to confusion in troubleshooting.

### Body

In some of the POST, PUT, and DELETE requests you are required to provide a JSON/XML body. Depending on the resource, you will need to provide certain fields in the body to successfully execute a request. Check the body section for each API (bottom of page) to see what fields are supported.

### String Restrictions in Body/Internal IDs

#### Body

Some string parameters/fields, such as id, name, are restricted by the underlying cloud provider, such as Openstack. The allowable range for these parameters is included in the Create section for each resource, in

this notation: String minimum-length . . maximum length, for example, for Tenant name: String 1 . . 64

Generally, names are either 1..64 (for Tenant/User) or 1..255 (for Network/Subnet/Flavor/Image/VM).

#### Internal ID

Ids are restricted to 72 characters such as internal\_id 1..72 and external\_id 1..72.

Internal id naming must conform the standards stated in RFC 3986 Uniform Resource Identifier (URI): Generic Syntax. See sections related to URI encoding, sections 2.2 Reserved Characters and 2.3 Unreserved Characters. ESC will accept an internal id specified in the request URL from the unreserved character set: unreserved = ALPHA / DIGIT / "-" / "." / "\_"

NOTE: the tilde “~” is not supported in the internal id character set.

The internal id received in a request must be unique within the scope of all the domain resources (tenant, network, subnet, service catalog, deployment ) For example, you cannot create 2 networks with the same internal\_network\_id, even if the networks are created under different tenants.

## REST API Security

### REST Authentication

#### Overview

ESC REST API uses http basic access authentication where the ESC client will have to provide a username and password when making ESC REST requests. The user name and password will be encoded with Base64 in transit, but not encrypted or hashed. HTTPS will be used in conjunction with Basic Authentication to provide the encryption.

#### Setup

By default, the REST authentication is disabled. To enable it pass the argument `--enable-https-rest` and/or `--enable-http-rest` and `--user_rest_pass admin:<password>` to ESC bootvm.py, ESC installation script.

#### Username and Password

The REST interface has only one default username/password (admin credentials).

The REST password can be updated using escadm tool from the ESC VM CLI:

```
$ escadm rest set --username admin --password <password>
```

You can also update the password through the REST API:

[http://\[ESC\\_VM\\_IP\]:8080/ESCManger/v0/authentication/setpassword?userName=yourUsername&password=yourPassword](http://[ESC_VM_IP]:8080/ESCManger/v0/authentication/setpassword?userName=yourUsername&password=yourPassword)

#### Sending an Authorized Request

To send an authorized request an ESC client should send the request with the following header:

```
Authorization: Basic <hashed-pass>
```

where is the Base64 enconded string of the default username/password

Most libraries and web clients have an interface for simply providing the username/password and the app will encode the username/password and add the HTTP Basic Auth header.

Example using the default admin credentials:

```
http://[ESC_VM_IP]:8080/ESCManger/v0/tenants/
```

Headers:

Content-Type application/xml

Authorization Basic <hashed-pass>

## RESTHttps Support

### Overview

ESC supports https communication over port 8443. ESC will generate a self-signed certificate that the client will need to trust to get the https communication going.

### Setup

By default, the REST https is disabled and restricted to localhost. To enable it pass the argument --enable-https-rest to ESC bootvm.py, ESC installation script.

### HA Considerations

In an HA setup every ESC HA VM will have its own self-signed generated certificate. Upon an HA switchover, ESC north bound client will be required to re-accept the new certificate it will be served.

## REST API List

### 01-Tenants : Manage ESC tenants

DELETE	/v0/tenants/{internal_tenant_id}	Delete a tenant from ESC
Implementation Notes		
Delete a tenant from ESC		
Parameters		
Parameter	Value	Description
Callback	(required)	Callback URL for ESC notifications

Parameter	Value	Description	Parameter Type	Data Type
<b>internal_tenant_id</b>	(required)	<b>Internal tenant ID (max length 72 characters)</b>	path	string

**Response Messages**

HTTP Status Code	Reason	Response Model	Headers
200	Tenant deletion request accepted		
400	Invalid Request		
404	Invalid Tenant Id		

**Try it out!**

GET	/v0/tenants/{internal_tenant_id}	Get a tenant by its name
-----	----------------------------------	--------------------------

