 as a range of the hash bucket numbers. See RFC 3074.
```

Returns:

possible object is JAXBElement<String>

---

setLoadBalancingPartnerHba

```
public void setLoadBalancingPartnerHba(javax.xml.bind.JAXBElement<java.lang.String> value)
```

Sets the value of the loadBalancingPartnerHba property.

Parameters:

value - allowed object is JAXBElement<String>

---

getLoadBalancingProcessedRequests

```
public javax.xml.bind.JAXBElement<java.lang.String> getLoadBalancingProcessedRequests()
```

Gets the value of the loadBalancingProcessedRequests property.

Network Registrar Type: AT_INT

```
The number of requests, both v4 and v6, subject to load balancing,
 processed by the server (i.e., were in the server's hash bucket
 assignment). This counter includes only the requests since the most
 recent transition to NORMAL state.
```

Returns:

possible object is JAXBElement<String>

---

setLoadBalancingProcessedRequests

```
public void setLoadBalancingProcessedRequests(javax.xml.bind.JAXBElement<java.lang.String> value)
```

Sets the value of the loadBalancingProcessedRequests property.

Parameters:

value - allowed object is JAXBElement<String>

---

getLoadBalancingProcessedTotal

```
public javax.xml.bind.JAXBElement<java.lang.String> getLoadBalancingProcessedTotal()
```

Gets the value of the loadBalancingProcessedTotal property.

Network Registrar Type: AT_INT

The number of requests, both v4 and v6, subject to load balancing,
 processed by the server (i.e., were in the server's hash bucket
 assignment). This counter includes the requests since this server
 was last started or reloaded.

Returns:

possible object is JAXBElement<String>

---

setLoadBalancingProcessedTotal

public void setLoadBalancingProcessedTotal(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the loadBalancingProcessedTotal property.

Parameters:

value - allowed object is JAXBElement<String>

---

getMaximumBindingUpdatesInFlight

public javax.xml.bind.JAXBElement<java.lang.String> getMaximumBindingUpdatesInFlight()

Gets the value of the maximumBindingUpdatesInFlight property.

Network Registrar Type: AT_INT

Displays the maximum number of binding updates (both v4 and v6)
 that were in-flight (sent) at one time.

Returns:

possible object is JAXBElement<String>

---

setMaximumBindingUpdatesInFlight

public void setMaximumBindingUpdatesInFlight(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the maximumBindingUpdatesInFlight property.

Parameters:

value - allowed object is JAXBElement<String>

---

getMaximumBindingUpdatesQueued

public javax.xml.bind.JAXBElement<java.lang.String> getMaximumBindingUpdatesQueued()

Gets the value of the maximumBindingUpdatesQueued property.

Network Registrar Type: AT_INT

Displays the maximum number of binding updates (both v4 and v6)
 that were queued at one time.

Returns:

possible object is JAXBElement<String>

setMaximumBindingUpdatesQueued

public void setMaximumBindingUpdatesQueued(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the maximumBindingUpdatesQueued property.

Parameters:
value - allowed object is JAXBElement<String>

getMaximumClientLeadTime

public javax.xml.bind.JAXBElement<java.lang.String> getMaximumClientLeadTime()

Gets the value of the maximumClientLeadTime property.

Network Registrar Type: AT_INT

```
The current maximum client lead time on this system.
```

Returns:
possible object is JAXBElement<String>

setMaximumClientLeadTime

public void setMaximumClientLeadTime(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the maximumClientLeadTime property.

Parameters:
value - allowed object is JAXBElement<String>

getOtherServerDownTime

public javax.xml.bind.JAXBElement<java.lang.String> getOtherServerDownTime()

Gets the value of the otherServerDownTime property.

Network Registrar Type: AT_DATE

```
The time at which the partner server was considered to be
 really down (as opposed to the last time that we could
 communicate with it, which might be different if there were
 network problems).  This is the time given on the
 setPartnerDown command (if one was given), or it defaults to
 the last time that we communicated with the partner.
```

Returns:
possible object is JAXBElement<String>

setOtherServerDownTime

public void setOtherServerDownTime(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the otherServerDownTime property.

Parameters:

value - allowed object is JAXBElement<String>

getOurIp6Address

public javax.xml.bind.JAXBElement<java.lang.String> getOurIp6Address()

Gets the value of the ourIp6Address property.

Network Registrar Type: AT_IP6ADDR

Specifies the IPv6 address of our end of the connection.

Returns:

possible object is JAXBElement<String>

setOurIp6Address

public void setOurIp6Address(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the ourIp6Address property.

Parameters:

value - allowed object is JAXBElement<String>

getOurIpaddr

public javax.xml.bind.JAXBElement<java.lang.String> getOurIpaddr()

Gets the value of the ourIpaddr property.

Network Registrar Type: AT_IPADDR

The IP address of our interface to this partner server.

Returns:

possible object is JAXBElement<String>

setOurIpaddr

public void setOurIpaddr(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the ourIpaddr property.

Parameters:

value - allowed object is JAXBElement<String>

getPartnerRole

public javax.xml.bind.JAXBElement<java.lang.String> getPartnerRole()

Gets the value of the partnerRole property.

Network Registrar Type: AT_ENUMINT
Valid values: none, main, backup

```
The failover role of the partner of the server returning this
 object.
```

Returns:
possible object is JAXBElement<String>

setPartnerRole

public void setPartnerRole(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the partnerRole property.

Parameters:
value - allowed object is JAXBElement<String>

getPartnerState

public javax.xml.bind.JAXBElement<java.lang.String> getPartnerState()

Gets the value of the partnerState property.

Network Registrar Type: AT_ENUMINT
Valid values: none, startup, normal, communications-interrupted, partner-down, potential-conflict, recover, paused, shutdown, recover-done

```
The last known state which the partner's end of the failover
 relationship is in.
```

Returns:
possible object is JAXBElement<String>

setPartnerState

public void setPartnerState(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the partnerState property.

Parameters:
value - allowed object is JAXBElement<String>

getPartnerVendorMajorVersion

public javax.xml.bind.JAXBElement<java.lang.String> getPartnerVendorMajorVersion()

Gets the value of the partnerVendorMajorVersion property.

Network Registrar Type: AT_INT

```
This is the major version from the vendor ID from the partner
 server.
```

Returns:

possible object is JAXBElement<String>

setPartnerVendorMajorVersion

public void setPartnerVendorMajorVersion(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the partnerVendorMajorVersion property.

Parameters:

value - allowed object is JAXBElement<String>

getPartnerVendorMinorVersion

public javax.xml.bind.JAXBElement<java.lang.String> getPartnerVendorMinorVersion()

Gets the value of the partnerVendorMinorVersion property.

Network Registrar Type: AT_INT

```
This is the minor version from the vendor ID from the partner
 server.
```

Returns:

possible object is JAXBElement<String>

setPartnerVendorMinorVersion

public void setPartnerVendorMinorVersion(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the partnerVendorMinorVersion property.

Parameters:

value - allowed object is JAXBElement<String>

getRequestBuffersAllocated

public javax.xml.bind.JAXBElement<java.lang.String> getRequestBuffersAllocated()

Gets the value of the requestBuffersAllocated property.

Network Registrar Type: AT_INT

```
Shows the number of request buffers that the server has allocated
 to support the failover capability.
```

Returns:

possible object is JAXBElement<String>

---

setRequestBuffersAllocated

public void setRequestBuffersAllocated(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the requestBuffersAllocated property.

Parameters:

value - allowed object is JAXBElement<String>

---

getRequestBuffersInUse

public javax.xml.bind.JAXBElement<java.lang.String> getRequestBuffersInUse()

Gets the value of the requestBuffersInUse property.

Network Registrar Type: AT_INT

```
Displays the number of failover request buffers the DHCP server is
 using at the time the statistics are calculated.
```

Returns:

possible object is JAXBElement<String>

---

setRequestBuffersInUse

public void setRequestBuffersInUse(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the requestBuffersInUse property.

Parameters:

value - allowed object is JAXBElement<String>

---

getRole

public javax.xml.bind.JAXBElement<java.lang.String> getRole()

Gets the value of the role property.

Network Registrar Type: AT_ENUMINT
Valid values: none, main, backup

```
The failover role of the server returning this object.
```

Returns:

possible object is JAXBElement<String>

setRole

`public void setRole(javax.xml.bind.JAXBElement<java.lang.String> value)`

Sets the value of the role property.

Parameters:

value - allowed object is JAXBElement<String>

getSafePeriodRemaining

`public javax.xml.bind.JAXBElement<java.lang.String> getSafePeriodRemaining()`

Gets the value of the safePeriodRemaining property.

Network Registrar Type: AT_TIME

```
Duration in seconds remaining in safe-period.
 If this is != 0, then this server is currently running down a
 safe period with respect to its partner.
```

Returns:

possible object is JAXBElement<String>

setSafePeriodRemaining

`public void setSafePeriodRemaining(javax.xml.bind.JAXBElement<java.lang.String> value)`

Sets the value of the safePeriodRemaining property.

Parameters:

value - allowed object is JAXBElement<String>

getSequenceNumber

`public javax.xml.bind.JAXBElement<java.lang.String> getSequenceNumber()`

Gets the value of the sequenceNumber property.

Network Registrar Type: AT_VERSION

```
Sequence number unique across failover objects, if different
 from sequence in lease, lease is considered "not up to date"
 independent of the sf-up-to-date lease flag.
```

Returns:

possible object is JAXBElement<String>

setSequenceNumber

public void setSequenceNumber(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the sequenceNumber property.

Parameters:

value - allowed object is JAXBElement<String>

---

getSmoothedTimeDelta

public javax.xml.bind.JAXBElement<java.lang.String> getSmoothedTimeDelta()

Gets the value of the smoothedTimeDelta property.

Network Registrar Type: AT_STIME

```
The smoothed time difference between the local server and
 the partner server. If the local server's time is ahead of
 the partner's, the value will be positive. If the local
 server's time is behind the partner's, the value will be
 negative. When the partners are not in communication, the
 last known value is reported.
```

Returns:

possible object is JAXBElement<String>

---

setSmoothedTimeDelta

public void setSmoothedTimeDelta(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the smoothedTimeDelta property.

Parameters:

value - allowed object is JAXBElement<String>

---

getStartOfCommInterrupted

public javax.xml.bind.JAXBElement<java.lang.String> getStartOfCommInterrupted()

Gets the value of the startOfCommInterrupted property.

Network Registrar Type: AT_DATE

```
The time at which this partner most recent went into communications
 interrupted state.  This is valid across reloads, while the
 start-time-of-state will never have a time earlier than the most
 recent server reload.
```

Returns:

possible object is JAXBElement<String>

setStartOfCommInterrupted

public void setStartOfCommInterrupted(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the startOfCommInterrupted property.

Parameters:

value - allowed object is JAXBElement<String>

getStartTimeOfPartnerState

public javax.xml.bind.JAXBElement<java.lang.String> getStartTimeOfPartnerState()

Gets the value of the startTimeOfPartnerState property.

Network Registrar Type: AT_DATE

The time at which the partner's current failover state began.

Returns:

possible object is JAXBElement<String>

setStartTimeOfPartnerState

public void setStartTimeOfPartnerState(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the startTimeOfPartnerState property.

Parameters:

value - allowed object is JAXBElement<String>

getStartTimeOfState

public javax.xml.bind.JAXBElement<java.lang.String> getStartTimeOfState()

Gets the value of the startTimeOfState property.

Network Registrar Type: AT_DATE

The time at which the current failover state began.

Returns:

possible object is JAXBElement<String>

setStartTimeOfState

public void setStartTimeOfState(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the startTimeOfState property.

Parameters:

value - allowed object is JAXBElement<String>

getState

public javax.xml.bind.JAXBElement<java.lang.String> getState()

Gets the value of the state property.

Network Registrar Type: AT_ENUMINT
Valid values: none, startup, normal, communications-interrupted, partner-down, potential-conflict, recover, paused, shutdown, recover-done

The state which this end of the failover relationship is in.

Returns:

possible object is JAXBElement<String>

setState

public void setState(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the state property.

Parameters:

value - allowed object is JAXBElement<String>

getUpdateRequestDoneTime

public javax.xml.bind.JAXBElement<java.lang.String> getUpdateRequestDoneTime()

Gets the value of the updateRequestDoneTime property.

Network Registrar Type: AT_DATE

The time at which the last update request (if any)
 completed.

Returns:

possible object is JAXBElement<String>

setUpdateRequestDoneTime

public void setUpdateRequestDoneTime(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the updateRequestDoneTime property.

Parameters:

value - allowed object is JAXBElement<String>

getUpdateRequestOutstanding

public javax.xml.bind.JAXBElement<java.lang.String> getUpdateRequestOutstanding()

Gets the value of the updateRequestOutstanding property.

Network Registrar Type: AT_ENUMINT
Valid values: none, update, update-all

```
If unset or zero, then the server does not have an update request
 queued for its partner.  If != 0, then it does have an update
 request queued for its failover partner.
```

Returns:

possible object is JAXBElement<String>

---

setUpdateRequestOutstanding

public void setUpdateRequestOutstanding(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the updateRequestOutstanding property.

Parameters:

value - allowed object is JAXBElement<String>

---

getUpdateRequestStartTime

public javax.xml.bind.JAXBElement<java.lang.String> getUpdateRequestStartTime()

Gets the value of the updateRequestStartTime property.

Network Registrar Type: AT_DATE

```
The time at which the update-request-outstanding update request (if
 any) was started.
```

Returns:

possible object is JAXBElement<String>

---

setUpdateRequestStartTime

public void setUpdateRequestStartTime(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the updateRequestStartTime property.

Parameters:

value - allowed object is JAXBElement<String>

---

getUpdateResponseDoneTime

public javax.xml.bind.JAXBElement<java.lang.String> getUpdateResponseDoneTime()

Gets the value of the updateResponseDoneTime property.

Network Registrar Type: AT_DATE

The time that the most recent update response sent an update done
 to the partner server.

Returns:

possible object is JAXBElement<String>

---

setUpdateResponseDoneTime

public void setUpdateResponseDoneTime(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the updateResponseDoneTime property.

Parameters:

value - allowed object is JAXBElement<String>

---

getUpdateResponseInProgress

public javax.xml.bind.JAXBElement<java.lang.String> getUpdateResponseInProgress()

Gets the value of the updateResponseInProgress property.

Network Registrar Type: AT_STRING

Only appears if this server is processing an update response. This
 string gives information about the type of and origin of the
 response.

Returns:

possible object is JAXBElement<String>

---

setUpdateResponseInProgress

public void setUpdateResponseInProgress(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the updateResponseInProgress property.

Parameters:

value - allowed object is JAXBElement<String>

---

getUpdateResponsePercentComplete

public javax.xml.bind.JAXBElement<java.lang.String> getUpdateResponsePercentComplete()

Gets the value of the updateResponsePercentComplete property.

Network Registrar Type: AT_INT

Number between 0 and 100. Only valid if
 update-response-in-progress appears. If this appears, it is the
 percent complete of the current update response.

Returns:

possible object is JAXBElement<String>

setUpdateResponsePercentComplete

public void setUpdateResponsePercentComplete(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the updateResponsePercentComplete property.

Parameters:

value - allowed object is JAXBElement<String>

getUpdateResponseStartTime

public javax.xml.bind.JAXBElement<java.lang.String> getUpdateResponseStartTime()

Gets the value of the updateResponseStartTime property.

Network Registrar Type: AT_DATE

```
The time that the update response mentioned in
 update-response-in-progress was started.
```

Returns:

possible object is JAXBElement<String>

setUpdateResponseStartTime

public void setUpdateResponseStartTime(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the updateResponseStartTime property.

Parameters:

value - allowed object is JAXBElement<String>

getUseOtherAvailable

public javax.xml.bind.JAXBElement<java.lang.String> getUseOtherAvailable()

Gets the value of the useOtherAvailable property.

Network Registrar Type: AT_BOOL

```
If false or unset, then other-available leases cannot be used by
 this server.  If true, then other-available leases can be used by
 this server.  Valid at all times, but should only be true if state
 is PARTNER-DOWN.
```

Returns:

possible object is JAXBElement<String>

setUseOtherAvailable

public void setUseOtherAvailable(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the useOtherAvailable property.

Parameters:

value - allowed object is JAXBElement<String>

getUseOtherAvailableTime

public javax.xml.bind.JAXBElement<java.lang.String> getUseOtherAvailableTime()

Gets the value of the useOtherAvailableTime property.

Network Registrar Type: AT_DATE

```
Appears if current state is PARTNER-DOWN and use-other-available is
 not true. Contains the time when use-other-available will go to
 true.
```

Returns:

possible object is JAXBElement<String>

setUseOtherAvailableTime

public void setUseOtherAvailableTime(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the useOtherAvailableTime property.

Parameters:

value - allowed object is JAXBElement<String>

getV6BindingAcksReceived

public javax.xml.bind.JAXBElement<java.lang.String> getV6BindingAcksReceived()

Gets the value of the v6BindingAcksReceived property.

Network Registrar Type: AT_INT

```
The number of v6 binding acknowledgements (BNDACK6) messages received
 from the failover partner since the start of the most recently
 established connection.
```

Returns:

possible object is JAXBElement<String>

setV6BindingAcksReceived

public void setV6BindingAcksReceived(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the v6BindingAcksReceived property.

Parameters:

value - allowed object is JAXBElement<String>

---

getV6BindingAcksReceivedTotal

public javax.xml.bind.JAXBElement<java.lang.String> getV6BindingAcksReceivedTotal()

Gets the value of the v6BindingAcksReceivedTotal property.

Network Registrar Type: AT_INT

```
The number of v6 binding acknowledgements (BNDACK6) messages received
 from the failover partner since the most recent statistics reset.
```

Returns:

possible object is JAXBElement<String>

---

setV6BindingAcksReceivedTotal

public void setV6BindingAcksReceivedTotal(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the v6BindingAcksReceivedTotal property.

Parameters:

value - allowed object is JAXBElement<String>

---

getV6BindingAcksSent

public javax.xml.bind.JAXBElement<java.lang.String> getV6BindingAcksSent()

Gets the value of the v6BindingAcksSent property.

Network Registrar Type: AT_INT

```
The number of v6 binding acknowledgements (BNDACK6) messages sent
 to the failover partner since the start of the most recently
 established connection.
```

Returns:

possible object is JAXBElement<String>

---

setV6BindingAcksSent

public void setV6BindingAcksSent(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the v6BindingAcksSent property.

Parameters:

value - allowed object is JAXBElement<String>

getV6BindingAcksSentTotal

public javax.xml.bind.JAXBElement<java.lang.String> getV6BindingAcksSentTotal()

Gets the value of the v6BindingAcksSentTotal property.

Network Registrar Type: AT_INT

```
The number of v6 binding acknowledgements (BNDACK6) messages sent
 to the failover partner since the most recent statistics reset.
```

Returns:

possible object is JAXBElement<String>

setV6BindingAcksSentTotal

public void setV6BindingAcksSentTotal(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the v6BindingAcksSentTotal property.

Parameters:

value - allowed object is JAXBElement<String>

getV6BindingUpdatesReceived

public javax.xml.bind.JAXBElement<java.lang.String> getV6BindingUpdatesReceived()

Gets the value of the v6BindingUpdatesReceived property.

Network Registrar Type: AT_INT

```
The number of v6 binding updates (BNDUPD6) messages received from
 the failover partner since the start of the most recently established
 connection.
```

Returns:

possible object is JAXBElement<String>

setV6BindingUpdatesReceived

public void setV6BindingUpdatesReceived(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the v6BindingUpdatesReceived property.

Parameters:

value - allowed object is JAXBElement<String>

getV6BindingUpdatesReceivedTotal

public javax.xml.bind.JAXBElement<java.lang.String> getV6BindingUpdatesReceivedTotal()

Gets the value of the v6BindingUpdatesReceivedTotal property.

Network Registrar Type: AT_INT

```
The number of v6 binding updates (BNDUPD6) messages received from
 the failover partner since the most recent statistics reset.
```

Returns:

possible object is JAXBElement<String>

---

setV6BindingUpdatesReceivedTotal

public void setV6BindingUpdatesReceivedTotal(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the v6BindingUpdatesReceivedTotal property.

Parameters:

value - allowed object is JAXBElement<String>

---

getV6BindingUpdatesSent

public javax.xml.bind.JAXBElement<java.lang.String> getV6BindingUpdatesSent()

Gets the value of the v6BindingUpdatesSent property.

Network Registrar Type: AT_INT

```
The number of v6 binding updates (BNDUPD6) messages sent to the
 failover partner since the start of the most recently established
 connection.
```

Returns:

possible object is JAXBElement<String>

---

setV6BindingUpdatesSent

public void setV6BindingUpdatesSent(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the v6BindingUpdatesSent property.

Parameters:

value - allowed object is JAXBElement<String>

---

getV6BindingUpdatesSentTotal

public javax.xml.bind.JAXBElement<java.lang.String> getV6BindingUpdatesSentTotal()

Gets the value of the v6BindingUpdatesSentTotal property.

Network Registrar Type: AT_INT

```
The number of v6 binding updates (BNDUPD6) messages sent to the
```

failover partner since the most recent statistics reset.

Returns:

possible object is JAXBElement<String>

---

setV6BindingUpdatesSentTotal

public void setV6BindingUpdatesSentTotal(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the v6BindingUpdatesSentTotal property.

Parameters:

value - allowed object is JAXBElement<String>

---

getV6UpdateRequestDoneTime

public javax.xml.bind.JAXBElement<java.lang.String> getV6UpdateRequestDoneTime()

Gets the value of the v6UpdateRequestDoneTime property.

Network Registrar Type: AT_DATE

The time at which the last v6 update request (if any) completed.

Returns:

possible object is JAXBElement<String>

---

setV6UpdateRequestDoneTime

public void setV6UpdateRequestDoneTime(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the v6UpdateRequestDoneTime property.

Parameters:

value - allowed object is JAXBElement<String>

---

getV6UpdateRequestOutstanding

public javax.xml.bind.JAXBElement<java.lang.String> getV6UpdateRequestOutstanding()

Gets the value of the v6UpdateRequestOutstanding property.

Network Registrar Type: AT_ENUMINT
Valid values: none, update, update-all

If unset or zero, then the server does not have an v6 update request
 queued for its partner. If != 0, then it does have an v6 update
 request queued for its failover partner.

Returns:

possible object is JAXBElement<String>

setV6UpdateRequestOutstanding

public void setV6UpdateRequestOutstanding(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the v6UpdateRequestOutstanding property.

Parameters:

value - allowed object is JAXBElement<String>

getV6UpdateRequestStartTime

public javax.xml.bind.JAXBElement<java.lang.String> getV6UpdateRequestStartTime()

Gets the value of the v6UpdateRequestStartTime property.

Network Registrar Type: AT_DATE

The time at which the v6-update-request-outstanding update request
 (if any) was started.

Returns:

possible object is JAXBElement<String>

setV6UpdateRequestStartTime

public void setV6UpdateRequestStartTime(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the v6UpdateRequestStartTime property.

Parameters:

value - allowed object is JAXBElement<String>

getV6UpdateResponseDoneTime

public javax.xml.bind.JAXBElement<java.lang.String> getV6UpdateResponseDoneTime()

Gets the value of the v6UpdateResponseDoneTime property.

Network Registrar Type: AT_DATE

The time that the most recent v6 update response sent an update
 done to the partner server.
 Note: This is also updated for periodic failover scans to handle
 pending state changes, which may run even when failover communication
 is down.

Returns:

possible object is JAXBElement<String>

setV6UpdateResponseDoneTime

```
public void setV6UpdateResponseDoneTime(javax.xml.bind.JAXBElement<java.lang.String> value)
```

Sets the value of the v6UpdateResponseDoneTime property.

Parameters:

value - allowed object is JAXBElement<String>

getV6UpdateResponseInProgress

```
public javax.xml.bind.JAXBElement<java.lang.String> getV6UpdateResponseInProgress()
```

Gets the value of the v6UpdateResponseInProgress property.

Network Registrar Type: AT_STRING

```
Only appears if this server is processing an v6 update response.
 This string gives information about the type of and origin of the
 response.
```

Returns:

possible object is JAXBElement<String>

setV6UpdateResponseInProgress

```
public void setV6UpdateResponseInProgress(javax.xml.bind.JAXBElement<java.lang.String> value)
```

Sets the value of the v6UpdateResponseInProgress property.

Parameters:

value - allowed object is JAXBElement<String>

getV6UpdateResponsePercentComplete

```
public javax.xml.bind.JAXBElement<java.lang.String> getV6UpdateResponsePercentComplete()
```

Gets the value of the v6UpdateResponsePercentComplete property.

Network Registrar Type: AT_INT

```
Number between 0 and 100. Only valid if v6-update-response-in-
 progress appears. If this appears, it is the percent complete of
 the current v6 update response.
```

Returns:

possible object is JAXBElement<String>

setV6UpdateResponsePercentComplete

```
public void setV6UpdateResponsePercentComplete(javax.xml.bind.JAXBElement<java.lang.String> value)
```

Sets the value of the v6UpdateResponsePercentComplete property.

Parameters:

value - allowed object is JAXBElement<String>

---

getV6UpdateResponseStartTime

public javax.xml.bind.JAXBElement<java.lang.String> getV6UpdateResponseStartTime()

Gets the value of the v6UpdateResponseStartTime property.

Network Registrar Type: AT_DATE

```
The time that the v6 update response mentioned in
 v6-update-response-in-progress was started.
 Note: This is also updated for periodic failover scans to handle
 pending state changes, which may run even when failover communication
 is down.
```

Returns:

possible object is JAXBElement<String>

---

setV6UpdateResponseStartTime

public void setV6UpdateResponseStartTime(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the v6UpdateResponseStartTime property.

Parameters:

value - allowed object is JAXBElement<String>

Package com.cisco.cnr.ws.xsd

Class FailoverRelatedServerArray

java.lang.Object
    com.cisco.cnr.ws.xsd.ClassBaseArray
        com.cisco.cnr.ws.xsd.FailoverRelatedServerArray

---

public class **FailoverRelatedServerArray**
extends ClassBaseArray

Java class for FailoverRelatedServerArray complex type.

The following schema fragment specifies the expected content contained within this class.

```
<complexType name="FailoverRelatedServerArray">

Constructor Detail

Filter

`public Filter()`

Method Detail

getClassid

`public java.lang.String getClassid()`

Gets the value of the classid property.

Network Registrar Type: AT_INT
Required.

```
The class this filter is used for.
```

Returns:
possible object is `String`

setClassid

`public void setClassid(java.lang.String value)`

Sets the value of the classid property.

Parameters:
value - allowed object is `String`

getDescription

`public javax.xml.bind.JAXBElement<java.lang.String> getDescription()`

Gets the value of the description property.

Network Registrar Type: AT_STRING

```
An optional descriptive name for this filter, which
```

can be used to identify a saved search.

Returns:

possible object is JAXBElement<String>

---

setDescription

public void setDescription(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the description property.

Parameters:

value - allowed object is JAXBElement<String>

---

getFilterElementList

public javax.xml.bind.JAXBElement<FilterElementArray> getFilterElementList()

Gets the value of the filterElementList property.

Network Registrar Type: AT_NLIST(AT_OBJ(FilterElement))

The attributes used in this filter.

Returns:

possible object is JAXBElement<FilterElementArray>

---

setFilterElementList

public void setFilterElementList(javax.xml.bind.JAXBElement<FilterElementArray> value)

Sets the value of the filterElementList property.

Parameters:

value - allowed object is JAXBElement<FilterElementArray>

---

getNegativeTest

public javax.xml.bind.JAXBElement<java.lang.String> getNegativeTest()

Gets the value of the negativeTest property.

Network Registrar Type: AT_BOOL

Indicates the filter should reverse the test criteria.
 A negative filter will return true if filter elements
 do not match.

Returns:

possible object is JAXBElement<String>

---

setNegativeTest

public void setNegativeTest(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the negativeTest property.

Parameters:

value - allowed object is JAXBElement<String>

Package com.cisco.cnr.ws.xsd

Class FilterArray

java.lang.Object
    com.cisco.cnr.ws.xsd.ClassBaseArray
        com.cisco.cnr.ws.xsd.FilterArray

Constructor Detail

FilterElement

```
public FilterElement()
```

Method Detail

getAnyMatchSublist

```
public javax.xml.bind.JAXBElement<FilterElementArray> getAnyMatchSublist()
```

Gets the value of the anyMatchSublist property.

Network Registrar Type: AT_NLIST(AT_OBJ(FilterElement))

```
Defines a list of match elements within an OR clause,
 where any element can match.
```

Returns:
possible object is JAXBElement<FilterElementArray>

setAnyMatchSublist

public void setAnyMatchSublist(javax.xml.bind.JAXBElement<FilterElementArray> value)

Sets the value of the anyMatchSublist property.

Parameters:

value - allowed object is JAXBElement<FilterElementArray>

getAttrid

public java.lang.String getAttrid()

Gets the value of the attrid property.

Network Registrar Type: AT_INT
Required.

The attribute id to be used in the match

Returns:

possible object is String

setAttrid

public void setAttrid(java.lang.String value)

Sets the value of the attrid property.

Parameters:

value - allowed object is String

getBlobVal

public javax.xml.bind.JAXBElement<java.lang.String> getBlobVal()

Gets the value of the blobVal property.

Network Registrar Type: AT_BLOB

Defines the binary large object (blob) value to use for an
 exact binary match.

Returns:

possible object is JAXBElement<String>

setBlobVal

public void setBlobVal(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the blobVal property.

Parameters:
value - allowed object is JAXBElement<String>

getDateEnd

public javax.xml.bind.JAXBElement<java.lang.String> getDateEnd()

Gets the value of the dateEnd property.

Network Registrar Type: AT_DATE

Defines the end date for a date range match.

Returns:
possible object is JAXBElement<String>

setDateEnd

public void setDateEnd(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the dateEnd property.

Parameters:
value - allowed object is JAXBElement<String>

getDateStart

public javax.xml.bind.JAXBElement<java.lang.String> getDateStart()

Gets the value of the dateStart property.

Network Registrar Type: AT_DATE

Defines the start date for a date range match.

Returns:
possible object is JAXBElement<String>

setDateStart

public void setDateStart(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the dateStart property.

Parameters:
value - allowed object is JAXBElement<String>

getIntEnd

public javax.xml.bind.JAXBElement<java.lang.String> getIntEnd()

Gets the value of the intEnd property.

Network Registrar Type: AT_INT

Defines the ending value of an integer range match.

Returns:
possible object is JAXBElement<String>

setIntEnd

public void setIntEnd(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the intEnd property.

Parameters:
value - allowed object is JAXBElement<String>

getIntStart

public javax.xml.bind.JAXBElement<java.lang.String> getIntStart()

Gets the value of the intStart property.

Network Registrar Type: AT_INT

Defines the starting value of an integer range match.

Returns:

possible object is JAXBElement<String>

---

setIntStart

public void setIntStart(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the intStart property.

Parameters:

value - allowed object is JAXBElement<String>

---

getIntVal

public javax.xml.bind.JAXBElement<java.lang.String> getIntVal()

Gets the value of the intVal property.

Network Registrar Type: AT_INT

Defines the integer to match.

Returns:

possible object is JAXBElement<String>

---

setIntVal

public void setIntVal(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the intVal property.

Parameters:

value - allowed object is JAXBElement<String>

---

getIpAddr

public javax.xml.bind.JAXBElement<java.lang.String> getIpAddr()

Gets the value of the ipAddr property.

Network Registrar Type: AT_IPADDR

Defines the IPv4 address to match.

Returns:

possible object is JAXBElement<String>

setIpAddr

public void setIpAddr(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the ipAddr property.

Parameters:

value - allowed object is JAXBElement<String>

getIpRange

public javax.xml.bind.JAXBElement<java.lang.String> getIpRange()

Gets the value of the ipRange property.

Network Registrar Type: AT_IPPAIR

Defines the start and end IPv4 addresses for an IPv4 range match.

Returns:

possible object is JAXBElement<String>

setIpRange

public void setIpRange(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the ipRange property.

Parameters:

value - allowed object is JAXBElement<String>

getIpSubnet

public javax.xml.bind.JAXBElement<java.lang.String> getIpSubnet()

Gets the value of the ipSubnet property.

Network Registrar Type: AT_SUBNET

Defines the containing IPv4 subnet address and length to match.

Returns:
possible object is JAXBElement<String>

setIpSubnet

public void setIpSubnet(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the ipSubnet property.

Parameters:
value - allowed object is JAXBElement<String>

getIp6Addr

public javax.xml.bind.JAXBElement<java.lang.String> getIp6Addr()

Gets the value of the ip6Addr property.

Network Registrar Type: AT_IP6ADDR

Defines the IPv6 address to match.

Returns:
possible object is JAXBElement<String>

setIp6Addr

public void setIp6Addr(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the ip6Addr property.

Parameters:
value - allowed object is JAXBElement<String>

getIp6Prefix

public javax.xml.bind.JAXBElement<java.lang.String> getIp6Prefix()

Gets the value of the ip6Prefix property.

Network Registrar Type: AT_PREFIX

Defines the containing IPv6 prefix address and length to match.

Returns:
possible object is JAXBElement<String>

setIp6Prefix

public void setIp6Prefix(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the ip6Prefix property.

Parameters:
value - allowed object is JAXBElement<String>

getMatchType

public java.lang.String getMatchType()

Gets the value of the matchType property.

Network Registrar Type: AT_ENUMINT
Required.
Valid values: RegularExpression, IntegerRange, IntegerValue, IPRange, IPAddress, IPSubnet, IP6Address, IP6Prefix, DateRange, ExactBinary, SubList, String, Contains

Controls the types of matches that can be performed on an
 attribute:
     0   RegularExpression
          Match string regular expression. For data types
          other than AT_STRING, the string parsed value is used.
     1   IntegerRange
          Match integer value within specified range.
     2   IntegerValue
          Match integer value.
     3   IPRange
          Match IP address value within specified range.
     4   IPAddress
          Match IP address value.
     5   IPSubnet
          Match IP address or subnet value contained in
          specified subnet.
     6   IP6Address

```
          Match IPv6 address value.
    7     IP6Prefix
          Match IPv6 address or prefix value contained in
          specified prefix.
    8     DateRange
          Match AT_DATE value within specified range.
    9     ExactBinary
          Match exact binary value.

    10    SubList
          Match any element in list.

    11    String
          Match a case-insensitive string value.
    12    Contains
          Match value which contains the specified value.
          Currently only supported for IPv6 addresses and
          prefixes.
```

Returns:

possible object is `String`

setMatchType

public void setMatchType(java.lang.String value)

Sets the value of the matchType property.

Parameters:

value - allowed object is `String`

getNegativeTest

public javax.xml.bind.JAXBElement<java.lang.String> getNegativeTest()

Gets the value of the negativeTest property.

Network Registrar Type: AT_BOOL

```
Indicates the filter element should reverse the test criteria.
 A negative filter element will return true if element
 does not match.
```

Returns:

possible object is `JAXBElement<String>`

setNegativeTest

`public void setNegativeTest(javax.xml.bind.JAXBElement<java.lang.String> value)`

Sets the value of the negativeTest property.

Parameters:

value - allowed object is JAXBElement<String>

getRegexpStr

`public javax.xml.bind.JAXBElement<java.lang.String> getRegexpStr()`

Gets the value of the regexpStr property.

Network Registrar Type: AT_STRING

`Defines the regular expression to match.`

Returns:

possible object is JAXBElement<String>

setRegexpStr

`public void setRegexpStr(javax.xml.bind.JAXBElement<java.lang.String> value)`

Sets the value of the regexpStr property.

Parameters:

value - allowed object is JAXBElement<String>

getStringVal

`public javax.xml.bind.JAXBElement<java.lang.String> getStringVal()`

Gets the value of the stringVal property.

Network Registrar Type: AT_STRING

`Defines the string value for a case insensitive match.`

Returns:

possible object is JAXBElement<String>

setStringVal

public void setStringVal(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the stringVal property.

Parameters:

value - allowed object is JAXBElement<String>

Package com.cisco.cnr.ws.xsd

Class FilterElementArray

java.lang.Object
    com.cisco.cnr.ws.xsd.ClassBaseArray
        com.cisco.cnr.ws.xsd.FilterElementArray

public Key()

Method Detail

getAlgorithm

public javax.xml.bind.JAXBElement<java.lang.String> getAlgorithm()

Gets the value of the algorithm property.

Network Registrar Type: AT_ENUMSTR
Default value: hmac-md5
Valid values: hmac-md5

The algorithm that this key is used with. Currently we only
 support hmac-md5.

Returns:

possible object is JAXBElement<String>

setAlgorithm

public void setAlgorithm(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the algorithm property.

Parameters:

value - allowed object is JAXBElement<String>

getDescription

public javax.xml.bind.JAXBElement<java.lang.String> getDescription()

Gets the value of the description property.

Network Registrar Type: AT_STRING

An optional description for this Key configuration.

Returns:

possible object is JAXBElement<String>

setDescription

public void setDescription(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the description property.

Parameters:
value - allowed object is JAXBElement<String>

---

getId

public javax.xml.bind.JAXBElement<java.lang.String> getId()

Gets the value of the id property.

Network Registrar Type: AT_INT

Displays an integer id for the key.

Returns:
possible object is JAXBElement<String>

---

setId

public void setId(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the id property.

Parameters:
value - allowed object is JAXBElement<String>

---

getName

public java.lang.String getName()

Gets the value of the name property.

Network Registrar Type: AT_DNSNAME
Required. Unique.

The name of this key.

Returns:
possible object is String

---

setName

public void setName(java.lang.String value)

Sets the value of the name property.

Parameters:
value - allowed object is String

---

getSecret

public java.lang.String getSecret()

Gets the value of the secret property.

Network Registrar Type: AT_KEY
Required.

A base64 encoded string used for transaction authentication.

Returns:

possible object is String

---

setSecret

`public void setSecret(java.lang.String value)`

Sets the value of the secret property.

Parameters:

value - allowed object is String

---

getSecurityType

`public javax.xml.bind.JAXBElement<java.lang.String> getSecurityType()`

Gets the value of the securityType property.

Network Registrar Type: AT_ENUMSTR
Default value: TSIG
Valid values: TSIG

```
The type of security that this key is going to be used for.
 Currently we only support TSIG keys.
```

Returns:

possible object is JAXBElement<String>

---

setSecurityType

`public void setSecurityType(javax.xml.bind.JAXBElement<java.lang.String> value)`

Sets the value of the securityType property.

Parameters:

value - allowed object is JAXBElement<String>

---

getTenantId

`public javax.xml.bind.JAXBElement<java.lang.String> getTenantId()`

Gets the value of the tenantId property.

Network Registrar Type: AT_SHORT
Immutable.
Default value: 0

```
Identifies the tenant owner of this object.
```

Returns:

possible object is JAXBElement<String>

---

setTenantId

`public void setTenantId(javax.xml.bind.JAXBElement<java.lang.String> value)`

Sets the value of the tenantId property.

Parameters:

value - allowed object is JAXBElement<String>

getTimeSkew

public javax.xml.bind.JAXBElement<java.lang.String> getTimeSkew()

Gets the value of the timeSkew property.

Network Registrar Type: AT_RANGETIME
Default value: 5m
Valid values: 1s - 60m

The time stamp fudge factor (amount that the time values can
 differ).

Returns:

possible object is JAXBElement<String>

setTimeSkew

public void setTimeSkew(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the timeSkew property.

Parameters:

value - allowed object is JAXBElement<String>

Package com.cisco.cnr.ws.xsd

Class KeyArray

java.lang.Object
    com.cisco.cnr.ws.xsd.ClassBaseArray
        com.cisco.cnr.ws.xsd.KeyArray

Constructor Detail

LDAPRelatedServer

public LDAPRelatedServer()

Method Detail

getAcknowledgedRequests

public javax.xml.bind.JAXBElement<java.lang.String> getAcknowledgedRequests()

Gets the value of the acknowledgedRequests property.

Network Registrar Type: AT_INT

Displays the number of acknowledged LDAP requests.

Returns:
possible object is JAXBElement<String>

setAcknowledgedRequests

public void setAcknowledgedRequests(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the acknowledgedRequests property.

Parameters:

value - allowed object is JAXBElement<String>

getCommState

public javax.xml.bind.JAXBElement<java.lang.String> getCommState()

Gets the value of the commState property.

Network Registrar Type: AT_ENUMINT
Valid values: none, ok, interrupted

```
Status of communication between the DHCP and remote server.
 An 'ok' indicates DHCP server succeeded in communicating to
 the remote server. An 'interrupted' indicates DHCP Server was
 unsuccessful in communicating to the remote server.
```

Returns:

possible object is JAXBElement<String>

setCommState

public void setCommState(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the commState property.

Parameters:

value - allowed object is JAXBElement<String>

getInFlightRequests

public javax.xml.bind.JAXBElement<java.lang.String> getInFlightRequests()

Gets the value of the inFlightRequests property.

Network Registrar Type: AT_INT

Displays the number of LDAP requests currently in-flight.

Returns:

possible object is JAXBElement<String>

---

setInFlightRequests

public void setInFlightRequests(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the inFlightRequests property.

Parameters:

value - allowed object is JAXBElement<String>

---

getIp6Address

public javax.xml.bind.JAXBElement<java.lang.String> getIp6Address()

Gets the value of the ip6Address property.

Network Registrar Type: AT_IP6ADDR

The IPv6 Address for the LDAP server as configured in the DHCP
 server.

Returns:

possible object is JAXBElement<String>

---

setIp6Address

public void setIp6Address(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the ip6Address property.

Parameters:

value - allowed object is JAXBElement<String>

---

getIpaddr

public javax.xml.bind.JAXBElement<java.lang.String> getIpaddr()

Gets the value of the ipaddr property.

Network Registrar Type: AT_IPADDR

The IP Address for the LDAP server as configured in the DHCP
 server.

Returns:

possible object is JAXBElement<String>

setIpaddr

public void setIpaddr(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the ipaddr property.

Parameters:

value - allowed object is JAXBElement<String>

getMaxRequests

public javax.xml.bind.JAXBElement<java.lang.String> getMaxRequests()

Gets the value of the maxRequests property.

Network Registrar Type: AT_INT

```
Displays the configured maximum allowed outstanding LDAP requests.
 This is what was configured in the max-requests attribute for the
 LDAP server.
```

Returns:

possible object is JAXBElement<String>

setMaxRequests

public void setMaxRequests(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the maxRequests property.

Parameters:

value - allowed object is JAXBElement<String>

getRequests

public javax.xml.bind.JAXBElement<java.lang.String> getRequests()

Gets the value of the requests property.

Network Registrar Type: AT_INT

Number of requests currently outstanding for the LDAP server.

Returns:

possible object is JAXBElement<String>

---

setRequests

public void setRequests(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the requests property.

Parameters:

value - allowed object is JAXBElement<String>

---

getServerDeactivatedCount

public javax.xml.bind.JAXBElement<java.lang.String> getServerDeactivatedCount()

Gets the value of the serverDeactivatedCount property.

Network Registrar Type: AT_INT

Displays the number of times DHCP server changed the internal LDAP
 server state from CONNECTED to NOT-CONNECTED as LDAP server
 is unresponsive.

Returns:

possible object is JAXBElement<String>

---

setServerDeactivatedCount

public void setServerDeactivatedCount(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the serverDeactivatedCount property.

Parameters:

value - allowed object is JAXBElement<String>

---

getTimedOutRequests

public javax.xml.bind.JAXBElement<java.lang.String> getTimedOutRequests()

Gets the value of the timedOutRequests property.

Network Registrar Type: AT_INT

Displays the number of timed-out LDAP requests.

Returns:

possible object is JAXBElement<String>

setTimedOutRequests

public void setTimedOutRequests(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the timedOutRequests property.

Parameters:

value - allowed object is JAXBElement<String>

Package com.cisco.cnr.ws.xsd

javax.xml.bind.JAXBElement<java.lang.String> **getClientVendorClass**()	Gets the value of the clientVendorClass property.
javax.xml.bind.JAXBElement<java.lang.String> **getClientVendorInfo**()	Gets the value of the clientVendorInfo property.
javax.xml.bind.JAXBElement<java.lang.String> **getDataSource**()	Gets the value of the dataSource property.
javax.xml.bind.JAXBElement<java.lang.String> **getDbtxnGeneration**()	Gets the value of the dbtxnGeneration property.
javax.xml.bind.JAXBElement<java.lang.String> **getDbtxnSeq**()	Gets the value of the dbtxnSeq property.
javax.xml.bind.JAXBElement<java.lang.String> **getExpiration**()	Gets the value of the expiration property.
javax.xml.bind.JAXBElement<java.lang.String> **getFailoverExpirationTime**()	Gets the value of the failoverExpirationTime property.
javax.xml.bind.JAXBElement<java.lang.String> **getFlags**()	Gets the value of the flags property.
javax.xml.bind.JAXBElement<java.lang.String> **getFwdDnsUpdateConfigName**()	Gets the value of the fwdDnsUpdateConfigName property.
javax.xml.bind.JAXBElement<java.lang.String> **getGiaddr**()	

		Gets the value of the giaddr property.
javax.xml.bind.JAXBElement<java.lang.String>	**getLeaseRebindingTime**()	Gets the value of the leaseRebindingTime property.
javax.xml.bind.JAXBElement<java.lang.String>	**getLeaseRenewalTime**()	Gets the value of the leaseRenewalTime property.
javax.xml.bind.JAXBElement<java.lang.String>	**getLimitationId**()	Gets the value of the limitationId property.
javax.xml.bind.JAXBElement<java.lang.String>	**getParameterRequestList**()	Gets the value of the parameterRequestList property.
javax.xml.bind.JAXBElement<java.lang.String>	**getRelayAgentAuth**()	Gets the value of the relayAgentAuth property.
javax.xml.bind.JAXBElement<java.lang.String>	**getRelayAgentCircuitId**()	Gets the value of the relayAgentCircuitId property.
javax.xml.bind.JAXBElement<java.lang.String>	**getRelayAgentDeviceClass**()	Gets the value of the relayAgentDeviceClass property.
javax.xml.bind.JAXBElement<java.lang.String>	**getRelayAgentOption**()	Gets the value of the relayAgentOption property.
javax.xml.bind.JAXBElement<java.lang.String>	**getRelayAgentRadiusClass**()	Gets the value of the relayAgentRadiusClass property.
javax.xml.bind.JAXBElement<java.lang.String>	**getRelayAgentRadiusOptions**()	Gets the value of the relayAgentRadiusOptions property.
javax.xml.bind.JAXBElement<java.lang.String>	**getRelayAgentRadiusPoolName**()	Gets the value of the relayAgentRadiusPoolName property.
javax.xml.bind.JAXBElement<java.lang.String>	**getRelayAgentRadiusSessionTimeout**()	Gets the value of the relayAgentRadiusSessionTimeout property.
javax.xml.bind.JAXBElement<java.lang.String>	**getRelayAgentRadiusUser**()	Gets the value of the relayAgentRadiusUser property.
javax.xml.bind.JAXBElement<java.lang.String>	**getRelayAgentRadiusV6PoolName**()	Gets the value of the relayAgentRadiusV6PoolName property.
javax.xml.bind.JAXBElement<java.lang.String>	**getRelayAgentRadiusVendorSpecific**()	Gets the value of the relayAgentRadiusVendorSpecific property.
javax.xml.bind.JAXBElement<java.lang.String>	**getRelayAgentRemoteId**()	Gets the value of the relayAgentRemoteId property.
javax.xml.bind.JAXBElement<java.lang.String>	**getRelayAgentServerIdOverride**()	Gets the value of the relayAgentServerIdOverride property.
javax.xml.bind.JAXBElement<java.lang.String>	**getRelayAgentSubnetSelection**()	Gets the value of the relayAgentSubnetSelection

		property.
javax.xml.bind.JAXBElement<java.lang.String>	**getRelayAgentSubscriberId**()	Gets the value of the relayAgentSubscriberId property.
javax.xml.bind.JAXBElement<java.lang.String>	**getRelayAgentVIVendorClass**()	Gets the value of the relayAgentVIVendorClass property.
javax.xml.bind.JAXBElement<java.lang.String>	**getRelayAgentVpnId**()	Gets the value of the relayAgentVpnId property.
javax.xml.bind.JAXBElement<java.lang.String>	**getReservationLookupKey**()	Gets the value of the reservationLookupKey property.
javax.xml.bind.JAXBElement<java.lang.String>	**getReservationLookupKeyType**()	Gets the value of the reservationLookupKeyType property.
javax.xml.bind.JAXBElement<java.lang.String>	**getReservationRelayAgentOption**()	Gets the value of the reservationRelayAgentOption property.
javax.xml.bind.JAXBElement<java.lang.String>	**getRevDnsUpdateConfigName**()	Gets the value of the revDnsUpdateConfigName property.
javax.xml.bind.JAXBElement<java.lang.String>	**getScopeName**()	Gets the value of the scopeName property.
javax.xml.bind.JAXBElement<java.lang.String>	**getStartTimeOfState**()	Gets the value of the startTimeOfState property.
javax.xml.bind.JAXBElement<java.lang.String>	**getState**()	Gets the value of the state property.
javax.xml.bind.JAXBElement<java.lang.String>	**getStateExpirationTime**()	Gets the value of the stateExpirationTime property.
javax.xml.bind.JAXBElement<java.lang.String>	**getTenantId**()	Gets the value of the tenantId property.
javax.xml.bind.JAXBElement<java.lang.String>	**getUserDefinedData**()	Gets the value of the userDefinedData property.
javax.xml.bind.JAXBElement<java.lang.String>	**getVendorClassId**()	Gets the value of the vendorClassId property.
javax.xml.bind.JAXBElement<java.lang.String>	**getVendorSpecificInformation**()	Gets the value of the vendorSpecificInformation property.
javax.xml.bind.JAXBElement<java.lang.String>	**getVpnId**()	Gets the value of the vpnId property.
void	**setAddress**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the address property.
void	**setBindingEndTime**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the bindingEndTime property.
void	**setBindingStartTime**(javax.xml.bind.JAXBElement<java.lang.String> value)	

		Sets the value of the bindingStartTime property.
void	**setClientBinaryClientId**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the clientBinaryClientId property.
void	**setClientDnsName**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the clientDnsName property.
void	**setClientDomainName**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the clientDomainName property.
void	**setClientDuid**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the clientDuid property.
void	**setClientFlags**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the clientFlags property.
void	**setClientHostName**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the clientHostName property.
void	**setClientIaid**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the clientIaid property.
void	**setClientLastTransactionTime**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the clientLastTransactionTime property.
void	**setClientMacAddr**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the clientMacAddr property.
void	**setClientOsType**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the clientOsType property.
void	**setClientOverrideClientId**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the clientOverrideClientId property.
void	**setClientVendorClass**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the clientVendorClass property.
void	**setClientVendorInfo**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the clientVendorInfo property.
void	**setDataSource**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the dataSource property.
void	**setDbtxnGeneration**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the dbtxnGeneration property.
void	**setDbtxnSeq**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the dbtxnSeq property.
void	**setExpiration**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the expiration property.
void	**setFailoverExpirationTime**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the failoverExpirationTime property.
void	**setFlags**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the flags property.
void	**setFwdDnsUpdateConfigName**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the fwdDnsUpdateConfigName

		property.
void	[**setGiaddr**](javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the giaddr property.
void	[**setLeaseRebindingTime**](javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the leaseRebindingTime property.
void	[**setLeaseRenewalTime**](javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the leaseRenewalTime property.
void	[**setLimitationId**](javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the limitationId property.
void	[**setParameterRequestList**](javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the parameterRequestList property.
void	[**setRelayAgentAuth**](javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the relayAgentAuth property.
void	[**setRelayAgentCircuitId**](javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the relayAgentCircuitId property.
void	[**setRelayAgentDeviceClass**](javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the relayAgentDeviceClass property.
void	[**setRelayAgentOption**](javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the relayAgentOption property.
void	[**setRelayAgentRadiusClass**](javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the relayAgentRadiusClass property.
void	[**setRelayAgentRadiusOptions**](javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the relayAgentRadiusOptions property.
void	[**setRelayAgentRadiusPoolName**](javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the relayAgentRadiusPoolName property.
void	[**setRelayAgentRadiusSessionTimeout**](javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the relayAgentRadiusSessionTimeout property.
void	[**setRelayAgentRadiusUser**](javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the relayAgentRadiusUser property.
void	[**setRelayAgentRadiusV6PoolName**](javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the relayAgentRadiusV6PoolName property.
void	[**setRelayAgentRadiusVendorSpecific**](javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the relayAgentRadiusVendorSpecific property.
void	[**setRelayAgentRemoteId**](javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the relayAgentRemoteId property.
void	[**setRelayAgentServerIdOverride**](javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the relayAgentServerIdOverride property.

void	**setRelayAgentSubnetSelection**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the relayAgentSubnetSelection property.
void	**setRelayAgentSubscriberId**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the relayAgentSubscriberId property.
void	**setRelayAgentVIVendorClass**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the relayAgentVIVendorClass property.
void	**setRelayAgentVpnId**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the relayAgentVpnId property.
void	**setReservationLookupKey**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the reservationLookupKey property.
void	**setReservationLookupKeyType**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the reservationLookupKeyType property.
void	**setReservationRelayAgentOption**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the reservationRelayAgentOption property.
void	**setRevDnsUpdateConfigName**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the revDnsUpdateConfigName property.
void	**setScopeName**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the scopeName property.
void	**setStartTimeOfState**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the startTimeOfState property.
void	**setState**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the state property.
void	**setStateExpirationTime**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the stateExpirationTime property.
void	**setTenantId**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the tenantId property.
void	**setUserDefinedData**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the userDefinedData property.
void	**setVendorClassId**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the vendorClassId property.
void	**setVendorSpecificInformation**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the vendorSpecificInformation property.
void	**setVpnId**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the vpnId property.

Constructor Detail

Lease

public Lease()

Method Detail

getAddress

public javax.xml.bind.JAXBElement<java.lang.String> getAddress()

Gets the value of the address property.

Network Registrar Type: AT_IPADDR

```
Specifies the IP address of the lease.  The address is added at
 creation.
```

Returns:
possible object is JAXBElement<String>

setAddress

public void setAddress(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the address property.

Parameters:
value - allowed object is JAXBElement<String>

getBindingEndTime

public javax.xml.bind.JAXBElement<java.lang.String> getBindingEndTime()

Gets the value of the bindingEndTime property.

Network Registrar Type: AT_DATE

Within the DHCPlease database, holds the time at which a
 lease binding ended.

Returns:

possible object is JAXBElement<String>

setBindingEndTime

public void setBindingEndTime(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the bindingEndTime property.

Parameters:

value - allowed object is JAXBElement<String>

getBindingStartTime

public javax.xml.bind.JAXBElement<java.lang.String> getBindingStartTime()

Gets the value of the bindingStartTime property.

Network Registrar Type: AT_DATE

Within the DHCP lease database, shows the time at which a
 lease binding began.

Returns:

possible object is JAXBElement<String>

setBindingStartTime

public void setBindingStartTime(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the bindingStartTime property.

Parameters:

value - allowed object is JAXBElement<String>

getClientBinaryClientId

public javax.xml.bind.JAXBElement<java.lang.String> getClientBinaryClientId()

Gets the value of the clientBinaryClientId property.

Network Registrar Type: AT_BLOB

Displays the binary form of the client's client-identifier, if any.

Returns:

possible object is JAXBElement<String>

setClientBinaryClientId

`public void setClientBinaryClientId(javax.xml.bind.JAXBElement<java.lang.String> value)`

Sets the value of the clientBinaryClientId property.

Parameters:

value - allowed object is JAXBElement<String>

getClientDnsName

`public javax.xml.bind.JAXBElement<java.lang.String> getClientDnsName()`

Gets the value of the clientDnsName property.

Network Registrar Type: AT_STRING

```
Displays the client DNS name, which the DHCP server attempted
 (possibly successfully) to enter into the DNS server for
 a specified client.
 This attribute is related to the client-host-name, but may not be
 identical due to name collisions in the DNS server database.
```

Returns:

possible object is JAXBElement<String>

setClientDnsName

`public void setClientDnsName(javax.xml.bind.JAXBElement<java.lang.String> value)`

Sets the value of the clientDnsName property.

Parameters:

value - allowed object is JAXBElement<String>

getClientDomainName

`public javax.xml.bind.JAXBElement<java.lang.String> getClientDomainName()`

Gets the value of the clientDomainName property.

Network Registrar Type: AT_STRING

```
Displays the domain (if any) to which the client DNS name belongs.
```

Returns:

possible object is JAXBElement<String>

setClientDomainName

public void setClientDomainName(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the clientDomainName property.

Parameters:

value - allowed object is JAXBElement<String>

getClientDuid

public javax.xml.bind.JAXBElement<java.lang.String> getClientDuid()

Gets the value of the clientDuid property.

Network Registrar Type: AT_BLOB

```
Identifies the DUID of the RFC 4361 client identifier.
```

Returns:

possible object is JAXBElement<String>

setClientDuid

public void setClientDuid(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the clientDuid property.

Parameters:

value - allowed object is JAXBElement<String>

getClientFlags

public javax.xml.bind.JAXBElement<java.lang.String> getClientFlags()

Gets the value of the clientFlags property.

Network Registrar Type: AT_FLAGSINT
Valid values: client-valid, client-id-created-from-mac-address, client-dns-name-up-to-date, client-up-to-date-in-mcd, reverse-dns-up-to-date, host-name-has-changed, clear-host-name, domain-name-has-changed, dns-update-pending, client-fqdn-present, client-updates-name, use-test-before-update, avoid-dns-retry, dual-zone-dns-update, client-invalid-due-to-macaddress, in-limitation-list, used-over-limit-client-class, synthesized-dns-name, reservation-uses-client-id, client-id-from-override-id, client-id-from-string, override-client-id-from-string, limit-retention, deallocate-prl, renewal-tracked

```
Displays any of the following values associated with the client
 lease state:
    2  client-id-created-from-mac-address
       Indicates that the client-id was created for internal use
       from the client supplied MAC address.  It is never
       reported externally if this is true.
    3  client-dns-name-up-to-date
       Indicates that the client-dns-name (A) is actually current
       in the DNS server database.
    5  reverse-dns-up-to-date
```

```
             Indicates that the reverse (PTR) DNS entry is current in
             the DNS database.
         9   dns-update-pending
             Indicates that a DNS operation is pending for this client.
        16   in-limitation-list
             Indicates that this lease is presently in a limitation list
             using the limitation-id shown.
        23   limit-retention
             Indicates if this lease is subject to lease time retention
             restrictions.
        25   renewal-tracked
             Indicates if the client's renewal is being tracked (only
             if DHCP server's distribute-renewal feature is enabled).
     These are for internal use only:
       client-valid
       client-fqdn-present
       client-updates-name
       clear-host-name
       host-name-has-changed
       domain-name-has-changed
       use-test-before-update
       avoid-dns-retry (no longer used)
       dual-zone-dns-update
       client-invalid-due-to-macaddress
       used-over-limit-client-class
       synthesize-dns-name
       reservation-uses-client-id
       client-id-from-override-id
       client-id-from-string
       override-client-id-from-string
       deallocate-prl
```

Returns:

possible object is JAXBElement<String>

---

setClientFlags

public void setClientFlags(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the clientFlags property.

Parameters:

value - allowed object is JAXBElement<String>

---

getClientHostName

public javax.xml.bind.JAXBElement<java.lang.String> getClientHostName()

Gets the value of the clientHostName property.

Network Registrar Type: AT_STRING

```
Displays the DNS name that the client requested the DHCP server
 to place in the DNS server.
```

Returns:

possible object is JAXBElement<String>

---

setClientHostName

public void setClientHostName(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the clientHostName property.

Parameters:

value - allowed object is JAXBElement<String>

---

getClientIaid

public javax.xml.bind.JAXBElement<java.lang.String> getClientIaid()

Gets the value of the clientIaid property.

Network Registrar Type: AT_INT
Default value: 0

Identifies the IAID of the RFC 4361 client identifier.

Returns:

possible object is JAXBElement<String>

---

setClientIaid

public void setClientIaid(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the clientIaid property.

Parameters:

value - allowed object is JAXBElement<String>

---

getClientLastTransactionTime

public javax.xml.bind.JAXBElement<java.lang.String> getClientLastTransactionTime()

Gets the value of the clientLastTransactionTime property.

Network Registrar Type: AT_DATE

Displays the time when the client most recently contacted the
 DHCP server.

Returns:

possible object is JAXBElement<String>

setClientLastTransactionTime

public void setClientLastTransactionTime(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the clientLastTransactionTime property.

Parameters:

value - allowed object is JAXBElement<String>

getClientMacAddr

public javax.xml.bind.JAXBElement<java.lang.String> getClientMacAddr()

Gets the value of the clientMacAddr property.

Network Registrar Type: AT_MACADDR

```
Displays the MAC address which the client presented to the DHCP
 server.
```

Returns:

possible object is JAXBElement<String>

setClientMacAddr

public void setClientMacAddr(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the clientMacAddr property.

Parameters:

value - allowed object is JAXBElement<String>

getClientOsType

public javax.xml.bind.JAXBElement<java.lang.String> getClientOsType()

Gets the value of the clientOsType property.

Network Registrar Type: AT_STRING

```
Indicates the operating system of the client. This attribute is used
 only by the updateSms keyword and has no other purpose. If you
 enable failover, the main server transmits this value to the backup
 server. The syntax of this attribute's value is OS-name major.minor.:
 Operating system values are as follows:
    Microsoft Windows NT Server
    Microsoft Windows NT Advanced Server
    Microsoft Windows NT Workstation 4.0
    Microsoft Windows NT Workstation 3.51
    Microsoft Windows 2000 Professional
    Microsoft Windows 95
    Microsoft Windows 9x
    Microsoft Windows for Workgroups
```

```
    Microsoft Windows
    Dos
    Netware
    LANMAN Workstation
    LANMAN Server
    OS/2
    MAC OS
```

Returns:

possible object is JAXBElement<String>

---

setClientOsType

public void setClientOsType(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the clientOsType property.

Parameters:

value - allowed object is JAXBElement<String>

---

getClientOverrideClientId

public javax.xml.bind.JAXBElement<java.lang.String> getClientOverrideClientId()

Gets the value of the clientOverrideClientId property.

Network Registrar Type: AT_BLOB

```
The value of the override-client-id expression for this
 client.  If it appears, it is used as the client-id for
 this client.
```

Returns:

possible object is JAXBElement<String>

---

setClientOverrideClientId

public void setClientOverrideClientId(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the clientOverrideClientId property.

Parameters:

value - allowed object is JAXBElement<String>

---

getClientVendorClass

public javax.xml.bind.JAXBElement<java.lang.String> getClientVendorClass()

Gets the value of the clientVendorClass property.

Network Registrar Type: AT_OPTION

The most recently received client vendor class option.

Returns:
possible object is JAXBElement<String>

---

setClientVendorClass

public void setClientVendorClass(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the clientVendorClass property.

Parameters:
value - allowed object is JAXBElement<String>

---

getClientVendorInfo

public javax.xml.bind.JAXBElement<java.lang.String> getClientVendorInfo()

Gets the value of the clientVendorInfo property.

Network Registrar Type: AT_OPTION

The most recently received vendor-specific information
 option.

Returns:
possible object is JAXBElement<String>

---

setClientVendorInfo

public void setClientVendorInfo(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the clientVendorInfo property.

Parameters:
value - allowed object is JAXBElement<String>

---

getDataSource

public javax.xml.bind.JAXBElement<java.lang.String> getDataSource()

Gets the value of the dataSource property.

Network Registrar Type: AT_ENUMINT
Valid values: unknown, main-main, backup-main, main-backup, backup-backup, main-main-active, backup-main-active, main-backup-active, backup-backup-active, main-main-history, backup-main-history, main-backup-history, backup-backup-history

Records the original source of the lease data
 and the machine from which the data was retrieved.

```
        0   unknown
        4   main-main
       20   main-main-active
       28   main-main-history
            Indicates the data originated on the main server and
            was retrieved from the main server.
        5   backup-main
       21   backup-main-active
       29   backup-main-history
            Indicates the data originated on the backup server and
            was retrieved from the main server.
        6   main-backup
       22   main-backup-active
       30   main-backup-history
            Indicates the data originated on the main server and
            was retrieved from the backup server.
        7   backup-backup
       23   backup-backup-active
       31   backup-backup-history
            Indicates the data originated on the backup server and
            was retrieved from the backup.
            The suffix -active denotes the data was returned from
            the active portion of the lease-state database while
            -history indicates that the data was from the history
            portion of the lease-state database.
 When viewing leases with the UI's, you will see all four
 values routinely, especially if load-balancing is enabled.
 When looking at lease history records, main-main and
 backup-backup are the usual values, but in cases where the
 lease history poller has determined that some data may be
 missing, then main-backup and backup-main can appear as
 well.
```

Returns:

possible object is JAXBElement<String>

---

setDataSource

```
public void setDataSource(javax.xml.bind.JAXBElement<java.lang.String> value)
```

Sets the value of the dataSource property.

Parameters:

value - allowed object is JAXBElement<String>

---

getDbtxnGeneration

```
public javax.xml.bind.JAXBElement<java.lang.String> getDbtxnGeneration()
```

Gets the value of the dbtxnGeneration property.

Network Registrar Type: AT_INT

```
The generation number for database transaction sequence numbers that
 exceed the 32-bit number space.
```

Returns:

possible object is JAXBElement<String>

---

setDbtxnGeneration

public void setDbtxnGeneration(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the dbtxnGeneration property.

Parameters:

value - allowed object is JAXBElement<String>

---

getDbtxnSeq

public javax.xml.bind.JAXBElement<java.lang.String> getDbtxnSeq()

Gets the value of the dbtxnSeq property.

Network Registrar Type: AT_INT

```
The database transaction sequence number used by CCM
 to record aggregated lease history.
```

Returns:

possible object is JAXBElement<String>

---

setDbtxnSeq

public void setDbtxnSeq(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the dbtxnSeq property.

Parameters:

value - allowed object is JAXBElement<String>

---

getExpiration

public javax.xml.bind.JAXBElement<java.lang.String> getExpiration()

Gets the value of the expiration property.

Network Registrar Type: AT_DATE

```
Displays the date and time the lease will expire.
```

Returns:

possible object is JAXBElement<String>

setExpiration

`public void setExpiration(javax.xml.bind.JAXBElement<java.lang.String> value)`

Sets the value of the expiration property.

Parameters:

value - allowed object is JAXBElement<String>

getFailoverExpirationTime

`public javax.xml.bind.JAXBElement<java.lang.String> getFailoverExpirationTime()`

Gets the value of the failoverExpirationTime property.

Network Registrar Type: AT_DATE

```
The latest time that this server has ever acked to
 the failover partner.  In the absence of information
 from the failover partner, this server must wait for
 this time to expire before it can act on the
 state-expiration-time.
```

Returns:

possible object is JAXBElement<String>

setFailoverExpirationTime

`public void setFailoverExpirationTime(javax.xml.bind.JAXBElement<java.lang.String> value)`

Sets the value of the failoverExpirationTime property.

Parameters:

value - allowed object is JAXBElement<String>

getFlags

`public javax.xml.bind.JAXBElement<java.lang.String> getFlags()`

Gets the value of the flags property.

Network Registrar Type: AT_FLAGSINT
Valid values: reserved, deactivated, failover-updated, dynamic, client-reserved, use-bndack-time

```
Displays flags that describe this lease:
    1 (lease) reserved
       The lease is reserved because of a lease reservation object.
       The reservation-lookup-key specifies the client for which this
       lease is reserved.
    3 deactivated
       The lease is deactivated, which means that it should
       not be used.  Any client which is using a deactivated
       lease will be NAK'ed on their next renewal.
```

5 failover-updated
            The server has successfully updated the failover partner
            regarding this lease.
         7 dynamic
            Last written by server which knew only about the lease
            because it was created by a send-reservation request.
        13 client-reserved
            Indicates that lease is in-range on a scope that has
            restrict-to-reservations enabled.
        15 use-bndack-time
            Use the time that we sent to the BNDACK as the time of lease
            expiration, so that a renewal at 1/2 the MCLT isn't required.
            Used for permanent leases and for GetNextAddress leases.
            This is persisted, but only lasts until the next BNDACK, when
            it is cleared.

Returns:

possible object is JAXBElement<String>

setFlags

public void setFlags(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the flags property.

Parameters:

value - allowed object is JAXBElement<String>

getFwdDnsUpdateConfigName

public javax.xml.bind.JAXBElement<java.lang.String> getFwdDnsUpdateConfigName()

Gets the value of the fwdDnsUpdateConfigName property.

Network Registrar Type: AT_NAMEREF

Names the Dns update configuration object used
 to perform dynamic DNS update on a forward zone.

Returns:

possible object is JAXBElement<String>

setFwdDnsUpdateConfigName

public void setFwdDnsUpdateConfigName(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the fwdDnsUpdateConfigName property.

Parameters:

value - allowed object is JAXBElement<String>

getGiaddr

public javax.xml.bind.JAXBElement<java.lang.String> getGiaddr()

Gets the value of the giaddr property.

Network Registrar Type: AT_IPADDR

```
If present, the contents of the last received non-zero giaddr
 field. This represents the relay agent through which the client
 and server last communicated.
```

Returns:

possible object is JAXBElement<String>

setGiaddr

public void setGiaddr(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the giaddr property.

Parameters:

value - allowed object is JAXBElement<String>

getLeaseRebindingTime

public javax.xml.bind.JAXBElement<java.lang.String> getLeaseRebindingTime()

Gets the value of the leaseRebindingTime property.

Network Registrar Type: AT_DATE

```
Displays the earliest time the client is expected to issue
 a rebinding request.
```

Returns:

possible object is JAXBElement<String>

setLeaseRebindingTime

public void setLeaseRebindingTime(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the leaseRebindingTime property.

Parameters:

value - allowed object is JAXBElement<String>

getLeaseRenewalTime

public javax.xml.bind.JAXBElement<java.lang.String> getLeaseRenewalTime()

Gets the value of the leaseRenewalTime property.

Network Registrar Type: AT_DATE

```
Displays the earliest time the client is expected to issue
 a renewal request.
```

Returns:

possible object is JAXBElement<String>

---

setLeaseRenewalTime

public void setLeaseRenewalTime(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the leaseRenewalTime property.

Parameters:

value - allowed object is JAXBElement<String>

---

getLimitationId

public javax.xml.bind.JAXBElement<java.lang.String> getLimitationId()

Gets the value of the limitationId property.

Network Registrar Type: AT_BLOB

```
Displays the value set for a client-class or client limiting the
 number of simultaneous active leases a DHCP server can give out
 to devices on customer premises.
```

Returns:

possible object is JAXBElement<String>

---

setLimitationId

public void setLimitationId(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the limitationId property.

Parameters:

value - allowed object is JAXBElement<String>

---

getParameterRequestList

public javax.xml.bind.JAXBElement<java.lang.String> getParameterRequestList()

Gets the value of the parameterRequestList property.

Network Registrar Type: AT_OPTION

Identifies the parameter request list received from DHCP client in
 request packets.

Returns:

possible object is JAXBElement<String>

---

setParameterRequestList

public void setParameterRequestList(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the parameterRequestList property.

Parameters:

value - allowed object is JAXBElement<String>

---

getRelayAgentAuth

public javax.xml.bind.JAXBElement<java.lang.String> getRelayAgentAuth()

Gets the value of the relayAgentAuth property.

Network Registrar Type: AT_BLOB

The contents of the 'authentication' suboption 8 of the relay-agent
 information option 82 from this client.

Returns:

possible object is JAXBElement<String>

---

setRelayAgentAuth

public void setRelayAgentAuth(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the relayAgentAuth property.

Parameters:

value - allowed object is JAXBElement<String>

---

getRelayAgentCircuitId

public javax.xml.bind.JAXBElement<java.lang.String> getRelayAgentCircuitId()

Gets the value of the relayAgentCircuitId property.

Network Registrar Type: AT_BLOB

Displays the circuit-id sub-option of the DHCP relay-agent
 information option 82 from this client.

Returns:

possible object is JAXBElement<String>

setRelayAgentCircuitId

public void setRelayAgentCircuitId(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the relayAgentCircuitId property.

Parameters:

value - allowed object is JAXBElement<String>

getRelayAgentDeviceClass

public javax.xml.bind.JAXBElement<java.lang.String> getRelayAgentDeviceClass()

Gets the value of the relayAgentDeviceClass property.

Network Registrar Type: AT_INT

```
The contents of the 'device-class' suboption 4 of the relay-agent
 information option 82 from this client.
```

Returns:

possible object is JAXBElement<String>

setRelayAgentDeviceClass

public void setRelayAgentDeviceClass(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the relayAgentDeviceClass property.

Parameters:

value - allowed object is JAXBElement<String>

getRelayAgentOption

public javax.xml.bind.JAXBElement<java.lang.String> getRelayAgentOption()

Gets the value of the relayAgentOption property.

Network Registrar Type: AT_OPTION

```
Displays the contents of the relay-agent information option 82
 from the most recent client interaction.
```

Returns:

possible object is JAXBElement<String>

setRelayAgentOption

```
public void setRelayAgentOption(javax.xml.bind.JAXBElement<java.lang.String> value)
```

Sets the value of the relayAgentOption property.

Parameters:

value - allowed object is JAXBElement<String>

getRelayAgentRadiusClass

```
public javax.xml.bind.JAXBElement<java.lang.String> getRelayAgentRadiusClass()
```

Gets the value of the relayAgentRadiusClass property.

Network Registrar Type: AT_STRING

```
Displays the contents, if any, of the RADIUS class attribute
 that was contained in the RADIUS Attributes suboption of the DHCP
 relay-agent information option 82 from this client.
```

Returns:

possible object is JAXBElement<String>

setRelayAgentRadiusClass

```
public void setRelayAgentRadiusClass(javax.xml.bind.JAXBElement<java.lang.String> value)
```

Sets the value of the relayAgentRadiusClass property.

Parameters:

value - allowed object is JAXBElement<String>

getRelayAgentRadiusOptions

```
public javax.xml.bind.JAXBElement<java.lang.String> getRelayAgentRadiusOptions()
```

Gets the value of the relayAgentRadiusOptions property.

Network Registrar Type: AT_BLOB

```
The contents of the 'radius' suboption 7 of the relay-agent
 information option 82 from this client.
 This suboption has additional structure that is available on
 other attributes of this class.
```

Returns:

possible object is JAXBElement<String>

setRelayAgentRadiusOptions

```
public void setRelayAgentRadiusOptions(javax.xml.bind.JAXBElement<java.lang.String> value)
```

Sets the value of the relayAgentRadiusOptions property.

Parameters:

value - allowed object is JAXBElement<String>

---

getRelayAgentRadiusPoolName

public javax.xml.bind.JAXBElement<java.lang.String> getRelayAgentRadiusPoolName()

Gets the value of the relayAgentRadiusPoolName property.

Network Registrar Type: AT_STRING

```
Displays the contents, if any, of the RADIUS framed-pool attribute
  88 contained in the RADIUS attributes suboption of the DHCP
 relay-agent information option 82 from this client.
```

Returns:

possible object is JAXBElement<String>

---

setRelayAgentRadiusPoolName

public void setRelayAgentRadiusPoolName(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the relayAgentRadiusPoolName property.

Parameters:

value - allowed object is JAXBElement<String>

---

getRelayAgentRadiusSessionTimeout

public javax.xml.bind.JAXBElement<java.lang.String> getRelayAgentRadiusSessionTimeout()

Gets the value of the relayAgentRadiusSessionTimeout property.

Network Registrar Type: AT_INT

```
If present, the contents of the RADIUS 'session-timeout' attribute
  27 that was contained in the RADIUS Attributes suboption 7 of the
 relay-agent information option 82 from this client.
```

Returns:

possible object is JAXBElement<String>

---

setRelayAgentRadiusSessionTimeout

public void setRelayAgentRadiusSessionTimeout(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the relayAgentRadiusSessionTimeout property.

Parameters:

value - allowed object is JAXBElement<String>

getRelayAgentRadiusUser

public javax.xml.bind.JAXBElement<java.lang.String> getRelayAgentRadiusUser()

Gets the value of the relayAgentRadiusUser property.

Network Registrar Type: AT_STRING

```
Displays the contents, if any, of the RADIUS user attribute
 contained in the RADIUS attributes suboption of the DHCP relay-agent
 information option 82 from this client.
```

Returns:

possible object is JAXBElement<String>

setRelayAgentRadiusUser

public void setRelayAgentRadiusUser(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the relayAgentRadiusUser property.

Parameters:

value - allowed object is JAXBElement<String>

getRelayAgentRadiusV6PoolName

public javax.xml.bind.JAXBElement<java.lang.String> getRelayAgentRadiusV6PoolName()

Gets the value of the relayAgentRadiusV6PoolName property.

Network Registrar Type: AT_STRING

```
If present, the contents of the RADIUS 'v6-pool-name' attribute 100
 that was contained in the RADIUS Attributes suboption 7 of the
 relay-agent information option 82 from this client.
```

Returns:

possible object is JAXBElement<String>

setRelayAgentRadiusV6PoolName

public void setRelayAgentRadiusV6PoolName(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the relayAgentRadiusV6PoolName property.

Parameters:

value - allowed object is JAXBElement<String>

getRelayAgentRadiusVendorSpecific

public javax.xml.bind.JAXBElement<java.lang.String> getRelayAgentRadiusVendorSpecific()

Gets the value of the relayAgentRadiusVendorSpecific property.

Network Registrar Type: AT_BLOB

```
If present, the contents of the RADIUS 'vendor-specific' attribute
  26 that was contained in the RADIUS Attributes suboption 7 of the
 relay-agent information option 82 from this client.
```

Returns:

possible object is JAXBElement<String>

---

setRelayAgentRadiusVendorSpecific

public void setRelayAgentRadiusVendorSpecific(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the relayAgentRadiusVendorSpecific property.

Parameters:

value - allowed object is JAXBElement<String>

---

getRelayAgentRemoteId

public javax.xml.bind.JAXBElement<java.lang.String> getRelayAgentRemoteId()

Gets the value of the relayAgentRemoteId property.

Network Registrar Type: AT_BLOB

```
Displays the remote-id sub-option of the DHCP relay-agent
 information option 82 from this client.
```

Returns:

possible object is JAXBElement<String>

---

setRelayAgentRemoteId

public void setRelayAgentRemoteId(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the relayAgentRemoteId property.

Parameters:

value - allowed object is JAXBElement<String>

---

getRelayAgentServerIdOverride

```
public javax.xml.bind.JAXBElement<java.lang.String> getRelayAgentServerIdOverride()
```

Gets the value of the relayAgentServerIdOverride property.

Network Registrar Type: AT_IPADDR

```
Displays the IP address in the server-id-override sub-option of the
 DHCP relay-agent information option 82 from this client.
 This value corresponds to one of two suboption numbers:
 If the IANA assigned suboption 152 is present in the packet,
 that value is returned; otherwise, if the Cisco suboption 182 is
 present, that value is returned.
```

Returns:

possible object is JAXBElement<String>

setRelayAgentServerIdOverride

```
public void setRelayAgentServerIdOverride(javax.xml.bind.JAXBElement<java.lang.String> value)
```

Sets the value of the relayAgentServerIdOverride property.

Parameters:

value - allowed object is JAXBElement<String>

getRelayAgentSubnetSelection

```
public javax.xml.bind.JAXBElement<java.lang.String> getRelayAgentSubnetSelection()
```

Gets the value of the relayAgentSubnetSelection property.

Network Registrar Type: AT_IPADDR

```
Displays the IP address in the subnet selection sub-option
 of the DHCP relay-agent information option 82 from this client.
 This value corresponds to one of two suboption numbers:
 If the IANA assigned suboption is present in the packet,
 that value is returned; otherwise, if Cisco suboption 150 is
 present, that value is returned.
```

Returns:

possible object is JAXBElement<String>

setRelayAgentSubnetSelection

```
public void setRelayAgentSubnetSelection(javax.xml.bind.JAXBElement<java.lang.String> value)
```

Sets the value of the relayAgentSubnetSelection property.

Parameters:

value - allowed object is JAXBElement<String>

getRelayAgentSubscriberId

public javax.xml.bind.JAXBElement<java.lang.String> getRelayAgentSubscriberId()

Gets the value of the relayAgentSubscriberId property.

Network Registrar Type: AT_STRING

```
Displays the contents of the subscriber-id suboption of the
 relay-agent information option 82 from this client.
```

Returns:

possible object is JAXBElement<String>

setRelayAgentSubscriberId

public void setRelayAgentSubscriberId(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the relayAgentSubscriberId property.

Parameters:

value - allowed object is JAXBElement<String>

getRelayAgentVIVendorClass

public javax.xml.bind.JAXBElement<java.lang.String> getRelayAgentVIVendorClass()

Gets the value of the relayAgentVIVendorClass property.

Network Registrar Type: AT_BLOB

```
The contents of the 'v-i-vendor-class' suboption 9 of the
 relay-agent information option 82 from this client.
```

Returns:

possible object is JAXBElement<String>

setRelayAgentVIVendorClass

public void setRelayAgentVIVendorClass(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the relayAgentVIVendorClass property.

Parameters:

value - allowed object is JAXBElement<String>

getRelayAgentVpnId

public javax.xml.bind.JAXBElement<java.lang.String> getRelayAgentVpnId()

Gets the value of the relayAgentVpnId property.

Network Registrar Type: AT_BLOB

```
Displays the contents of the vpn-id sub-option of the DHCP
 relay-agent information option 82 from this client.
 This value corresponds to one of two suboption numbers:
 If the IANA assigned suboption 151 is present in the packet,
 that value is returned; otherwise, if Cisco suboption 181 is
 present, that value is returned.
```

Returns:
possible object is JAXBElement<String>

---

setRelayAgentVpnId

`public void setRelayAgentVpnId(javax.xml.bind.JAXBElement<java.lang.String> value)`

Sets the value of the relayAgentVpnId property.