### Implementation Notes

Only tenants created using ESC will be checked

### Parameters

Parameter	Value	Description	Parameter Type	Data Type
<b>internal_tenant_id</b>	(required)	<b>Internal tenant ID (max length 72 characters)</b>	path	string

### Response Messages

HTTP Status Code	Reason	Response Model	Headers
200	Get request accepted		
404	Invalid Request - Invalid Tenant ID		

**Try it out!**

POST	/v0/tenants/{internal_tenant_id}	Create a tenant in ESC
------	----------------------------------	------------------------

### Implementation Notes

Creates a tenant which will be managed by ESC and can be used for creating other resources under

it.Example request:

```
POST /v0/tenants/tentest HTTP/1.1
Content-Type: application/xml
Accept: application/xml
Callback: http://127.0.0.1:9010/
Body:
<tenant xmlns="urn:ietf:params:xml:ns:netconf:base:1.0">
  <name>example-tenant</name>
  <managed_resource>true</managed_resource>
</tenant>
```

After the tenant creation operation is done, ECS will send a callback to the client with the result. Example callback:

```
HTTP/1.1 201 OK
Content-Type: application/xml; charset=UTF-8
ESC_TRANSACTION_ID: d53f0047-2315-466c-b7e3-aa78e0a567e8
ESC-Status-Code: 200
ESC-Status-Message: Tenant successfully created
<tenant xmlns="urn:ietf:params:xml:ns:netconf:base:1.0">
  <enabled>true</enabled>
  <event_type>CREATE_TENANT</event_type>
  <external_tenant_id>484c620285ea4f588227ff3396215980</external_tenant_id>
  <internal_tenant_id>tentest</internal_tenant_id>
  <name>example-tenant</name>
  <managed_resource>true</managed_resource>
</tenant>
```

## Parameters

PUT

/v0/{internalTenantId}/subnets/{internalSubnetId}

Update a Subnet

## Implementation Notes

Update a Subnet

## Parameters

Parameter	Value	Description	Parameter Type	Data Type
-----------	-------	-------------	----------------	-----------

Parameter	Value	Description	Parameter Type	Data Type
<b>Callback</b>	(required)	<b>Callback URL for ESC notifications</b>	header	string
<b>internalTenantId</b>	(required)	<b>Internal tenant ID of the subnet (max length 72 characters)</b>	path	string
<b>internalSubnetId</b>	(required)	<b>Internal subnet ID (max length 72 characters)</b>	path	string
<b>body</b>	(required)	<b>Subnet configuration payload</b>	body	<div> <span>Model</span> <span>Model Schema</span> <pre>{   "dnsServerIps": "string",   "networkFromCdg": {     "locator": {       "vim_id": "string",       "vim_type": "OPENSTACK",       "vim_project": "string",       "vim_project_id": "string",       "vim_region": "string",       "vim_vdc": "string"     },     "vimNetName": "string",     "internal_tenant_id": "string",     "internal_network_id": "string",     "internal_deployment_id": "string",     "name": "string",     "shared": true,     "external_tenant_id": "string",     "tenant_name": "string",     "external_network_id": "string",     "subnet": [       "string"     ],     "admin_state_up": true,     "locators": {       "datacenter": "string",       "switch_name": "string"     },     "event_type": "CREATE_NETWORK",     "provider_physical_network": "string",     "provider_network_type": "string",     "parent_subnet": "string"   } }</pre> </div>

Parameter	Value	Description	Parameter Type	Data Type
				<pre>     "vlan_id": 0,     "number_of_ports": 0,     "provider_segmentation_id": "string",     "switch_name": "string",     "router_external": true   },   "internal_tenant_id": "string",   "external_tenant_id": "string",   "internal_network_id": "string",   "external_network_id": "string",   "internal_subnet_id": "string",   "external_subnet_id": "string",   "name": "string",   "allocation_pools": [     {       "start": "string",       "end": "string"     }   ],   "gateway_ip": "string",   "ip_version": 0,   "cidr": "string",   "enable_dhcp": true,   "event_type": "CREATE_SUBNET" } </pre>

GET

/v0/images/{internalImageId}

Get the image by the internal image ID

## Implementation Notes

Images not created by ESC will not be checked

## Parameters

Parameter	Value	Description	Parameter Type	Data Type
<b>internalImageId</b>	(required)	<b>Internal image ID (max length 72 characters)</b>	path	string

## Response Messages

HTTP Status Code	Reason	Response Model	Headers
200	Request accepted		
400	Invalid Request		
404	Image Id not found		

Try it out!