Parameters:
value - allowed object is JAXBElement<String>

---

getReservationLookupKey

`public javax.xml.bind.JAXBElement<java.lang.String> getReservationLookupKey()`

Gets the value of the reservationLookupKey property.

Network Registrar Type: AT_BLOB

```
Specifies the lookup key of the lease reservation for this lease.
```

Returns:
possible object is JAXBElement<String>

---

setReservationLookupKey

`public void setReservationLookupKey(javax.xml.bind.JAXBElement<java.lang.String> value)`

Sets the value of the reservationLookupKey property.

Parameters:
value - allowed object is JAXBElement<String>

---

getReservationLookupKeyType

`public javax.xml.bind.JAXBElement<java.lang.String> getReservationLookupKeyType()`

Gets the value of the reservationLookupKeyType property.

Network Registrar Type: AT_INT

```
Specifies the data type of the reservation-lookup-key attribute. The
 type can be 7 for AT_BLOB, 9 for AT_MACADDR, or 46 for AT_NSTRING.
```

Returns:

possible object is JAXBElement<String>

---

setReservationLookupKeyType

public void setReservationLookupKeyType(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the reservationLookupKeyType property.

Parameters:

value - allowed object is JAXBElement<String>

---

getReservationRelayAgentOption

public javax.xml.bind.JAXBElement<java.lang.String> getReservationRelayAgentOption()

Gets the value of the reservationRelayAgentOption property.

Network Registrar Type: AT_OPTION

```
Displays the contents of the relay-agent information option 82
 configured on a reservation for this IP address.  This will be used
 when responding to a DHCPLEASEQUERY for this IP address in the absence
 of relay-agent information stored from a client interaction.
```

Returns:

possible object is JAXBElement<String>

---

setReservationRelayAgentOption

public void setReservationRelayAgentOption(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the reservationRelayAgentOption property.

Parameters:

value - allowed object is JAXBElement<String>

---

getRevDnsUpdateConfigName

public javax.xml.bind.JAXBElement<java.lang.String> getRevDnsUpdateConfigName()

Gets the value of the revDnsUpdateConfigName property.

Network Registrar Type: AT_NAMEREF

```
Names the Dns update configuration object used
```

to perform dynamic DNS update on a reverse zone.

Returns:

possible object is JAXBElement<String>

---

setRevDnsUpdateConfigName

public void setRevDnsUpdateConfigName(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the revDnsUpdateConfigName property.

Parameters:

value - allowed object is JAXBElement<String>

---

getScopeName

public javax.xml.bind.JAXBElement<java.lang.String> getScopeName()

Gets the value of the scopeName property.

Network Registrar Type: AT_NAMEREF

A reference to the scope that contains this lease.

Returns:

possible object is JAXBElement<String>

---

setScopeName

public void setScopeName(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the scopeName property.

Parameters:

value - allowed object is JAXBElement<String>

---

getStartTimeOfState

public javax.xml.bind.JAXBElement<java.lang.String> getStartTimeOfState()

Gets the value of the startTimeOfState property.

Network Registrar Type: AT_DATE

Displays the time the state changed to its current value.

Returns:

possible object is JAXBElement<String>

setStartTimeOfState

public void setStartTimeOfState(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the startTimeOfState property.

Parameters:

value - allowed object is JAXBElement<String>

getState

public javax.xml.bind.JAXBElement<java.lang.String> getState()

Gets the value of the state property.

Network Registrar Type: AT_ENUMINT
Valid values: available, offered, leased, expired, unavailable, released, other-available, pending-available

```
Displays the current state of the lease.
    1   available
        The lease is not currently leased by any client. Any
        client information is from the most recent client to
        lease or be offered this lease.
    2   offered
        The lease is offered to the associated client. In many
        cases, the database is not written with information
        concerning offering a lease to a client since there is
        no requirement to update stable storage with this
        information.
    3   leased
        The lease is currently leased to the client whose
        information appears in the lease.
    4   expired
        The client specified has not renewed the lease, and it
        expired. Upon expiration the DNS information for this
        client was scheduled for removal.
    5   unavailable
        The lease is unavailable.  It was made unavailable because
        of some conflict. A ping attempt might have shown that the
        another client using the, or the DHCP server might have
        detected another DHCP server handing out this IP address,
        or a DHCP client might have declined the lease. Use
        start-time-of-state to determine when the lease became
        unavailable, and look in the log file around that time to
        determine exactly why the lease became unavailable.
    6   released
        The client specified has released the lease, but the
        server was configured to apply a 'release-grace-period'.
        The lease won't be made available until the
        grace-period expires.
    7   other-available
        Used only when failover is enabled.  A lease in the
        other-available state is available for allocation by the
        other server in the failover pair, but not available for
        allocation by this server.
    8   pending-available
        Used only when failover is enabled.  A lease in the
```

pending-available state will be available as soon as
this server can synchronize its available state with
the other server.

Returns:

possible object is JAXBElement<String>

---

setState

public void setState(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the state property.

Parameters:

value - allowed object is JAXBElement<String>

---

getStateExpirationTime

public javax.xml.bind.JAXBElement<java.lang.String> getStateExpirationTime()

Gets the value of the stateExpirationTime property.

Network Registrar Type: AT_DATE

Identifies the time that we believe that the client's lease period,
 grace period, or release grace period will expire. A failover
 partner cannot, on its own, act on this time until the
 failover-expiration-time has also expired.

Returns:

possible object is JAXBElement<String>

---

setStateExpirationTime

public void setStateExpirationTime(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the stateExpirationTime property.

Parameters:

value - allowed object is JAXBElement<String>

---

getTenantId

public javax.xml.bind.JAXBElement<java.lang.String> getTenantId()

Gets the value of the tenantId property.

Network Registrar Type: AT_SHORT
Default value: 0

Identifies the tenant owner of this object.

Returns:

possible object is JAXBElement<String>

---

setTenantId

public void setTenantId(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the tenantId property.

Parameters:

value - allowed object is JAXBElement<String>

---

getUserDefinedData

public javax.xml.bind.JAXBElement<java.lang.String> getUserDefinedData()

Gets the value of the userDefinedData property.

Network Registrar Type: AT_STRING

```
This string value is associated with the lease in order to allow
 customer applications to relate the lease record to other
 databases.  It is not used directly by the DHCP server, but may be
 read and written by extensions and expressions.
```

Returns:

possible object is JAXBElement<String>

---

setUserDefinedData

public void setUserDefinedData(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the userDefinedData property.

Parameters:

value - allowed object is JAXBElement<String>

---

getVendorClassId

public javax.xml.bind.JAXBElement<java.lang.String> getVendorClassId()

Gets the value of the vendorClassId property.

Network Registrar Type: AT_STRING

```
Displays the vendor-class-id as offered in a DHCP request option 60.
```

Returns:

possible object is JAXBElement<String>

setVendorClassId

```
public void setVendorClassId(javax.xml.bind.JAXBElement<java.lang.String> value)
```

Sets the value of the vendorClassId property.

Parameters:

value - allowed object is JAXBElement<String>

getVendorSpecificInformation

```
public javax.xml.bind.JAXBElement<java.lang.String> getVendorSpecificInformation()
```

Gets the value of the vendorSpecificInformation property.

Network Registrar Type: AT_BLOB

```
Identifies the vendor specific information received from DHCP
 client in request packets.
```

Returns:

possible object is JAXBElement<String>

setVendorSpecificInformation

```
public void setVendorSpecificInformation(javax.xml.bind.JAXBElement<java.lang.String> value)
```

Sets the value of the vendorSpecificInformation property.

Parameters:

value - allowed object is JAXBElement<String>

getVpnId

```
public javax.xml.bind.JAXBElement<java.lang.String> getVpnId()
```

Gets the value of the vpnId property.

Network Registrar Type: AT_INT
Immutable.
Default value: 0

```
Displays the identifier of the DHCP VPN that contains this lease.
```

Returns:

possible object is JAXBElement<String>

setVpnId

```
public void setVpnId(javax.xml.bind.JAXBElement<java.lang.String> value)
```

Sets the value of the vpnId property.

Parameters:

value - allowed object is JAXBElement<String>

Package com.cisco.cnr.ws.xsd

Class Lease6

java.lang.Object
    com.cisco.cnr.ws.xsd.ClassBase
        com.cisco.cnr.ws.xsd.Lease6

---

public class **Lease6**
extends ClassBase

The Network Registrar Lease6 class.

A DHCPv6 lease.

Java class for Lease6 complex type.

The following schema fragment specifies the expected content contained within this class.

```
<complexType name="Lease6">
  <complexContent>
    <extension base="{http://ws.cnr.cisco.com/xsd}ClassBase">
      <sequence>
        <element name="bindingEndTime" type="{http://www.w3.org/2001/XMLSchema}string" minOccurs="0"/>
        <element name="bindingFlags" type="{http://www.w3.org/2001/XMLSchema}string" minOccurs="0"/>
        <element name="bindingIaid" type="{http://www.w3.org/2001/XMLSchema}string" minOccurs="0"/>
        <element name="bindingRebindingTime" type="{http://www.w3.org/2001/XMLSchema}string" minOccurs="0"/>
        <element name="bindingRenewalTime" type="{http://www.w3.org/2001/XMLSchema}string" minOccurs="0"/>
        <element name="bindingStartTime" type="{http://www.w3.org/2001/XMLSchema}string" minOccurs="0"/>
        <element name="bindingType" type="{http://www.w3.org/2001/XMLSchema}string" minOccurs="0"/>
        <element name="clientActiveLeases" type="{http://www.w3.org/2001/XMLSchema}string" minOccurs="0"/>
        <element name="clientClassName" type="{http://www.w3.org/2001/XMLSchema}string" minOccurs="0"/>

Method Summary

All Methods **Instance Methods** **Concrete Methods**

Modifier and Type	Method	Description
javax.xml.bind.JAXBElement<java.lang.String>	**getBindingEndTime**()	Gets the value of the bindingEndTime property.
javax.xml.bind.JAXBElement<java.lang.String>	**getBindingFlags**()	Gets the value of the bindingFlags property.
javax.xml.bind.JAXBElement<java.lang.String>	**getBindingIaid**()	Gets the value of the bindingIaid property.
javax.xml.bind.JAXBElement<java.lang.String>	**getBindingRebindingTime**()	Gets the value of the bindingRebindingTime property.
javax.xml.bind.JAXBElement<java.lang.String>	**getBindingRenewalTime**()	Gets the value of the bindingRenewalTime property.
javax.xml.bind.JAXBElement<java.lang.String>	**getBindingStartTime**()	Gets the value of the bindingStartTime property.
javax.xml.bind.JAXBElement<java.lang.String>	**getBindingType**()	Gets the value of the bindingType property.
javax.xml.bind.JAXBElement<java.lang.String>	**getClientActiveLeases**()	Gets the value of the

		clientActiveLeases property.
javax.xml.bind.JAXBElement<java.lang.String>	**getClientClassName**()	Gets the value of the clientClassName property.
javax.xml.bind.JAXBElement<java.lang.String>	**getClientFlags**()	Gets the value of the clientFlags property.
javax.xml.bind.JAXBElement<java.lang.String>	**getClientId**()	Gets the value of the clientId property.
javax.xml.bind.JAXBElement<java.lang.String>	**getClientLastTransactionTime**()	Gets the value of the clientLastTransactionTime property.
javax.xml.bind.JAXBElement<java.lang.String>	**getClientLookupKey**()	Gets the value of the clientLookupKey property.
javax.xml.bind.JAXBElement<java.lang.String>	**getClientLookupKeyType**()	Gets the value of the clientLookupKeyType property.
javax.xml.bind.JAXBElement<java.lang.String>	**getClientOro**()	Gets the value of the clientOro property.
javax.xml.bind.JAXBElement<java.lang.String>	**getClientReconfigureKey**()	Gets the value of the clientReconfigureKey property.
javax.xml.bind.JAXBElement<java.lang.String>	**getClientReconfigureKeyGenerationTime**()	Gets the value of the clientReconfigureKeyGenerationTime property.
javax.xml.bind.JAXBElement<java.lang.String>	**getClientRelayAddress**()	Gets the value of the clientRelayAddress property.
javax.xml.bind.JAXBElement<java.lang.String>	**getClientRelayMessage**()	Gets the value of the clientRelayMessage property.
javax.xml.bind.JAXBElement<java.lang.String>	**getClientRelayPort**()	Gets the value of the clientRelayPort property.
javax.xml.bind.JAXBElement<java.lang.String>	**getClientUserDefinedData**()	Gets the value of the clientUserDefinedData property.
javax.xml.bind.JAXBElement<**StringArray**>	**getClientVendorClass**()	Gets the value of the clientVendorClass property.
javax.xml.bind.JAXBElement<**StringArray**>	**getClientVendorInfo**()	Gets the value of the clientVendorInfo property.
javax.xml.bind.JAXBElement<java.lang.String>	**getCmMacAddress**()	Gets the value of the cmMacAddress property.
javax.xml.bind.JAXBElement<java.lang.String>	**getCreationTime**()	Gets the value of the creationTime property.
javax.xml.bind.JAXBElement<java.lang.String>	**getDataSource**()	Gets the value of the dataSource property.
javax.xml.bind.JAXBElement<java.lang.String>	**getDbtxnGeneration**()	Gets the value of the dbtxnGeneration property.
javax.xml.bind.JAXBElement<java.lang.String>	**getDbtxnSeq**()	Gets the value of the dbtxnSeq property.
javax.xml.bind.JAXBElement<java.lang.String>	**getDnsUpdateFlags**()	Gets the value of the dnsUpdateFlags property.

javax.xml.bind.JAXBElement<java.lang.String>	**getExcludedPrefix**()	Gets the value of the excludedPrefix property.
javax.xml.bind.JAXBElement<java.lang.String>	**getFailoverExpirationTime**()	Gets the value of the failoverExpirationTime property.
javax.xml.bind.JAXBElement<java.lang.String>	**getFlags**()	Gets the value of the flags property.
javax.xml.bind.JAXBElement<java.lang.String>	**getForwardDnsupdate**()	Gets the value of the forwardDnsupdate property.
javax.xml.bind.JAXBElement<java.lang.String>	**getFqdn**()	Gets the value of the fqdn property.
javax.xml.bind.JAXBElement<java.lang.String>	**getFqdnHostLabelCount**()	Gets the value of the fqdnHostLabelCount property.
javax.xml.bind.JAXBElement<java.lang.String>	**getIp6Address**()	Gets the value of the ip6Address property.
javax.xml.bind.JAXBElement<java.lang.String>	**getNameNumber**()	Gets the value of the nameNumber property.
javax.xml.bind.JAXBElement<java.lang.String>	**getPreferredLifetime**()	Gets the value of the preferredLifetime property.
javax.xml.bind.JAXBElement<java.lang.String>	**getPrefixName**()	Gets the value of the prefixName property.
javax.xml.bind.JAXBElement<java.lang.String>	**getRequestedFqdn**()	Gets the value of the requestedFqdn property.
javax.xml.bind.JAXBElement<java.lang.String>	**getRequestedPrefixLength**()	Gets the value of the requestedPrefixLength property.
javax.xml.bind.JAXBElement<java.lang.String>	**getReservationCmMacAddress**()	Gets the value of the reservationCmMacAddress property.
javax.xml.bind.JAXBElement<java.lang.String>	**getReservationLookupKey**()	Gets the value of the reservationLookupKey property.
javax.xml.bind.JAXBElement<java.lang.String>	**getReservationLookupKeyType**()	Gets the value of the reservationLookupKeyType property.
javax.xml.bind.JAXBElement<java.lang.String>	**getReverseDnsupdate**()	Gets the value of the reverseDnsupdate property.
javax.xml.bind.JAXBElement<java.lang.String>	**getStartTimeOfState**()	Gets the value of the startTimeOfState property.
javax.xml.bind.JAXBElement<java.lang.String>	**getState**()	Gets the value of the state property.
javax.xml.bind.JAXBElement<java.lang.String>	**getStateExpirationTime**()	Gets the value of the stateExpirationTime property.
javax.xml.bind.JAXBElement<java.lang.String>	**getTenantId**()	Gets the value of the tenantId property.
javax.xml.bind.JAXBElement<java.lang.String>	**getValidLifetime**()	Gets the value of the validLifetime property.
javax.xml.bind.JAXBElement<java.lang.String>	**getVpnId**()	Gets the value of the vpnId property.
void	**setBindingEndTime**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the bindingEndTime property.
void	**setBindingFlags**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the bindingFlags

		property.
void	**[setBindingIaid](javax.xml.bind.JAXBElement<java.lang.String> value)**	Sets the value of the bindingIaid property.
void	**[setBindingRebindingTime](javax.xml.bind.JAXBElement<java.lang.String> value)**	Sets the value of the bindingRebindingTime property.
void	**[setBindingRenewalTime](javax.xml.bind.JAXBElement<java.lang.String> value)**	Sets the value of the bindingRenewalTime property.
void	**[setBindingStartTime](javax.xml.bind.JAXBElement<java.lang.String> value)**	Sets the value of the bindingStartTime property.
void	**[setBindingType](javax.xml.bind.JAXBElement<java.lang.String> value)**	Sets the value of the bindingType property.
void	**[setClientActiveLeases](javax.xml.bind.JAXBElement<java.lang.String> value)**	Sets the value of the clientActiveLeases property.
void	**[setClientClassName](javax.xml.bind.JAXBElement<java.lang.String> value)**	Sets the value of the clientClassName property.
void	**[setClientFlags](javax.xml.bind.JAXBElement<java.lang.String> value)**	Sets the value of the clientFlags property.
void	**[setClientId](javax.xml.bind.JAXBElement<java.lang.String> value)**	Sets the value of the clientId property.
void	**[setClientLastTransactionTime](javax.xml.bind.JAXBElement<java.lang.String> value)**	Sets the value of the clientLastTransactionTime property.
void	**[setClientLookupKey](javax.xml.bind.JAXBElement<java.lang.String> value)**	Sets the value of the clientLookupKey property.
void	**[setClientLookupKeyType](javax.xml.bind.JAXBElement<java.lang.String> value)**	Sets the value of the clientLookupKeyType property.
void	**[setClientOro](javax.xml.bind.JAXBElement<java.lang.String> value)**	Sets the value of the clientOro property.
void	**[setClientReconfigureKey](javax.xml.bind.JAXBElement<java.lang.String> value)**	Sets the value of the clientReconfigureKey property.
void	**[setClientReconfigureKeyGenerationTime](javax.xml.bind.JAXBElement<java.lang.String> value)**	Sets the value of the clientReconfigureKeyGenerationTime property.
void	**[setClientRelayAddress](javax.xml.bind.JAXBElement<java.lang.String> value)**	Sets the value of the clientRelayAddress property.
void	**[setClientRelayMessage](javax.xml.bind.JAXBElement<java.lang.String> value)**	Sets the value of the clientRelayMessage property.
void	**[setClientRelayPort](javax.xml.bind.JAXBElement<java.lang.String> value)**	Sets the value of the clientRelayPort property.
void	**[setClientUserDefinedData](javax.xml.bind.JAXBElement<java.lang.String> value)**	Sets the value of the clientUserDefinedData property.
void	**[setClientVendorClass](javax.xml.bind.JAXBElement<StringArray> value)**	Sets the value of the clientVendorClass property.
void	**[setClientVendorInfo](javax.xml.bind.JAXBElement<StringArray> value)**	Sets the value of the clientVendorInfo property.

void	**setCmMacAddress**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the cmMacAddress property.
void	**setCreationTime**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the creationTime property.
void	**setDataSource**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the dataSource property.
void	**setDbtxnGeneration**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the dbtxnGeneration property.
void	**setDbtxnSeq**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the dbtxnSeq property.
void	**setDnsUpdateFlags**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the dnsUpdateFlags property.
void	**setExcludedPrefix**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the excludedPrefix property.
void	**setFailoverExpirationTime**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the failoverExpirationTime property.
void	**setFlags**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the flags property.
void	**setForwardDnsupdate**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the forwardDnsupdate property.
void	**setFqdn**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the fqdn property.
void	**setFqdnHostLabelCount**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the fqdnHostLabelCount property.
void	**setIp6Address**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the ip6Address property.
void	**setNameNumber**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the nameNumber property.
void	**setPreferredLifetime**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the preferredLifetime property.
void	**setPrefixName**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the prefixName property.
void	**setRequestedFqdn**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the requestedFqdn property.
void	**setRequestedPrefixLength**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the requestedPrefixLength property.
void	**setReservationCmMacAddress**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the reservationCmMacAddress property.
void	**setReservationLookupKey**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the reservationLookupKey property.
void	**setReservationLookupKeyType**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the reservationLookupKeyType property.
void	**setReverseDnsupdate**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the reverseDnsupdate property.
void	**setStartTimeOfState**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the

			startTimeOfState property.
void	[setState](javax.xml.bind.JAXBElement<java.lang.String> value)		Sets the value of the state property.
void	[setStateExpirationTime](javax.xml.bind.JAXBElement<java.lang.String> value)		Sets the value of the stateExpirationTime property.
void	[setTenantId](javax.xml.bind.JAXBElement<java.lang.String> value)		Sets the value of the tenantId property.
void	[setValidLifetime](javax.xml.bind.JAXBElement<java.lang.String> value)		Sets the value of the validLifetime property.
void	[setVpnId](javax.xml.bind.JAXBElement<java.lang.String> value)		Sets the value of the vpnId property.

Constructor Detail

Lease6

public Lease6()

Method Detail

getBindingEndTime

public javax.xml.bind.JAXBElement<java.lang.String> getBindingEndTime()

Gets the value of the bindingEndTime property.

Network Registrar Type: AT_DATE

Within the lease database, this holds the time when a lease binding
 ended.

Returns:

possible object is JAXBElement<String>

---

setBindingEndTime

public void setBindingEndTime(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the bindingEndTime property.

Parameters:

value - allowed object is JAXBElement<String>

---

getBindingFlags

public javax.xml.bind.JAXBElement<java.lang.String> getBindingFlags()

Gets the value of the bindingFlags property.

Network Registrar Type: AT_FLAGSINT
Valid values: virtual-binding

```
Displays any of the following values associated with the binding:
    9   virtual-binding
        Indicates if a binding is created for GetNextAddress6
        request.
```

Returns:

possible object is JAXBElement<String>

---

setBindingFlags

public void setBindingFlags(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the bindingFlags property.

Parameters:

value - allowed object is JAXBElement<String>

---

getBindingIaid

public javax.xml.bind.JAXBElement<java.lang.String> getBindingIaid()

Gets the value of the bindingIaid property.

Network Registrar Type: AT_INT

The IAID of the binding.

Returns:

possible object is JAXBElement<String>

---

setBindingIaid

public void setBindingIaid(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the bindingIaid property.

Parameters:

value - allowed object is JAXBElement<String>

getBindingRebindingTime

public javax.xml.bind.JAXBElement<java.lang.String> getBindingRebindingTime()

Gets the value of the bindingRebindingTime property.

Network Registrar Type: AT_DATE

```
Displays the earliest time when the server requested the client
 to issue a Rebind request for the binding.
```

Returns:

possible object is JAXBElement<String>

setBindingRebindingTime

public void setBindingRebindingTime(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the bindingRebindingTime property.

Parameters:

value - allowed object is JAXBElement<String>

getBindingRenewalTime

public javax.xml.bind.JAXBElement<java.lang.String> getBindingRenewalTime()

Gets the value of the bindingRenewalTime property.

Network Registrar Type: AT_DATE

```
Displays the earliest time when the server requested the client
 to issue a Renew request for the binding.
```

Returns:

possible object is JAXBElement<String>

setBindingRenewalTime

public void setBindingRenewalTime(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the bindingRenewalTime property.

Parameters:

value - allowed object is JAXBElement<String>

getBindingStartTime

public javax.xml.bind.JAXBElement<java.lang.String> getBindingStartTime()

Gets the value of the bindingStartTime property.

Network Registrar Type: AT_DATE

```
Within the lease database, holds the time when a lease binding
 began.
```

Returns:

possible object is JAXBElement<String>

---

setBindingStartTime

public void setBindingStartTime(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the bindingStartTime property.

Parameters:

value - allowed object is JAXBElement<String>

---

getBindingType

public javax.xml.bind.JAXBElement<java.lang.String> getBindingType()

Gets the value of the bindingType property.

Network Registrar Type: AT_ENUMINT
Valid values: IA_NA, IA_TA, IA_PD

```
Specifies the type of binding for the lease. The type number matches
 the DHCPv6 option number.
```

Returns:

possible object is JAXBElement<String>

---

setBindingType

public void setBindingType(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the bindingType property.

Parameters:

value - allowed object is JAXBElement<String>

---

getClientActiveLeases

public javax.xml.bind.JAXBElement<java.lang.String> getClientActiveLeases()

Gets the value of the clientActiveLeases property.

Network Registrar Type: AT_INT

```
Shows the number of active leases that a client currently
 has in use.
```

Returns:

possible object is JAXBElement<String>

setClientActiveLeases

public void setClientActiveLeases(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the clientActiveLeases property.

Parameters:
value - allowed object is JAXBElement<String>

getClientClassName

public javax.xml.bind.JAXBElement<java.lang.String> getClientClassName()

Gets the value of the clientClassName property.

Network Registrar Type: AT_NAMEREF

Displays the most recently derived class name for the client.

Returns:
possible object is JAXBElement<String>

setClientClassName

public void setClientClassName(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the clientClassName property.

Parameters:
value - allowed object is JAXBElement<String>

getClientFlags

public javax.xml.bind.JAXBElement<java.lang.String> getClientFlags()

Gets the value of the clientFlags property.

Network Registrar Type: AT_FLAGSINT
Valid values: client-valid, limit-retention, reconfigure-active, binding-update-needed, binding-update-in-flight, renewal-tracked

Displays any of the following values associated with the client:
    1 client-valid
       This should always be set.
    5 limit-retention
       Indicates if client's leases are subject to lease time
       retention restrictions.
    6 reconfigure-active
       Indicates if the client is being sent Reconfigure messages.
    8 binding-update-needed
       Indicates if a binding update is needed for the client.
    9 binding-update-in-flight
       Indicates if a binding update has been sent or is waiting

to be sent for the client.
```
    11  renewal-tracked
        Indicates if the client's renewal is being tracked (only
        if DHCP server's distribute-renewal feature is enabled).
```

Returns:

possible object is JAXBElement<String>

---

setClientFlags

public void setClientFlags(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the clientFlags property.

Parameters:

value - allowed object is JAXBElement<String>

---

getClientId

public javax.xml.bind.JAXBElement<java.lang.String> getClientId()

Gets the value of the clientId property.

Network Registrar Type: AT_BLOB

```
Displays the DUID of the client for the lease.
```

Returns:

possible object is JAXBElement<String>

---

setClientId

public void setClientId(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the clientId property.

Parameters:

value - allowed object is JAXBElement<String>

---

getClientLastTransactionTime

public javax.xml.bind.JAXBElement<java.lang.String> getClientLastTransactionTime()

Gets the value of the clientLastTransactionTime property.

Network Registrar Type: AT_DATE

```
Displays the time of last client transaction related to this lease.
```

Returns:

possible object is JAXBElement<String>

setClientLastTransactionTime

public void setClientLastTransactionTime(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the clientLastTransactionTime property.

Parameters:

value - allowed object is JAXBElement<String>

getClientLookupKey

public javax.xml.bind.JAXBElement<java.lang.String> getClientLookupKey()

Gets the value of the clientLookupKey property.

Network Registrar Type: AT_BLOB

```
Provides the lookup key for the client - it is either the client
 identifier (DUID) or the v6-override-client-id expression.
```

Returns:

possible object is JAXBElement<String>

setClientLookupKey

public void setClientLookupKey(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the clientLookupKey property.

Parameters:

value - allowed object is JAXBElement<String>

getClientLookupKeyType

public javax.xml.bind.JAXBElement<java.lang.String> getClientLookupKeyType()

Gets the value of the clientLookupKeyType property.

Network Registrar Type: AT_INT

```
Provides the data type of the client-lookup-key attribute. The type
 can be 7 for AT_BLOB or 46 for AT_NSTRING.
```

Returns:

possible object is JAXBElement<String>

setClientLookupKeyType

public void setClientLookupKeyType(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the clientLookupKeyType property.

Parameters:

value - allowed object is JAXBElement<String>

---

getClientOro

public javax.xml.bind.JAXBElement<java.lang.String> getClientOro()

Gets the value of the clientOro property.

Network Registrar Type: AT_OPTION6

```
Identifies the oro received from DHCP client in request messages.
```

Returns:

possible object is JAXBElement<String>

---

setClientOro

public void setClientOro(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the clientOro property.

Parameters:

value - allowed object is JAXBElement<String>

---

getClientReconfigureKey

public javax.xml.bind.JAXBElement<java.lang.String> getClientReconfigureKey()

Gets the value of the clientReconfigureKey property.

Network Registrar Type: AT_BLOB

```
The 128-bit key required for Reconfigure Messages to the client
 per the RFC 3315 Reconfigure Key Authentication Protocol.
```

Returns:

possible object is JAXBElement<String>

---

setClientReconfigureKey

public void setClientReconfigureKey(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the clientReconfigureKey property.

Parameters:

value - allowed object is JAXBElement<String>

---

getClientReconfigureKeyGenerationTime

public javax.xml.bind.JAXBElement<java.lang.String> getClientReconfigureKeyGenerationTime()

Gets the value of the clientReconfigureKeyGenerationTime property.

Network Registrar Type: AT_DATE

```
The time at which the client-reconfigure-key was generated.
```

Returns:
possible object is JAXBElement<String>

---

setClientReconfigureKeyGenerationTime

```
public void setClientReconfigureKeyGenerationTime(javax.xml.bind.JAXBElement<java.lang.String> value)
```

Sets the value of the clientReconfigureKeyGenerationTime property.

Parameters:
value - allowed object is JAXBElement<String>

---

getClientRelayAddress

```
public javax.xml.bind.JAXBElement<java.lang.String> getClientRelayAddress()
```

Gets the value of the clientRelayAddress property.

Network Registrar Type: AT_IP6ADDR

```
If present, displays the source address from the most recently
 received Relay-Forw message. If not present, the client communicated
 directly to the server.
```

Returns:
possible object is JAXBElement<String>

---

setClientRelayAddress

```
public void setClientRelayAddress(javax.xml.bind.JAXBElement<java.lang.String> value)
```

Sets the value of the clientRelayAddress property.

Parameters:
value - allowed object is JAXBElement<String>

---

getClientRelayMessage

```
public javax.xml.bind.JAXBElement<java.lang.String> getClientRelayMessage()
```

Gets the value of the clientRelayMessage property.

Network Registrar Type: AT_MSG6

```
Displays the most recently received relayed message. This data
 includes the complete Relay-Forw message(s) but excludes the client's
 message.
```

Returns:

possible object is JAXBElement<String>

---

setClientRelayMessage

public void setClientRelayMessage(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the clientRelayMessage property.

Parameters:

value - allowed object is JAXBElement<String>

---

getClientRelayPort

public javax.xml.bind.JAXBElement<java.lang.String> getClientRelayPort()

Gets the value of the clientRelayPort property.

Network Registrar Type: AT_INT

```
If present, displays the source port from the most recently
 received Relay-Forw message. If not present, relay used the
 default port (547). This is to support the "Generalized UDP
 Source Port for DHCP Relay" RFC.
```

Returns:

possible object is JAXBElement<String>

---

setClientRelayPort

public void setClientRelayPort(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the clientRelayPort property.

Parameters:

value - allowed object is JAXBElement<String>

---

getClientUserDefinedData

public javax.xml.bind.JAXBElement<java.lang.String> getClientUserDefinedData()

Gets the value of the clientUserDefinedData property.

Network Registrar Type: AT_STRING

```
Enables customer applications to relate the client record to other
 databases.  It is not used directly by the DHCP server, but may be
 read and written by extensions and expressions.
```

Returns:

possible object is JAXBElement<String>

setClientUserDefinedData

public void setClientUserDefinedData(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the clientUserDefinedData property.

Parameters:

value - allowed object is JAXBElement<String>

getClientVendorClass

public javax.xml.bind.JAXBElement<[StringArray](#)> getClientVendorClass()

Gets the value of the clientVendorClass property.

Network Registrar Type: AT_NLIST(AT_OPTION6)

```
Displays the most recently received client vendor class data. Each
 group of data bytes starts with the 4-byte enterprise-number
 followed by the vendor-class-data bytes (if any).
```

Returns:

possible object is JAXBElement<[StringArray](#)>

setClientVendorClass

public void setClientVendorClass(javax.xml.bind.JAXBElement<[StringArray](#)> value)

Sets the value of the clientVendorClass property.

Parameters:

value - allowed object is JAXBElement<[StringArray](#)>

getClientVendorInfo

public javax.xml.bind.JAXBElement<[StringArray](#)> getClientVendorInfo()

Gets the value of the clientVendorInfo property.

Network Registrar Type: AT_NLIST(AT_OPTION6)

```
The most recently received vendor-specific information
 options data from the client. Each group of data bytes
 starts with the 4-byte enterprise-number followed by the
 option-data bytes (if any).
```

Returns:

possible object is JAXBElement<[StringArray](#)>

setClientVendorInfo

public void setClientVendorInfo(javax.xml.bind.JAXBElement<[StringArray](#)> value)

Sets the value of the clientVendorInfo property.

Parameters:

value - allowed object is JAXBElement<StringArray>

---

getCmMacAddress

public javax.xml.bind.JAXBElement<java.lang.String> getCmMacAddress()

Gets the value of the cmMacAddress property.

Network Registrar Type: AT_MACADDR

Specifies the cable modem MAC address for this lease, if applicable.

Returns:
possible object is JAXBElement<String>

---

setCmMacAddress

public void setCmMacAddress(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the cmMacAddress property.

Parameters:
value - allowed object is JAXBElement<String>

---

getCreationTime

public javax.xml.bind.JAXBElement<java.lang.String> getCreationTime()

Gets the value of the creationTime property.

Network Registrar Type: AT_DATE

Sets the time when the lease was created.

Returns:
possible object is JAXBElement<String>

---

setCreationTime

public void setCreationTime(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the creationTime property.

Parameters:
value - allowed object is JAXBElement<String>

---

getDataSource

```
public javax.xml.bind.JAXBElement<java.lang.String> getDataSource()
```

Gets the value of the dataSource property.

Network Registrar Type: AT_ENUMINT
Valid values: unknown, main-main, backup-main, main-backup, backup-backup, main-main-active, backup-main-active, main-backup-active, backup-backup-active, main-main-history, backup-main-history, main-backup-history, backup-backup-history

```
Records the original source of the lease data and the machine
 from which the data was retrieved.
     0    unknown
     4    main-main
     20   main-main-active
     28   main-main-history
          Indicates the data originated on the main server and
          was retrieved from the main server.
     5    backup-main
     21   backup-main-active
     29   backup-main-history
          Indicates the data originated on the backup server and
          was retrieved from the main server.
     6    main-backup
     22   main-backup-active
     30   main-backup-history
          Indicates the data originated on the main server and
          was retrieved from the backup server.
     7    backup-backup
     23   backup-backup-active
     31   backup-backup-history
          Indicates the data originated on the backup server and
          was retrieved from the backup.
          The suffix -active denotes the data was returned from
          the active portion of the lease-state database while
          -history indicates that the data was from the history
          portion of the lease-state database.
 When viewing leases with the UIs, you will see all four
 values routinely, especially if load-balancing is enabled.
 When looking at lease history records, main-main and
 backup-backup are the usual values, but in cases where the
 lease history poller has determined that some data may be
 missing, then main-backup and backup-main can appear as
 well.
```

Returns:
possible object is JAXBElement<String>

setDataSource

```
public void setDataSource(javax.xml.bind.JAXBElement<java.lang.String> value)
```

Sets the value of the dataSource property.

Parameters:
value - allowed object is JAXBElement<String>

getDbtxnGeneration

```
public javax.xml.bind.JAXBElement<java.lang.String> getDbtxnGeneration()
```

Gets the value of the dbtxnGeneration property.

Network Registrar Type: AT_INT

```
The generation number for database transaction sequence numbers that
 exceed the 32-bit number space.
```

Returns:

possible object is JAXBElement<String>

---

setDbtxnGeneration

public void setDbtxnGeneration(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the dbtxnGeneration property.

Parameters:

value - allowed object is JAXBElement<String>

---

getDbtxnSeq

public javax.xml.bind.JAXBElement<java.lang.String> getDbtxnSeq()

Gets the value of the dbtxnSeq property.

Network Registrar Type: AT_INT

```
The database transaction sequence number used by CCM
 to record aggregated lease history.
```

Returns:

possible object is JAXBElement<String>

---

setDbtxnSeq

public void setDbtxnSeq(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the dbtxnSeq property.

Parameters:

value - allowed object is JAXBElement<String>

---

getDnsUpdateFlags

public javax.xml.bind.JAXBElement<java.lang.String> getDnsUpdateFlags()

Gets the value of the dnsUpdateFlags property.

Network Registrar Type: AT_FLAGSINT
Valid values: forward-uptodate, reverse-uptodate, update-pending, add-pending, delete-pending, synthesized-name, using-requested-fqdn

```
The dns update flags maintained for the lease / fqdn binding.
```

Returns:

possible object is JAXBElement<String>

setDnsUpdateFlags

public void setDnsUpdateFlags(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the dnsUpdateFlags property.

Parameters:

value - allowed object is JAXBElement<String>

getExcludedPrefix

public javax.xml.bind.JAXBElement<java.lang.String> getExcludedPrefix()

Gets the value of the excludedPrefix property.

Network Registrar Type: AT_IP6

```
Specifies the excluded prefix for a prefix delegation lease if one
 was configured at the time the lease was assigned to the client.
  See RFC 6603.
```

Returns:

possible object is JAXBElement<String>

setExcludedPrefix

public void setExcludedPrefix(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the excludedPrefix property.

Parameters:

value - allowed object is JAXBElement<String>

getFailoverExpirationTime

public javax.xml.bind.JAXBElement<java.lang.String> getFailoverExpirationTime()

Gets the value of the failoverExpirationTime property.

Network Registrar Type: AT_DATE

```
Specifies the lifetime that this server has acked to the failover
 partner. Usually, this server must wait for this time to have
 expired before it can act on the state-expiration-time.
```

Returns:

possible object is JAXBElement<String>

setFailoverExpirationTime

public void setFailoverExpirationTime(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the failoverExpirationTime property.

Parameters:

value - allowed object is JAXBElement<String>

getFlags

public javax.xml.bind.JAXBElement<java.lang.String> getFlags()

Gets the value of the flags property.

Network Registrar Type: AT_FLAGSINT
Valid values: reserved, deactivated, failover-updated, previously-reserved, client-reserved, revoked, use-bndack-time

```
Flags for the lease:
    1   (lease) reserved
        The lease is reserved because of a lease reservation6 object.
        The reservation-lookup-key specifies the client for which this
        lease is reserved.
    3   deactivated
        The lease is deactivated, which means that it should not be
        used. Any client which is using a deactivated lease will be
        sent lifetimes of 0 on the next renewal.
    5   failover-updated
        The lease is up-to-date with respect to failover (note that
        this is only true if the current lease's failover sequence
        number matches the failover object's sequence number).
    8   previously-reserved
        The lease was reserved at an earlier time but is no longer.
        However, communication with the failover partner is needed to
        completely remove this reservation.
   13   client-reserved
        Indicates that lease is in-range on a prefix that has
        restrict-to-reservations enabled.
   14   revoked
        The lease is no longer usable by the client, but the client
        may still be using it.
   15   use-bndack-time
        Use the time that we sent to the BNDACK as the time of lease
        expiration, so that a renewal at 1/2 the MCLT isn't required.
        Used for permanent leases and for GetNextAddress6 leases.
        This is persisted, but only lasts until the next BNDACK, when
        it is cleared.
```

Returns:

possible object is JAXBElement<String>

setFlags

public void setFlags(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the flags property.

Parameters:

value - allowed object is JAXBElement<String>

getForwardDnsupdate

public javax.xml.bind.JAXBElement<java.lang.String> getForwardDnsupdate()

Gets the value of the forwardDnsupdate property.

Network Registrar Type: AT_NAMEREF

```
Names the forward zone's DNS Update Configuration object
  for the lease.
```

Returns:

possible object is JAXBElement<String>

setForwardDnsupdate

public void setForwardDnsupdate(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the forwardDnsupdate property.

Parameters:

value - allowed object is JAXBElement<String>

getFqdn

public javax.xml.bind.JAXBElement<java.lang.String> getFqdn()

Gets the value of the fqdn property.

Network Registrar Type: AT_DNSNAME