**POST /v0/images/{internalImageId}**

Create an image in ESC

### Implementation Notes

Creates an Image(Template) which will be managed by ESC and can be used for creating instance VMs. An optional properties list can be included in the image creation payload. This is only supported for creation of images on openstack. Image properties will be stored in openstack as image metadata. Property name and values are not validated by ESC.

Example 1 create image request (without properties):

```
POST /v0/images/my_image_id HTTP/1.1
Content-Type: application/xml
Accept: application/xml
Callback: http://127.0.0.1:9010/
Body:

<?xml version="1.0"?>
<image xmlns="urn:ietf:params:xml:ns:netconf:base:1.0">
    <name>uLinuxImg</name>
    <src>http://VAR_FILE_SERVER_IP/share/images/myULinux.qcow2</src>
    <disk_bus>virtio</disk_bus>
</image>
```

Example 2 create image request with properties:

```
POST /v0/images/my_image_id HTTP/1.1
Content-Type: application/xml
Accept: application/xml
Callback: http://127.0.0.1:9010/
Body:

<?xml version="1.0"?>
<image xmlns="urn:ietf:params:xml:ns:netconf:base:1.0">
    <name>uLinuxImg</name>
    <src>http://VAR_FILE_SERVER_IP/share/images/myULinux.qcow2</src>
    <disk_bus>virtio</disk_bus>
    <properties>
        <property>
            <name>os_secure_boot</name>
            <value>enabled</value>
        </property>
        <property>
            <name>hw_rng_model</name>
            <value>virtio</value>
        </property>
        <property>
            <name>hw_vif_multiqueue_enabled</name>
            <value>true</value>
        </property>
    </properties>
</image>
```

```
</properties>
</image>
```

Example 3 create image with properties Use of image properties allow flexible assignment of image metadata, such as hw\_disk\_bus and hw\_vif\_model. This extends current limitation of ESC schema with disk\_bus := ide | scsi | virtio and e1000\_net := true | false and virtio\_net := true | false.

```
POST /v0/images/my_image_id HTTP/1.1
Content-Type: application/xml
Accept: application/xml
Callback: http://127.0.0.1:9010/
Body:

<?xml version="1.0"?>
<image xmlns="urn:ietf:params:xml:ns:netconf:base:1.0">
    <name>uLinuxImg</name>
    <src>http://VAR_FILE_SERVER_IP/share/images/myULinux.qcow2</src>
    <disk_bus>virtio</disk_bus>
    <properties>
        <property>
            <name>hw_disk_bus</name>
            <value>pcnet</value>
        </property>
        <property>
            <name>hw_vif_model</name>
            <value>pcnet</value>
        </property>
    </properties>
</image>
```

After the Image creation operation is done, ESC will send a callback to the client with the result.

Example callback:

```
HTTP/1.1 201 OK
Content-Type: application/xml; charset=UTF-8
ESC_TRANSACTION_ID: d53f0047-2315-466c-b7e3-aa78e0a567e8
ESC-Status-Code: 200
ESC-Status-Message: Image successfully created
```

```
<?xml version="1.0" encoding="UTF-8" standalone="yes"?>
<image xmlns="urn:ietf:params:xml:ns:netconf:base:1.0">
    <disk_bus>virtio</disk_bus>
    <e1000_net>false</e1000_net>
    <event_type>CREATE_IMAGE</event_type>
    <external_image_id>5021843b-fcc5-2c1b-8fc4-935147f95872</external_image_id>
    <external_tenant_id>SystemAdminTenantId</external_tenant_id>
```

```

<imageisenabled>true</imageisenabled>
<name>uLinuxImg</name>
<internal_image_id>my_image_id</internal_image_id>
<internal_tenant_id>SystemAdminTenantId</internal_tenant_id>
<visibility>public</visibility>
<src>http://VAR_FILE_SERVER_IP/share/images/myULinux.qcow2</src>
</image>

```

## Parameters

Parameter	Value	Description	Parameter Type	Data Type
<b>Callback</b>	(required)	<b>Callback URL for ESC notifications</b>	header	string
<b>internalImageId</b>	(required)	<b>Internal image ID (max length 72 characters)</b>	path	string
<b>body</b>	(required)	<b>ESC datamodel with the image to create</b>	body	string

Parameter content type:  
application/xml ▾

## Response Messages

HTTP Status Code	Reason	Response Model	Headers
200	Request accepted		
400	Invalid Request		
409	Conflicting Request		
500	Internal server error

GET /v0/images Get all images

## Implementation Notes

All images created in ESC will be returned as a List

## Response Messages

HTTP Status Code	Reason	Response Model	Headers
200	Request accepted		
<a href="#">Try it out!</a>			

## 05-Flavors : Manage ESC flavors

GET	/v0/flavors	<a href="#">Get all flavors</a>	
<b>Implementation Notes</b>			
All flavors created in ESC will be returned as a List			
<b>Response Messages</b>			
HTTP Status Code	Reason	Response Model	Headers
200	Request accepted		
<a href="#">Try it out!</a>			

DELETE	/v0/flavors/{internalFlavorId}	<a href="#">Delete a flavor from ESC</a>		
<b>Implementation Notes</b>				
Delete a flavor from ESC				
<b>Parameters</b>				
Parameter	Value	Description	Parameter Type	Data Type
Callback	<input type="text" value="(required)"/>	Callback URL for ESC notifications	header	string
internalFlavorId	<input type="text" value="required"/>	Internal flavor ID (max length 72 characters)	path	string
<b>Response Messages</b>				
HTTP Status Code	Reason	Response Model	Headers	
200	Request accepted			
404	Flavor Id not found			
500	Internal server error			

GET

/v0/flavors/{internalFlavorId}

Get the flavor by the internal flavor ID

## Implementation Notes

Flavors not created by ESC will not be checked

## Parameters

Parameter	Value	Description	Parameter Type	Data Type
<b>internalFlavorId</b>	(required)	Internal flavor ID (max length 72 characters)	path	string

## Response Messages

HTTP Status Code	Reason	Response Model	Headers
200	Request accepted		
404	Flavor Id not found		
406	Operation not supported on VIM/Flavor part of service registration		

Try it out!

POST

/v0/flavors/{internalFlavorId}

Create a flavor in ESC

## Implementation Notes

Creates a Flavor which could be used for creating instance VMs.

Example request:

```
POST /v0/flavors/my_flavor_id HTTP/1.1
Content-Type: application/xml
Accept: application/xml
Callback: http://127.0.0.1:9010/
Body:
<?xml version="1.0"?>
<flavor xmlns="urn:ietf:params:xml:ns:netconf:base:1.0">
    <name>lightVMFlavor</name>
    <vcpus>2</vcpus>
    <memory_mb>2048</memory_mb>
</flavor>
```

After the Flavor creation operation is done, ESC will send a callback to the client with the result.

Example callback:

```
HTTP/1.1 201 OK
Content-Type: application/xml; charset=UTF-8
ESC_TRANSACTION_ID: d53f0047-2315-466c-b7e3-aa78e0a567e8
ESC-Status-Code: 200
ESC-Status-Message: Flavor creation completed successfully created
<?xml version="1.0" encoding="UTF-8" standalone="yes"?>
<flavor xmlns="urn:ietf:params:xml:ns:netconf:base:1.0">
    <ephemeral_disk_mb>0</ephemeral_disk_mb>
    <event_type>CREATE_FLAVOR</event_type>
    <external_flavor_id>fb63c114-de1a-40d8-abae-fa6011abd150</external_flavor_id>
    <name>lightVMFlavor</name>
    <internal_flavor_id>my_flavor_id</internal_flavor_id>
    <memory_mb>2048</memory_mb>
    <vcpus>2</vcpus>
</flavor>
```