```
The fully qualified domain name assigned to the lease by the
  server (and possibly successfully entered into DNS).
```

Returns:

possible object is JAXBElement<String>

setFqdn

public void setFqdn(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the fqdn property.

Parameters:

value - allowed object is JAXBElement<String>

getFqdnHostLabelCount

public javax.xml.bind.JAXBElement<java.lang.String> getFqdnHostLabelCount()

Gets the value of the fqdnHostLabelCount property.

Network Registrar Type: AT_INT
Default value: 1

```
The number of labels in the fqdn that constitute the
 host name portion.
```

Returns:

possible object is JAXBElement<String>

---

setFqdnHostLabelCount

public void setFqdnHostLabelCount(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the fqdnHostLabelCount property.

Parameters:

value - allowed object is JAXBElement<String>

---

getIp6Address

public javax.xml.bind.JAXBElement<java.lang.String> getIp6Address()

Gets the value of the ip6Address property.

Network Registrar Type: AT_IP6

```
Specifies the IPv6 address, or its prefix, of the lease.
```

Returns:

possible object is JAXBElement<String>

---

setIp6Address

public void setIp6Address(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the ip6Address property.

Parameters:

value - allowed object is JAXBElement<String>

---

getNameNumber

public javax.xml.bind.JAXBElement<java.lang.String> getNameNumber()

Gets the value of the nameNumber property.

Network Registrar Type: AT_INT

```
The numeric characters in the fqdn, if any, that were added
 by the DHCP server to disambiguate the host name.
```

Returns:

possible object is JAXBElement<String>

---

setNameNumber

public void setNameNumber(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the nameNumber property.

Parameters:
value - allowed object is JAXBElement<String>

---

getPreferredLifetime

public javax.xml.bind.JAXBElement<java.lang.String> getPreferredLifetime()

Gets the value of the preferredLifetime property.

Network Registrar Type: AT_DATE

Sets the time at which the address or prefix that was last
 communicated to the client is no longer preferred.

Returns:
possible object is JAXBElement<String>

---

setPreferredLifetime

public void setPreferredLifetime(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the preferredLifetime property.

Parameters:
value - allowed object is JAXBElement<String>

---

getPrefixName

public javax.xml.bind.JAXBElement<java.lang.String> getPrefixName()

Gets the value of the prefixName property.

Network Registrar Type: AT_NAMEREF

Identifies the prefix that contains this lease.

Returns:
possible object is JAXBElement<String>

---

setPrefixName

public void setPrefixName(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the prefixName property.

Parameters:

value - allowed object is JAXBElement<String>

---

getRequestedFqdn

public javax.xml.bind.JAXBElement<java.lang.String> getRequestedFqdn()

Gets the value of the requestedFqdn property.

Network Registrar Type: AT_ROF_FQDN

```
The partial or fully qualified domain name most recently
 requested by the client for the lease.
```

Returns:

possible object is JAXBElement<String>

---

setRequestedFqdn

public void setRequestedFqdn(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the requestedFqdn property.

Parameters:

value - allowed object is JAXBElement<String>

---

getRequestedPrefixLength

public javax.xml.bind.JAXBElement<java.lang.String> getRequestedPrefixLength()

Gets the value of the requestedPrefixLength property.

Network Registrar Type: AT_RANGEINT
Default value: 0
Valid values: 0 - 128

```
Specifies the requested prefix length (such as by a client in an
 IAPREFIX option - see RFC 3633, section 10).
```

Returns:

possible object is JAXBElement<String>

---

setRequestedPrefixLength

public void setRequestedPrefixLength(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the requestedPrefixLength property.

Parameters:

value - allowed object is JAXBElement<String>

getReservationCmMacAddress

public javax.xml.bind.JAXBElement<java.lang.String> getReservationCmMacAddress()

Gets the value of the reservationCmMacAddress property.

Network Registrar Type: AT_MACADDR

Specifies the cable modem MAC address configured on a reservation for
 this client. This will be used for responding to a LEASEQUERY when no
 leased lease is available for this client.

Returns:

possible object is JAXBElement<String>

setReservationCmMacAddress

public void setReservationCmMacAddress(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the reservationCmMacAddress property.

Parameters:

value - allowed object is JAXBElement<String>

getReservationLookupKey

public javax.xml.bind.JAXBElement<java.lang.String> getReservationLookupKey()

Gets the value of the reservationLookupKey property.

Network Registrar Type: AT_BLOB

Specifies the lookup key of the lease reservation for this lease.

Returns:

possible object is JAXBElement<String>

setReservationLookupKey

public void setReservationLookupKey(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the reservationLookupKey property.

Parameters:

value - allowed object is JAXBElement<String>

getReservationLookupKeyType

public javax.xml.bind.JAXBElement<java.lang.String> getReservationLookupKeyType()

Gets the value of the reservationLookupKeyType property.

Network Registrar Type: AT_INT

Specifies the data type of the reservation-lookup-key attribute. The
 type can be 7 for AT_BLOB or 46 for AT_NSTRING.

Returns:

possible object is JAXBElement<String>

---

setReservationLookupKeyType

public void setReservationLookupKeyType(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the reservationLookupKeyType property.

Parameters:

value - allowed object is JAXBElement<String>

---

getReverseDnsupdate

public javax.xml.bind.JAXBElement<java.lang.String> getReverseDnsupdate()

Gets the value of the reverseDnsupdate property.

Network Registrar Type: AT_NAMEREF

Names the reverse zone's DNS update configuration object
 for the lease.

Returns:

possible object is JAXBElement<String>

---

setReverseDnsupdate

public void setReverseDnsupdate(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the reverseDnsupdate property.

Parameters:

value - allowed object is JAXBElement<String>

---

getStartTimeOfState

public javax.xml.bind.JAXBElement<java.lang.String> getStartTimeOfState()

Gets the value of the startTimeOfState property.

Network Registrar Type: AT_DATE

Sets the time when the state last changed to its current value.

Returns:

possible object is JAXBElement<String>

setStartTimeOfState

public void setStartTimeOfState(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the startTimeOfState property.

Parameters:

value - allowed object is JAXBElement<String>

getState

public javax.xml.bind.JAXBElement<java.lang.String> getState()

Gets the value of the state property.

Network Registrar Type: AT_ENUMINT
Valid values: available, offered, leased, expired, unavailable, released, other-available, pending-available, revoked, pending-delete

```
Displays the current state of the lease:
    1  available
       The lease is not currently leased by the client.
    2  offered
       The lease is offered to the client. In many cases, the
       database is not written with information concerning offering
       a lease to a client since there is no requirement to update
       stable storage with this information.
    3  leased
       The lease is currently leased to the client.
    4  expired
       The client has not renewed the lease, and it expired and will
       be made available after the grace period expires.
    5  unavailable
       The lease is unavailable.  It was made unavailable because of
       some conflict.
    6  released
       The client has released the lease, but the server was
       configured to apply a grace period to the lease.  The lease
       will not be made available until the grace period expires.
    7  other-available
       Used only when failover is enabled.  A lease in the
       other-available state is available for allocation by the
       failover partner, but not available for allocation by this
       server.
    8  pending-available
       Used only when failover is enabled.  A lease in the
       pending-available state will be available as soon as this
       server can synchronize its state with the failover partner.
   10  revoked
       The lease is no longer usable by the client, but the client
       may still be using it.  This is DEPRECATED and no longer used
       (see the revoked flag in the flags attribute).
   11  pending-delete
       Used only when failover is enabled.  A lease in the
       pending-delete state will be disassociated from its client as
       soon as this server can synchronize its state with the
       failover partner.
```

Returns:

possible object is JAXBElement<String>

setState

public void setState(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the state property.

Parameters:

value - allowed object is JAXBElement<String>

getStateExpirationTime

public javax.xml.bind.JAXBElement<java.lang.String> getStateExpirationTime()

Gets the value of the stateExpirationTime property.

Network Registrar Type: AT_DATE

```
Determines the earliest time at which the current state is to expire,
 resulting in a state transition. Possible transitions are:
      OFFERED to deleted (if not reserved)
      LEASED to EXPIRED
      EXPIRED to AVAILABLE
      RELEASED to AVAILABLE
      AVAILABLE to deleted (if not reserved)
```

Returns:

possible object is JAXBElement<String>

setStateExpirationTime

public void setStateExpirationTime(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the stateExpirationTime property.

Parameters:

value - allowed object is JAXBElement<String>

getTenantId

public javax.xml.bind.JAXBElement<java.lang.String> getTenantId()

Gets the value of the tenantId property.

Network Registrar Type: AT_SHORT
Default value: 0

```
Identifies the tenant owner of this object.
```

Returns:

possible object is JAXBElement<String>

setTenantId

public void setTenantId(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the tenantId property.

Parameters:

value - allowed object is JAXBElement<String>

getValidLifetime

public javax.xml.bind.JAXBElement<java.lang.String> getValidLifetime()

Gets the value of the validLifetime property.

Network Registrar Type: AT_DATE

Sets the time at which the address or prefix that was last
 communicated to the client is no longer valid.

Returns:

possible object is JAXBElement<String>

setValidLifetime

public void setValidLifetime(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the validLifetime property.

Parameters:

value - allowed object is JAXBElement<String>

getVpnId

public javax.xml.bind.JAXBElement<java.lang.String> getVpnId()

Gets the value of the vpnId property.

Network Registrar Type: AT_INT
Immutable.
Default value: 0

Identifies the DHCP VPN that contains this lease.

Returns:

possible object is JAXBElement<String>

setVpnId

public void setVpnId(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the vpnId property.

Parameters:

value - allowed object is JAXBElement<String>

Package com.cisco.cnr.ws.xsd

Class Lease6Array

java.lang.Object
    com.cisco.cnr.ws.xsd.ClassBaseArray
        com.cisco.cnr.ws.xsd.Lease6Array

Class Link

java.lang.Object
    com.cisco.cnr.ws.xsd.ClassBase
        com.cisco.cnr.ws.xsd.Link

```
public class Link
extends ClassBase
```

The Network Registrar Link class.

This object represents a physical network link. Multiple logical IP networks may be running concurrently on the same link.

Java class for Link complex type.

The following schema fragment specifies the expected content contained within this class.

```
 <complexType name="Link">
   <complexContent>
     <extension base="{http://ws.cnr.cisco.com/xsd}ClassBase">
       <sequence>
         <element name="LinkType" type="{http://www.w3.org/2001/XMLSchema}string" minOccurs="0"/>
         <element name="description" type="{http://www.w3.org/2001/XMLSchema}string" minOccurs="0"/>
         <element name="embeddedPolicy" type="{http://ws.cnr.cisco.com/xsd}Policy" minOccurs="0"/>
         <element name="freeAddressConfig" type="{http://www.w3.org/2001/XMLSchema}string" minOccurs="0"/>
         <element name="groupName" type="{http://www.w3.org/2001/XMLSchema}string" minOccurs="0"/>
         <element name="interface" type="{http://www.w3.org/2001/XMLSchema}string" minOccurs="0"/>

Method Summary

All Methods	**Instance Methods** **Concrete Methods**

Modifier and Type	Method	Description
javax.xml.bind.JAXBElement<java.lang.String>	**getDescription**()	Gets the value of the description property.
javax.xml.bind.JAXBElement<**Policy**>	**getEmbeddedPolicy**()	Gets the value of the embeddedPolicy property.
javax.xml.bind.JAXBElement<java.lang.String>	**getFreeAddressConfig**()	Gets the value of the freeAddressConfig property.
javax.xml.bind.JAXBElement<java.lang.String>	**getGroupName**()	Gets the value of the groupName property.
javax.xml.bind.JAXBElement<java.lang.String>	**getInterface**()	Gets the value of the interface property.
javax.xml.bind.JAXBElement<java.lang.String>	**getLinkType**()	Gets the value of the LinkType property.
javax.xml.bind.JAXBElement<java.lang.String>	**getLocalCluster**()	Gets the value of the localCluster property.
javax.xml.bind.JAXBElement<java.lang.String>	**getMaintenance**()	Gets the value of the maintenance property.
java.lang.String	**getName**()	Gets the value of

		the name property.
javax.xml.bind.JAXBElement<java.lang.String>	**getOwner**()	Gets the value of the owner property.
javax.xml.bind.JAXBElement<java.lang.String>	**getPolicy**()	Gets the value of the policy property.
javax.xml.bind.JAXBElement<**PrefixArray**>	**getPrefixList**()	Gets the value of the prefixList property.
javax.xml.bind.JAXBElement<java.lang.String>	**getRegion**()	Gets the value of the region property.
javax.xml.bind.JAXBElement<java.lang.String>	**getTemplateRootPrefix**()	Gets the value of the templateRootPrefix property.
javax.xml.bind.JAXBElement<java.lang.String>	**getTenantId**()	Gets the value of the tenantId property.
javax.xml.bind.JAXBElement<java.lang.String>	**getVpnId**()	Gets the value of the vpnId property.
void	**setDescription**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the description property.
void	**setEmbeddedPolicy**(javax.xml.bind.JAXBElement<**Policy**> value)	Sets the value of the embeddedPolicy property.
void	**setFreeAddressConfig**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the freeAddressConfig property.
void	**setGroupName**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the groupName property.
void	**setInterface**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the interface property.

void	[setLinkType](javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the linkType property.
void	[setLocalCluster](javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the localCluster property.
void	[setMaintenance](javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the maintenance property.
void	[setName](java.lang.String value)	Sets the value of the name property.
void	[setOwner](javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the owner property.
void	[setPolicy](javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the policy property.
void	[setPrefixList](javax.xml.bind.JAXBElement<[PrefixArray]> value)	Sets the value of the prefixList property.
void	[setRegion](javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the region property.
void	[setTemplateRootPrefix](javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the templateRootPrefix property.
void	[setTenantId](javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the tenantId property.
void	[setVpnId](javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the vpnId property.

Constructor Detail

Link

public Link()

Method Detail

getLinkType

public javax.xml.bind.JAXBElement<java.lang.String> getLinkType()

Gets the value of the LinkType property.

Network Registrar Type: AT_ENUMINT
Default value: topological
Valid values: topological, location-independent, universal

```
Specifies the type of link.
 Topological links are used to determine where in the network a
 client is located.
 Location-independent links must be part of a link group and are
 available to clients on the other links in the link group. Each link
 group may have only a single location-independent link.
 A universal link is available to all clients on the VPN. Each VPN
 may have only a single universal link. A universal link can not be
 part of a link group.
```

Returns:

possible object is JAXBElement<String>

setLinkType

public void setLinkType(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the linkType property.

Parameters:

value - allowed object is JAXBElement<String>

---

getDescription

public javax.xml.bind.JAXBElement<java.lang.String> getDescription()

Gets the value of the description property.

Network Registrar Type: AT_STRING

```
Describes the link.
```

Returns:

possible object is JAXBElement<String>

---

setDescription

public void setDescription(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the description property.

Parameters:

value - allowed object is JAXBElement<String>

---

getEmbeddedPolicy

public javax.xml.bind.JAXBElement<Policy> getEmbeddedPolicy()

Gets the value of the embeddedPolicy property.

Network Registrar Type: AT_OBJ(Policy)

```
Refers to a policy embedded within a single specific link object
 used when replying to clients.
```

Returns:

possible object is JAXBElement<Policy>

---

setEmbeddedPolicy

public void setEmbeddedPolicy(javax.xml.bind.JAXBElement<Policy> value)

Sets the value of the embeddedPolicy property.

Parameters:

value - allowed object is JAXBElement<[Policy]>

getFreeAddressConfig

public javax.xml.bind.JAXBElement<java.lang.String> getFreeAddressConfig()

Gets the value of the freeAddressConfig property.

Network Registrar Type: AT_NAMEREF

```
Identifies which trap captures unexpected free address events
 on this Link.
 If this attribute is not configured, the server looks for
 the v6-default-free-address-config on the DHCPServer object.
```

Returns:

possible object is JAXBElement<String>

setFreeAddressConfig

public void setFreeAddressConfig(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the freeAddressConfig property.

Parameters:

value - allowed object is JAXBElement<String>

getGroupName

public javax.xml.bind.JAXBElement<java.lang.String> getGroupName()

Gets the value of the groupName property.

Network Registrar Type: AT_STRING

```
Specifies the link group to which this link belongs. When servicing
 client requests, the prefixes under the links in the link group may
 be used by clients.
```

Returns:

possible object is JAXBElement<String>

setGroupName

public void setGroupName(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the groupName property.

Parameters:
value - allowed object is JAXBElement<String>

getInterface

public javax.xml.bind.JAXBElement<java.lang.String> getInterface()

Gets the value of the interface property.

Network Registrar Type: AT_OID
Unique.

Specifies the router-interface associated with this link.

Returns:
possible object is JAXBElement<String>

setInterface

public void setInterface(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the interface property.

Parameters:
value - allowed object is JAXBElement<String>

getLocalCluster

public javax.xml.bind.JAXBElement<java.lang.String> getLocalCluster()

Gets the value of the localCluster property.

Network Registrar Type: AT_OID

Identifies the local DHCP cluster or failover pair

for this regional link.

Returns:

possible object is JAXBElement<String>

setLocalCluster

public void setLocalCluster(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the localCluster property.

Parameters:

value - allowed object is JAXBElement<String>

getMaintenance

public javax.xml.bind.JAXBElement<java.lang.String> getMaintenance()

Gets the value of the maintenance property.

Network Registrar Type: AT_BOOL
Default value: disabled

If this attribute is enabled, all Prefixes under this link will
 participate in the current maintenance window. DHCP clients
 will have their renewal times adjusted to avoid renewals during
 the maintenance window. In addition, they will be directed to
 renew during the renewal-period after the end of the maintenance
 window.

Returns:

possible object is JAXBElement<String>

setMaintenance

public void setMaintenance(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the maintenance property.

Parameters:

value - allowed object is JAXBElement<String>

getName

`public java.lang.String getName()`

Gets the value of the name property.

Network Registrar Type: AT_STRING
Required. Unique.

```
Provides user-assigned name for the link.
```

Returns:
possible object is `String`

setName

`public void setName(java.lang.String value)`

Sets the value of the name property.

Parameters:
value - allowed object is `String`

getOwner

`public javax.xml.bind.JAXBElement<java.lang.String> getOwner()`

Gets the value of the owner property.

Network Registrar Type: AT_NAMEREF

```
Identifies the owner of this link, referenced by name. Owners
 can be used to limit administrative access by owner.
```

Returns:
possible object is `JAXBElement<String>`

setOwner

`public void setOwner(javax.xml.bind.JAXBElement<java.lang.String> value)`

Sets the value of the owner property.

Parameters:
value - allowed object is `JAXBElement<String>`

getPolicy

public javax.xml.bind.JAXBElement<java.lang.String> getPolicy()

Gets the value of the policy property.

Network Registrar Type: AT_NAMEREF
Default value: default

```
Refers to a shared policy used when replying to clients.
```

Returns:

possible object is JAXBElement<String>

setPolicy

public void setPolicy(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the policy property.

Parameters:

value - allowed object is JAXBElement<String>

getPrefixList

public javax.xml.bind.JAXBElement<PrefixArray> getPrefixList()

Gets the value of the prefixList property.

Network Registrar Type: AT_NLIST(AT_OBJ(Prefix))

```
Lists the prefixes to be associated with the link. This
 attribute is used to add or modify the link and its prefixes
 in a single database action. All objects must be valid, or none will
 be accepted. The associated prefixes will be stored separately,
 and will not be returned in the parent link object.
```

Returns:

possible object is JAXBElement<PrefixArray>

setPrefixList

public void setPrefixList(javax.xml.bind.JAXBElement<PrefixArray> value)

Sets the value of the prefixList property.

Parameters:

value - allowed object is JAXBElement<PrefixArray>

getRegion

public javax.xml.bind.JAXBElement<java.lang.String> getRegion()

Gets the value of the region property.

Network Registrar Type: AT_NAMEREF

```
Identifies the region for this link, referenced by name. Regions
 can be used to limit administrative access by region.
```

Returns:

possible object is JAXBElement<String>

setRegion

public void setRegion(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the region property.

Parameters:

value - allowed object is JAXBElement<String>

getTemplateRootPrefix

public javax.xml.bind.JAXBElement<java.lang.String> getTemplateRootPrefix()

Gets the value of the templateRootPrefix property.

Network Registrar Type: AT_PREFIX

```
Identifies the root prefix address for prefixes associated with
 the link. This attribute is used when processing a link template
 that defines associated prefixes.
```

Returns:

possible object is JAXBElement<String>

setTemplateRootPrefix

public void setTemplateRootPrefix(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the templateRootPrefix property.

Parameters:

value - allowed object is JAXBElement<String>

getTenantId

public javax.xml.bind.JAXBElement<java.lang.String> getTenantId()

Gets the value of the tenantId property.

Network Registrar Type: AT_SHORT
Immutable.
Default value: 0

Identifies the tenant owner of this object.

Returns:

possible object is JAXBElement<String>

setTenantId

public void setTenantId(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the tenantId property.

Parameters:

value - allowed object is JAXBElement<String>

getVpnId

public javax.xml.bind.JAXBElement<java.lang.String> getVpnId()

Gets the value of the vpnId property.

Network Registrar Type: AT_INT
Immutable.

Default value: 0

Identifies the VPN that contains the link.

Returns:

possible object is JAXBElement<String>

---

setVpnId

public void setVpnId(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the vpnId property.

Parameters:

value - allowed object is JAXBElement<String>

Package com.cisco.cnr.ws.xsd

Class LinkArray

java.lang.Object
    com.cisco.cnr.ws.xsd.ClassBaseArray
        com.cisco.cnr.ws.xsd.LinkArray

public LinkArray()

Package com.cisco.cnr.ws.xsd

Class LinkTemplate

java.lang.Object
    com.cisco.cnr.ws.xsd.ClassBase
        com.cisco.cnr.ws.xsd.LinkTemplate

---

public class **LinkTemplate**
extends ClassBase

The Network Registrar LinkTemplate class.

A template to create IPv6 links and associated prefixes. The root prefix address and vpn can only be supplied as context variables. Attributes of type AT_EXPR are evaluated as expressions to generate a link-specific value for the corresponding link attribute. The prefix-expr attribute is a special case where the expression result defines the list of prefix addresses and prefix templates, which combined with the link vpn, are used to create associated prefixes. All other attributes, except the link name and description, are copied literally from the template to the newly created link.

Java class for LinkTemplate complex type.

The following schema fragment specifies the expected content contained within this class.

```
<complexType name="LinkTemplate">
  <complexContent>
    <extension base="{http://ws.cnr.cisco.com/xsd}ClassBase">
      <sequence>
        <element name="LinkTemplateType" type="{http://www.w3.org/2001/XMLSchema}string" minOccurs="0"/>
        <element name="description" type="{http://www.w3.org/2001/XMLSchema}string" minOccurs="0"/>
        <element name="embeddedPolicy" type="{http://ws.cnr.cisco.com/xsd}Policy" minOccurs="0"/>
        <element name="freeAddressConfig" type="{http://www.w3.org/2001/XMLSchema}string" minOccurs="0"/>
        <element name="groupName" type="{http://www.w3.org/2001/XMLSchema}string" minOccurs="0"/>
        <element name="linkDescriptionExpr" type="{http://www.w3.org/2001/XMLSchema}string" minOccurs="0"/>
        <element name="linkNameExpr" type="{http://www.w3.org/2001/XMLSchema}string" minOccurs="0"/>
        <element name="name" type="{http://www.w3.org/2001/XMLSchema}string"/>
        <element name="optionsExpr" type="{http://www.w3.org/2001/XMLSchema}string" minOccurs="0"/>
        <element name="owner" type="{http://www.w3.org/2001/XMLSchema}string" minOccurs="0"/>

Constructor Detail

LinkTemplate

```
public LinkTemplate()
```

Method Detail

getLinkTemplateType

`public javax.xml.bind.JAXBElement<java.lang.String> getLinkTemplateType()`

Gets the value of the LinkTemplateType property.

Network Registrar Type: AT_ENUMINT
Default value: topological
Valid values: topological, location-independent, universal

```
Specifies the type of link.
 Topological links are used to determine where in the network a
 client is located.
 Location-independent links must be part of a link group and are
 available to clients on the other links in the link group. Each link
 group may have only a single location-independent link.
 A universal link is available to all clients on the VPN. Each VPN
 may have only a single universal link. A universal link can not be
 part of a link group.
```

Returns:

possible object is JAXBElement<String>

setLinkTemplateType

`public void setLinkTemplateType(javax.xml.bind.JAXBElement<java.lang.String> value)`

Sets the value of the linkTemplateType property.

Parameters:

value - allowed object is JAXBElement<String>

getDescription

`public javax.xml.bind.JAXBElement<java.lang.String> getDescription()`

Gets the value of the description property.

Network Registrar Type: AT_STRING

```
Describes the link template.
```

Returns:

possible object is JAXBElement<String>

setDescription

public void setDescription(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the description property.

Parameters:

value - allowed object is JAXBElement<String>

getEmbeddedPolicy

public javax.xml.bind.JAXBElement<Policy> getEmbeddedPolicy()

Gets the value of the embeddedPolicy property.

Network Registrar Type: AT_OBJ(Policy)

```
Specifies an policy embedded.
 Note: When the template is applied, this will replace the
 entire embedded-policy in the link.
```

Returns:

possible object is JAXBElement<Policy>

setEmbeddedPolicy

public void setEmbeddedPolicy(javax.xml.bind.JAXBElement<Policy> value)

Sets the value of the embeddedPolicy property.

Parameters:

value - allowed object is JAXBElement<Policy>

getFreeAddressConfig

public javax.xml.bind.JAXBElement<java.lang.String> getFreeAddressConfig()

Gets the value of the freeAddressConfig property.

Network Registrar Type: AT_NAMEREF

```
Identifies which trap captures unexpected free address events
 on this link.
 If this attribute is not configured, the server looks for
```

the v6-default-free-address-config on the DHCPServer object.

Returns:

possible object is JAXBElement<String>

---

setFreeAddressConfig

public void setFreeAddressConfig(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the freeAddressConfig property.

Parameters:

value - allowed object is JAXBElement<String>

---

getGroupName

public javax.xml.bind.JAXBElement<java.lang.String> getGroupName()

Gets the value of the groupName property.

Network Registrar Type: AT_STRING

Specifies the link group to which this link belongs. When servicing
 client requests, the prefixes under the links in the link group may
 be used by clients.

Returns:

possible object is JAXBElement<String>

---

setGroupName

public void setGroupName(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the groupName property.

Parameters:

value - allowed object is JAXBElement<String>

---

getLinkDescriptionExpr

public javax.xml.bind.JAXBElement<java.lang.String> getLinkDescriptionExpr()

Gets the value of the linkDescriptionExpr property.

Network Registrar Type: AT_EXPR

```
An expression to define the description on the link object
  created when using the template.
```

Returns:

possible object is JAXBElement<String>

---

setLinkDescriptionExpr

```
public void setLinkDescriptionExpr(javax.xml.bind.JAXBElement<java.lang.String> value)
```

Sets the value of the linkDescriptionExpr property.

Parameters:

value - allowed object is JAXBElement<String>

---

getLinkNameExpr

```
public javax.xml.bind.JAXBElement<java.lang.String> getLinkNameExpr()
```

Gets the value of the linkNameExpr property.

Network Registrar Type: AT_EXPR

```
An expression to define the name of the link object created
 when using the template.
```

Returns:

possible object is JAXBElement<String>

---

setLinkNameExpr

```
public void setLinkNameExpr(javax.xml.bind.JAXBElement<java.lang.String> value)
```

Sets the value of the linkNameExpr property.

Parameters:

value - allowed object is JAXBElement<String>

---

getName

public java.lang.String getName()

Gets the value of the name property.

Network Registrar Type: AT_STRING
Required. Unique.

```
Assigns a name to this link template.
```

Returns:

possible object is `String`

---

setName

public void setName(java.lang.String value)

Sets the value of the name property.

Parameters:

value - allowed object is `String`

---

getOptionsExpr

public javax.xml.bind.JAXBElement<java.lang.String> getOptionsExpr()

Gets the value of the optionsExpr property.

Network Registrar Type: AT_EXPR

```
An expression to define the list of embedded policy options
 to be created.
```

Returns:

possible object is `JAXBElement<String>`

---

setOptionsExpr

public void setOptionsExpr(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the optionsExpr property.

Parameters:

value - allowed object is `JAXBElement<String>`

getOwner

`public javax.xml.bind.JAXBElement<java.lang.String> getOwner()`

Gets the value of the owner property.

Network Registrar Type: AT_NAMEREF

```
Identifies the owner of this link, referenced by name. Owners
 can be used to limit administrative access by owner.
```

Returns:

possible object is JAXBElement<String>

setOwner

`public void setOwner(javax.xml.bind.JAXBElement<java.lang.String> value)`

Sets the value of the owner property.

Parameters:

value - allowed object is JAXBElement<String>

getPolicy

`public javax.xml.bind.JAXBElement<java.lang.String> getPolicy()`

Gets the value of the policy property.

Network Registrar Type: AT_NAMEREF
Default value: default

```
Refers to a shared policy used when replying to clients.
```

Returns:

possible object is JAXBElement<String>

setPolicy

`public void setPolicy(javax.xml.bind.JAXBElement<java.lang.String> value)`

Sets the value of the policy property.

Parameters:

value - allowed object is JAXBElement<String>

getPrefixExpr

public javax.xml.bind.JAXBElement<java.lang.String> getPrefixExpr()

Gets the value of the prefixExpr property.

Network Registrar Type: AT_EXPR

```
Defines an expression used to create the list of associated
 prefixes.
```

Returns:

possible object is JAXBElement<String>

setPrefixExpr

public void setPrefixExpr(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the prefixExpr property.

Parameters:

value - allowed object is JAXBElement<String>

getRegion

public javax.xml.bind.JAXBElement<java.lang.String> getRegion()

Gets the value of the region property.

Network Registrar Type: AT_NAMEREF

```
Identifies the region for this link, referenced by name. Regions
 can be used to limit administrative access by region.
```

Returns:

possible object is JAXBElement<String>

setRegion

public void setRegion(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the region property.

Parameters:

value - allowed object is JAXBElement<String>

---

getTenantId

```
public javax.xml.bind.JAXBElement<java.lang.String> getTenantId()
```

Gets the value of the tenantId property.

Network Registrar Type: AT_SHORT
Immutable.
Default value: 0

Identifies the tenant owner of this object.

Returns:

possible object is JAXBElement<String>

---

setTenantId

```
public void setTenantId(javax.xml.bind.JAXBElement<java.lang.String> value)
```

Sets the value of the tenantId property.

Parameters:

value - allowed object is JAXBElement<String>

Package com.cisco.cnr.ws.xsd

Class LinkTemplateArray

java.lang.Object
    com.cisco.cnr.ws.xsd.ClassBaseArray
        com.cisco.cnr.ws.xsd.LinkTemplateArray

---

public class **LinkTemplateArray**
extends ClassBaseArray

Java class for LinkTemplateArray complex type.

The following schema fragment specifies the expected content contained within this class.