## Parameters

Parameter	Value	Description	Parameter Type	Data Type
<b>Callback</b>	(required)	<b>Callback URL for ESC notifications</b>	header	string
<b>internalFlavorId</b>	(required)	<b>Internal flavor ID (max length 72 characters)</b>	path	string
<b>body</b>	(required)	<b>ESC datamodel with the flavor to create</b>	body	string

Parameter content type:

    <vm_state_machine_state>VM_ALIVE_STATE</vm_state_machine_state>
  </deployment_details>
  <deployment_name>MyDemoDepName</deployment_name>
  <deployment_stage>VM_ALIVE</deployment_stage>
  <external_deployment_id>8d084aab-6a66-4a70-8f47-42b91f7477ac</external_deployment_id>
  <external_tenant_id>SystemAdminTenantId</external_tenant_id>
  <internal_deployment_id>my_dep_id</internal_deployment_id>
  <internal_tenant_id>SystemAdminTenantId</internal_tenant_id>

```

```
<service_state_machine_state>SERVICE_INSERT_STATE</service_state_machine_state>
</deployment>
```

After the Deployment operation is done, ESC will send a SERVICE\_ALIVE callback to the client with the result.

Example callback:

```
HTTP/1.1 201 OK
Content-Type: application/xml; charset=UTF-8
ESC_TRANSACTION_ID: d53f0047-2315-466c-b7e3-aa78e0a567e8
ESC-Status-Code: 200
ESC-Status-Message: Service group deployment completed successfully!

<?xml version="1.0" encoding="UTF-8" standalone="yes"?>
<deployment xmlns="urn:ietf:params:xml:ns:netconf:base:1.0">
  <datacenter>
    <default>false</default>
  </datacenter>
  <deployment_name>MyDemoDepName</deployment_name>
  <deployment_stage>SERVICE_ALIVE</deployment_stage>
  <external_deployment_id>8d084aab-6a66-4a70-8f47-42b91f7477ac</external_deployment_id>
  <external_tenant_id>SystemAdminTenantId</external_tenant_id>
  <internal_deployment_id>my_dep_id</internal_deployment_id>
  <internal_tenant_id>SystemAdminTenantId</internal_tenant_id>
  <service_state_machine_state>SERVICE_ACTIVE_STATE</service_state_machine_state>
</deployment>
```

## Parameters

Parameter	Value	Description	Parameter Type	Data Type
<b>Callback</b>	<b>(required)</b>	<b>Callback URL for ESC notifications</b>	header	string
<b>Callback-ESC-Events</b>	<b>(required)</b>	<b>Callback URL for ESC event notifications</b>	header	string
<b>internal_deployment_id</b>	<b>(required)</b>	<b>Internal ID of the deployment (max length 72 characters)</b>	path	string

Parameter	Value	Description	Parameter Type	Data Type
<b>body</b>	(required)	<b>ESC datamodel to deploy</b>	body	string
Parameter content type: application/xml ▾				
<b>Response Messages</b>				
HTTP Status Code	Reason	Response Model	Headers	
200	Request accepted			
400	Invalid Request			
404	An associated resource not found			
406	Not Acceptable			
409	Conflicting Request			
500	Internal server error			
503	Failed to query VIM			
<a href="#">Try it out!</a>				

**PUT** /v0/deployments/{internal\_deployment\_id} Update an existing deployment in ESC

### Implementation Notes

Updates an existing deployment. Updates could be addition or removal of VM groups, interfaces, networks, KPIs and Rules, Day 0 config.

After the service update operation is done, ESC will send a callback to the client with the result.

Example request of adding VM group:

```
PUT /v0/deployments/my_dep_id HTTP/1.1
Content-Type: application/xml
Accept: application/xml
Callback: http://127.0.0.1:9010/
Callback-ESC-Events: http://127.0.0.1:9010/
```

Body:

```
<esc_datamodel xmlns:ns2="urn:ietf:params:xml:ns:netconf:notification:1.0" xmlns="http://www.cisco.co
```

```

</deployment_details>
<deployment_name>MyDemoDepName</deployment_name>
<deployment_stage>VM_ALIVE</deployment_stage>
<external_deployment_id>8d084aab-6a66-4a70-8f47-42b91f7477ac</external_deployment_id>
<external_tenant_id>SystemAdminTenantId</external_tenant_id>
<internal_deployment_id>my_dep_id</internal_deployment_id>
<internal_tenant_id>SystemAdminTenantId</internal_tenant_id>
<service_state_machine_state>SERVICE_INSERT_STATE</service_state_machine_state>
</deployment>
```

After the Deployment Update operation is done, ESC will send a SERVICE\_UPDATED callback to the client with the result.

Example callback:

```
HTTP/1.1 201 OK
Content-Type: application/xml; charset=UTF-8
ESC_TRANSACTION_ID: d53f0047-2315-466c-b7e3-aa78e0a567e8
ESC-Status-Code: 200
ESC-Status-Message: Service group update completed successfully
```

```
<?xml version="1.0" encoding="UTF-8" standalone="yes"?>
<deployment xmlns="urn:ietf:params:xml:ns:netconf:base:1.0">
<datacenter><default>false</default></datacenter>
<deployment_name>MyDemoDepName</deployment_name>
<deployment_stage>SERVICE_UPDATED</deployment_stage>
<external_deployment_id>8d084aab-6a66-4a70-8f47-42b91f7477ac</external_deployment_id>

## Parameters

Parameter	Value	Description	Parameter Type	Data Type
-----------	-------	-------------	----------------	-----------

Parameter	Value	Description	Parameter Type	Data Type
<b>Callback</b>	(required)	<b>Callback URL for ESC notifications</b>	header	string
<b>Callback-ESC-Events</b>	(required)	<b>Callback URL for ESC event notifications</b>	header	string
<b>internal_deployment_id</b>	(required)	<b>Internal ID of the deployment (max length 72 characters)</b>	path	string
<b>body</b>	(required)	<b>ESC datamodel to update</b>	body	string
Parameter content type:				
<input type="button" value="application/xml ▾"/>				

## Response Messages

HTTP Status Code	Reason	Response Model	Headers
200	Request accepted		
400	Invalid Request		
404	An associated resource not found		
406	Not Acceptable		
409	Conflicting Request		
500	Internal server error		
<input type="button" value="Try it out!"/>			

GET

/v0/deployments/config/{internal\_deployment\_id}

Find deployment configuration data by its internal ID

## Implementation Notes

Deployment configuration data will be returned if found in CDB

## Parameters

Parameter	Value	Description	Parameter Type	Data Type
<b>internal_deployment_id</b>	(required)	Internal ID of the deployment (max length 1024 characters)	path	string

**Response Messages**

HTTP Status Code	Reason	Response Model	Headers
200	Request accepted		
404	Deployment Id not found		

[Try it out!](#)

## 07-Deployment Operations : Operations to a deployment

**POST** /v0/{internal\_tenant\_id}/deployments/service/{internal\_deployment\_id}

Handle deployment operation request with the operation type as payload

### Implementation Notes

Performs actions like stop, start, reboot, disable\_monitoring or enable\_monitoring on a deployment. Example request:

```
POST /v0/tenants/test-tenant1/deployments/vm/test-dep1-cirros_overid_0_cfeefcee-a1fe-4e94-9ffc-81792b2657
Content-Type: application/xml
Accept: application/json
Callback: http://127.0.0.1:9010/

Body:
<service_operation xmlns="urn:ietf:params:xml:ns:netconf:base:1.0">
    <operation>stop</operation>
</service_operation>
```