```
<complexType name="LinkTemplateArray">
  <complexContent>
    <extension base="{http://ws.cnr.cisco.com/xsd}ClassBaseArray">
    </extension>
  </complexContent>
</complexType>
```

Constructor Summary

Constructors

Constructor	Description
LinkTemplateArray()	

Method Summary

Methods inherited from class com.cisco.cnr.ws.xsd.ClassBaseArray

getList

Methods inherited from class java.lang.Object

equals, getClass, hashCode, notify, notifyAll, toString, wait, wait, wait

Constructor Detail

LinkTemplateArray

public LinkTemplateArray()

Package com.cisco.cnr.ws.xsd

Class ObjectFactory

java.lang.Object
    com.cisco.cnr.ws.xsd.ObjectFactory

---

public class **ObjectFactory**
extends java.lang.Object

This object contains factory methods for each Java content interface and Java element interface generated in the com.cisco.cnr.ws.xsd package.

An ObjectFactory allows you to programatically construct new instances of the Java representation for XML content. The Java representation of XML content can consist of schema derived interfaces and classes representing the binding of schema type definitions, element declarations and model groups. Factory methods for each of these are provided in this class.

Constructor Summary

Constructors	
Constructor	**Description**
ObjectFactory()	Create a new ObjectFactory that can be used to create new instances of schema derived classes for package: com.cisco.cnr.ws.xsd

Method Summary

All Methods **Instance Methods** **Concrete Methods**

Modifier and Type	Method	Description
ACL	**createACL**()	Create an instance of ACL
javax.xml.bind.JAXBElement<**ACL**>	**createACL**(**ACL** value)	Create an instance of JAXBElement<ACL>
ACLArray	**createACLArray**()	Create an instance of ACLArray
javax.xml.bind.JAXBElement<**ACLArray**>	**createACLArray**(**ACLArray** value)	Create an instance of JAXBElement<ACLArray>
javax.xml.bind.JAXBElement<java.lang.String>	**createACLDescription**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<**ACL**>	**createACLItem**(**ACL** value)	Create an instance of JAXBElement<ACL>
javax.xml.bind.JAXBElement<java.lang.String>	**createACLMatchList**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createACLTenantId**(java.lang.String value)	Create an instance of JAXBElement<String>
AddrSet	**createAddrSet**()	Create an instance of AddrSet
javax.xml.bind.JAXBElement<**AddrSet**>	**createAddrSet**(**AddrSet** value)	Create an instance of JAXBElement<AddrSet>
AddrSetArray	**createAddrSetArray**()	Create an instance of AddrSetArray
javax.xml.bind.JAXBElement<**AddrSetArray**>	**createAddrSetArray**(**AddrSetArray** value)	Create an instance of JAXBElement<AddrSetArray>
javax.xml.bind.JAXBElement<**StringArray**>	**createAddrSetIpaddrs**(**StringArray** value)	Create an instance of JAXBElement<StringArray>
javax.xml.bind.JAXBElement<**AddrSet**>	**createAddrSetItem**(**AddrSet** value)	Create an instance of JAXBElement<AddrSet>
javax.xml.bind.JAXBElement<java.lang.String>	**createAddrSetName**(java.lang.String value)	Create an instance of JAXBElement<String>
AttrDesc	**createAttrDesc**()	Create an instance of AttrDesc
javax.xml.bind.JAXBElement<**AttrDesc**>	**createAttrDesc**(**AttrDesc** value)	Create an instance of JAXBElement<AttrDesc>
AttrDescArray	**createAttrDescArray**()	Create an instance of AttrDescArray
javax.xml.bind.JAXBElement<**AttrDescArray**>	**createAttrDescArray**(**AttrDescArray** value)	Create an instance of JAXBElement<AttrDescArray>

javax.xml.bind.JAXBElement<java.lang.String>	**createAttrDescBaseType**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<**AttrDescArray**>	**createAttrDescChildren**(**AttrDescArray** value)	Create an instance of JAXBElement<**AttrDescArray**>
javax.xml.bind.JAXBElement<java.lang.String>	**createAttrDescDesc**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createAttrDescFlags**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createAttrDescId**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<**AttrDesc**>	**createAttrDescItem**(**AttrDesc** value)	Create an instance of JAXBElement<**AttrDesc**>
javax.xml.bind.JAXBElement<java.lang.String>	**createAttrDescName**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<**AttrDescArray**>	**createAttrDescOptionList**(**AttrDescArray** value)	Create an instance of JAXBElement<**AttrDescArray**>
javax.xml.bind.JAXBElement<java.lang.String>	**createAttrDescOptionSet**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createAttrDescRepeat**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createAttrDescSpec**(java.lang.String value)	Create an instance of JAXBElement<String>
AuthDnsSec	**createAuthDnsSec**()	Create an instance of **AuthDnsSec**
javax.xml.bind.JAXBElement<**AuthDnsSec**>	**createAuthDnsSec**(**AuthDnsSec** value)	Create an instance of JAXBElement<**AuthDnsSec**>
javax.xml.bind.JAXBElement<java.lang.String>	**createAuthDnsSecDescription**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createAuthDnsSecKeyRollover**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createAuthDnsSecKskAlgorithm**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createAuthDnsSecKskBits**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createAuthDnsSecKskRolloverInterval**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createAuthDnsSecName**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createAuthDnsSecZskAlgorithm**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createAuthDnsSecZskBits**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createAuthDnsSecZskLifetime**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createAuthDnsSecZskRolloverInterval**(java.lang.String value)	Create an instance of JAXBElement<String>
CCMCluster	**createCCMCluster**()	Create an instance of **CCMCluster**
javax.xml.bind.JAXBElement<**CCMCluster**>	**createCCMCluster**(**CCMCluster** value)	Create an instance of JAXBElement<**CCMCluster**>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMClusterAddrutilPollInterval**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMClusterAddrutilPollOffset**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMClusterAddrutilPollRetry**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMClusterAdmin**(java.lang.String value)	Create an instance of JAXBElement<String>
CCMClusterArray	**createCCMClusterArray**()	Create an instance of **CCMClusterArray**
javax.xml.bind.JAXBElement<**CCMClusterArray**>	**createCCMClusterArray**(**CCMClusterArray** value)	Create an instance of JAXBElement<**CCMClusterArray**>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMClusterClusterId**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMClusterFqdn**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMClusterHttpPort**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMClusterHttpsPort**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMClusterIp6Address**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMClusterIpaddr**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<**CCMCluster**>	**createCCMClusterItem**(**CCMCluster** value)	Create an instance of JAXBElement<**CCMCluster**>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMClusterLeaseHistPollInterval**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMClusterLeaseHistPollOffset**(java.lang.String value)	Create an instance of JAXBElement<String>

javax.xml.bind.JAXBElement<java.lang.String>	**createCCMClusterLeaseHistPollRetry**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMClusterLicensedServices**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<**CCMServerArray**>	**createCCMClusterLocalServers**(**CCMServerArray** value)	Create an instance of JAXBElement<**CCMServerArray**>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMClusterPassword**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMClusterPasswordSecret**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMClusterPollLeaseHistInterval**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMClusterPollLeaseHistOffset**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMClusterPollLeaseHistRetry**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMClusterPollReplicaInterval**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMClusterPollReplicaOffset**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMClusterPollReplicaRrs**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMClusterPollSubnetUtilInterval**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMClusterPollSubnetUtilOffset**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMClusterPollSubnetUtilRetry**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMClusterProductVersion**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMClusterRemoteId**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMClusterReplicaPollInterval**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMClusterReplicaPollOffset**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMClusterReplicationInitialized**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMClusterRestoreState**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMClusterScpPort**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMClusterScpReadTimeout**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMClusterSharedSecret**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMClusterTenantId**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMClusterUseHttpsPort**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMClusterUseSsl**(java.lang.String value)	Create an instance of JAXBElement<String>
CCMFailoverPair	**createCCMFailoverPair**()	Create an instance of **CCMFailoverPair**
javax.xml.bind.JAXBElement<**CCMFailoverPair**>	**createCCMFailoverPair**(**CCMFailoverPair** value)	Create an instance of JAXBElement<**CCMFailoverPair**>
CCMFailoverPairArray	**createCCMFailoverPairArray**()	Create an instance of **CCMFailoverPairArray**
javax.xml.bind.JAXBElement<**CCMFailoverPairArray**>	**createCCMFailoverPairArray**(**CCMFailoverPairArray** value)	Create an instance of JAXBElement<**CCMFailoverPairArray**>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMFailoverPairBackupIp6Address**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMFailoverPairBackupPct**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMFailoverPairBackupServer**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMFailoverPairDynamicBootpBackupPct**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMFailoverPairFailover**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<**CCMFailoverPair**>	**createCCMFailoverPairItem**(**CCMFailoverPair** value)	Create an instance of JAXBElement<**CCMFailoverPair**>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMFailoverPairLoadBalancing**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMFailoverPairMainIp6Address**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMFailoverPairMainServer**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMFailoverPairMclt**(java.lang.String value)	

		Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMFailoverPairRebindLimit**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMFailoverPairRelayHealthCheck**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMFailoverPairRhcElapsedTime**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMFailoverPairRhcMonitorFirstRelay**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMFailoverPairRhcRequestCount**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMFailoverPairRhcResponseTime**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMFailoverPairRhcRestartTime**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMFailoverPairRhcServerPreference**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMFailoverPairRhcUnresponsiveTime**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMFailoverPairRhcWarningInterval**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMFailoverPairSafePeriod**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMFailoverPairScopetemplate**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMFailoverPairSyncFailureTrap**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMFailoverPairTenantId**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMFailoverPairUseSafePeriod**(java.lang.String value)	Create an instance of JAXBElement<String>
CCMHaDnsPair	**createCCMHaDnsPair**()	Create an instance of [CCMHaDnsPair](#)
javax.xml.bind.JAXBElement<**CCMHaDnsPair**>	**createCCMHaDnsPair**(**CCMHaDnsPair** value)	Create an instance of JAXBElement<[CCMHaDnsPair](#)>
CCMHaDnsPairArray	**createCCMHaDnsPairArray**()	Create an instance of [CCMHaDnsPairArray](#)
javax.xml.bind.JAXBElement<**CCMHaDnsPairArray**>	**createCCMHaDnsPairArray**(**CCMHaDnsPairArray** value)	Create an instance of JAXBElement<[CCMHaDnsPairArray](#)>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMHaDnsPairDescription**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMHaDnsPairHaDns**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMHaDnsPairHaDnsBackupAddress**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMHaDnsPairHaDnsBackupIp6Address**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMHaDnsPairHaDnsBackupMname**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMHaDnsPairHaDnsBackupServer**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMHaDnsPairHaDnsMainAddress**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMHaDnsPairHaDnsMainIp6Address**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMHaDnsPairHaDnsMainMname**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMHaDnsPairHaDnsMainServer**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMHaDnsPairHaDnsPort**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMHaDnsPairHaDnsSoaMnameUpdate**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMHaDnsPairHaDnsSyncQuietPeriod**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<**CCMHaDnsPair**>	**createCCMHaDnsPairItem**(**CCMHaDnsPair** value)	Create an instance of JAXBElement<[CCMHaDnsPair](#)>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMHaDnsPairTenantId**(java.lang.String value)	Create an instance of JAXBElement<String>

CCMHostArray	**createCCMHostArray**()	Create an instance of [CCMHostArray](#)

javax.xml.bind.JAXBElement<**CCMHostArray**>	**createCCMHostArray**(**CCMHostArray** value)	Create an instance of JAXBElement<**CCMHostArray**>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMHostCreatePtrRecords**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<**StringArray**>	**createCCMHostIp6AddressList**(**StringArray** value)	Create an instance of JAXBElement<**StringArray**>
javax.xml.bind.JAXBElement<**CCMHost**>	**createCCMHostItem**(**CCMHost** value)	Create an instance of JAXBElement<**CCMHost**>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMHostName**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMHostTenantId**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMHostViewId**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMHostZone**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMHostZoneOrigin**(java.lang.String value)	Create an instance of JAXBElement<String>
CCMReverseZone	**createCCMReverseZone**()	Create an instance of **CCMReverseZone**
javax.xml.bind.JAXBElement<**CCMReverseZone**>	**createCCMReverseZone**(**CCMReverseZone** value)	Create an instance of JAXBElement<**CCMReverseZone**>
javax.xml.bind.JAXBElement<**StringArray**>	**createCCMReverseZoneAlternateViewIds**(**StringArray** value)	Create an instance of JAXBElement<**StringArray**>
CCMReverseZoneArray	**createCCMReverseZoneArray**()	Create an instance of **CCMReverseZoneArray**
javax.xml.bind.JAXBElement<**CCMReverseZoneArray**>	**createCCMReverseZoneArray**(**CCMReverseZoneArray** value)	Create an instance of JAXBElement<**CCMReverseZoneArray**>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMReverseZoneDefttl**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMReverseZoneDescription**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMReverseZoneDistMap**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMReverseZoneDnssec**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMReverseZoneDsRr**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMReverseZoneExpire**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<**CCMReverseZone**>	**createCCMReverseZoneItem**(**CCMReverseZone** value)	Create an instance of JAXBElement<**CCMReverseZone**>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMReverseZoneKeyGroup**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMReverseZoneMinttl**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMReverseZoneNotify**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<**StringArray**>	**createCCMReverseZoneNotifyList**(**StringArray** value)	Create an instance of JAXBElement<**StringArray**>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMReverseZoneNsttl**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMReverseZoneOwner**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMReverseZoneRefresh**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMReverseZoneRegion**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMReverseZoneRestrictQueryAcl**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMReverseZoneRestrictXfer**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMReverseZoneRestrictXferAcl**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMReverseZoneRetry**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMReverseZoneRoundRobin**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMReverseZoneRpz**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMReverseZoneScvgEnabled**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMReverseZoneScvgInterval**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMReverseZoneScvgMaxRecords**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMReverseZoneScvgRefreshInterval**(java.lang.String value)	Create an instance of JAXBElement<String>

Return Type	Method	Description
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMReverseZoneSoattl**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMReverseZoneTenantId**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMReverseZoneUpdateAcl**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<**StringArray**>	**createCCMReverseZoneUpdatePolicyList**(**StringArray** value)	Create an instance of JAXBElement<StringArray>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMReverseZoneViewId**(java.lang.String value)	Create an instance of JAXBElement<String>
CCMRR	**createCCMRR**()	Create an instance of CCMRR
javax.xml.bind.JAXBElement<**CCMRR**>	**createCCMRR**(CCMRR value)	Create an instance of JAXBElement<CCMRR>
CCMRRArray	**createCCMRRArray**()	Create an instance of CCMRRArray
javax.xml.bind.JAXBElement<**CCMRRArray**>	**createCCMRRArray**(CCMRRArray value)	Create an instance of JAXBElement<CCMRRArray>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMRRAxfrVersion**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<**CCMRR**>	**createCCMRRItem**(CCMRR value)	Create an instance of JAXBElement<CCMRR>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMRROrder**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMRRrdata**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMRRRrClass**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMRRRrType**(java.lang.String value)	Create an instance of JAXBElement<String>
CCMRRSet	**createCCMRRSet**()	Create an instance of CCMRRSet
javax.xml.bind.JAXBElement<**CCMRRSet**>	**createCCMRRSet**(CCMRRSet value)	Create an instance of JAXBElement<CCMRRSet>
CCMRRSetArray	**createCCMRRSetArray**()	Create an instance of CCMRRSetArray
javax.xml.bind.JAXBElement<**CCMRRSetArray**>	**createCCMRRSetArray**(CCMRRSetArray value)	Create an instance of JAXBElement<CCMRRSetArray>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMRRSetAxfrVersion**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMRRSetDescription**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMRRSetHits**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMRRSetHostHealthCheck**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<**CCMRRSet**>	**createCCMRRSetItem**(CCMRRSet value)	Create an instance of JAXBElement<CCMRRSet>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMRRSetLastAccessTime**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMRRSetLastResetTime**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMRRSetProtectedState**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<**CCMRRArray**>	**createCCMRRSetRrList**(CCMRRArray value)	Create an instance of JAXBElement<CCMRRArray>
javax.xml.bind.JAXBElement<**StringArray**>	**createCCMRRSetRrs**(**StringArray** value)	Create an instance of JAXBElement<StringArray>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMRRSetTenantId**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMRRSetViewId**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMRRSetViewQualifiedFqdn**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMRRSetZoneOrigin**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMRRTimestamp**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMRRTtl**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMRRWeight**(java.lang.String value)	Create an instance of JAXBElement<String>
CCMScopeTemplate	**createCCMScopeTemplate**()	Create an instance of CCMScopeTemplate
javax.xml.bind.JAXBElement<**CCMScopeTemplate**>	**createCCMScopeTemplate**(CCMScopeTemplate value)	Create an instance of JAXBElement<CCMScopeTemplate>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMScopeTemplateAllocateFirstAvailable**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMScopeTemplateAllocationPriority**(java.lang.String value)	Create an instance of JAXBElement<String>

CCMScopeTemplateArray	**createCCMScopeTemplateArray**()	Create an instance of [CCMScopeTemplateArray](#)
javax.xml.bind.JAXBElement<[CCMScopeTemplateArray](#)>	**createCCMScopeTemplateArray**([CCMScopeTemplateArray](#) value)	Create an instance of JAXBElement<[CCMScopeTemplateArray](#)>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMScopeTemplateBackupPct**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMScopeTemplateBootp**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMScopeTemplateDeactivated**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMScopeTemplateDescription**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMScopeTemplateDhcp**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMScopeTemplateDnsHostBytes**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMScopeTemplateDynamicBootp**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<[Policy](#)>	**createCCMScopeTemplateEmbeddedPolicy**([Policy](#) value)	Create an instance of JAXBElement<[Policy](#)>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMScopeTemplateFreeAddressConfig**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMScopeTemplateGracePeriod**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMScopeTemplateIgnoreDeclines**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<[CCMScopeTemplate](#)>	**createCCMScopeTemplateItem**([CCMScopeTemplate](#) value)	Create an instance of JAXBElement<[CCMScopeTemplate](#)>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMScopeTemplateOfferTimeout**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMScopeTemplateOptionsExpr**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMScopeTemplatePingClients**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMScopeTemplatePingTimeout**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMScopeTemplatePolicy**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMScopeTemplateRangesExpr**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMScopeTemplateRenewOnly**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMScopeTemplateRestrictToReservations**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMScopeTemplateRouterHost**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMScopeTemplateScopeDescriptionExpr**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMScopeTemplateScopeName**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<[StringArray](#)>	**createCCMScopeTemplateSelectionTagList**([StringArray](#) value)	Create an instance of JAXBElement<[StringArray](#)>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMScopeTemplateTenantId**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMScopeTemplateUpdateDnsForBootp**(java.lang.String value)	Create an instance of JAXBElement<String>
CCMSecondaryZone	**createCCMSecondaryZone**()	Create an instance of [CCMSecondaryZone](#)
javax.xml.bind.JAXBElement<[CCMSecondaryZone](#)>	**createCCMSecondaryZone**([CCMSecondaryZone](#) value)	Create an instance of JAXBElement<[CCMSecondaryZone](#)>
javax.xml.bind.JAXBElement<[StringArray](#)>	**createCCMSecondaryZoneAlternateViewIds**([StringArray](#) value)	Create an instance of JAXBElement<[StringArray](#)>
CCMSecondaryZoneArray	**createCCMSecondaryZoneArray**()	Create an instance of [CCMSecondaryZoneArray](#)
javax.xml.bind.JAXBElement<[CCMSecondaryZoneArray](#)>	**createCCMSecondaryZoneArray**([CCMSecondaryZoneArray](#) value)	Create an instance of JAXBElement<[CCMSecondaryZoneArray](#)>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMSecondaryZoneDescription**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMSecondaryZoneDnssec**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<[CCMSecondaryZone](#)>	**createCCMSecondaryZoneItem**([CCMSecondaryZone](#) value)	Create an instance of JAXBElement<[CCMSecondaryZone](#)>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMSecondaryZoneNotify**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<[StringArray](#)>	**createCCMSecondaryZoneNotifyList**([StringArray](#) value)	Create an instance of JAXBElement<[StringArray](#)>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMSecondaryZoneRestrictQueryAcl**(java.lang.String value)	Create an instance of JAXBElement<String>

javax.xml.bind.JAXBElement<java.lang.String>	**createCCMSecondaryZoneRestrictXfer**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMSecondaryZoneRestrictXferAcl**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMSecondaryZoneRoundRobin**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMSecondaryZoneRpz**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMSecondaryZoneTenantId**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMSecondaryZoneUseGssTsig**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMSecondaryZoneViewId**(java.lang.String value)	Create an instance of JAXBElement<String>
CCMServer	**createCCMServer**()	Create an instance of [CCMServer]
javax.xml.bind.JAXBElement<**CCMServer**>	**createCCMServer**(**CCMServer** value)	Create an instance of JAXBElement<[CCMServer]>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMServerAdmin**(java.lang.String value)	Create an instance of JAXBElement<String>
CCMServerArray	**createCCMServerArray**()	Create an instance of [CCMServerArray]
javax.xml.bind.JAXBElement<**CCMServerArray**>	**createCCMServerArray**(**CCMServerArray** value)	Create an instance of JAXBElement<[CCMServerArray]>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMServerCCMServerType**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMServerFqdn**(java.lang.String value)	Create an instance of JAXBElement<String>
CCMServerInfo	**createCCMServerInfo**()	Create an instance of [CCMServerInfo]
javax.xml.bind.JAXBElement<**CCMServerInfo**>	**createCCMServerInfo**(**CCMServerInfo** value)	Create an instance of JAXBElement<[CCMServerInfo]>
CCMServerInfoArray	**createCCMServerInfoArray**()	Create an instance of [CCMServerInfoArray]
javax.xml.bind.JAXBElement<**CCMServerInfoArray**>	**createCCMServerInfoArray**(**CCMServerInfoArray** value)	Create an instance of JAXBElement<[CCMServerInfoArray]>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMServerInfoClassid**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMServerInfoHealth**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<**CCMServerInfo**>	**createCCMServerInfoItem**(**CCMServerInfo** value)	Create an instance of JAXBElement<[CCMServerInfo]>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMServerInfoPid**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMServerInfoState**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMServerIpaddr**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<**CCMServer**>	**createCCMServerItem**(**CCMServer** value)	Create an instance of JAXBElement<[CCMServer]>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMServerLocal**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMServerPassword**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMServerPasswordSecret**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMServerScpPort**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMServerScpReadTimeout**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMServerUseSsl**(java.lang.String value)	Create an instance of JAXBElement<String>
CCMSubnet	**createCCMSubnet**()	Create an instance of [CCMSubnet]
javax.xml.bind.JAXBElement<**CCMSubnet**>	**createCCMSubnet**(**CCMSubnet** value)	Create an instance of JAXBElement<[CCMSubnet]>
CCMSubnetArray	**createCCMSubnetArray**()	Create an instance of [CCMSubnetArray]
javax.xml.bind.JAXBElement<**CCMSubnetArray**>	**createCCMSubnetArray**(**CCMSubnetArray** value)	Create an instance of JAXBElement<[CCMSubnetArray]>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMSubnetCCMSubnetType**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMSubnetDescription**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMSubnetDnsHostBytes**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMSubnetFailoverpair**(java.lang.String value)	Create an instance of JAXBElement<String>

javax.xml.bind.JAXBElement<java.lang.String>	**createCCMSubnetForwardZoneName**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMSubnetInterface**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement**<CCMSubnet>**	**createCCMSubnetItem**(**CCMSubnet** value)	Create an instance of JAXBElement**<CCMSubnet>**
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMSubnetOwner**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMSubnetParent**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMSubnetPrimarySubnet**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMSubnetRegion**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMSubnetReverseZoneName**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement**<ScopeArray>**	**createCCMSubnetScopeList**(**ScopeArray** value)	Create an instance of JAXBElement**<ScopeArray>**
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMSubnetSubnetState**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMSubnetTenantId**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMSubnetVpnId**(java.lang.String value)	Create an instance of JAXBElement<String>
CCMZDCaching	**createCCMZDCaching**()	Create an instance of **CCMZDCaching**
javax.xml.bind.JAXBElement**<CCMZDCaching>**	**createCCMZDCaching**(**CCMZDCaching** value)	Create an instance of JAXBElement**<CCMZDCaching>**
CCMZDCachingArray	**createCCMZDCachingArray**()	Create an instance of **CCMZDCachingArray**
javax.xml.bind.JAXBElement**<CCMZDCachingArray>**	**createCCMZDCachingArray**(**CCMZDCachingArray** value)	Create an instance of JAXBElement**<CCMZDCachingArray>**
javax.xml.bind.JAXBElement**<CCMZDCaching>**	**createCCMZDCachingItem**(**CCMZDCaching** value)	Create an instance of JAXBElement**<CCMZDCaching>**
javax.xml.bind.JAXBElement**<DnsIPnPortArray>**	**createCCMZDCachingMasterServers**(**DnsIPnPortArray** value)	Create an instance of JAXBElement**<DnsIPnPortArray>**
javax.xml.bind.JAXBElement**<DnsIPnPortArray>**	**createCCMZDCachingPrimaryServers**(**DnsIPnPortArray** value)	Create an instance of JAXBElement**<DnsIPnPortArray>**
CCMZDSecondary	**createCCMZDSecondary**()	Create an instance of **CCMZDSecondary**
javax.xml.bind.JAXBElement**<CCMZDSecondary>**	**createCCMZDSecondary**(**CCMZDSecondary** value)	Create an instance of JAXBElement**<CCMZDSecondary>**
CCMZDSecondaryArray	**createCCMZDSecondaryArray**()	Create an instance of **CCMZDSecondaryArray**
javax.xml.bind.JAXBElement**<CCMZDSecondaryArray>**	**createCCMZDSecondaryArray**(**CCMZDSecondaryArray** value)	Create an instance of JAXBElement**<CCMZDSecondaryArray>**
javax.xml.bind.JAXBElement**<CCMZDSecondary>**	**createCCMZDSecondaryItem**(**CCMZDSecondary** value)	Create an instance of JAXBElement**<CCMZDSecondary>**
javax.xml.bind.JAXBElement**<StringArray>**	**createCCMZDSecondaryMasterServers**(**StringArray** value)	Create an instance of JAXBElement**<StringArray>**
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMZDSecondaryNotify**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement**<StringArray>**	**createCCMZDSecondaryNotifyList**(**StringArray** value)	Create an instance of JAXBElement**<StringArray>**
javax.xml.bind.JAXBElement**<StringArray>**	**createCCMZDSecondaryPrimaryServers**(**StringArray** value)	Create an instance of JAXBElement**<StringArray>**
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMZDSecondaryRestrictQuery**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMZDSecondaryRestrictQueryAcl**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMZDSecondaryRestrictXfer**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMZDSecondaryRestrictXferAcl**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMZDSecondaryRoundRobin**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMZDSecondaryUseGssTsig**(java.lang.String value)	Create an instance of JAXBElement<String>
CCMZone	**createCCMZone**()	Create an instance of **CCMZone**
javax.xml.bind.JAXBElement**<CCMZone>**	**createCCMZone**(**CCMZone** value)	Create an instance of JAXBElement**<CCMZone>**
javax.xml.bind.JAXBElement**<StringArray>**	**createCCMZoneAlternateViewIds**(**StringArray** value)	Create an instance of JAXBElement**<StringArray>**
CCMZoneArray	**createCCMZoneArray**()	Create an instance of **CCMZoneArray**
javax.xml.bind.JAXBElement**<CCMZoneArray>**	**createCCMZoneArray**(**CCMZoneArray** value)	Create an instance of JAXBElement**<CCMZoneArray>**

javax.xml.bind.JAXBElement<java.lang.String>	**createCCMZoneDefttl**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMZoneDescription**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMZoneDistMap**(java.lang.String value)	Create an instance of JAXBElement<String>
CCMZoneDistribution	**createCCMZoneDistribution**()	Create an instance of [CCMZoneDistribution](#)
javax.xml.bind.JAXBElement<[CCMZoneDistribution](#)>	**createCCMZoneDistribution**([CCMZoneDistribution](#) value)	Create an instance of JAXBElement<[CCMZoneDistribution](#)>
CCMZoneDistributionArray	**createCCMZoneDistributionArray**()	Create an instance of [CCMZoneDistributionArray](#)
javax.xml.bind.JAXBElement<[CCMZoneDistributionArray](#)>	**createCCMZoneDistributionArray**([CCMZoneDistributionArray](#) value)	Create an instance of JAXBElement<[CCMZoneDistributionArray](#)>
javax.xml.bind.JAXBElement<[CCMZDCachingArray](#)>	**createCCMZoneDistributionCachingServerList**([CCMZDCachingArray](#) value)	Create an instance of JAXBElement<[CCMZDCachingArray](#)>
javax.xml.bind.JAXBElement<java.lang.String>	**createCCMZoneDistributionDescription**(java.lang.String value)	Create an instance of JAXBElement<String>

javax.xml.bind.JAXBElement<java.lang.String>	**createCertificateConfiguredBy**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCertificateDescription**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCertificateIssuer**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<**Certificate**>	**createCertificateItem**(**Certificate** value)	Create an instance of JAXBElement<**Certificate**>
javax.xml.bind.JAXBElement<java.lang.String>	**createCertificateKeyContents**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCertificatePublicKeyAlgorithm**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCertificateSerialNumber**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCertificateSignatureAlgorithm**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCertificateSubject**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCertificateValidityNotAfter**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCertificateValidityNotBefore**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCertificateValidityPeriod**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCertificateVersion**(java.lang.String value)	Create an instance of JAXBElement<String>
ClassBase	**createClassBase**()	Create an instance of [ClassBase](#)
javax.xml.bind.JAXBElement<**ClassBase**>	**createClassBase**(**ClassBase** value)	Create an instance of JAXBElement<**ClassBase**>
javax.xml.bind.JAXBElement<**ClassBaseArray**>	**createClassBaseArray**(**ClassBaseArray** value)	Create an instance of JAXBElement<**ClassBaseArray**>
javax.xml.bind.JAXBElement<java.lang.String>	**createClassBaseObjectOid**(java.lang.String value)	Create an instance of JAXBElement<String>
ClientClass	**createClientClass**()	Create an instance of [ClientClass](#)
javax.xml.bind.JAXBElement<**ClientClass**>	**createClientClass**(**ClientClass** value)	Create an instance of JAXBElement<**ClientClass**>
javax.xml.bind.JAXBElement<java.lang.String>	**createClientClassAction**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createClientClassAddToEnvironmentDictionary**(java.lang.String value)	Create an instance of JAXBElement<String>
ClientClassArray	**createClientClassArray**()	Create an instance of [ClientClassArray](#)
javax.xml.bind.JAXBElement<**ClientClassArray**>	**createClientClassArray**(**ClientClassArray** value)	Create an instance of JAXBElement<**ClientClassArray**>
javax.xml.bind.JAXBElement<java.lang.String>	**createClientClassClientLookupId**(java.lang.String value)	Create an instance of JAXBElement<String>

javax.xml.bind.JAXBElement<java.lang.String>	**createClientClassDefaultVpn**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createClientClassDomainName**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<**Policy**>	**createClientClassEmbeddedPolicy**(**Policy** value)	Create an instance of JAXBElement<**Policy**>
javax.xml.bind.JAXBElement<java.lang.String>	**createClientClassHostName**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<**ClientClass**>	**createClientClassItem**(**ClientClass** value)	Create an instance of JAXBElement<**ClientClass**>
javax.xml.bind.JAXBElement<java.lang.String>	**createClientClassLimitationId**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createClientClassOverLimitClientClassName**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createClientClassOverrideClientId**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createClientClassOverrideVpn**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createClientClassPolicyName**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<**StringArray**>	**createClientClassSelectionCriteria**(**StringArray** value)	Create an instance of JAXBElement<**StringArray**>
javax.xml.bind.JAXBElement<java.lang.String>	**createClientClassTenantId**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createClientClassUnauthenticatedClientClassName**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createClientClassUserDefined**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createClientClassV6ClientLookupId**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createClientClassV6OverrideClientId**(java.lang.String value)	Create an instance of JAXBElement<String>
ClientEntry	**createClientEntry**()	Create an instance of **ClientEntry**
javax.xml.bind.JAXBElement<**ClientEntry**>	**createClientEntry**(**ClientEntry** value)	Create an instance of JAXBElement<**ClientEntry**>
javax.xml.bind.JAXBElement<java.lang.String>	**createClientEntryAction**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createClientEntryAddToEnvironmentDictionary**(java.lang.String value)	Create an instance of JAXBElement<String>
ClientEntryArray	**createClientEntryArray**()	Create an instance of **ClientEntryArray**
javax.xml.bind.JAXBElement<**ClientEntryArray**>	**createClientEntryArray**(**ClientEntryArray** value)	Create an instance of JAXBElement<**ClientEntryArray**>
javax.xml.bind.JAXBElement<java.lang.String>	**createClientEntryAuthenticateUntil**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createClientEntryClientClassName**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createClientEntryDefaultVpn**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createClientEntryDomainName**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<**Policy**>	**createClientEntryEmbeddedPolicy**(**Policy** value)	Create an instance of JAXBElement<**Policy**>
javax.xml.bind.JAXBElement<java.lang.String>	**createClientEntryHostName**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<**ClientEntry**>	**createClientEntryItem**(**ClientEntry** value)	Create an instance of JAXBElement<**ClientEntry**>
javax.xml.bind.JAXBElement<java.lang.String>	**createClientEntryOverLimitClientClassName**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createClientEntryOverrideVpn**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createClientEntryPolicyName**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<**StringArray**>	**createClientEntryReservedAddresses**(**StringArray** value)	Create an instance of JAXBElement<**StringArray**>
javax.xml.bind.JAXBElement<**StringArray**>	**createClientEntryReservedIp6Addresses**(**StringArray** value)	Create an instance of JAXBElement<**StringArray**>
javax.xml.bind.JAXBElement<**StringArray**>	**createClientEntryReservedPrefixes**(**StringArray** value)	Create an instance of JAXBElement<**StringArray**>
javax.xml.bind.JAXBElement<**StringArray**>	**createClientEntrySelectionCriteria**(**StringArray** value)	Create an instance of JAXBElement<**StringArray**>
javax.xml.bind.JAXBElement<java.lang.String>	**createClientEntryTenantId**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createClientEntryUnauthenticatedClientClassName**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createClientEntryUserDefined**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createClientEntryUserid**(java.lang.String value)	Create an instance of JAXBElement<String>

CnrSoapAuth	**createCnrSoapAuth**()	Create an instance of [CnrSoapAuth]
javax.xml.bind.JAXBElement<**CnrSoapAuth**>	**createCnrSoapAuth**(**CnrSoapAuth** value)	Create an instance of JAXBElement<[CnrSoapAuth]>
javax.xml.bind.JAXBElement<java.lang.String>	**createCnrStatus**(java.lang.String value)	Create an instance of JAXBElement<String>
CurrentPrefixUtilization	**createCurrentPrefixUtilization**()	Create an instance of [CurrentPrefixUtilization]
javax.xml.bind.JAXBElement<**CurrentPrefixUtilization**>	**createCurrentPrefixUtilization**(**CurrentPrefixUtilization** value)	Create an instance of JAXBElement<[CurrentPrefixUtilization]>
javax.xml.bind.JAXBElement<java.lang.String>	**createCurrentPrefixUtilizationActiveDynamic**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCurrentPrefixUtilizationAggregationLevel**(java.lang.String value)	Create an instance of JAXBElement<String>
CurrentPrefixUtilizationArray	**createCurrentPrefixUtilizationArray**()	Create an instance of [CurrentPrefixUtilizationArray]
javax.xml.bind.JAXBElement<**CurrentPrefixUtilizationArray**>	**createCurrentPrefixUtilizationArray**(**CurrentPrefixUtilizationArray** value)	Create an instance of JAXBElement<[CurrentPrefixUtilizationArray]>
javax.xml.bind.JAXBElement<java.lang.String>	**createCurrentPrefixUtilizationAvailable**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCurrentPrefixUtilizationClusterId**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCurrentPrefixUtilizationDeactivated**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCurrentPrefixUtilizationDhcpType**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCurrentPrefixUtilizationExpired**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<**CurrentPrefixUtilizationArray**>	**createCurrentPrefixUtilizationHistoryList**(**CurrentPrefixUtilizationArray** value)	Create an instance of JAXBElement<[CurrentPrefixUtilizationArray]>
javax.xml.bind.JAXBElement<**CurrentPrefixUtilization**>	**createCurrentPrefixUtilizationItem**(**CurrentPrefixUtilization** value)	Create an instance of JAXBElement<[CurrentPrefixUtilization]>
javax.xml.bind.JAXBElement<java.lang.String>	**createCurrentPrefixUtilizationLeased**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCurrentPrefixUtilizationLeasedDeactivated**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCurrentPrefixUtilizationLinkName**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCurrentPrefixUtilizationMaxPdBalancingLength**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCurrentPrefixUtilizationOffered**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCurrentPrefixUtilizationOtherAvailable**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCurrentPrefixUtilizationOwner**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCurrentPrefixUtilizationPendingAvailable**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCurrentPrefixUtilizationPendingDelete**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCurrentPrefixUtilizationPrefix**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCurrentPrefixUtilizationPrefixCount**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCurrentPrefixUtilizationPrefixDeactivated**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCurrentPrefixUtilizationPrefixDeactivatedCount**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCurrentPrefixUtilizationPrefixesAvailable**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCurrentPrefixUtilizationPrefixesInTransition**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCurrentPrefixUtilizationPrefixesInUse**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCurrentPrefixUtilizationPrefixesOtherAvailable**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCurrentPrefixUtilizationPrefixName**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCurrentPrefixUtilizationPrefixRange**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCurrentPrefixUtilizationRegion**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCurrentPrefixUtilizationReservedActive**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCurrentPrefixUtilizationReservedInactive**(java.lang.String value)	Create an instance of JAXBElement<String>

javax.xml.bind.JAXBElement<java.lang.String>	**createCurrentPrefixUtilizationReservedLeasedDeactivated**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCurrentPrefixUtilizationReservedUnavail**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCurrentPrefixUtilizationRevoked**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCurrentPrefixUtilizationSelectionTags**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCurrentPrefixUtilizationTenantId**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCurrentPrefixUtilizationTimestamp**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCurrentPrefixUtilizationTotalReserved**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCurrentPrefixUtilizationUnavail**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCurrentPrefixUtilizationVpnId**(java.lang.String value)	Create an instance of JAXBElement<String>
CurrentUtilization	**createCurrentUtilization**()	Create an instance of [CurrentUtilization]
javax.xml.bind.JAXBElement<**CurrentUtilization**>	**createCurrentUtilization**(**CurrentUtilization** value)	Create an instance of JAXBElement<[CurrentUtilization]>
javax.xml.bind.JAXBElement<java.lang.String>	**createCurrentUtilizationActiveDynamic**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCurrentUtilizationAggregationLevel**(java.lang.String value)	Create an instance of JAXBElement<String>
CurrentUtilizationArray	**createCurrentUtilizationArray**()	Create an instance of [CurrentUtilizationArray]
javax.xml.bind.JAXBElement<**CurrentUtilizationArray**>	**createCurrentUtilizationArray**(**CurrentUtilizationArray** value)	Create an instance of JAXBElement<[CurrentUtilizationArray]>
javax.xml.bind.JAXBElement<java.lang.String>	**createCurrentUtilizationAvail**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCurrentUtilizationClusterId**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCurrentUtilizationDeactivated**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCurrentUtilizationExpired**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCurrentUtilizationFailoverRole**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCurrentUtilizationFailoverState**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCurrentUtilizationFreeDynamic**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<**CurrentUtilizationArray**>	**createCurrentUtilizationHistoryList**(**CurrentUtilizationArray** value)	Create an instance of JAXBElement<[CurrentUtilizationArray]>
javax.xml.bind.JAXBElement<**CurrentUtilization**>	**createCurrentUtilizationItem**(**CurrentUtilization** value)	Create an instance of JAXBElement<[CurrentUtilization]>
javax.xml.bind.JAXBElement<java.lang.String>	**createCurrentUtilizationLeased**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCurrentUtilizationLeasedDeactivated**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCurrentUtilizationOffered**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCurrentUtilizationOtherAvail**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCurrentUtilizationOwner**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCurrentUtilizationPendAvail**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCurrentUtilizationPrimarySubnet**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCurrentUtilizationRegion**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCurrentUtilizationReservedActive**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCurrentUtilizationReservedInactive**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCurrentUtilizationReservedLeasedDeactivated**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCurrentUtilizationReservedUnavail**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCurrentUtilizationScopeDeactivated**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCurrentUtilizationScopeName**(java.lang.String value)	Create an instance of JAXBElement<String>

javax.xml.bind.JAXBElement<java.lang.String>	**createCurrentUtilizationSelectionTags**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCurrentUtilizationSubnet**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCurrentUtilizationTenantId**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCurrentUtilizationTimestamp**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCurrentUtilizationTotalDynamic**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCurrentUtilizationTotalReserved**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCurrentUtilizationUnavail**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createCurrentUtilizationVpnId**(java.lang.String value)	Create an instance of JAXBElement<String>
DHCP6Stats	**createDHCP6Stats**()	Create an instance of [DHCP6Stats]
javax.xml.bind.JAXBElement<**DHCP6Stats**>	**createDHCP6Stats**(**DHCP6Stats** value)	Create an instance of JAXBElement<[DHCP6Stats]>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCP6StatsActiveLeasequeries**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCP6StatsActiveLeasequeryData**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCP6StatsActiveLeasequeryDone**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCP6StatsActiveLeasequeryReplies**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCP6StatsActiveLeases**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCP6StatsAdvertises**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCP6StatsAllocatedLeases**(java.lang.String value)	Create an instance of JAXBElement<String>