While the stop deployment operation is being performed, ESC will send a VM\_STOPPED callback to the client for each VM stopped as part of this request. Example callback:

```
HTTP/1.1 200 OK
Content-Type: application/xml; charset=UTF-8
ESC_TRANSACTION_ID: 5e47b5ff-bc59-4ece-b15b-8941910def74
ESC-Status-Code: 200
ESC-Status-Message: VM successfully stopped

<?xml version="1.0" encoding="UTF-8" standalone="yes"?>
```

```

<deployment xmlns="urn:ietf:params:xml:ns:netconf:base:1.0">
  <datacenter>
    <default>false</default>
  </datacenter>
  <deployment_details>
    <host_uuid>17be6eae40795ec068ce77a05fcb1c47f7ac42dfba160261719d4087</host_uuid>

## Parameters

Parameter	Value	Description	Parameter Type	Data Type
<b>Callback</b>	(required)	<b>Callback URL for ESC notifications</b>	header	string
<b>Callback-ESC-Events</b>	(required)	<b>Callback URL for ESC event notifications</b>	header	string
<b>internal_tenant_id</b>	(required)	<b>Internal tenant ID (max length 72 characters)</b>	path	string

Parameter	Value	Description	Parameter Type	Data Type
<b>internal_deployment_id</b>	(required)	<b>Internal deployment ID (max length 72 characters)</b>	path	string
<b>body</b>	(required)	<b>Deployment operation payload specifying the type of operation</b>	body	<div style="display: flex; justify-content: space-between;"> <span>Model</span> <span>Model Schema</span> </div> <pre>{   "operation": "stop",   "properties": {} }</pre> <p>Click to set as parameter value</p>

**Response Messages**

HTTP Status Code	Reason	Response Model	Headers
200	Deployment operation request accepted		
400	Missing callback or, Deployment operation is not applicable		
404	Deployment or tenant not found		

**Try it out!**

## 08-VM Operations : Operations to a VM

POST	/v0/{internal_tenant_id}/deployments/migrate-vm/{vm_name}	Handle VM migrate operation request with the operation type as payload
<b>Parameters</b>		

Parameter	Value	Description	Parameter Type	Data Type
<b>Callback</b>	(required)	<b>Callback URL for notifications</b>	header	string
<b>Callback-ESC-Events</b>	(required)	<b>Callback URL for ESC event notifications</b>	header	string

Parameter	Value	Description	Parameter Type	Data Type
<b>internal_tenant_id</b>	(required)	Internal tenant ID (max length 72 characters)	path	string
<b>vm_name</b>	(required)	VM name	path	string
<b>body</b>	(required)	Migrate VM operation payload specifying the type of operation	body	<div style="display: flex; justify-content: space-between;"> <span>Model</span> <span>Model Schema</span> </div> <pre>{   "migrationType": "live",   "host": "string",   "blockMigration": "auto",   "operation": "migrate" }</pre> <p>Click to set as parameter value</p>

## Response Messages

HTTP Status Code	Reason	Response Model	Headers
200	VM operation request accepted		
400	Missing callback or, VM operation is not applicable		
404	VM or tenant not found		

Try it out!

POST	/v0/{internal_tenant_id}/deployments/recovery-vm/{vm_name}	Handle recovery VM operation request with the operation type as payload									
<b>Parameters</b>											
<table border="1"> <thead> <tr> <th>Parameter</th><th>Value</th><th>Description</th></tr> </thead> <tbody> <tr> <td>Callback</td><td></td><td>Callback URL for notifications</td></tr> <tr> <td>Callback-ESC-Events</td><td></td><td>Callback URL for ESC event notifications</td></tr> </tbody> </table>			Parameter	Value	Description	Callback		Callback URL for notifications	Callback-ESC-Events		Callback URL for ESC event notifications
Parameter	Value	Description									
Callback		Callback URL for notifications

Parameter	Value	Description	Parameter Type	Data Type
<b>internal_tenant_id</b>	(required)	Internal tenant ID (max length 72 characters)	path	string
<b>vm_name</b>	(required)	VM name	path	string
<b>body</b>	(required)	Recovery VM operation payload specifying the type of operation: recovery_do	body	Model Model Schema
Parameter content type:	application/xml ▾			<pre>{   "operation": "string",   "checkVmBeforeRecovery": true,   "properties": {} }</pre>
Click to set as parameter value				

**Response Messages**

HTTP Status Code	Reason	Response Model	Headers
200	Recovery VM operation request accepted		
400	Recovery VM operation is not applicable		
404	VM or tenant not found		

Try it out!

POST	/v0/{internal_tenant_id}/deployments/snapshot-vm/{vm_name}	Handle VM snapshot operation request with the operation type as payload		
<b>Implementation Notes</b>				
Create a snapshot of an existing VM managed by ESC.				
<b>Parameters</b>				
Parameter	Value	Description	Parameter Type	Data Type
<b>Callback</b>	(required)	Callback URL for notifications	header	string
<b>Callback-ESC-Events</b>	(required)	Callback URL for ESC event notifications	header	string

Parameter	Value	Description	Parameter Type	Data Type
<b>internal_tenant_id</b>	(required)	<b>Internal tenant ID (max length 72 characters)</b>	path	string
<b>vm_name</b>	(required)	<b>VM name</b>	path	string
<b>body</b>	(required)	<b>VM snapshot operation payload specifying the type of operation and the name of snapshot</b>	body	<span>Model</span> Model Schema <div style="border: 1px solid #ccc; padding: 10px; background-color: #fff;"> <pre>{   "operation": "snapshot",   "name": "string",   "id": "string",   "metadata": {} }</pre> </div>

Click to set as parameter value

## Response Messages

HTTP Status Code	Reason	Response Model	Headers
201	VM snapshot operation request accepted		
400	Missing callback or, VM operation is not applicable		
404	VM or tenant not found		

Try it out!

**POST** /v0/{internal\_tenant\_id}/deployments/vm/{vm\_name}

Handle VM operation request with the operation type as payload

## Implementation Notes

Performs actions like stop, start, reboot, confirm\_resize, revert\_resize, disable\_monitoring or enable\_monitoring on an existing VM managed by ESC. Example request:

```
POST /v0/test-tenant1/deployments/vm/test-dep1-cirros_overid_0_cfeefcee-a1fe-4e94-9ffc-81792b265788 HTTP/
Content-Type: application/xml
Accept: application/json
Callback: http://127.0.0.1:9010/
Callback-ESC-Events: http://127.0.0.1:9010/

Body:
<vm_operation xmlns="urn:ietf:params:xml:ns:netconf:base:1.0">
  <operation>stop</operation>
```

```
</vm_operation>
```

After the VM stop operation is done, ESC will send a VM\_STOP\_COMPLETE callback to the client with the result. Example callback:

```
HTTP/1.1 200 OK
Content-Type: application/xml; charset=UTF-8
ESC_TRANSACTION_ID: 4546c40a-d6e3-4abe-a7e7-51af4fc5362
ESC-Status-Code: 200
ESC-Status-Message: Successfully stopped VM [test-dep1-cirros_overid_0_cfeefcee-a1fe-4e94-9ffc-81792b2657]

**PUT** /v0/config/{category}/{key}/{value} Change an ESC config parameter under a category, with a given key

### Implementation Notes

Change an ESC config parameter under a category, with a given key.

Format: PUT /v0/config/{category}/{key}/{value}

Example request:

curl -X PUT -H "accept: Application/xml" <http://127.0.0.1:8080/ESCManger/v0/config/log/level/debug>

Example response:

```
<?xml version="1.0" encoding="UTF-8" standalone="yes"?>
<escconfigparameter>
  <category>LOG</category>
  <key>LEVEL</key>
  <type>STRING</type>
  <value xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" xmlns:xs="http://www.w3.org/2001/XMLSchema">debug</value>
</escconfigparameter>
```

Details of Config Parameters: Please refer to installation and user guide for more details.

Category: DEFAULT Key: VM\_RECOVERY\_RETRY\_MAX Default Value: 3 Type: Int Description: Number of maximum recovery attempts allowed per VM.

Category: OPENSTACK Key: ENDPOINT Default Value: adminURL Type: String Description: The parameter to set up the keystone endpoint value of ESC. Options : adminURL, publicURL

Category: LOG Key: LEVEL Default Value: INFO Type: String Description: Level of logging of ESCManager. Options: INFO, TRACE, DEBUG.

Category: AFFINITY Key: FILTER Default Value: SameHostFilter Type: String Description: A constant string used to build PolicyEngine and initializing VM policy table. Options: SameHostFilter, ServerGroupAffinity

Category: ANTI-AFFINITY Key: FILTER Default Value: DifferentHostFilter Type: String Description: A

constant string used to build PolicyEngine and initializing VM policy table. Options: DifferentHostFilter, ServerGroupAffinity

## Parameters

Parameter	Value	Description	Parameter Type	Data Type
<b>category</b>	(required)	<b>ESC config parameter category</b>	path	string
<b>key</b>	(required)	<b>ESC config parameter key</b>	path	string
<b>value</b>	(required)	<b>ESC config parameter value</b>	path	string

## Response Messages