DHCP6StatsArray	**createDHCP6StatsArray**()	Create an instance of [DHCP6StatsArray]
javax.xml.bind.JAXBElement<**DHCP6StatsArray**>	**createDHCP6StatsArray**(**DHCP6StatsArray** value)	Create an instance of JAXBElement<[DHCP6StatsArray]>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCP6StatsAuthFails**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCP6StatsBulkLeasequeries**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCP6StatsBulkLeasequeryData**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCP6StatsBulkLeasequeryDone**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCP6StatsBulkLeasequeryReplies**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCP6StatsClientClassFails**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCP6StatsClientReservedActiveLeases**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCP6StatsClientReservedLeases**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCP6StatsConfirms**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCP6StatsDeclines**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCP6StatsDiscards**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCP6StatsDroppedTotal**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCP6StatsDuplicates**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCP6StatsExtensionDrops**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCP6StatsExtensionErrors**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCP6StatsGraceExpirations**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCP6StatsInfoRequests**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCP6StatsInvalidClients**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCP6StatsInvalidPackets**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<**DHCP6Stats**>	**createDHCP6StatsItem**(**DHCP6Stats** value)	Create an instance of JAXBElement<[DHCP6Stats]>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCP6StatsLeasequeries**(java.lang.String value)	Create an instance of JAXBElement<String>

javax.xml.bind.JAXBElement<java.lang.String>	**createDHCP6StatsLeasequeryReplies**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCP6StatsOfferTimeouts**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCP6StatsOtherServer**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCP6StatsOverMaxWaiting**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCP6StatsPacketsReceived**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCP6StatsPacketsReceivedRelay**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCP6StatsPacketsSent**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCP6StatsPacketsSentRelay**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCP6StatsQueueLimitedSolicitsDropped**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCP6StatsRebinds**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCP6StatsReconfigures**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCP6StatsReleases**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCP6StatsRenews**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCP6StatsReplies**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<**StringArray**>	**createDHCP6StatsReplyLatencyCounts**(**StringArray** value)	Create an instance of JAXBElement<**StringArray**>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCP6StatsRequestDroppedOld**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCP6StatsRequestDroppedOthers**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCP6StatsRequests**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCP6StatsReservedActiveLeases**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCP6StatsReservedLeases**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCP6StatsResponseDroppedOld**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCP6StatsResponseDroppedOthers**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCP6StatsServerDuid**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCP6StatsSolicits**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCP6StatsTcpConnectionsDropped**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCP6StatsTcpCurrentConnections**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCP6StatsTcpLqStatusCatchUpComplete**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCP6StatsTcpLqStatusDataMissing**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCP6StatsTcpLqStatusMalformedQuery**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCP6StatsTcpLqStatusNotAllowed**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCP6StatsTcpLqStatusNotConfigured**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCP6StatsTcpLqStatusQueryTerminated**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCP6StatsTcpLqStatusUnknownQuery**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCP6StatsTcpLqStatusUnspecFail**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCP6StatsTcpTotalConnections**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCP6StatsTotalPrefixes**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCP6StatsUnknownLinks**(java.lang.String value)	Create an instance of JAXBElement<String>
DHCPFailoverStats	**createDHCPFailoverStats**()	Create an instance of **DHCPFailoverStats**
javax.xml.bind.JAXBElement<**DHCPFailoverStats**>	**createDHCPFailoverStats**(**DHCPFailoverStats** value)	Create an instance of JAXBElement<**DHCPFailoverStats**>

javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPFailoverStatsActiveBindingUpdateLatencyAverage**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<**StringArray**>	**createDHCPFailoverStatsActiveBindingUpdateLatencyCounts**(**StringArray** value)	Create an instance of JAXBElement<**StringArray**>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPFailoverStatsActiveBindingUpdateLatencyMaximum**(java.lang.String value)	Create an instance of JAXBElement<String>
DHCPFailoverStatsArray	**createDHCPFailoverStatsArray**()	Create an instance of **DHCPFailoverStatsArray**
javax.xml.bind.JAXBElement<**DHCPFailoverStatsArray**>	**createDHCPFailoverStatsArray**(DHCPFailoverStatsArray value)	Create an instance of JAXBElement<**DHCPFailoverStatsArray**>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPFailoverStatsBindingAcksReceived**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPFailoverStatsBindingAcksSent**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPFailoverStatsBindingNaksReceived**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPFailoverStatsBindingNaksSent**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPFailoverStatsBindingUpdatesReceived**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPFailoverStatsBindingUpdatesSent**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPFailoverStatsConnectAcksReceived**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPFailoverStatsConnectAcksSent**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPFailoverStatsConnectionsTerminatedByPartner**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPFailoverStatsConnectionsTerminatedByServer**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPFailoverStatsConnectsReceived**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPFailoverStatsConnectsSent**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPFailoverStatsContactsReceived**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPFailoverStatsContactsSent**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPFailoverStatsDecayingMaxRequestBuffersInUse**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPFailoverStatsDiscardedMessages**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPFailoverStatsDisconnectsReceived**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPFailoverStatsDisconnectsSent**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPFailoverStatsFailedConnections**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPFailoverStatsInvalidConnections**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPFailoverStatsInvalidMessagesReceived**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<**DHCPFailoverStats**>	**createDHCPFailoverStatsItem**(**DHCPFailoverStats** value)	Create an instance of JAXBElement<**DHCPFailoverStats**>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPFailoverStatsPacketsReceived**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPFailoverStatsPacketsSent**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPFailoverStatsPoolRequestsReceived**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPFailoverStatsPoolResponsesSent**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPFailoverStatsQueuedBindingUpdateLatencyAverage**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<**StringArray**>	**createDHCPFailoverStatsQueuedBindingUpdateLatencyCounts**(**StringArray** value)	Create an instance of JAXBElement<**StringArray**>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPFailoverStatsQueuedBindingUpdateLatencyMaximum**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPFailoverStatsQueuedBindingUpdates**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPFailoverStatsRequestBuffersAllocated**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPFailoverStatsRequestBuffersInUse**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPFailoverStatsStateReceived**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPFailoverStatsStateSent**(java.lang.String value)	Create an instance of JAXBElement<String>

javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPFailoverStatsSuccessfulConnections**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPFailoverStatsUnavailableRequests**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPFailoverStatsUpdateDoneReceived**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPFailoverStatsUpdateDoneSent**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPFailoverStatsUpdateRequestsReceived**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPFailoverStatsUpdateRequestsSent**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPFailoverStatsV6BindingAcksReceived**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPFailoverStatsV6BindingAcksSent**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPFailoverStatsV6BindingNacksReceived**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPFailoverStatsV6BindingNacksSent**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPFailoverStatsV6BindingUpdatesReceived**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPFailoverStatsV6BindingUpdatesSent**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPFailoverStatsV6PoolRequestsReceived**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPFailoverStatsV6PoolRequestsSent**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPFailoverStatsV6PoolResponsesReceived**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPFailoverStatsV6PoolResponsesSent**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPFailoverStatsV6UpdateDoneReceived**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPFailoverStatsV6UpdateDoneSent**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPFailoverStatsV6UpdateRequestsReceived**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPFailoverStatsV6UpdateRequestsSent**(java.lang.String value)	Create an instance of JAXBElement<String>
DHCPMaintenanceWindow	**createDHCPMaintenanceWindow**()	Create an instance of DHCPMaintenanceWindow
javax.xml.bind.JAXBElement<**DHCPMaintenanceWindow**>	**createDHCPMaintenanceWindow**(DHCPMaintenanceWindow value)	Create an instance of JAXBElement<DHCPMaintenanceWindow>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPMaintenanceWindowAllPrefixesLinks**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPMaintenanceWindowAllScopes**(java.lang.String value)	Create an instance of JAXBElement<String>
DHCPMaintenanceWindowArray	**createDHCPMaintenanceWindowArray**()	Create an instance of DHCPMaintenanceWindowArray
javax.xml.bind.JAXBElement<**DHCPMaintenanceWindowArray**>	**createDHCPMaintenanceWindowArray**(DHCPMaintenanceWindowArray value)	Create an instance of JAXBElement<DHCPMaintenanceWindowArray>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPMaintenanceWindowEnd**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<**DHCPMaintenanceWindow**>	**createDHCPMaintenanceWindowItem**(DHCPMaintenanceWindow value)	Create an instance of JAXBElement<DHCPMaintenanceWindow>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPMaintenanceWindowRefreshPeriod**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPMaintenanceWindowStart**(java.lang.String value)	Create an instance of JAXBElement<String>
DHCPRenewalData	**createDHCPRenewalData**()	Create an instance of DHCPRenewalData
javax.xml.bind.JAXBElement<**DHCPRenewalData**>	**createDHCPRenewalData**(DHCPRenewalData value)	Create an instance of JAXBElement<DHCPRenewalData>
DHCPRenewalDataArray	**createDHCPRenewalDataArray**()	Create an instance of DHCPRenewalDataArray
javax.xml.bind.JAXBElement<**DHCPRenewalDataArray**>	**createDHCPRenewalDataArray**(DHCPRenewalDataArray value)	Create an instance of JAXBElement<DHCPRenewalDataArray>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPRenewalDataBucketInterval**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<**StringArray**>	**createDHCPRenewalDataBuckets**(StringArray value)	Create an instance of JAXBElement<StringArray>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPRenewalDataClients**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPRenewalDataClientsAdjusted**(java.lang.String value)	Create an instance of JAXBElement<String>

javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPRenewalDataConfiguredBucketInterval**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPRenewalDataConfiguredMaxRenewalTime**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPRenewalDataEndTime**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPRenewalDataInterval**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<**DHCPRenewalData**>	**createDHCPRenewalDataItem**(**DHCPRenewalData** value)	Create an instance of JAXBElement<**DHCPRenewalData**>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPRenewalDataLateRenewals**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPRenewalDataMaxBuckets**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPRenewalDataMaxLeaseTime**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPRenewalDataMaxPreferredLifetime**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPRenewalDataStartTime**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPRenewalDataTrackedRenewalPeriod**(java.lang.String value)	Create an instance of JAXBElement<String>
DHCPScopeAggregationStats	**createDHCPScopeAggregationStats**()	Create an instance of DHCPScopeAggregationStats
javax.xml.bind.JAXBElement<**DHCPScopeAggregationStats**>	**createDHCPScopeAggregationStats**(DHCPScopeAggregationStats value)	Create an instance of JAXBElement<DHCPScopeAggregationStats>
DHCPScopeAggregationStatsArray	**createDHCPScopeAggregationStatsArray**()	Create an instance of DHCPScopeAggregationStatsArray
javax.xml.bind.JAXBElement<**DHCPScopeAggregationStatsArray**>	**createDHCPScopeAggregationStatsArray**(DHCPScopeAggregationStatsArray value)	Create an instance of JAXBElement<DHCPScopeAggregationStatsArray>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPScopeAggregationStatsInUseAddresses**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<**DHCPScopeAggregationStats**>	**createDHCPScopeAggregationStatsItem**(DHCPScopeAggregationStats value)	Create an instance of JAXBElement<DHCPScopeAggregationStats>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPScopeAggregationStatsMode**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPScopeAggregationStatsName**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPScopeAggregationStatsTotalAddresses**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPScopeAggregationStatsUtilizedPct**(java.lang.String value)	Create an instance of JAXBElement<String>
DHCPScopeStatus	**createDHCPScopeStatus**()	Create an instance of DHCPScopeStatus
javax.xml.bind.JAXBElement<**DHCPScopeStatus**>	**createDHCPScopeStatus**(DHCPScopeStatus value)	Create an instance of JAXBElement<DHCPScopeStatus>
DHCPScopeStatusArray	**createDHCPScopeStatusArray**()	Create an instance of DHCPScopeStatusArray
javax.xml.bind.JAXBElement<**DHCPScopeStatusArray**>	**createDHCPScopeStatusArray**(DHCPScopeStatusArray value)	Create an instance of JAXBElement<DHCPScopeStatusArray>
javax.xml.bind.JAXBElement<**DHCPScopeStatus**>	**createDHCPScopeStatusItem**(DHCPScopeStatus value)	Create an instance of JAXBElement<DHCPScopeStatus>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPScopeStatusName**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPScopeStatusScopeStatus**(java.lang.String value)	Create an instance of JAXBElement<String>
DHCPServer	**createDHCPServer**()	Create an instance of DHCPServer
javax.xml.bind.JAXBElement<**DHCPServer**>	**createDHCPServer**(DHCPServer value)	Create an instance of JAXBElement<DHCPServer>
DHCPServerActivityStats	**createDHCPServerActivityStats**()	Create an instance of DHCPServerActivityStats
javax.xml.bind.JAXBElement<**DHCPServerActivityStats**>	**createDHCPServerActivityStats**(DHCPServerActivityStats value)	Create an instance of JAXBElement<DHCPServerActivityStats>
javax.xml.bind.JAXBElement<**StringArray**>	**createDHCPServerActivityStatsAckLatencyCounts**(StringArray value)	Create an instance of JAXBElement<StringArray>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPServerActivityStatsAcks**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPServerActivityStatsAcksPerSecond**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPServerActivityStatsActiveLeases**(java.lang.String value)	Create an instance of JAXBElement<String>
DHCPServerActivityStatsArray	**createDHCPServerActivityStatsArray**()	Create an instance of DHCPServerActivityStatsArray

javax.xml.bind.JAXBElement<**DHCPServerActivityStatsArray**>	**createDHCPServerActivityStatsArray**(DHCPServerActivityStatsArray value)	Create an instance of JAXBElement<**DHCPServerActivityStatsArray**>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPServerActivityStatsBootpReceived**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPServerActivityStatsBootpSent**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPServerActivityStatsClientClassFails**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPServerActivityStatsClientReservedActiveLeases**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPServerActivityStatsClientReservedLeases**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPServerActivityStatsConfiguredLeases**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPServerActivityStatsDecayingMaxRequestBuffersInUse**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPServerActivityStatsDeclines**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPServerActivityStatsDiscards**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPServerActivityStatsDiscovers**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPServerActivityStatsDroppedTotal**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPServerActivityStatsDuplicates**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPServerActivityStatsExtensionDrops**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPServerActivityStatsExtensionErrors**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPServerActivityStatsGraceExpirations**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPServerActivityStatsInforms**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPServerActivityStatsInvalidClients**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPServerActivityStatsInvalidPackets**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<**DHCPServerActivityStats**>	**createDHCPServerActivityStatsItem**(DHCPServerActivityStats value)	Create an instance of JAXBElement<**DHCPServerActivityStats**>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPServerActivityStatsLeaseQueries**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPServerActivityStatsLeaseQueriesActive**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPServerActivityStatsLeaseQueriesUnassigned**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPServerActivityStatsLeaseQueriesUnknown**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPServerActivityStatsNaks**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPServerActivityStatsOffers**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPServerActivityStatsOfferTimeouts**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPServerActivityStatsOverMaxWaiting**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPServerActivityStatsPacketsDropped**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPServerActivityStatsPacketsReceived**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPServerActivityStatsPacketsSent**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPServerActivityStatsQueueLimitedDiscoversDropped**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPServerActivityStatsReleases**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPServerActivityStatsRequestBuffersAllocated**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPServerActivityStatsRequestBuffersInUse**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPServerActivityStatsRequestDroppedOld**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPServerActivityStatsRequestDroppedOthers**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPServerActivityStatsRequests**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPServerActivityStatsReservedActiveLeases**(java.lang.String value)	

		Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPServerActivityStatsReservedLeases**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPServerActivityStatsResponseBuffersAllocated**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPServerActivityStatsResponseBuffersInUse**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPServerActivityStatsResponseDroppedOld**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPServerActivityStatsResponseDroppedOthers**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPServerActivityStatsResponsesDropped**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPServerActivityStatsTcpActiveLeaseQueries**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPServerActivityStatsTcpBulkLeaseQueries**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPServerActivityStatsTcpConnectionsDropped**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPServerActivityStatsTcpCurrentConnections**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPServerActivityStatsTcpLqActive**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPServerActivityStatsTcpLqDone**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPServerActivityStatsTcpLqStatus**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPServerActivityStatsTcpLqStatusCatchupComplete**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPServerActivityStatsTcpLqStatusConnectionActive**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPServerActivityStatsTcpLqStatusDataMissing**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPServerActivityStatsTcpLqStatusMalformedQuery**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPServerActivityStatsTcpLqStatusNotAllowed**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPServerActivityStatsTcpLqStatusQueryTerminated**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPServerActivityStatsTcpLqStatusUnspecFail**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPServerActivityStatsTcpLqUnassigned**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPServerActivityStatsTcpTotalConnections**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPServerActivityStatsTimeouts**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPServerActivityStatsTotalScopes**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPServerActivityStatsUnknownScopes**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPServerActivitySummaryInterval**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<[StringArray](#)>	**createDHCPServerAddrBlocksDefaultSelectionTags**([StringArray](#) value)	Create an instance of JAXBElement<[StringArray](#)>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPServerAddrBlocksUseClientAffinity**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPServerAddrBlocksUseLanSegments**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPServerAddrBlocksUseSelectionTags**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPServerCacheClientForRequests**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPServerClientCacheCount**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPServerClientCacheTtl**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPServerClientClass**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPServerClientClassLookupId**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPServerCollectPerformanceStatistics**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPServerCollectSampleCounters**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPServerDefaultFreeAddressConfig**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDHCPServerDeferLeaseExtensions**(java.lang.String value)	Create an instance of JAXBElement<String>

javax.xml.bind.JAXBElement<java.lang.String>	**[createDHCPServerDeleteOrphanedLeases](java.lang.String value)**	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**[createDHCPServerDeleteOrphanedSubnets](java.lang.String value)**	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**[createDHCPServerDistributeRenewals](java.lang.String value)**	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**[createDHCPServerDistributeRenewalsBucketInterval](java.lang.String value)**	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**[createDHCPServerDistributeRenewalsMaxRenewalTime](java.lang.String value)**	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**[createDHCPServerDnsClientIdentity](java.lang.String value)**	Create an instance of JAXBElement<String>

javax.xml.bind.JAXBElement<java.lang.String>	**createDnsEnumEntrySetZoneTemplate**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDnsEnumEntrySubtype**(java.lang.String value)	Create an instance of JAXBElement<String>
DnsException	**createDnsException**()	Create an instance of [DnsException]
javax.xml.bind.JAXBElement**<DnsException>**	**createDnsException**(**DnsException** value)	Create an instance of JAXBElement**<DnsException>**
javax.xml.bind.JAXBElement**<DnsIPnPortArray>**	**createDnsExceptionAddr**(**DnsIPnPortArray** value)	Create an instance of JAXBElement**<DnsIPnPortArray>**
DnsExceptionArray	**createDnsExceptionArray**()	Create an instance of [DnsExceptionArray]
javax.xml.bind.JAXBElement**<DnsExceptionArray>**	**createDnsExceptionArray**(**DnsExceptionArray** value)	Create an instance of JAXBElement**<DnsExceptionArray>**
javax.xml.bind.JAXBElement<java.lang.String>	**createDNSExceptionDescription**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement**<StringArray>**	**createDnsExceptionHost**(**StringArray** value)	Create an instance of JAXBElement**<StringArray>**
javax.xml.bind.JAXBElement**<DnsException>**	**createDnsExceptionItem**(**DnsException** value)	Create an instance of JAXBElement**<DnsException>**
javax.xml.bind.JAXBElement<java.lang.String>	**createDnsExceptionPrime**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDnsExceptionTls**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDnsExceptionTlsAuthName**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDnsExceptionUsesViews**(java.lang.String value)	Create an instance of JAXBElement<String>
DnsForwarder	**createDNSForwarder**()	Create an instance of [DnsForwarder]
javax.xml.bind.JAXBElement**<DnsForwarder>**	**createDnsForwarder**(**DnsForwarder** value)	Create an instance of JAXBElement**<DnsForwarder>**
javax.xml.bind.JAXBElement**<DnsIPnPortArray>**	**createDnsForwarderAddr**(**DnsIPnPortArray** value)	Create an instance of JAXBElement**<DnsIPnPortArray>**
DnsForwarderArray	**createDnsForwarderArray**()	Create an instance of [DnsForwarderArray]
javax.xml.bind.JAXBElement**<DnsForwarderArray>**	**createDnsForwarderArray**(**DnsForwarderArray** value)	Create an instance of JAXBElement**<DnsForwarderArray>**
javax.xml.bind.JAXBElement<java.lang.String>	**createDnsForwarderCiscoUmbrella**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDnsForwarderDescription**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement**<StringArray>**	**createDnsForwarderHost**(**StringArray** value)	Create an instance of JAXBElement**<StringArray>**
javax.xml.bind.JAXBElement**<DnsForwarder>**	**createDnsForwarderItem**(**DnsForwarder** value)	Create an instance of JAXBElement**<DnsForwarder>**
javax.xml.bind.JAXBElement<java.lang.String>	**createDnsForwarderTls**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDnsForwarderTlsAuthName**(java.lang.String value)	Create an instance of JAXBElement<String>
DnsHAStatus	**createDnsHAStatus**()	Create an instance of [DnsHAStatus]
javax.xml.bind.JAXBElement**<DnsHAStatus>**	**createDnsHAStatus**(**DnsHAStatus** value)	Create an instance of JAXBElement**<DnsHAStatus>**
DnsHAStatusArray	**createDnsHAStatusArray**()	Create an instance of [DnsHAStatusArray]
javax.xml.bind.JAXBElement**<DnsHAStatusArray>**	**createDnsHAStatusArray**(**DnsHAStatusArray** value)	Create an instance of JAXBElement**<DnsHAStatusArray>**
javax.xml.bind.JAXBElement<java.lang.String>	**createDnsHAStatusClusterName**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDnsHAStatusHaZoneCount**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement**<DnsHAStatus>**	**createDnsHAStatusItem**(**DnsHAStatus** value)	Create an instance of JAXBElement**<DnsHAStatus>**
javax.xml.bind.JAXBElement<java.lang.String>	**createDnsHAStatusRole**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDnsHAStatusState**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDnsHAStatusZoneSyncCompleteCount**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement**<CCMZoneArray>**	**createDnsHAStatusZoneSyncCompleteList**(**CCMZoneArray** value)	Create an instance of JAXBElement**<CCMZoneArray>**

javax.xml.bind.JAXBElement<java.lang.String>	**createDnsHAStatusZoneSyncFailedCount**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<**CCMZoneArray**>	**createDnsHAStatusZoneSyncFailedList**(**CCMZoneArray** value)	Create an instance of JAXBElement<**CCMZoneArray**>
javax.xml.bind.JAXBElement<java.lang.String>	**createDnsHAStatusZoneSyncPendingCount**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<**CCMZoneArray**>	**createDnsHAStatusZoneSyncPendingList**(**CCMZoneArray** value)	Create an instance of JAXBElement<**CCMZoneArray**>
DnsIPnPort	**createDnsIPnPort**()	Create an instance of **DnsIPnPort**
javax.xml.bind.JAXBElement<**DnsIPnPort**>	**createDnsIPnPort**(**DnsIPnPort** value)	Create an instance of JAXBElement<**DnsIPnPort**>
DnsIPnPortArray	**createDnsIPnPortArray**()	Create an instance of **DnsIPnPortArray**
javax.xml.bind.JAXBElement<**DnsIPnPortArray**>	**createDnsIPnPortArray**(**DnsIPnPortArray** value)	Create an instance of JAXBElement<**DnsIPnPortArray**>
javax.xml.bind.JAXBElement<**DnsIPnPort**>	**createDnsIPnPortItem**(**DnsIPnPort** value)	Create an instance of JAXBElement<**DnsIPnPort**>
javax.xml.bind.JAXBElement<java.lang.String>	**createDnsIPnPortPort**(java.lang.String value)	Create an instance of JAXBElement<String>
DNSRelatedServer	**createDNSRelatedServer**()	Create an instance of **DNSRelatedServer**
javax.xml.bind.JAXBElement<**DNSRelatedServer**>	**createDNSRelatedServer**(**DNSRelatedServer** value)	Create an instance of JAXBElement<**DNSRelatedServer**>
javax.xml.bind.JAXBElement<java.lang.String>	**createDNSRelatedServerAcknowledgedRequests**(java.lang.String value)	Create an instance of JAXBElement<String>
DNSRelatedServerArray	**createDNSRelatedServerArray**()	Create an instance of **DNSRelatedServerArray**
javax.xml.bind.JAXBElement<**DNSRelatedServerArray**>	**createDNSRelatedServerArray**(**DNSRelatedServerArray** value)	Create an instance of JAXBElement<**DNSRelatedServerArray**>
javax.xml.bind.JAXBElement<java.lang.String>	**createDNSRelatedServerCommState**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDNSRelatedServerCurrentTime**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDNSRelatedServerDeactivatedCount**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDNSRelatedServerDnsServerFlags**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDNSRelatedServerDnsServerState**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDNSRelatedServerDnsTimeout**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDNSRelatedServerHaDnsFailoverTimeout**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDNSRelatedServerHaDnsProbeRetry**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDNSRelatedServerHaDnsProbeTimeout**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDNSRelatedServerHaDnsRole**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDNSRelatedServerInFlightRequests**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDNSRelatedServerIp6Address**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDNSRelatedServerIpaddr**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<**DNSRelatedServer**>	**createDNSRelatedServerItem**(**DNSRelatedServer** value)	Create an instance of JAXBElement<**DNSRelatedServer**>
javax.xml.bind.JAXBElement<java.lang.String>	**createDNSRelatedServerLastHaDnsRoleSwitchTime**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDNSRelatedServerLastProbeSentTime**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDNSRelatedServerLastReplyReceivedTime**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDNSRelatedServerMaxDnsRetries**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDNSRelatedServerMaxRequests**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDNSRelatedServerProbePollingEventId**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDNSRelatedServerRequests**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDNSRelatedServerServerDeactivatedCount**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDNSRelatedServerTimedOutRequests**(java.lang.String value)	Create an instance of JAXBElement<String>
DnsSec	**createDnsSec**()	Create an instance of **DnsSec**

javax.xml.bind.JAXBElement<**DnsSec**>	**createDnsSec(DnsSec** value)	Create an instance of JAXBElement<**DnsSec**>
javax.xml.bind.JAXBElement<java.lang.String>	**createDnsSecAggressiveNsec**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDnsSecDnssec**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<**StringArray**>	**createDnsSecDomainInsecure**(**StringArray** value)	Create an instance of JAXBElement<**StringArray**>
DnsSecKey	**createDnsSecKey**()	Create an instance of **DnsSecKey**
javax.xml.bind.JAXBElement<**DnsSecKey**>	**createDnsSecKey**(**DnsSecKey** value)	Create an instance of JAXBElement<**DnsSecKey**>
javax.xml.bind.JAXBElement<java.lang.String>	**createDnsSecKeyActivationDate**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDnsSecKeyAlgorithm**(java.lang.String value)	Create an instance of JAXBElement<String>
DnsSecKeyArray	**createDnsSecKeyArray**()	Create an instance of **DnsSecKeyArray**
javax.xml.bind.JAXBElement<**DnsSecKeyArray**>	**createDnsSecKeyArray**(**DnsSecKeyArray** value)	Create an instance of JAXBElement<**DnsSecKeyArray**>
javax.xml.bind.JAXBElement<java.lang.String>	**createDnsSecKeyBits**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDnsSecKeyCacheSize**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDnsSecKeyDeactivationDate**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDnsSecKeyDescription**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDnsSecKeyDnsSecKeyType**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDnsSecKeyEnableSigning**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDnsSecKeyExpirationDate**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<**DnsSecKey**>	**createDnsSecKeyItem**(**DnsSecKey** value)	Create an instance of JAXBElement<**DnsSecKey**>
javax.xml.bind.JAXBElement<java.lang.String>	**createDnsSecKeyKeyGroup**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDnsSecKeyRolloverDueDate**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDnsSecKeyStatus**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDnsSecKeyTenantId**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDnsSecNegCacheSize**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDnsSecPrefetchKey**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<**StringArray**>	**createDnsSecTrustAnchorList**(**StringArray** value)	Create an instance of JAXBElement<**StringArray**>
DNSServer	**createDNSServer**()	Create an instance of **DNSServer**
javax.xml.bind.JAXBElement<**DNSServer**>	**createDNSServer**(**DNSServer** value)	Create an instance of JAXBElement<**DNSServer**>
javax.xml.bind.JAXBElement<java.lang.String>	**createDNSServerAclBlocklist**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDNSServerActivityCounterLogSettings**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDNSServerActivitySummaryInterval**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDNSServerActivitySummaryType**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDNSServerAllowAnyQueryAcl**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDNSServerBlackholeAcl**(java.lang.String value)	Create an instance of JAXBElement<String>
DNSServerCacheStats	**createDNSServerCacheStats**()	Create an instance of **DNSServerCacheStats**
javax.xml.bind.JAXBElement<**DNSServerCacheStats**>	**createDNSServerCacheStats**(**DNSServerCacheStats** value)	Create an instance of JAXBElement<**DNSServerCacheStats**>
DNSServerCacheStatsArray	**createDNSServerCacheStatsArray**()	Create an instance of **DNSServerCacheStatsArray**
javax.xml.bind.JAXBElement<**DNSServerCacheStatsArray**>	**createDNSServerCacheStatsArray**(**DNSServerCacheStatsArray** value)	Create an instance of JAXBElement<**DNSServerCacheStatsArray**>
javax.xml.bind.JAXBElement<java.lang.String>	**createDNSServerCacheStatsCacheFull**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDNSServerCacheStatsCacheHits**(java.lang.String value)	Create an instance of JAXBElement<String>

javax.xml.bind.JAXBElement<java.lang.String>	**createDNSServerCacheStatsCacheMisses**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDNSServerCacheStatsCacheNxdomain**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDNSServerCacheStatsCacheRecords**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDNSServerCacheStatsCacheRrs**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDNSServerCacheStatsCacheSize**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<**DNSServerCacheStats**>	**createDNSServerCacheStatsItem**(DNSServerCacheStats value)	Create an instance of JAXBElement<**DNSServerCacheStats**>
javax.xml.bind.JAXBElement<java.lang.String>	**createDNSServerConntrackUsageWarning**(java.lang.String value)	Create an instance of JAXBElement<String>
DNSServerDBStats	**createDNSServerDBStats**()	Create an instance of **DNSServerDBStats**
javax.xml.bind.JAXBElement<**DNSServerDBStats**>	**createDNSServerDBStats**(DNSServerDBStats value)	Create an instance of JAXBElement<**DNSServerDBStats**>
DNSServerDBStatsArray	**createDNSServerDBStatsArray**()	Create an instance of **DNSServerDBStatsArray**
javax.xml.bind.JAXBElement<**DNSServerDBStatsArray**>	**createDNSServerDBStatsArray**(DNSServerDBStatsArray value)	Create an instance of JAXBElement<**DNSServerDBStatsArray**>
javax.xml.bind.JAXBElement<java.lang.String>	**createDNSServerDBStatsCsetdbCheckPts**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDNSServerDBStatsCsetdbCsetsTrimmed**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDNSServerDBStatsCsetdbDeletes**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDNSServerDBStatsCsetdbLogPurges**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDNSServerDBStatsCsetdbLogPurgesCount**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDNSServerDBStatsCsetdbReads**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDNSServerDBStatsCsetdbTxn**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDNSServerDBStatsCsetdbTxnAborts**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDNSServerDBStatsCsetdbTxnCommits**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDNSServerDBStatsCsetdbWrites**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDNSServerDBStatsCsetqCount**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<**DNSServerDBStats**>	**createDNSServerDBStatsItem**(DNSServerDBStats value)	Create an instance of JAXBElement<**DNSServerDBStats**>
javax.xml.bind.JAXBElement<java.lang.String>	**createDNSServerDBStatsRrdbCheckPts**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDNSServerDBStatsRrdbDeletes**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDNSServerDBStatsRrdbLogPurges**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDNSServerDBStatsRrdbLogPurgesCount**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDNSServerDBStatsRrdbReads**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDNSServerDBStatsRrdbTxn**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDNSServerDBStatsRrdbTxnAborts**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDNSServerDBStatsRrdbTxnCommits**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDNSServerDBStatsRrdbWrites**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDNSServerDropRecursiveQueries**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDNSServerEdnsMaxPayload**(java.lang.String value)	Create an instance of JAXBElement<String>
DNSServerErrorsStats	**createDNSServerErrorsStats**()	Create an instance of **DNSServerErrorsStats**
javax.xml.bind.JAXBElement<**DNSServerErrorsStats**>	**createDNSServerErrorsStats**(DNSServerErrorsStats value)	Create an instance of JAXBElement<**DNSServerErrorsStats**>
DNSServerErrorsStatsArray	**createDNSServerErrorsStatsArray**()	Create an instance of **DNSServerErrorsStatsArray**
javax.xml.bind.JAXBElement<**DNSServerErrorsStatsArray**>	**createDNSServerErrorsStatsArray**(DNSServerErrorsStatsArray value)	Create an instance of JAXBElement<**DNSServerErrorsStatsArray**>

javax.xml.bind.JAXBElement<java.lang.String>	**createDNSServerErrorsStatsAxfrInErrors**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDNSServerErrorsStatsAxfrOutErrors**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDNSServerErrorsStatsExceededMaxDnsPackets**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<**DNSServerErrorsStats**>	**createDNSServerErrorsStatsItem**(DNSServerErrorsStats value)	Create an instance of JAXBElement<**DNSServerErrorsStats**>
javax.xml.bind.JAXBElement<java.lang.String>	**createDNSServerErrorsStatsIxfrInErrors**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDNSServerErrorsStatsIxfrOutErrors**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDNSServerErrorsStatsSentFormatErrors**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDNSServerErrorsStatsSentRefusalErrors**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDNSServerErrorsStatsSentTotalErrors**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDNSServerErrorsStatsUpdateErrors**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDNSServerErrorsStatsUpdatePrereqFail**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDNSServerErrorsStatsUpdatePrereqFailures**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDNSServerErrorsStatsXferFailedAttempts**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDNSServerErrorsStatsXferInAuthErrors**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDNSServerGssTsigConfig**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDNSServerGssTsigProcessing**(java.lang.String value)	Create an instance of JAXBElement<String>
DNSServerHaStats	**createDNSServerHaStats**()	Create an instance of DNSServerHaStats
javax.xml.bind.JAXBElement<**DNSServerHaStats**>	**createDNSServerHaStats**(DNSServerHaStats value)	Create an instance of JAXBElement<DNSServerHaStats>
DNSServerHaStatsArray	**createDNSServerHaStatsArray**()	Create an instance of DNSServerHaStatsArray
javax.xml.bind.JAXBElement<**DNSServerHaStatsArray**>	**createDNSServerHaStatsArray**(DNSServerHaStatsArray value)	Create an instance of JAXBElement<DNSServerHaStatsArray>
javax.xml.bind.JAXBElement<java.lang.String>	**createDNSServerHaStatsHaCommInterrupted**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDNSServerHaStatsHaCurrentState**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDNSServerHaStatsHaFullZoneResync**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDNSServerHaStatsHaLastTimeStateChanged**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDNSServerHaStatsHaMsgConnectRecv**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDNSServerHaStatsHaMsgConnectSent**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDNSServerHaStatsHaMsgHeartbeatRecv**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDNSServerHaStatsHaMsgHeartbeatSent**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDNSServerHaStatsHaMsgReconcileRecv**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDNSServerHaStatsHaMsgReconcileSent**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDNSServerHaStatsHaMsgReqRecv**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDNSServerHaStatsHaMsgReqRecvTime**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDNSServerHaStatsHaMsgReqSent**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDNSServerHaStatsHaMsgReqSentTime**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDNSServerHaStatsHaMsgRespRecv**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDNSServerHaStatsHaMsgRespSent**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDNSServerHaStatsHaMsgRrsyncRecv**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDNSServerHaStatsHaMsgRrsyncSent**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDNSServerHaStatsHaMsgRrupdateRecv**(java.lang.String value)	Create an instance of JAXBElement<String>

javax.xml.bind.JAXBElement<java.lang.String>	**createDNSServerHaStatsHaMsgRrupdateSent**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDNSServerHaStatsHaMsgShutdownRecv**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDNSServerHaStatsHaMsgShutdownSent**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDNSServerHaStatsHaMsgZonesyncRecv**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDNSServerHaStatsHaMsgZonesyncSent**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDNSServerHaStatsHaPartnerDown**(java.lang.String value)	Create an instance of JAXBElement<String>

javax.xml.bind.JAXBElement<java.lang.String>	**createDNSServerTls**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDNSServerTlsCertificate**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDNSServerTlsPort**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDNSServerTopNames**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDNSServerTopNamesMaxAge**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDNSServerTopNamesMaxCount**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDNSServerTransferSourceAddress**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDNSServerTransferSourceIp6Address**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDNSServerTransferSourcePort**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDNSServerTrapsEnabled**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDNSServerTsigProcessing**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDNSServerUpdateAcl**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDNSServerUpdateRelaxZoneName**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDNSServerXferIgnoreSerialDecrease**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDNSServerXferRrMetaData**(java.lang.String value)	Create an instance of JAXBElement<String>
DNSTopNameStats	**createDNSTopNameStats**()	Create an instance of DNSTopNameStats
javax.xml.bind.JAXBElement<**DNSTopNameStats**>	**createDNSTopNameStats**(DNSTopNameStats value)	Create an instance of JAXBElement<DNSTopNameStats>
DNSTopNameStatsArray	**createDNSTopNameStatsArray**()	Create an instance of DNSTopNameStatsArray
javax.xml.bind.JAXBElement<**DNSTopNameStatsArray**>	**createDNSTopNameStatsArray**(DNSTopNameStatsArray value)	Create an instance of JAXBElement<DNSTopNameStatsArray>
javax.xml.bind.JAXBElement<**DNSTopNameStats**>	**createDNSTopNameStatsItem**(DNSTopNameStats value)	Create an instance of JAXBElement<DNSTopNameStats>
javax.xml.bind.JAXBElement<java.lang.String>	**createDNSTopNameStatsLastAccessTime**(java.lang.String value)	Create an instance of JAXBElement<String>

javax.xml.bind.JAXBElement<java.lang.String>	**createDNSTopNameStatsLastResetTime**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDNSTopNameStatsTimestamp**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<**CCMRRSetArray**>	**createDNSTopNameStatsTopNames**(**CCMRRSetArray** value)	Create an instance of JAXBElement<**CCMRRSetArray**>
javax.xml.bind.JAXBElement<java.lang.String>	**createDNSTopNameStatsTotalCounted**(java.lang.String value)	Create an instance of JAXBElement<String>
DnsTrustAnchor	**createDnsTrustAnchor**()	Create an instance of **DnsTrustAnchor**
javax.xml.bind.JAXBElement<**DnsTrustAnchor**>	**createDnsTrustAnchor**(**DnsTrustAnchor** value)	Create an instance of JAXBElement<**DnsTrustAnchor**>
DnsTrustAnchorArray	**createDnsTrustAnchorArray**()	Create an instance of **DnsTrustAnchorArray**
javax.xml.bind.JAXBElement<**DnsTrustAnchorArray**>	**createDnsTrustAnchorArray**(**DnsTrustAnchorArray** value)	Create an instance of JAXBElement<**DnsTrustAnchorArray**>
javax.xml.bind.JAXBElement<java.lang.String>	**createDnsTrustAnchorAutoUpdate**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDnsTrustAnchorDescription**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<**DnsTrustAnchor**>	**createDnsTrustAnchorItem**(**DnsTrustAnchor** value)	Create an instance of JAXBElement<**DnsTrustAnchor**>
javax.xml.bind.JAXBElement<java.lang.String>	**createDnsTrustAnchorTimestamp**(java.lang.String value)	Create an instance of JAXBElement<String>
DnsUpdateConfig	**createDnsUpdateConfig**()	Create an instance of **DnsUpdateConfig**
javax.xml.bind.JAXBElement<**DnsUpdateConfig**>	**createDnsUpdateConfig**(**DnsUpdateConfig** value)	Create an instance of JAXBElement<**DnsUpdateConfig**>
DnsUpdateConfigArray	**createDnsUpdateConfigArray**()	Create an instance of **DnsUpdateConfigArray**
javax.xml.bind.JAXBElement<**DnsUpdateConfigArray**>	**createDnsUpdateConfigArray**(**DnsUpdateConfigArray** value)	Create an instance of JAXBElement<**DnsUpdateConfigArray**>
javax.xml.bind.JAXBElement<java.lang.String>	**createDnsUpdateConfigBackupServerAddr**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDnsUpdateConfigBackupServerIp6Address**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDnsUpdateConfigBackupServerKey**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDnsUpdateConfigDnsClientIdentity**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDnsUpdateConfigDnsHostBytes**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDnsUpdateConfigDynamicDns**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDnsUpdateConfigForceDnsUpdates**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDnsUpdateConfigForwardZoneName**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDnsUpdateConfigHostNameGenerator**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<**DnsUpdateConfig**>	**createDnsUpdateConfigItem**(**DnsUpdateConfig** value)	Create an instance of JAXBElement<**DnsUpdateConfig**>
javax.xml.bind.JAXBElement<java.lang.String>	**createDnsUpdateConfigMaxDnsTtl**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDnsUpdateConfigMinDnsTtl**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDnsUpdateConfigPrefixDelegationUpdates**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDnsUpdateConfigReverseZoneName**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDnsUpdateConfigReverseZonePrefixLength**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDnsUpdateConfigServerAddr**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDnsUpdateConfigServerIp6Address**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDnsUpdateConfigServerKey**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDnsUpdateConfigSynthesizeName**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDnsUpdateConfigSyntheticNameStem**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDnsUpdateConfigTenantId**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDnsUpdateConfigUpdateDnsForBootp**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDnsUpdateConfigUseDnsUpdatePrereqs**(java.lang.String value)	Create an instance of JAXBElement<String>

javax.xml.bind.JAXBElement<java.lang.String>	**createDnsUpdateConfigUseGssTsig**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDnsUpdateConfigV4SyntheticNameGenerator**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDnsUpdateConfigV6HostNameGenerator**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDnsUpdateConfigV6SyntheticNameGenerator**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDnsUpdateConfigViewId**(java.lang.String value)	Create an instance of JAXBElement<String>
DnsView	**createDnsView**()	Create an instance of [DnsView]
javax.xml.bind.JAXBElement<**[DnsView]**>	**createDnsView**([DnsView] value)	Create an instance of JAXBElement<**[DnsView]**>
javax.xml.bind.JAXBElement<java.lang.String>	**createDnsViewAclMatchClients**(java.lang.String value)	Create an instance of JAXBElement<String>
DnsViewArray	**createDnsViewArray**()	Create an instance of [DnsViewArray]
javax.xml.bind.JAXBElement<**[DnsViewArray]**>	**createDnsViewArray**([DnsViewArray] value)	Create an instance of JAXBElement<**[DnsViewArray]**>
javax.xml.bind.JAXBElement<java.lang.String>	**createDnsViewDescription**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<**[DnsView]**>	**createDnsViewItem**([DnsView] value)	Create an instance of JAXBElement<**[DnsView]**>
javax.xml.bind.JAXBElement<java.lang.String>	**createDnsViewPriority**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDnsViewTenantId**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDnsViewViewId**(java.lang.String value)	Create an instance of JAXBElement<String>
DnsZoneStatus	**createDnsZoneStatus**()	Create an instance of [DnsZoneStatus]
javax.xml.bind.JAXBElement<**[DnsZoneStatus]**>	**createDnsZoneStatus**([DnsZoneStatus] value)	Create an instance of JAXBElement<**[DnsZoneStatus]**>
DnsZoneStatusArray	**createDnsZoneStatusArray**()	Create an instance of [DnsZoneStatusArray]
javax.xml.bind.JAXBElement<**[DnsZoneStatusArray]**>	**createDnsZoneStatusArray**([DnsZoneStatusArray] value)	Create an instance of JAXBElement<[DnsZoneStatusArray]>
javax.xml.bind.JAXBElement<java.lang.String>	**createDnsZoneStatusHaFailureCode**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDnsZoneStatusHaStatus**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<**[DnsZoneStatus]**>	**createDnsZoneStatusItem**([DnsZoneStatus] value)	Create an instance of JAXBElement<**[DnsZoneStatus]**>
javax.xml.bind.JAXBElement<java.lang.String>	**createDnsZoneStatusOrigin**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDnsZoneStatusViewQualifiedName**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createDnsZoneStatusZoneStatus**(java.lang.String value)	Create an instance of JAXBElement<String>
FailoverRelatedServer	**createFailoverRelatedServer**()	Create an instance of [FailoverRelatedServer]
javax.xml.bind.JAXBElement<**[FailoverRelatedServer]**>	**createFailoverRelatedServer**([FailoverRelatedServer] value)	Create an instance of JAXBElement<[FailoverRelatedServer]>
FailoverRelatedServerArray	**createFailoverRelatedServerArray**()	Create an instance of [FailoverRelatedServerArray]
javax.xml.bind.JAXBElement<**[FailoverRelatedServerArray]**>	**createFailoverRelatedServerArray**([FailoverRelatedServerArray] value)	Create an instance of JAXBElement<[FailoverRelatedServerArray]>
javax.xml.bind.JAXBElement<java.lang.String>	**createFailoverRelatedServerBindingAcksReceived**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createFailoverRelatedServerBindingAcksReceivedTotal**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createFailoverRelatedServerBindingAcksSent**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createFailoverRelatedServerBindingAcksSentTotal**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createFailoverRelatedServerBindingUpdatesReceived**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createFailoverRelatedServerBindingUpdatesReceivedTotal**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createFailoverRelatedServerBindingUpdatesSent**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createFailoverRelatedServerBindingUpdatesSentTotal**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createFailoverRelatedServerCommState**(java.lang.String value)	Create an instance of JAXBElement<String>

javax.xml.bind.JAXBElement<java.lang.String>	**createFailoverRelatedServerConnectionEndTime**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createFailoverRelatedServerConnectionStartTime**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createFailoverRelatedServerCurrentBindingUpdatesInFlight**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createFailoverRelatedServerCurrentBindingUpdatesQueued**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createFailoverRelatedServerCurrentTime**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createFailoverRelatedServerDecayingMaxRequestBuffersInUse**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createFailoverRelatedServerEstEndRecoverTime**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createFailoverRelatedServerEstPartnerEndRecoverTime**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createFailoverRelatedServerFailoverPairName**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createFailoverRelatedServerIp6Address**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createFailoverRelatedServerIpaddr**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<**FailoverRelatedServer**>	**createFailoverRelatedServerItem**(**FailoverRelatedServer** value)	Create an instance of JAXBElement<**FailoverRelatedServer**>
javax.xml.bind.JAXBElement<java.lang.String>	**createFailoverRelatedServerLastBindingAckReceivedTime**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createFailoverRelatedServerLastBindingAckSentTime**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createFailoverRelatedServerLastBindingUpdateReceivedTime**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createFailoverRelatedServerLastBindingUpdateSentTime**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createFailoverRelatedServerLastCommOkTime**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createFailoverRelatedServerLoadBalancingBackupPct**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createFailoverRelatedServerLoadBalancingDroppedRequests**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createFailoverRelatedServerLoadBalancingDroppedTotal**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createFailoverRelatedServerLoadBalancingLocalHba**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createFailoverRelatedServerLoadBalancingPartnerHba**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createFailoverRelatedServerLoadBalancingProcessedRequests**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createFailoverRelatedServerLoadBalancingProcessedTotal**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createFailoverRelatedServerMaximumBindingUpdatesInFlight**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createFailoverRelatedServerMaximumBindingUpdatesQueued**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createFailoverRelatedServerMaximumClientLeadTime**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createFailoverRelatedServerOtherServerDownTime**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createFailoverRelatedServerOurIp6Address**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createFailoverRelatedServerOurIpaddr**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createFailoverRelatedServerPartnerRole**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createFailoverRelatedServerPartnerState**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createFailoverRelatedServerPartnerVendorMajorVersion**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createFailoverRelatedServerPartnerVendorMinorVersion**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createFailoverRelatedServerRequestBuffersAllocated**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createFailoverRelatedServerRequestBuffersInUse**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createFailoverRelatedServerRole**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createFailoverRelatedServerSafePeriodRemaining**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createFailoverRelatedServerSequenceNumber**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createFailoverRelatedServerSmoothedTimeDelta**(java.lang.String value)	

		Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createFailoverRelatedServerStartOfCommInterrupted**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createFailoverRelatedServerStartTimeOfPartnerState**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createFailoverRelatedServerStartTimeOfState**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createFailoverRelatedServerState**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createFailoverRelatedServerUpdateRequestDoneTime**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createFailoverRelatedServerUpdateRequestOutstanding**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createFailoverRelatedServerUpdateRequestStartTime**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createFailoverRelatedServerUpdateResponseDoneTime**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createFailoverRelatedServerUpdateResponseInProgress**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createFailoverRelatedServerUpdateResponsePercentComplete**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createFailoverRelatedServerUpdateResponseStartTime**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createFailoverRelatedServerUseOtherAvailable**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createFailoverRelatedServerUseOtherAvailableTime**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createFailoverRelatedServerV6BindingAcksReceived**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createFailoverRelatedServerV6BindingAcksReceivedTotal**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createFailoverRelatedServerV6BindingAcksSent**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createFailoverRelatedServerV6BindingAcksSentTotal**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createFailoverRelatedServerV6BindingUpdatesReceived**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createFailoverRelatedServerV6BindingUpdatesReceivedTotal**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createFailoverRelatedServerV6BindingUpdatesSent**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createFailoverRelatedServerV6BindingUpdatesSentTotal**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createFailoverRelatedServerV6UpdateRequestDoneTime**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createFailoverRelatedServerV6UpdateRequestOutstanding**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createFailoverRelatedServerV6UpdateRequestStartTime**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createFailoverRelatedServerV6UpdateResponseDoneTime**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createFailoverRelatedServerV6UpdateResponseInProgress**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createFailoverRelatedServerV6UpdateResponsePercentComplete**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createFailoverRelatedServerV6UpdateResponseStartTime**(java.lang.String value)	Create an instance of JAXBElement<String>
Filter	**createFilter**()	Create an instance of [Filter]
javax.xml.bind.JAXBElement<**Filter**>	**createFilter**(**Filter** value)	Create an instance of JAXBElement<[Filter]>
FilterArray	**createFilterArray**()	Create an instance of [FilterArray]
javax.xml.bind.JAXBElement<**FilterArray**>	**createFilterArray**(**FilterArray** value)	Create an instance of JAXBElement<[FilterArray]>
javax.xml.bind.JAXBElement<java.lang.String>	**createFilterDescription**(java.lang.String value)	Create an instance of JAXBElement<String>
FilterElement	**createFilterElement**()	Create an instance of [FilterElement]
javax.xml.bind.JAXBElement<**FilterElement**>	**createFilterElement**(**FilterElement** value)	Create an instance of JAXBElement<[FilterElement]>
javax.xml.bind.JAXBElement<**FilterElementArray**>	**createFilterElementAnyMatchSublist**(**FilterElementArray** value)	Create an instance of JAXBElement<[FilterElementArray]>
FilterElementArray	**createFilterElementArray**()	Create an instance of [FilterElementArray]
javax.xml.bind.JAXBElement<**FilterElementArray**>	**createFilterElementArray**(**FilterElementArray** value)	Create an instance of JAXBElement<[FilterElementArray]>

javax.xml.bind.JAXBElement<java.lang.String>	**createFilterElementBlobVal**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createFilterElementDateEnd**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createFilterElementDateStart**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createFilterElementIntEnd**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createFilterElementIntStart**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createFilterElementIntVal**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createFilterElementIp6Addr**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createFilterElementIp6Prefix**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createFilterElementIpAddr**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createFilterElementIpRange**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createFilterElementIpSubnet**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<**FilterElement**>	**createFilterElementItem**(**FilterElement** value)	Create an instance of JAXBElement<**FilterElement**>
javax.xml.bind.JAXBElement<java.lang.String>	**createFilterElementNegativeTest**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createFilterElementRegexpStr**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createFilterElementStringVal**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<**FilterElementArray**>	**createFilterFilterElementList**(**FilterElementArray** value)	Create an instance of JAXBElement<**FilterElementArray**>
javax.xml.bind.JAXBElement<**Filter**>	**createFilterItem**(**Filter** value)	Create an instance of JAXBElement<**Filter**>
javax.xml.bind.JAXBElement<java.lang.String>	**createFilterNegativeTest**(java.lang.String value)	Create an instance of JAXBElement<String>
Key	**createKey**()	Create an instance of **Key**
javax.xml.bind.JAXBElement<**Key**>	**createKey**(**Key** value)	Create an instance of JAXBElement<**Key**>
javax.xml.bind.JAXBElement<java.lang.String>	**createKeyAlgorithm**(java.lang.String value)	Create an instance of JAXBElement<String>
KeyArray	**createKeyArray**()	Create an instance of **KeyArray**
javax.xml.bind.JAXBElement<**KeyArray**>	**createKeyArray**(**KeyArray** value)	Create an instance of JAXBElement<**KeyArray**>
javax.xml.bind.JAXBElement<java.lang.String>	**createKeyDescription**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createKeyId**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<**Key**>	**createKeyItem**(**Key** value)	Create an instance of JAXBElement<**Key**>
javax.xml.bind.JAXBElement<java.lang.String>	**createKeySecurityType**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createKeyTenantId**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createKeyTimeSkew**(java.lang.String value)	Create an instance of JAXBElement<String>
LDAPRelatedServer	**createLDAPRelatedServer**()	Create an instance of **LDAPRelatedServer**
javax.xml.bind.JAXBElement<**LDAPRelatedServer**>	**createLDAPRelatedServer**(**LDAPRelatedServer** value)	Create an instance of JAXBElement<**LDAPRelatedServer**>
javax.xml.bind.JAXBElement<java.lang.String>	**createLDAPRelatedServerAcknowledgedRequests**(java.lang.String value)	Create an instance of JAXBElement<String>
LDAPRelatedServerArray	**createLDAPRelatedServerArray**()	Create an instance of **LDAPRelatedServerArray**
javax.xml.bind.JAXBElement<**LDAPRelatedServerArray**>	**createLDAPRelatedServerArray**(**LDAPRelatedServerArray** value)	Create an instance of JAXBElement<**LDAPRelatedServerArray**>
javax.xml.bind.JAXBElement<java.lang.String>	**createLDAPRelatedServerCommState**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createLDAPRelatedServerInFlightRequests**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createLDAPRelatedServerIp6Address**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createLDAPRelatedServerIpaddr**(java.lang.String value)	Create an instance of JAXBElement<String>

javax.xml.bind.JAXBElement<**LDAPRelatedServer**>	**createLDAPRelatedServerItem**(**LDAPRelatedServer** value)	Create an instance of JAXBElement<**LDAPRelatedServer**>
javax.xml.bind.JAXBElement<java.lang.String>	**createLDAPRelatedServerMaxRequests**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createLDAPRelatedServerRequests**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createLDAPRelatedServerServerDeactivatedCount**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createLDAPRelatedServerTimedOutRequests**(java.lang.String value)	Create an instance of JAXBElement<String>
Lease	**createLease**()	Create an instance of **Lease**
javax.xml.bind.JAXBElement<**Lease**>	**createLease**(**Lease** value)	Create an instance of JAXBElement<**Lease**>
Lease6	**createLease6**()	Create an instance of **Lease6**
javax.xml.bind.JAXBElement<**Lease6**>	**createLease6**(**Lease6** value)	Create an instance of JAXBElement<**Lease6**>
Lease6Array	**createLease6Array**()	Create an instance of **Lease6Array**
javax.xml.bind.JAXBElement<**Lease6Array**>	**createLease6Array**(**Lease6Array** value)	Create an instance of JAXBElement<**Lease6Array**>
javax.xml.bind.JAXBElement<java.lang.String>	**createLease6BindingEndTime**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createLease6BindingFlags**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createLease6BindingIaid**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createLease6BindingRebindingTime**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createLease6BindingRenewalTime**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createLease6BindingStartTime**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createLease6BindingType**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createLease6ClientActiveLeases**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createLease6ClientClassName**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createLease6ClientFlags**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createLease6ClientId**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createLease6ClientLastTransactionTime**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createLease6ClientLookupKey**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createLease6ClientLookupKeyType**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createLease6ClientOro**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createLease6ClientReconfigureKey**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createLease6ClientReconfigureKeyGenerationTime**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createLease6ClientRelayAddress**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createLease6ClientRelayMessage**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createLease6ClientRelayPort**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createLease6ClientUserDefinedData**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<**StringArray**>	**createLease6ClientVendorClass**(**StringArray** value)	Create an instance of JAXBElement<**StringArray**>
javax.xml.bind.JAXBElement<**StringArray**>	**createLease6ClientVendorInfo**(**StringArray** value)	Create an instance of JAXBElement<**StringArray**>
javax.xml.bind.JAXBElement<java.lang.String>	**createLease6CmMacAddress**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createLease6CreationTime**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createLease6DataSource**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createLease6DbtxnGeneration**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createLease6DbtxnSeq**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createLease6DnsUpdateFlags**(java.lang.String value)	

		Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createLease6ExcludedPrefix**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createLease6FailoverExpirationTime**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createLease6Flags**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createLease6ForwardDnsupdate**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createLease6Fqdn**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createLease6FqdnHostLabelCount**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createLease6Ip6Address**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<**Lease6**>	**createLease6Item**(**Lease6** value)	Create an instance of JAXBElement<**Lease6**>
javax.xml.bind.JAXBElement<java.lang.String>	**createLease6NameNumber**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createLease6PreferredLifetime**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createLease6PrefixName**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createLease6RequestedFqdn**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createLease6RequestedPrefixLength**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createLease6ReservationCmMacAddress**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createLease6ReservationLookupKey**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createLease6ReservationLookupKeyType**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createLease6ReverseDnsupdate**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createLease6StartTimeOfState**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createLease6State**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createLease6StateExpirationTime**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createLease6TenantId**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createLease6ValidLifetime**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createLease6VpnId**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createLeaseAddress**(java.lang.String value)	Create an instance of JAXBElement<String>
LeaseArray	**createLeaseArray**()	Create an instance of **LeaseArray**
javax.xml.bind.JAXBElement<**LeaseArray**>	**createLeaseArray**(**LeaseArray** value)	Create an instance of JAXBElement<**LeaseArray**>
javax.xml.bind.JAXBElement<java.lang.String>	**createLeaseBindingEndTime**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createLeaseBindingStartTime**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createLeaseClientBinaryClientId**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createLeaseClientDnsName**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createLeaseClientDomainName**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createLeaseClientDuid**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createLeaseClientFlags**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createLeaseClientHostName**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createLeaseClientIaid**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createLeaseClientLastTransactionTime**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createLeaseClientMacAddr**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createLeaseClientOsType**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createLeaseClientOverrideClientId**(java.lang.String value)	Create an instance of JAXBElement<String>

javax.xml.bind.JAXBElement<java.lang.String>	**createLeaseClientVendorClass**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createLeaseClientVendorInfo**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createLeaseDataSource**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createLeaseDbtxnGeneration**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createLeaseDbtxnSeq**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createLeaseExpiration**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createLeaseFailoverExpirationTime**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createLeaseFlags**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createLeaseFwdDnsUpdateConfigName**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createLeaseGiaddr**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<**Lease**>	**createLeaseItem**(**Lease** value)	Create an instance of JAXBElement<**Lease**>
javax.xml.bind.JAXBElement<java.lang.String>	**createLeaseLeaseRebindingTime**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createLeaseLeaseRenewalTime**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createLeaseLimitationId**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createLeaseParameterRequestList**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createLeaseRelayAgentAuth**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createLeaseRelayAgentCircuitId**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createLeaseRelayAgentDeviceClass**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createLeaseRelayAgentOption**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createLeaseRelayAgentRadiusClass**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createLeaseRelayAgentRadiusOptions**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createLeaseRelayAgentRadiusPoolName**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createLeaseRelayAgentRadiusSessionTimeout**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createLeaseRelayAgentRadiusUser**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createLeaseRelayAgentRadiusV6PoolName**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createLeaseRelayAgentRadiusVendorSpecific**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createLeaseRelayAgentRemoteId**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createLeaseRelayAgentServerIdOverride**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createLeaseRelayAgentSubnetSelection**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createLeaseRelayAgentSubscriberId**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createLeaseRelayAgentVIVendorClass**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createLeaseRelayAgentVpnId**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createLeaseReservationLookupKey**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createLeaseReservationLookupKeyType**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createLeaseReservationRelayAgentOption**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createLeaseRevDnsUpdateConfigName**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createLeaseScopeName**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createLeaseStartTimeOfState**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createLeaseState**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createLeaseStateExpirationTime**(java.lang.String value)	Create an instance of JAXBElement<String>

javax.xml.bind.JAXBElement<java.lang.String>	**createLeaseTenantId**(java.lang.String value)		Create an instance of JAXBElement<String>	
javax.xml.bind.JAXBElement<java.lang.String>	**createLeaseUserDefinedData**(java.lang.String value)		Create an instance of JAXBElement<String>	
javax.xml.bind.JAXBElement<java.lang.String>	**createLeaseVendorClassId**(java.lang.String value)		Create an instance of JAXBElement<String>	
javax.xml.bind.JAXBElement<java.lang.String>	**createLeaseVendorSpecificInformation**(java.lang.String value)		Create an instance of JAXBElement<String>	
javax.xml.bind.JAXBElement<java.lang.String>	**createLeaseVpnId**(java.lang.String value)		Create an instance of JAXBElement<String>	
Link	**createLink**()		Create an instance of [Link]	
javax.xml.bind.JAXBElement<**[Link]**>	**createLink**([Link] value)		Create an instance of JAXBElement<[Link]>	
[LinkArray]	**createLinkArray**()		Create an instance of [LinkArray]	
javax.xml.bind.JAXBElement<**[LinkArray]**>	**createLinkArray**([LinkArray] value)		Create an instance of JAXBElement<[LinkArray]>	
javax.xml.bind.JAXBElement<java.lang.String>	**createLinkDescription**(java.lang.String value)		Create an instance of JAXBElement<String>	
javax.xml.bind.JAXBElement<**[Policy]**>	**createLinkEmbeddedPolicy**([Policy] value)		Create an instance of JAXBElement<[Policy]>	
javax.xml.bind.JAXBElement<java.lang.String>	**createLinkFreeAddressConfig**(java.lang.String value)		Create an instance of JAXBElement<String>	
javax.xml.bind.JAXBElement<java.lang.String>	**createLinkGroupName**(java.lang.String value)		Create an instance of JAXBElement<String>	
javax.xml.bind.JAXBElement<java.lang.String>	**createLinkInterface**(java.lang.String value)		Create an instance of JAXBElement<String>	
javax.xml.bind.JAXBElement<**[Link]**>	**createLinkItem**([Link] value)		Create an instance of JAXBElement<[Link]>	
javax.xml.bind.JAXBElement<java.lang.String>	**createLinkLinkType**(java.lang.String value)		Create an instance of JAXBElement<String>	
javax.xml.bind.JAXBElement<java.lang.String>	**createLinkLocalCluster**(java.lang.String value)		Create an instance of JAXBElement<String>	
javax.xml.bind.JAXBElement<java.lang.String>	**createLinkMaintenance**(java.lang.String value)		Create an instance of JAXBElement<String>	
javax.xml.bind.JAXBElement<java.lang.String>	**createLinkOwner**(java.lang.String value)		Create an instance of JAXBElement<String>	
javax.xml.bind.JAXBElement<java.lang.String>	**createLinkPolicy**(java.lang.String value)		Create an instance of JAXBElement<String>	
javax.xml.bind.JAXBElement<**[PrefixArray]**>	**createLinkPrefixList**([PrefixArray] value)		Create an instance of JAXBElement<[PrefixArray]>	
javax.xml.bind.JAXBElement<java.lang.String>	**createLinkRegion**(java.lang.String value)		Create an instance of JAXBElement<String>	
[LinkTemplate]	**createLinkTemplate**()		Create an instance of [LinkTemplate]	
javax.xml.bind.JAXBElement<**[LinkTemplate]**>	**createLinkTemplate**([LinkTemplate] value)		Create an instance of JAXBElement<[LinkTemplate]>	
[LinkTemplateArray]	**createLinkTemplateArray**()		Create an instance of [LinkTemplateArray]	
javax.xml.bind.JAXBElement<**[LinkTemplateArray]**>	**createLinkTemplateArray**([LinkTemplateArray] value)		Create an instance of JAXBElement<[LinkTemplateArray]>	
javax.xml.bind.JAXBElement<java.lang.String>	**createLinkTemplateDescription**(java.lang.String value)		Create an instance of JAXBElement<String>	
javax.xml.bind.JAXBElement<**[Policy]**>	**createLinkTemplateEmbeddedPolicy**([Policy] value)		Create an instance of JAXBElement<[Policy]>	
javax.xml.bind.JAXBElement<java.lang.String>	**createLinkTemplateFreeAddressConfig**(java.lang.String value)		Create an instance of JAXBElement<String>	
javax.xml.bind.JAXBElement<java.lang.String>	**createLinkTemplateGroupName**(java.lang.String value)		Create an instance of JAXBElement<String>	
javax.xml.bind.JAXBElement<**[LinkTemplate]**>	**createLinkTemplateItem**([LinkTemplate] value)		Create an instance of JAXBElement<[LinkTemplate]>	
javax.xml.bind.JAXBElement<java.lang.String>	**createLinkTemplateLinkDescriptionExpr**(java.lang.String value)		Create an instance of JAXBElement<String>	
javax.xml.bind.JAXBElement<java.lang.String>	**createLinkTemplateLinkNameExpr**(java.lang.String value)		Create an instance of JAXBElement<String>	
javax.xml.bind.JAXBElement<java.lang.String>	**createLinkTemplateLinkTemplateType**(java.lang.String value)		Create an instance of JAXBElement<String>	
javax.xml.bind.JAXBElement<java.lang.String>	**createLinkTemplateOptionsExpr**(java.lang.String value)		Create an instance of JAXBElement<String>	
javax.xml.bind.JAXBElement<java.lang.String>	**createLinkTemplateOwner**(java.lang.String value)		Create an instance of JAXBElement<String>	
javax.xml.bind.JAXBElement<java.lang.String>	**createLinkTemplatePolicy**(java.lang.String value)		Create an instance of JAXBElement<String>	
javax.xml.bind.JAXBElement<java.lang.String>	**createLinkTemplatePrefixExpr**(java.lang.String value)		Create an instance of JAXBElement<String>	
javax.xml.bind.JAXBElement<java.lang.String>	**createLinkTemplateRegion**(java.lang.String value)		Create an instance of JAXBElement<String>	
javax.xml.bind.JAXBElement<java.lang.String>	**createLinkTemplateRootPrefix**(java.lang.String value)			

			Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createLinkTemplateTenantId**(java.lang.String value)		Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createLinkTenantId**(java.lang.String value)		Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createLinkVpnId**(java.lang.String value)		Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.Object>	**createList**(java.lang.Object value)		Create an instance of JAXBElement<Object>
Option	**createOption**()		Create an instance of Option
javax.xml.bind.JAXBElement**<Option>**	**createOption**(**Option** value)		Create an instance of JAXBElement**<Option>**
OptionArray	**createOptionArray**()		Create an instance of **OptionArray**
javax.xml.bind.JAXBElement**<OptionArray>**	**createOptionArray**(**OptionArray** value)		Create an instance of JAXBElement**<OptionArray>**
OptionDefinitionSet	**createOptionDefinitionSet**()		Create an instance of **OptionDefinitionSet**
javax.xml.bind.JAXBElement**<OptionDefinitionSet>**	**createOptionDefinitionSet**(**OptionDefinitionSet** value)		Create an instance of JAXBElement**<OptionDefinitionSet>**
OptionDefinitionSetArray	**createOptionDefinitionSetArray**()		Create an instance of **OptionDefinitionSetArray**
javax.xml.bind.JAXBElement**<OptionDefinitionSetArray>**	**createOptionDefinitionSetArray**(**OptionDefinitionSetArray** value)		Create an instance of JAXBElement**<OptionDefinitionSetArray>**
javax.xml.bind.JAXBElement**<AttrDescArray>**	**createOptionDefinitionSetChildren**(**AttrDescArray** value)		Create an instance of JAXBElement**<AttrDescArray>**
javax.xml.bind.JAXBElement<java.lang.String>	**createOptionDefinitionSetDesc**(java.lang.String value)		Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createOptionDefinitionSetFlags**(java.lang.String value)		Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement**<OptionDefinitionSet>**	**createOptionDefinitionSetItem**(**OptionDefinitionSet** value)		Create an instance of JAXBElement**<OptionDefinitionSet>**
javax.xml.bind.JAXBElement**<AttrDescArray>**	**createOptionDefinitionSetOptionList**(**AttrDescArray** value)		Create an instance of JAXBElement**<AttrDescArray>**
javax.xml.bind.JAXBElement<java.lang.String>	**createOptionDefinitionSetTenantId**(java.lang.String value)		Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createOptionDefinitionSetVendorOptionEnterpriseId**(java.lang.String value)		Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createOptionDefinitionSetVendorOptionRegex**(java.lang.String value)		Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createOptionDefinitionSetVendorOptionString**(java.lang.String value)		Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createOptionExpression**(java.lang.String value)		Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement**<Option>**	**createOptionItem**(**Option** value)		Create an instance of JAXBElement**<Option>**
javax.xml.bind.JAXBElement<java.lang.String>	**createOptionNumber**(java.lang.String value)		Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createOptionOptionDefinitionSetName**(java.lang.String value)		Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createOptionOptionDesc**(java.lang.String value)		Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createOptionRoundRobin**(java.lang.String value)		Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement**<OptionArray>**	**createOptionSubOptions**(**OptionArray** value)		Create an instance of JAXBElement**<OptionArray>**
javax.xml.bind.JAXBElement<java.lang.String>	**createOptionValue**(java.lang.String value)		Create an instance of JAXBElement<String>
Policy	**createPolicy**()		Create an instance of Policy
javax.xml.bind.JAXBElement**<Policy>**	**createPolicy**(**Policy** value)		Create an instance of JAXBElement**<Policy>**
javax.xml.bind.JAXBElement<java.lang.String>	**createPolicyAffinityPeriod**(java.lang.String value)		Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createPolicyAllowClientARecordUpdate**(java.lang.String value)		Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createPolicyAllowDualZoneDnsUpdate**(java.lang.String value)		Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createPolicyAllowLeaseTimeOverride**(java.lang.String value)		Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createPolicyAllowNonTemporaryAddresses**(java.lang.String value)		Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createPolicyAllowRapidCommit**(java.lang.String value)		Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createPolicyAllowTemporaryAddresses**(java.lang.String value)		

javax.xml.bind.JAXBElement<java.lang.String>	**createPolicyV6MaxClientValidLifetime**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<**OptionArray**>	**createPolicyV6Options**(**OptionArray** value)	Create an instance of JAXBElement<**OptionArray**>
javax.xml.bind.JAXBElement<**StringArray**>	**createPolicyV6ReplyOptions**(**StringArray** value)	Create an instance of JAXBElement<**StringArray**>
javax.xml.bind.JAXBElement<**StringArray**>	**createPolicyV6RsooAllowedOptions**(**StringArray** value)	Create an instance of JAXBElement<**StringArray**>
javax.xml.bind.JAXBElement<**OptionArray**>	**createPolicyV6VendorOptions**(**OptionArray** value)	Create an instance of JAXBElement<**OptionArray**>
javax.xml.bind.JAXBElement<java.lang.String>	**createPolicyValidLifetime**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<**OptionArray**>	**createPolicyVendorOptions**(**OptionArray** value)	Create an instance of JAXBElement<**OptionArray**>
javax.xml.bind.JAXBElement<java.lang.String>	**createPolicyViewId**(java.lang.String value)	Create an instance of JAXBElement<String>
Prefix	**createPrefix**()	Create an instance of [Prefix](#)
javax.xml.bind.JAXBElement<**Prefix**>	**createPrefix**(**Prefix** value)	Create an instance of JAXBElement<**Prefix**>
javax.xml.bind.JAXBElement<java.lang.String>	**createPrefixAllocationAlgorithms**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createPrefixAllocationGroup**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createPrefixAllocationGroupPriority**(java.lang.String value)	Create an instance of JAXBElement<String>
PrefixArray	**createPrefixArray**()	Create an instance of [PrefixArray](#)
javax.xml.bind.JAXBElement<**PrefixArray**>	**createPrefixArray**(**PrefixArray** value)	Create an instance of JAXBElement<**PrefixArray**>
javax.xml.bind.JAXBElement<java.lang.String>	**createPrefixDeactivated**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createPrefixDescription**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createPrefixDhcpType**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<**Policy**>	**createPrefixEmbeddedPolicy**(**Policy** value)	Create an instance of JAXBElement<**Policy**>
javax.xml.bind.JAXBElement<java.lang.String>	**createPrefixExpirationTime**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createPrefixFreeAddressConfig**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createPrefixIgnoreDeclines**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<**Prefix**>	**createPrefixItem**(**Prefix** value)	Create an instance of JAXBElement<**Prefix**>
javax.xml.bind.JAXBElement<java.lang.String>	**createPrefixLink**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createPrefixLocalCluster**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createPrefixMaintenance**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createPrefixMaxLeases**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createPrefixMaxPdBalancingLength**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createPrefixOwner**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createPrefixPolicy**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createPrefixRange**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createPrefixRangeEnd**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createPrefixRangeStart**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createPrefixRegion**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createPrefixRestrictToAdminAllocation**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createPrefixRestrictToReservations**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createPrefixReverseZonePrefixLength**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<**StringArray**>	**createPrefixSelectionTags**(**StringArray** value)	Create an instance of JAXBElement<**StringArray**>
PrefixTemplate	**createPrefixTemplate**()	Create an instance of [PrefixTemplate](#)
javax.xml.bind.JAXBElement<**PrefixTemplate**>	**createPrefixTemplate**(**PrefixTemplate** value)	Create an instance of JAXBElement<**PrefixTemplate**>

javax.xml.bind.JAXBElement<java.lang.String>	**createPrefixTemplateAllocationAlgorithms**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createPrefixTemplateAllocationGroup**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createPrefixTemplateAllocationGroupPriority**(java.lang.String value)	Create an instance of JAXBElement<String>
PrefixTemplateArray	**createPrefixTemplateArray**()	Create an instance of [PrefixTemplateArray]
javax.xml.bind.JAXBElement<**PrefixTemplateArray**>	**createPrefixTemplateArray**(**PrefixTemplateArray** value)	Create an instance of JAXBElement<[PrefixTemplateArray]>
javax.xml.bind.JAXBElement<java.lang.String>	**createPrefixTemplateDeactivated**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createPrefixTemplateDescription**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createPrefixTemplateDhcpType**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<**Policy**>	**createPrefixTemplateEmbeddedPolicy**(**Policy** value)	Create an instance of JAXBElement<[Policy]>
javax.xml.bind.JAXBElement<java.lang.String>	**createPrefixTemplateExpirationTime**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createPrefixTemplateFreeAddressConfig**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createPrefixTemplateIgnoreDeclines**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<**PrefixTemplate**>	**createPrefixTemplateItem**(**PrefixTemplate** value)	Create an instance of JAXBElement<[PrefixTemplate]>
javax.xml.bind.JAXBElement<java.lang.String>	**createPrefixTemplateMaxLeases**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createPrefixTemplateMaxPdBalancingLength**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createPrefixTemplateOptionsExpr**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createPrefixTemplateOwner**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createPrefixTemplatePolicy**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createPrefixTemplatePrefixDescriptionExpr**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createPrefixTemplatePrefixNameExpr**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createPrefixTemplateRangeEndExpr**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createPrefixTemplateRangeExpr**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createPrefixTemplateRangeStartExpr**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createPrefixTemplateRegion**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createPrefixTemplateRestrictToAdminAllocation**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createPrefixTemplateRestrictToReservations**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createPrefixTemplateReverseZonePrefixLength**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<**StringArray**>	**createPrefixTemplateSelectionTags**(**StringArray** value)	Create an instance of JAXBElement<[StringArray]>
javax.xml.bind.JAXBElement<java.lang.String>	**createPrefixTemplateTenantId**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createPrefixTenantId**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createPrefixVpnId**(java.lang.String value)	Create an instance of JAXBElement<String>
Range	**createRange**()	Create an instance of [Range]
javax.xml.bind.JAXBElement<**Range**>	**createRange**(**Range** value)	Create an instance of JAXBElement<[Range]>
RangeArray	**createRangeArray**()	Create an instance of [RangeArray]
javax.xml.bind.JAXBElement<**RangeArray**>	**createRangeArray**(**RangeArray** value)	Create an instance of JAXBElement<[RangeArray]>
javax.xml.bind.JAXBElement<java.lang.String>	**createRangeEnd**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<**Range**>	**createRangeItem**(**Range** value)	Create an instance of JAXBElement<[Range]>
javax.xml.bind.JAXBElement<java.lang.String>	**createRangeStart**(java.lang.String value)	Create an instance of JAXBElement<String>
RelayAgentState	**createRelayAgentState**()	Create an instance of [RelayAgentState]
javax.xml.bind.JAXBElement<**RelayAgentState**>	**createRelayAgentState**(**RelayAgentState** value)	

		Create an instance of JAXBElement<RelayAgentState>
RelayAgentStateArray	**createRelayAgentStateArray**()	Create an instance of RelayAgentStateArray
javax.xml.bind.JAXBElement<**RelayAgentStateArray**>	**createRelayAgentStateArray**(**RelayAgentStateArray** value)	Create an instance of JAXBElement<RelayAgentStateArray>
javax.xml.bind.JAXBElement<java.lang.String>	**createRelayAgentStateCommState**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createRelayAgentStateCurrentResponsesForPartner**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createRelayAgentStateCurrentStateDuration**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createRelayAgentStateGiaddr**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createRelayAgentStateIp6Address**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<**RelayAgentState**>	**createRelayAgentStateItem**(**RelayAgentState** value)	Create an instance of JAXBElement<RelayAgentState>
javax.xml.bind.JAXBElement<java.lang.String>	**createRelayAgentStateLastOkTime**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createRelayAgentStateLastRelayIp6Address**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createRelayAgentStatePartnerLastDiscoverSolicitTime**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createRelayAgentStatePartnerRequestCount**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createRelayAgentStatePartnerUnresponsiveDuration**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createRelayAgentStateTotalResponsesForPartner**(java.lang.String value)	Create an instance of JAXBElement<String>
Reservation	**createReservation**()	Create an instance of Reservation
javax.xml.bind.JAXBElement<**Reservation**>	**createReservation**(**Reservation** value)	Create an instance of JAXBElement<Reservation>
Reservation6	**createReservation6**()	Create an instance of Reservation6
javax.xml.bind.JAXBElement<**Reservation6**>	**createReservation6**(**Reservation6** value)	Create an instance of JAXBElement<Reservation6>
Reservation6Array	**createReservation6Array**()	Create an instance of Reservation6Array
javax.xml.bind.JAXBElement<**Reservation6Array**>	**createReservation6Array**(**Reservation6Array** value)	Create an instance of JAXBElement<Reservation6Array>
javax.xml.bind.JAXBElement<java.lang.String>	**createReservation6ClientClass**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createReservation6CmMacAddress**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createReservation6Description**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createReservation6DeviceName**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<**StringArray**>	**createReservation6IncludeTags**(**StringArray** value)	Create an instance of JAXBElement<StringArray>
javax.xml.bind.JAXBElement<**Reservation6**>	**createReservation6Item**(**Reservation6** value)	Create an instance of JAXBElement<Reservation6>
javax.xml.bind.JAXBElement<java.lang.String>	**createReservation6Prefix**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createReservation6TenantId**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createReservation6VpnId**(java.lang.String value)	Create an instance of JAXBElement<String>
ReservationArray	**createReservationArray**()	Create an instance of ReservationArray
javax.xml.bind.JAXBElement<**ReservationArray**>	**createReservationArray**(**ReservationArray** value)	Create an instance of JAXBElement<ReservationArray>
javax.xml.bind.JAXBElement<java.lang.String>	**createReservationClientClass**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createReservationCmMacAddress**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createReservationDescription**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createReservationDeviceName**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<**StringArray**>	**createReservationIncludeTags**(**StringArray** value)	Create an instance of JAXBElement<StringArray>
javax.xml.bind.JAXBElement<**Reservation**>	**createReservationItem**(**Reservation** value)	Create an instance of JAXBElement<Reservation>
javax.xml.bind.JAXBElement<java.lang.String>	**createReservationScope**(java.lang.String value)	Create an instance of JAXBElement<String>

javax.xml.bind.JAXBElement<java.lang.String>	**createReservationTenantId**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createReservationVpnId**(java.lang.String value)	Create an instance of JAXBElement<String>
ResourceStatus	**createResourceStatus**()	Create an instance of [ResourceStatus]
javax.xml.bind.JAXBElement<**ResourceStatus**>	**createResourceStatus**(**ResourceStatus** value)	Create an instance of JAXBElement<[ResourceStatus]>
ResourceStatusArray	**createResourceStatusArray**()	Create an instance of [ResourceStatusArray]
javax.xml.bind.JAXBElement<**ResourceStatusArray**>	**createResourceStatusArray**(**ResourceStatusArray** value)	Create an instance of JAXBElement<[ResourceStatusArray]>
javax.xml.bind.JAXBElement<java.lang.String>	**createResourceStatusCritical**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<**ResourceStatus**>	**createResourceStatusItem**(**ResourceStatus** value)	Create an instance of JAXBElement<[ResourceStatus]>
javax.xml.bind.JAXBElement<java.lang.String>	**createResourceStatusOk**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createResourceStatusWarning**(java.lang.String value)	Create an instance of JAXBElement<String>
ResourceValue	**createResourceValue**()	Create an instance of [ResourceValue]
javax.xml.bind.JAXBElement<**ResourceValue**>	**createResourceValue**(**ResourceValue** value)	Create an instance of JAXBElement<[ResourceValue]>
ResourceValueArray	**createResourceValueArray**()	Create an instance of [ResourceValueArray]
javax.xml.bind.JAXBElement<**ResourceValueArray**>	**createResourceValueArray**(**ResourceValueArray** value)	Create an instance of JAXBElement<[ResourceValueArray]>
javax.xml.bind.JAXBElement<java.lang.String>	**createResourceValueAscendingOrdered**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createResourceValueEventClearMessage**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createResourceValueEventReportMessage**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createResourceValueEventState**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createResourceValueEventTimestamp**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createResourceValueIntCriticalLevel**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createResourceValueIntDataType**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createResourceValueIntWarningLevel**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<**ResourceValue**>	**createResourceValueItem**(**ResourceValue** value)	Create an instance of JAXBElement<[ResourceValue]>
javax.xml.bind.JAXBElement<java.lang.String>	**createResourceValueLastEventTime**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createResourceValueLastIntValue**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createResourceValueLastResetTime**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createResourceValueLastUpdatedTime**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createResourceValueLastValueMessage**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createResourceValueLastValueState**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createResourceValueName**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createResourceValuePeakIntValue**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createResourceValuePeakTime**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createResourceValuePeakValueMessage**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createResourceValueResourceType**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createResourceValueServerClass**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createResourceValueState**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createResourceValueTenantId**(java.lang.String value)	Create an instance of JAXBElement<String>
Scope	**createScope**()	Create an instance of [Scope]
javax.xml.bind.JAXBElement<**Scope**>	**createScope**(**Scope** value)	Create an instance of JAXBElement<[Scope]>

javax.xml.bind.JAXBElement<java.lang.String>	**createScopeAllocateFirstAvailable**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createScopeAllocationPriority**(java.lang.String value)	Create an instance of JAXBElement<String>
ScopeArray	**createScopeArray**()	Create an instance of [ScopeArray](#)
javax.xml.bind.JAXBElement**<ScopeArray>**	**createScopeArray**(**ScopeArray** value)	Create an instance of JAXBElement<[ScopeArray](#)>
javax.xml.bind.JAXBElement<java.lang.String>	**createScopeBackupPct**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createScopeBootp**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createScopeDeactivated**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createScopeDescription**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createScopeDhcp**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createScopeDnsHostBytes**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createScopeDynamicBootp**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement**<Policy>**	**createScopeEmbeddedPolicy**(**Policy** value)	Create an instance of JAXBElement<[Policy](#)>
javax.xml.bind.JAXBElement<java.lang.String>	**createScopeFailoverBackupAllocationBoundary**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createScopeFreeAddressConfig**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createScopeIgnoreDeclines**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement**<Scope>**	**createScopeItem**(**Scope** value)	Create an instance of JAXBElement<[Scope](#)>
javax.xml.bind.JAXBElement<java.lang.String>	**createScopeMaintenance**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createScopePingClients**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createScopePingTimeout**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createScopePolicy**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createScopePrimarySubnet**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement**<RangeArray>**	**createScopeRangeList**(**RangeArray** value)	Create an instance of JAXBElement<[RangeArray](#)>
javax.xml.bind.JAXBElement<java.lang.String>	**createScopeRenewOnly**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createScopeRestrictToAdminAllocation**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createScopeRestrictToReservations**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement**<StringArray>**	**createScopeSelectionTagList**(**StringArray** value)	Create an instance of JAXBElement<[StringArray](#)>
javax.xml.bind.JAXBElement<java.lang.String>	**createScopeTenantId**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createScopeVpnId**(java.lang.String value)	Create an instance of JAXBElement<String>
ServerSystemStats	**createServerSystemStats**()	Create an instance of [ServerSystemStats](#)
javax.xml.bind.JAXBElement**<ServerSystemStats>**	**createServerSystemStats**(**ServerSystemStats** value)	Create an instance of JAXBElement<[ServerSystemStats](#)>
ServerSystemStatsArray	**createServerSystemStatsArray**()	Create an instance of [ServerSystemStatsArray](#)
javax.xml.bind.JAXBElement**<ServerSystemStatsArray>**	**createServerSystemStatsArray**(**ServerSystemStatsArray** value)	Create an instance of JAXBElement<[ServerSystemStatsArray](#)>
javax.xml.bind.JAXBElement<java.lang.String>	**createServerSystemStatsCpuUtilization**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement**<ServerSystemStats>**	**createServerSystemStatsItem**(**ServerSystemStats** value)	Create an instance of JAXBElement<[ServerSystemStats](#)>
javax.xml.bind.JAXBElement<java.lang.String>	**createServerSystemStatsMemoryUtilization**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createServerSystemStatsName**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createServerSystemStatsPid**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createServerSystemStatsServerType**(java.lang.String value)	Create an instance of JAXBElement<String>

javax.xml.bind.JAXBElement<java.lang.String>	**createServerSystemStatsStatisticsRequestTime**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createServerSystemStatsVmUtilization**(java.lang.String value)	Create an instance of JAXBElement<String>
StringArray	**createStringArray**()	Create an instance of StringArray
javax.xml.bind.JAXBElement<**StringArray**>	**createStringArray**(**StringArray** value)	Create an instance of JAXBElement<StringArray>
javax.xml.bind.JAXBElement<java.lang.String>	**createStringItem**(java.lang.String value)	Create an instance of JAXBElement<String>
SystemStats	**createSystemStats**()	Create an instance of SystemStats
javax.xml.bind.JAXBElement<**SystemStats**>	**createSystemStats**(**SystemStats** value)	Create an instance of JAXBElement<SystemStats>
SystemStatsArray	**createSystemStatsArray**()	Create an instance of SystemStatsArray
javax.xml.bind.JAXBElement<**SystemStatsArray**>	**createSystemStatsArray**(**SystemStatsArray** value)	Create an instance of JAXBElement<SystemStatsArray>
javax.xml.bind.JAXBElement<java.lang.String>	**createSystemStatsDataFreeSpace**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createSystemStatsDataPath**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createSystemStatsDataTotalSpace**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<**SystemStats**>	**createSystemStatsItem**(**SystemStats** value)	Create an instance of JAXBElement<SystemStats>
javax.xml.bind.JAXBElement<java.lang.String>	**createSystemStatsLastBackupBytes**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createSystemStatsLastBackupElapsedTime**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createSystemStatsLastGoodBackup**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createSystemStatsLogsFreeSpace**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createSystemStatsLogsPath**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createSystemStatsLogsTotalSpace**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<**ServerSystemStatsArray**>	**createSystemStatsServerStats**(**ServerSystemStatsArray** value)	Create an instance of JAXBElement<ServerSystemStatsArray>
javax.xml.bind.JAXBElement<java.lang.String>	**createSystemStatsStatisticsRequestTime**(java.lang.String value)	Create an instance of JAXBElement<String>
TCPConnectionRelatedServer	**createTCPConnectionRelatedServer**()	Create an instance of TCPConnectionRelatedServer
javax.xml.bind.JAXBElement<**TCPConnectionRelatedServer**>	**createTCPConnectionRelatedServer**(**TCPConnectionRelatedServer** value)	Create an instance of JAXBElement<TCPConnectionRelatedServer>
TCPConnectionRelatedServerArray	**createTCPConnectionRelatedServerArray**()	Create an instance of TCPConnectionRelatedServerArray
javax.xml.bind.JAXBElement<**TCPConnectionRelatedServerArray**>	**createTCPConnectionRelatedServerArray**(**TCPConnectionRelatedServerArray** value)	Create an instance of JAXBElement<TCPConnectionRelatedServerArray>
javax.xml.bind.JAXBElement<java.lang.String>	**createTCPConnectionRelatedServerCommState**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createTCPConnectionRelatedServerCurrentRequests**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createTCPConnectionRelatedServerCurrentState**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createTCPConnectionRelatedServerIp6Address**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createTCPConnectionRelatedServerIpaddr**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<**TCPConnectionRelatedServer**>	**createTCPConnectionRelatedServerItem**(**TCPConnectionRelatedServer** value)	Create an instance of JAXBElement<TCPConnectionRelatedServer>
javax.xml.bind.JAXBElement<java.lang.String>	**createTCPConnectionRelatedServerLastReceiveTime**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createTCPConnectionRelatedServerLastSendTime**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createTCPConnectionRelatedServerName**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createTCPConnectionRelatedServerOurIp6Address**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createTCPConnectionRelatedServerOurIpaddr**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createTCPConnectionRelatedServerOurPort**(java.lang.String value)	Create an instance of JAXBElement<String>

javax.xml.bind.JAXBElement<java.lang.String>	**createTCPConnectionRelatedServerPort**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createTCPConnectionRelatedServerStartTime**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createTCPConnectionRelatedServerTotalBytesReceived**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createTCPConnectionRelatedServerTotalBytesSent**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createTCPConnectionRelatedServerTotalReplies**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createTCPConnectionRelatedServerTotalRequests**(java.lang.String value)	Create an instance of JAXBElement<String>
TCPListenerRelatedServer	**createTCPListenerRelatedServer**()	Create an instance of [TCPListenerRelatedServer]
javax.xml.bind.JAXBElement<**TCPListenerRelatedServer**>	**createTCPListenerRelatedServer**(TCPListenerRelatedServer value)	Create an instance of JAXBElement<[TCPListenerRelatedServer]>
TCPListenerRelatedServerArray	**createTCPListenerRelatedServerArray**()	Create an instance of [TCPListenerRelatedServerArray]
javax.xml.bind.JAXBElement<**TCPListenerRelatedServerArray**>	**createTCPListenerRelatedServerArray**(TCPListenerRelatedServerArray value)	Create an instance of JAXBElement<[TCPListenerRelatedServerArray]>
javax.xml.bind.JAXBElement<java.lang.String>	**createTCPListenerRelatedServerCommState**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createTCPListenerRelatedServerCurrentConnections**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createTCPListenerRelatedServerIp6Address**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createTCPListenerRelatedServerIpaddr**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<**TCPListenerRelatedServer**>	**createTCPListenerRelatedServerItem**(TCPListenerRelatedServer value)	Create an instance of JAXBElement<[TCPListenerRelatedServer]>
javax.xml.bind.JAXBElement<java.lang.String>	**createTCPListenerRelatedServerName**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createTCPListenerRelatedServerPort**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createTCPListenerRelatedServerRejectedConnections**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createTCPListenerRelatedServerTotalConnections**(java.lang.String value)	Create an instance of JAXBElement<String>
UpdatePolicy	**createUpdatePolicy**()	Create an instance of [UpdatePolicy]
javax.xml.bind.JAXBElement<**UpdatePolicy**>	**createUpdatePolicy**(UpdatePolicy value)	Create an instance of JAXBElement<[UpdatePolicy]>
UpdatePolicyArray	**createUpdatePolicyArray**()	Create an instance of [UpdatePolicyArray]
javax.xml.bind.JAXBElement<**UpdatePolicyArray**>	**createUpdatePolicyArray**(UpdatePolicyArray value)	Create an instance of JAXBElement<[UpdatePolicyArray]>
javax.xml.bind.JAXBElement<java.lang.String>	**createUpdatePolicyDescription**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<**UpdatePolicy**>	**createUpdatePolicyItem**(UpdatePolicy value)	Create an instance of JAXBElement<[UpdatePolicy]>
javax.xml.bind.JAXBElement<**StringArray**>	**createUpdatePolicyRules**(StringArray value)	Create an instance of JAXBElement<[StringArray]>
javax.xml.bind.JAXBElement<java.lang.String>	**createUpdatePolicyTenantId**(java.lang.String value)	Create an instance of JAXBElement<String>
VPN	**createVPN**()	Create an instance of [VPN]
javax.xml.bind.JAXBElement<**VPN**>	**createVPN**(VPN value)	Create an instance of JAXBElement<[VPN]>
javax.xml.bind.JAXBElement<**StringArray**>	**createVPNAddrBlocksDefaultSelectionTags**(StringArray value)	Create an instance of JAXBElement<[StringArray]>
javax.xml.bind.JAXBElement<java.lang.String>	**createVPNAddrBlocksUseClientAffinity**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createVPNAddrBlocksUseLanSegments**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createVPNAddrBlocksUseSelectionTags**(java.lang.String value)	Create an instance of JAXBElement<String>
VPNArray	**createVPNArray**()	Create an instance of [VPNArray]
javax.xml.bind.JAXBElement<**VPNArray**>	**createVPNArray**(VPNArray value)	Create an instance of JAXBElement<[VPNArray]>
javax.xml.bind.JAXBElement<java.lang.String>	**createVPNDescription**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<**VPN**>	**createVPNItem**(VPN value)	Create an instance of JAXBElement<[VPN]>
javax.xml.bind.JAXBElement<java.lang.String>	**createVPNTenantId**(java.lang.String value)	Create an instance of JAXBElement<String>

javax.xml.bind.JAXBElement<java.lang.String>	**createVPNTenantPrivateNetwork**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createVPNVpnId**(java.lang.String value)	Create an instance of JAXBElement<String>
javax.xml.bind.JAXBElement<java.lang.String>	**createVPNVrfName**(java.lang.String value)	Create an instance of JAXBElement<String>

Methods inherited from class java.lang.Object

equals, getClass, hashCode, notify, notifyAll, toString, wait, wait, wait

Constructor Detail

ObjectFactory

public ObjectFactory()

Create a new ObjectFactory that can be used to create new instances of schema derived classes for package: com.cisco.cnr.ws.xsd

Method Detail

createCnrSoapAuth

public CnrSoapAuth createCnrSoapAuth()

Create an instance of CnrSoapAuth

createClassBase

public ClassBase createClassBase()

Create an instance of ClassBase

createDnsEnumEntrySet

public DnsEnumEntrySet createDnsEnumEntrySet()

Create an instance of DnsEnumEntrySet

createPolicy

public Policy createPolicy()

Create an instance of Policy

createDnsZoneStatus

public DnsZoneStatus createDnsZoneStatus()

Create an instance of DnsZoneStatus

createCurrentPrefixUtilization

public CurrentPrefixUtilization createCurrentPrefixUtilization()

Create an instance of [CurrentPrefixUtilization](#)

---

createDHCPServerActivityStats

public [DHCPServerActivityStats](#) createDHCPServerActivityStats()

Create an instance of [DHCPServerActivityStats](#)

---

createCCMZoneDistribution

public [CCMZoneDistribution](#) createCCMZoneDistribution()

Create an instance of [CCMZoneDistribution](#)

---

createCCMRRSet

public [CCMRRSet](#) createCCMRRSet()

Create an instance of [CCMRRSet](#)

---

createFailoverRelatedServer

public [FailoverRelatedServer](#) createFailoverRelatedServer()

Create an instance of [FailoverRelatedServer](#)

---

createDnsSecKey

public [DnsSecKey](#) createDnsSecKey()

Create an instance of [DnsSecKey](#)

---

createDNSServerDBStats

public [DNSServerDBStats](#) createDNSServerDBStats()

Create an instance of [DNSServerDBStats](#)

---

createDHCPScopeStatus

public [DHCPScopeStatus](#) createDHCPScopeStatus()

Create an instance of [DHCPScopeStatus](#)

---

createDnsUpdateConfig

public [DnsUpdateConfig](#) createDnsUpdateConfig()

Create an instance of [DnsUpdateConfig](#)

---

createDNSCachingServerRateLimitItem

public [DNSCachingServerRateLimitItem](#) createDNSCachingServerRateLimitItem()

Create an instance of [DNSCachingServerRateLimitItem](#)

createDHCPScopeAggregationStats

public [DHCPScopeAggregationStats](#) createDHCPScopeAggregationStats()

Create an instance of [DHCPScopeAggregationStats](#)

createReservation

public [Reservation](#) createReservation()

Create an instance of [Reservation](#)

createDnsView

public [DnsView](#) createDnsView()

Create an instance of [DnsView](#)

createReservation6

public [Reservation6](#) createReservation6()

Create an instance of [Reservation6](#)

createDNSServerMaxCounterStats

public [DNSServerMaxCounterStats](#) createDNSServerMaxCounterStats()

Create an instance of [DNSServerMaxCounterStats](#)

createDNSServerCacheStats

public [DNSServerCacheStats](#) createDNSServerCacheStats()

Create an instance of [DNSServerCacheStats](#)

createResourceValue

public [ResourceValue](#) createResourceValue()

Create an instance of [ResourceValue](#)

createResourceStatus

public [ResourceStatus](#) createResourceStatus()

Create an instance of [ResourceStatus](#)

createTCPConnectionRelatedServer

public [TCPConnectionRelatedServer](#) createTCPConnectionRelatedServer()

Create an instance of [TCPConnectionRelatedServer](#)

createAuthDnsSec

public AuthDnsSec createAuthDnsSec()

Create an instance of AuthDnsSec

createAttrDesc

public AttrDesc createAttrDesc()

Create an instance of AttrDesc

createDNSServerPerformanceStats

public DNSServerPerformanceStats createDNSServerPerformanceStats()

Create an instance of DNSServerPerformanceStats

createDHCPServer

public DHCPServer createDHCPServer()

Create an instance of DHCPServer

createDHCPRenewalData

public DHCPRenewalData createDHCPRenewalData()

Create an instance of DHCPRenewalData

createOptionDefinitionSet

public OptionDefinitionSet createOptionDefinitionSet()

Create an instance of OptionDefinitionSet

createUpdatePolicy

public UpdatePolicy createUpdatePolicy()

Create an instance of UpdatePolicy

createDNSServerStats

public DNSServerStats createDNSServerStats()

Create an instance of DNSServerStats

createCCMHaDnsPair

public CCMHaDnsPair createCCMHaDnsPair()

Create an instance of CCMHaDnsPair

createDNSServerErrorsStats

public DNSServerErrorsStats createDNSServerErrorsStats()

Create an instance of DNSServerErrorsStats

createDHCP6Stats

public DHCP6Stats createDHCP6Stats()

Create an instance of DHCP6Stats

createDnsEnumConfig

public DnsEnumConfig createDnsEnumConfig()

Create an instance of DnsEnumConfig

createCurrentUtilization

public CurrentUtilization createCurrentUtilization()

Create an instance of CurrentUtilization

createCdnsRedirect

public CdnsRedirect createCdnsRedirect()

Create an instance of CdnsRedirect

createDHCPFailoverStats

public DHCPFailoverStats createDHCPFailoverStats()

Create an instance of DHCPFailoverStats

createDnsEnumEntry

public DnsEnumEntry createDnsEnumEntry()

Create an instance of DnsEnumEntry

createDHCPMaintenanceWindow

public DHCPMaintenanceWindow createDHCPMaintenanceWindow()

Create an instance of DHCPMaintenanceWindow

createCdnsDomainRateLimit

public CdnsDomainRateLimit createCdnsDomainRateLimit()

Create an instance of CdnsDomainRateLimit

createLink

public Link createLink()

Create an instance of Link

---

createKey

public Key createKey()

Create an instance of Key

---

createCertificate

public Certificate createCertificate()

Create an instance of Certificate

---

createCCMHost

public CCMHost createCCMHost()

Create an instance of CCMHost

---

createCCMCluster

public CCMCluster createCCMCluster()

Create an instance of CCMCluster

---

createDNSServerHaStats

public DNSServerHaStats createDNSServerHaStats()

Create an instance of DNSServerHaStats

---

createCCMZone

public CCMZone createCCMZone()

Create an instance of CCMZone

---

createDnsSec

public DnsSec createDnsSec()

Create an instance of DnsSec

---

createDNSServerIPv6Stats

public DNSServerIPv6Stats createDNSServerIPv6Stats()

Create an instance of DNSServerIPv6Stats

---

createDnsForwarder

public DnsForwarder createDnsForwarder()

Create an instance of DnsForwarder

createDNSCachingServerStats

public DNSCachingServerStats createDNSCachingServerStats()

Create an instance of DNSCachingServerStats

createPrefix

public Prefix createPrefix()

Create an instance of Prefix

createDNSRelatedServer

public DNSRelatedServer createDNSRelatedServer()

Create an instance of DNSRelatedServer

createClientClass

public ClientClass createClientClass()

Create an instance of ClientClass

createCCMSecondaryZone

public CCMSecondaryZone createCCMSecondaryZone()

Create an instance of CCMSecondaryZone

createDnsTrustAnchor

public DnsTrustAnchor createDnsTrustAnchor()

Create an instance of DnsTrustAnchor

createSystemStats

public SystemStats createSystemStats()

Create an instance of SystemStats

createServerSystemStats

public ServerSystemStats createServerSystemStats()

Create an instance of ServerSystemStats

createLease6

public Lease6 createLease6()

Create an instance of Lease6

createCCMServerInfo

public CCMServerInfo createCCMServerInfo()

Create an instance of CCMServerInfo

createDnsEnumDomain

public DnsEnumDomain createDnsEnumDomain()

Create an instance of DnsEnumDomain

createVPN

public VPN createVPN()

Create an instance of VPN

createClientEntry

public ClientEntry createClientEntry()

Create an instance of ClientEntry

createLDAPRelatedServer

public LDAPRelatedServer createLDAPRelatedServer()

Create an instance of LDAPRelatedServer

createCCMFailoverPair

public CCMFailoverPair createCCMFailoverPair()

Create an instance of CCMFailoverPair

createCCMScopeTemplate

public CCMScopeTemplate createCCMScopeTemplate()

Create an instance of CCMScopeTemplate

createDnsHAStatus

public DnsHAStatus createDnsHAStatus()

Create an instance of DnsHAStatus

createCCMReverseZone

public CCMReverseZone createCCMReverseZone()

Create an instance of CCMReverseZone

createDNSServerQueryStats

public DNSServerQueryStats createDNSServerQueryStats()

Create an instance of DNSServerQueryStats

createLease

public Lease createLease()

Create an instance of Lease

createDNSServerSecurityStats

public DNSServerSecurityStats createDNSServerSecurityStats()

Create an instance of DNSServerSecurityStats

createDNSCachingServer

public DNSCachingServer createDNSCachingServer()

Create an instance of DNSCachingServer

createDNSCachingServerRateLimitStats

public DNSCachingServerRateLimitStats createDNSCachingServerRateLimitStats()

Create an instance of DNSCachingServerRateLimitStats

createDNSTopNameStats

public DNSTopNameStats createDNSTopNameStats()

Create an instance of DNSTopNameStats

createPrefixTemplate

public PrefixTemplate createPrefixTemplate()

Create an instance of PrefixTemplate

createCdnsRateLimit

public CdnsRateLimit createCdnsRateLimit()

Create an instance of CdnsRateLimit

createACL

public ACL createACL()

Create an instance of ACL

createDHCPServerStats

public DHCPServerStats createDHCPServerStats()

Create an instance of DHCPServerStats

createTCPListenerRelatedServer

public TCPListenerRelatedServer createTCPListenerRelatedServer()

Create an instance of TCPListenerRelatedServer

createCCMZoneTemplate

public CCMZoneTemplate createCCMZoneTemplate()

Create an instance of CCMZoneTemplate

createCCMSubnet

public CCMSubnet createCCMSubnet()

Create an instance of CCMSubnet

createDnsException

public DnsException createDnsException()

Create an instance of DnsException

createScope

public Scope createScope()

Create an instance of Scope

createFilter

public Filter createFilter()

Create an instance of Filter

createDns64

public Dns64 createDns64()

Create an instance of Dns64

createDHCPTopUtilizedStats

public DHCPTopUtilizedStats createDHCPTopUtilizedStats()

Create an instance of DHCPTopUtilizedStats

createDNSServer

public DNSServer createDNSServer()

Create an instance of DNSServer

createRelayAgentState

public [RelayAgentState](#) createRelayAgentState()

Create an instance of [RelayAgentState](#)

createDNSCachingServerConfig

public [DNSCachingServerConfig](#) createDNSCachingServerConfig()

Create an instance of [DNSCachingServerConfig](#)

createDNSServerPushNotificationStats

public [DNSServerPushNotificationStats](#) createDNSServerPushNotificationStats()

Create an instance of [DNSServerPushNotificationStats](#)

createLinkTemplate

public [LinkTemplate](#) createLinkTemplate()

Create an instance of [LinkTemplate](#)

createCCMRR

public [CCMRR](#) createCCMRR()

Create an instance of [CCMRR](#)

createRange

public [Range](#) createRange()

Create an instance of [Range](#)

createCCMServer

public [CCMServer](#) createCCMServer()

Create an instance of [CCMServer](#)

createDnsIPnPort

public [DnsIPnPort](#) createDnsIPnPort()

Create an instance of [DnsIPnPort](#)

createFilterElement

public [FilterElement](#) createFilterElement()

Create an instance of [FilterElement](#)

createCCMZDCaching

public [CCMZDCaching](#) createCCMZDCaching()

Create an instance of [CCMZDCaching](#)

createCCMZDSecondary

public [CCMZDSecondary](#) createCCMZDSecondary()

Create an instance of [CCMZDSecondary](#)

createOption

public [Option](#) createOption()

Create an instance of [Option](#)

createAddrSet

public [AddrSet](#) createAddrSet()

Create an instance of [AddrSet](#)

createDnsEnumEntrySetArray

public [DnsEnumEntrySetArray](#) createDnsEnumEntrySetArray()

Create an instance of [DnsEnumEntrySetArray](#)

createPolicyArray

public [PolicyArray](#) createPolicyArray()

Create an instance of [PolicyArray](#)

createDnsZoneStatusArray

public [DnsZoneStatusArray](#) createDnsZoneStatusArray()

Create an instance of [DnsZoneStatusArray](#)

createCurrentPrefixUtilizationArray

public [CurrentPrefixUtilizationArray](#) createCurrentPrefixUtilizationArray()

Create an instance of [CurrentPrefixUtilizationArray](#)

createDHCPServerActivityStatsArray

public [DHCPServerActivityStatsArray](#) createDHCPServerActivityStatsArray()

Create an instance of [DHCPServerActivityStatsArray](#)

createCCMZoneDistributionArray

public [CCMZoneDistributionArray](#) createCCMZoneDistributionArray()

Create an instance of [CCMZoneDistributionArray](#)

createCCMRRSetArray

public [CCMRRSetArray](#) createCCMRRSetArray()

Create an instance of [CCMRRSetArray](#)

createFailoverRelatedServerArray

public [FailoverRelatedServerArray](#) createFailoverRelatedServerArray()

Create an instance of [FailoverRelatedServerArray](#)

createDnsSecKeyArray

public [DnsSecKeyArray](#) createDnsSecKeyArray()

Create an instance of [DnsSecKeyArray](#)

createDNSServerDBStatsArray

public [DNSServerDBStatsArray](#) createDNSServerDBStatsArray()

Create an instance of [DNSServerDBStatsArray](#)

createDHCPScopeStatusArray

public [DHCPScopeStatusArray](#) createDHCPScopeStatusArray()

Create an instance of [DHCPScopeStatusArray](#)

createDnsUpdateConfigArray

public [DnsUpdateConfigArray](#) createDnsUpdateConfigArray()

Create an instance of [DnsUpdateConfigArray](#)

createDNSCachingServerRateLimitItemArray

public [DNSCachingServerRateLimitItemArray](#) createDNSCachingServerRateLimitItemArray()

Create an instance of [DNSCachingServerRateLimitItemArray](#)

createFilterElementArray

public [FilterElementArray](#) createFilterElementArray()

Create an instance of [FilterElementArray](#)

createDHCPScopeAggregationStatsArray

public [DHCPScopeAggregationStatsArray](#) createDHCPScopeAggregationStatsArray()

Create an instance of [DHCPScopeAggregationStatsArray](#)

createReservationArray

public [ReservationArray](#) createReservationArray()

Create an instance of [ReservationArray](#)

createDnsViewArray

public [DnsViewArray](#) createDnsViewArray()

Create an instance of [DnsViewArray](#)

createReservation6Array

public [Reservation6Array](#) createReservation6Array()

Create an instance of [Reservation6Array](#)

createDNSServerMaxCounterStatsArray

public [DNSServerMaxCounterStatsArray](#) createDNSServerMaxCounterStatsArray()

Create an instance of [DNSServerMaxCounterStatsArray](#)

createDNSServerCacheStatsArray

public [DNSServerCacheStatsArray](#) createDNSServerCacheStatsArray()

Create an instance of [DNSServerCacheStatsArray](#)

createResourceValueArray

public [ResourceValueArray](#) createResourceValueArray()

Create an instance of [ResourceValueArray](#)

createResourceStatusArray

public [ResourceStatusArray](#) createResourceStatusArray()

Create an instance of [ResourceStatusArray](#)

createTCPConnectionRelatedServerArray

public [TCPConnectionRelatedServerArray](#) createTCPConnectionRelatedServerArray()

Create an instance of [TCPConnectionRelatedServerArray](#)

createAttrDescArray

public [AttrDescArray](#) createAttrDescArray()

Create an instance of [AttrDescArray](#)

createDNSServerPerformanceStatsArray

public [DNSServerPerformanceStatsArray](#) createDNSServerPerformanceStatsArray()

Create an instance of [DNSServerPerformanceStatsArray](#)

createDHCPRenewalDataArray

public [DHCPRenewalDataArray](#) createDHCPRenewalDataArray()

Create an instance of [DHCPRenewalDataArray](#)

createOptionDefinitionSetArray

public [OptionDefinitionSetArray](#) createOptionDefinitionSetArray()

Create an instance of [OptionDefinitionSetArray](#)

createCCMRRArray

public [CCMRRArray](#) createCCMRRArray()

Create an instance of [CCMRRArray](#)

createUpdatePolicyArray

public [UpdatePolicyArray](#) createUpdatePolicyArray()

Create an instance of [UpdatePolicyArray](#)

createDNSServerStatsArray

public [DNSServerStatsArray](#) createDNSServerStatsArray()

Create an instance of [DNSServerStatsArray](#)

createCCMHaDnsPairArray

public [CCMHaDnsPairArray](#) createCCMHaDnsPairArray()

Create an instance of [CCMHaDnsPairArray](#)

createDNSServerErrorsStatsArray

public [DNSServerErrorsStatsArray](#) createDNSServerErrorsStatsArray()

Create an instance of [DNSServerErrorsStatsArray](#)

createDHCP6StatsArray

public [DHCP6StatsArray](#) createDHCP6StatsArray()

Create an instance of [DHCP6StatsArray](#)

createRangeArray

public [RangeArray](#) createRangeArray()

Create an instance of [RangeArray](#)

createCurrentUtilizationArray

public [CurrentUtilizationArray](#) createCurrentUtilizationArray()

Create an instance of [CurrentUtilizationArray](#)

createCdnsRedirectArray

public [CdnsRedirectArray](#) createCdnsRedirectArray()

Create an instance of [CdnsRedirectArray](#)

createDHCPFailoverStatsArray

public [DHCPFailoverStatsArray](#) createDHCPFailoverStatsArray()

Create an instance of [DHCPFailoverStatsArray](#)

createDnsEnumEntryArray

public [DnsEnumEntryArray](#) createDnsEnumEntryArray()

Create an instance of [DnsEnumEntryArray](#)

createDHCPMaintenanceWindowArray

public [DHCPMaintenanceWindowArray](#) createDHCPMaintenanceWindowArray()

Create an instance of [DHCPMaintenanceWindowArray](#)

createCCMZDSecondaryArray

public [CCMZDSecondaryArray](#) createCCMZDSecondaryArray()

Create an instance of [CCMZDSecondaryArray](#)

createOptionArray

public [OptionArray](#) createOptionArray()

Create an instance of [OptionArray](#)

createCdnsDomainRateLimitArray

public [CdnsDomainRateLimitArray](#) createCdnsDomainRateLimitArray()

Create an instance of [CdnsDomainRateLimitArray](#)

createLinkArray

public `LinkArray` createLinkArray()

Create an instance of `LinkArray`

---

createKeyArray

public `KeyArray` createKeyArray()

Create an instance of `KeyArray`

---

createCertificateArray

public `CertificateArray` createCertificateArray()

Create an instance of `CertificateArray`

---

createCCMHostArray

public `CCMHostArray` createCCMHostArray()

Create an instance of `CCMHostArray`

---

createCCMClusterArray

public `CCMClusterArray` createCCMClusterArray()

Create an instance of `CCMClusterArray`

---

createDNSServerHaStatsArray

public `DNSServerHaStatsArray` createDNSServerHaStatsArray()

Create an instance of `DNSServerHaStatsArray`

---

createCCMZoneArray

public `CCMZoneArray` createCCMZoneArray()

Create an instance of `CCMZoneArray`

---

createDNSServerIPv6StatsArray

public `DNSServerIPv6StatsArray` createDNSServerIPv6StatsArray()

Create an instance of `DNSServerIPv6StatsArray`

---

createDnsForwarderArray

public `DnsForwarderArray` createDnsForwarderArray()

Create an instance of `DnsForwarderArray`

---

createDNSCachingServerStatsArray

public `DNSCachingServerStatsArray` createDNSCachingServerStatsArray()

Create an instance of [DNSCachingServerStatsArray](#)

createPrefixArray

public [PrefixArray](#) createPrefixArray()

Create an instance of [PrefixArray](#)

createDNSRelatedServerArray

public [DNSRelatedServerArray](#) createDNSRelatedServerArray()

Create an instance of [DNSRelatedServerArray](#)

createClientClassArray

public [ClientClassArray](#) createClientClassArray()

Create an instance of [ClientClassArray](#)

createCCMSecondaryZoneArray

public [CCMSecondaryZoneArray](#) createCCMSecondaryZoneArray()

Create an instance of [CCMSecondaryZoneArray](#)

createDnsTrustAnchorArray

public [DnsTrustAnchorArray](#) createDnsTrustAnchorArray()

Create an instance of [DnsTrustAnchorArray](#)

createSystemStatsArray

public [SystemStatsArray](#) createSystemStatsArray()

Create an instance of [SystemStatsArray](#)

createServerSystemStatsArray

public [ServerSystemStatsArray](#) createServerSystemStatsArray()

Create an instance of [ServerSystemStatsArray](#)

createLease6Array

public [Lease6Array](#) createLease6Array()

Create an instance of [Lease6Array](#)

createCCMZDCachingArray

public [CCMZDCachingArray](#) createCCMZDCachingArray()

Create an instance of [CCMZDCachingArray](#)

createCCMServerInfoArray

public [CCMServerInfoArray](#) createCCMServerInfoArray()

Create an instance of [CCMServerInfoArray](#)

createDnsEnumDomainArray

public [DnsEnumDomainArray](#) createDnsEnumDomainArray()

Create an instance of [DnsEnumDomainArray](#)

createVPNArray

public [VPNArray](#) createVPNArray()

Create an instance of [VPNArray](#)

createClientEntryArray

public [ClientEntryArray](#) createClientEntryArray()

Create an instance of [ClientEntryArray](#)

createLDAPRelatedServerArray

public [LDAPRelatedServerArray](#) createLDAPRelatedServerArray()

Create an instance of [LDAPRelatedServerArray](#)

createCCMFailoverPairArray

public [CCMFailoverPairArray](#) createCCMFailoverPairArray()

Create an instance of [CCMFailoverPairArray](#)

createCCMScopeTemplateArray

public [CCMScopeTemplateArray](#) createCCMScopeTemplateArray()

Create an instance of [CCMScopeTemplateArray](#)

createDnsHAStatusArray

public [DnsHAStatusArray](#) createDnsHAStatusArray()

Create an instance of [DnsHAStatusArray](#)

createCCMReverseZoneArray

public [CCMReverseZoneArray](#) createCCMReverseZoneArray()

Create an instance of [CCMReverseZoneArray](#)

createDNSServerQueryStatsArray

public DNSServerQueryStatsArray createDNSServerQueryStatsArray()

Create an instance of DNSServerQueryStatsArray

createAddrSetArray

public AddrSetArray createAddrSetArray()

Create an instance of AddrSetArray

createLeaseArray

public LeaseArray createLeaseArray()

Create an instance of LeaseArray

createDNSServerSecurityStatsArray

public DNSServerSecurityStatsArray createDNSServerSecurityStatsArray()

Create an instance of DNSServerSecurityStatsArray

createDNSCachingServerRateLimitStatsArray

public DNSCachingServerRateLimitStatsArray createDNSCachingServerRateLimitStatsArray()

Create an instance of DNSCachingServerRateLimitStatsArray

createDNSTopNameStatsArray

public DNSTopNameStatsArray createDNSTopNameStatsArray()

Create an instance of DNSTopNameStatsArray

createPrefixTemplateArray

public PrefixTemplateArray createPrefixTemplateArray()

Create an instance of PrefixTemplateArray

createACLArray

public ACLArray createACLArray()

Create an instance of ACLArray

createDHCPServerStatsArray

public DHCPServerStatsArray createDHCPServerStatsArray()

Create an instance of DHCPServerStatsArray

createCCMServerArray

public [CCMServerArray](#) createCCMServerArray()

Create an instance of [CCMServerArray](#)

createTCPListenerRelatedServerArray

public [TCPListenerRelatedServerArray](#) createTCPListenerRelatedServerArray()

Create an instance of [TCPListenerRelatedServerArray](#)

createDnsIPnPortArray

public [DnsIPnPortArray](#) createDnsIPnPortArray()

Create an instance of [DnsIPnPortArray](#)

createCCMZoneTemplateArray

public [CCMZoneTemplateArray](#) createCCMZoneTemplateArray()

Create an instance of [CCMZoneTemplateArray](#)

createCCMSubnetArray

public [CCMSubnetArray](#) createCCMSubnetArray()

Create an instance of [CCMSubnetArray](#)

createDnsExceptionArray

public [DnsExceptionArray](#) createDnsExceptionArray()

Create an instance of [DnsExceptionArray](#)

createScopeArray

public [ScopeArray](#) createScopeArray()

Create an instance of [ScopeArray](#)

createFilterArray

public [FilterArray](#) createFilterArray()

Create an instance of [FilterArray](#)

createDns64Array

public [Dns64Array](#) createDns64Array()

Create an instance of [Dns64Array](#)

createDHCPTopUtilizedStatsArray

public [DHCPTopUtilizedStatsArray](#) createDHCPTopUtilizedStatsArray()

Create an instance of DHCPTopUtilizedStatsArray

createRelayAgentStateArray

public RelayAgentStateArray createRelayAgentStateArray()

Create an instance of RelayAgentStateArray

createDNSServerPushNotificationStatsArray

public DNSServerPushNotificationStatsArray createDNSServerPushNotificationStatsArray()

Create an instance of DNSServerPushNotificationStatsArray

createLinkTemplateArray

public LinkTemplateArray createLinkTemplateArray()

Create an instance of LinkTemplateArray

createStringArray

public StringArray createStringArray()

Create an instance of StringArray

createCnrSoapAuth

public javax.xml.bind.JAXBElement<CnrSoapAuth> createCnrSoapAuth(CnrSoapAuth value)

Create an instance of JAXBElement<CnrSoapAuth>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<CnrSoapAuth>

createCnrStatus

public javax.xml.bind.JAXBElement<java.lang.String> createCnrStatus(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createClassBase

public javax.xml.bind.JAXBElement<ClassBase> createClassBase(ClassBase value)

Create an instance of JAXBElement<ClassBase>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[ClassBase](#)>

createDnsEnumEntrySet

public javax.xml.bind.JAXBElement<[DnsEnumEntrySet](#)> createDnsEnumEntrySet([DnsEnumEntrySet](#) value)

Create an instance of JAXBElement<[DnsEnumEntrySet](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[DnsEnumEntrySet](#)>

createPolicy

public javax.xml.bind.JAXBElement<[Policy](#)> createPolicy([Policy](#) value)

Create an instance of JAXBElement<[Policy](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[Policy](#)>

createDnsZoneStatus

public javax.xml.bind.JAXBElement<[DnsZoneStatus](#)> createDnsZoneStatus([DnsZoneStatus](#) value)

Create an instance of JAXBElement<[DnsZoneStatus](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[DnsZoneStatus](#)>

createCurrentPrefixUtilization

public javax.xml.bind.JAXBElement<[CurrentPrefixUtilization](#)> createCurrentPrefixUtilization([CurrentPrefixUtilization](#) value)

Create an instance of JAXBElement<[CurrentPrefixUtilization](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[CurrentPrefixUtilization](#)>

createDHCPServerActivityStats

public javax.xml.bind.JAXBElement<[DHCPServerActivityStats](#)> createDHCPServerActivityStats([DHCPServerActivityStats](#) value)

Create an instance of JAXBElement<[DHCPServerActivityStats](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[DHCPServerActivityStats](#)>

createCCMZoneDistribution

public javax.xml.bind.JAXBElement<[CCMZoneDistribution](#)> createCCMZoneDistribution([CCMZoneDistribution](#) value)

Create an instance of JAXBElement<[CCMZoneDistribution](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[CCMZoneDistribution](#)>

createCCMRRSet

public javax.xml.bind.JAXBElement<[CCMRRSet](#)> createCCMRRSet([CCMRRSet](#) value)

Create an instance of JAXBElement<[CCMRRSet](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[CCMRRSet](#)>

createFailoverRelatedServer

public javax.xml.bind.JAXBElement<[FailoverRelatedServer](#)> createFailoverRelatedServer([FailoverRelatedServer](#) value)

Create an instance of JAXBElement<[FailoverRelatedServer](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[FailoverRelatedServer](#)>

createDnsSecKey

public javax.xml.bind.JAXBElement<[DnsSecKey](#)> createDnsSecKey([DnsSecKey](#) value)

Create an instance of JAXBElement<[DnsSecKey](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[DnsSecKey](#)>

createDNSServerDBStats

public javax.xml.bind.JAXBElement<[DNSServerDBStats](#)> createDNSServerDBStats([DNSServerDBStats](#) value)

Create an instance of JAXBElement<[DNSServerDBStats](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[DNSServerDBStats](#)>

createDHCPScopeStatus

public javax.xml.bind.JAXBElement<[DHCPScopeStatus](#)> createDHCPScopeStatus([DHCPScopeStatus](#) value)

Create an instance of JAXBElement<[DHCPScopeStatus](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[DHCPScopeStatus](#)>

createDnsUpdateConfig

public javax.xml.bind.JAXBElement<[DnsUpdateConfig](#)> createDnsUpdateConfig([DnsUpdateConfig](#) value)

Create an instance of JAXBElement<[DnsUpdateConfig](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[DnsUpdateConfig](#)>

createDNSCachingServerRateLimitItem

public javax.xml.bind.JAXBElement<[DNSCachingServerRateLimitItem](#)> createDNSCachingServerRateLimitItem([DNSCachingServerRateLimitItem](#) value)

Create an instance of JAXBElement<[DNSCachingServerRateLimitItem](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[DNSCachingServerRateLimitItem](#)>

createDHCPScopeAggregationStats

public javax.xml.bind.JAXBElement<[DHCPScopeAggregationStats](#)> createDHCPScopeAggregationStats([DHCPScopeAggregationStats](#) value)

Create an instance of JAXBElement<[DHCPScopeAggregationStats](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[DHCPScopeAggregationStats](#)>

createReservation

public javax.xml.bind.JAXBElement<[Reservation](#)> createReservation([Reservation](#) value)

Create an instance of JAXBElement<[Reservation](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[Reservation](#)>

createDnsView

public javax.xml.bind.JAXBElement<[DnsView](#)> createDnsView([DnsView](#) value)

Create an instance of JAXBElement<[DnsView](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[DnsView](#)>

createReservation6

public javax.xml.bind.JAXBElement<[Reservation6](#)> createReservation6([Reservation6](#) value)

Create an instance of JAXBElement<[Reservation6](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[Reservation6](#)>

createDNSServerMaxCounterStats

public javax.xml.bind.JAXBElement<[DNSServerMaxCounterStats](#)> createDNSServerMaxCounterStats([DNSServerMaxCounterStats](#) value)

Create an instance of JAXBElement<[DNSServerMaxCounterStats](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[DNSServerMaxCounterStats](#)>

createDNSServerCacheStats

public javax.xml.bind.JAXBElement<[DNSServerCacheStats](#)> createDNSServerCacheStats([DNSServerCacheStats](#) value)

Create an instance of JAXBElement<[DNSServerCacheStats](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[DNSServerCacheStats](#)>

createResourceValue

public javax.xml.bind.JAXBElement<[ResourceValue](#)> createResourceValue([ResourceValue](#) value)

Create an instance of JAXBElement<[ResourceValue](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[ResourceValue](#)>

createResourceStatus

public javax.xml.bind.JAXBElement<[ResourceStatus](#)> createResourceStatus([ResourceStatus](#) value)

Create an instance of JAXBElement<[ResourceStatus](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[ResourceStatus](#)>

---

createTCPConnectionRelatedServer

public javax.xml.bind.JAXBElement<[TCPConnectionRelatedServer](#)> createTCPConnectionRelatedServer([TCPConnectionRelatedServer](#) value)

Create an instance of JAXBElement<[TCPConnectionRelatedServer](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[TCPConnectionRelatedServer](#)>

---

createAuthDnsSec

public javax.xml.bind.JAXBElement<[AuthDnsSec](#)> createAuthDnsSec([AuthDnsSec](#) value)

Create an instance of JAXBElement<[AuthDnsSec](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[AuthDnsSec](#)>

---

createAttrDesc

public javax.xml.bind.JAXBElement<[AttrDesc](#)> createAttrDesc([AttrDesc](#) value)

Create an instance of JAXBElement<[AttrDesc](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[AttrDesc](#)>

---

createDNSServerPerformanceStats

public javax.xml.bind.JAXBElement<[DNSServerPerformanceStats](#)> createDNSServerPerformanceStats([DNSServerPerformanceStats](#) value)

Create an instance of JAXBElement<[DNSServerPerformanceStats](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[DNSServerPerformanceStats](#)>

---

createDHCPServer

public javax.xml.bind.JAXBElement<[DHCPServer](#)> createDHCPServer([DHCPServer](#) value)

Create an instance of JAXBElement<[DHCPServer](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[DHCPServer](#)>

createDHCPRenewalData

public javax.xml.bind.JAXBElement<DHCPRenewalData> createDHCPRenewalData(DHCPRenewalData value)

Create an instance of JAXBElement<DHCPRenewalData>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<DHCPRenewalData>

createOptionDefinitionSet

public javax.xml.bind.JAXBElement<OptionDefinitionSet> createOptionDefinitionSet(OptionDefinitionSet value)

Create an instance of JAXBElement<OptionDefinitionSet>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<OptionDefinitionSet>

createUpdatePolicy

public javax.xml.bind.JAXBElement<UpdatePolicy> createUpdatePolicy(UpdatePolicy value)

Create an instance of JAXBElement<UpdatePolicy>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<UpdatePolicy>

createDNSServerStats

public javax.xml.bind.JAXBElement<DNSServerStats> createDNSServerStats(DNSServerStats value)

Create an instance of JAXBElement<DNSServerStats>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<DNSServerStats>

createCCMHaDnsPair

public javax.xml.bind.JAXBElement<CCMHaDnsPair> createCCMHaDnsPair(CCMHaDnsPair value)

Create an instance of JAXBElement<CCMHaDnsPair>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<CCMHaDnsPair>

createDNSServerErrorsStats

public javax.xml.bind.JAXBElement<DNSServerErrorsStats> createDNSServerErrorsStats(DNSServerErrorsStats value)

Create an instance of JAXBElement<DNSServerErrorsStats>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<DNSServerErrorsStats>

---

createDHCP6Stats

public javax.xml.bind.JAXBElement<DHCP6Stats> createDHCP6Stats(DHCP6Stats value)

Create an instance of JAXBElement<DHCP6Stats>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<DHCP6Stats>

---

createDnsEnumConfig

public javax.xml.bind.JAXBElement<DnsEnumConfig> createDnsEnumConfig(DnsEnumConfig value)

Create an instance of JAXBElement<DnsEnumConfig>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<DnsEnumConfig>

---

createCurrentUtilization

public javax.xml.bind.JAXBElement<CurrentUtilization> createCurrentUtilization(CurrentUtilization value)

Create an instance of JAXBElement<CurrentUtilization>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<CurrentUtilization>

---

createCdnsRedirect

public javax.xml.bind.JAXBElement<CdnsRedirect> createCdnsRedirect(CdnsRedirect value)

Create an instance of JAXBElement<CdnsRedirect>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<CdnsRedirect>

---

createDHCPFailoverStats

public javax.xml.bind.JAXBElement<DHCPFailoverStats> createDHCPFailoverStats(DHCPFailoverStats value)

Create an instance of JAXBElement<DHCPFailoverStats>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<DHCPFailoverStats>

---

createDnsEnumEntry

public javax.xml.bind.JAXBElement<DnsEnumEntry> createDnsEnumEntry(DnsEnumEntry value)

Create an instance of JAXBElement<DnsEnumEntry>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<DnsEnumEntry>

---

createDHCPMaintenanceWindow

public javax.xml.bind.JAXBElement<DHCPMaintenanceWindow> createDHCPMaintenanceWindow(DHCPMaintenanceWindow value)

Create an instance of JAXBElement<DHCPMaintenanceWindow>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<DHCPMaintenanceWindow>

---

createCdnsDomainRateLimit

public javax.xml.bind.JAXBElement<CdnsDomainRateLimit> createCdnsDomainRateLimit(CdnsDomainRateLimit value)

Create an instance of JAXBElement<CdnsDomainRateLimit>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<CdnsDomainRateLimit>

---

createLink

public javax.xml.bind.JAXBElement<Link> createLink(Link value)

Create an instance of JAXBElement<Link>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<Link>

---

createKey

public javax.xml.bind.JAXBElement<Key> createKey(Key value)

Create an instance of JAXBElement<Key>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[Key](#)>

---

createCertificate

public javax.xml.bind.JAXBElement<[Certificate](#)> createCertificate([Certificate](#) value)

Create an instance of JAXBElement<[Certificate](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[Certificate](#)>

---

createCCMHost

public javax.xml.bind.JAXBElement<[CCMHost](#)> createCCMHost([CCMHost](#) value)

Create an instance of JAXBElement<[CCMHost](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[CCMHost](#)>

---

createCCMCluster

public javax.xml.bind.JAXBElement<[CCMCluster](#)> createCCMCluster([CCMCluster](#) value)

Create an instance of JAXBElement<[CCMCluster](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[CCMCluster](#)>

---

createDNSServerHaStats

public javax.xml.bind.JAXBElement<[DNSServerHaStats](#)> createDNSServerHaStats([DNSServerHaStats](#) value)

Create an instance of JAXBElement<[DNSServerHaStats](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[DNSServerHaStats](#)>

---

createCCMZone

public javax.xml.bind.JAXBElement<[CCMZone](#)> createCCMZone([CCMZone](#) value)

Create an instance of JAXBElement<[CCMZone](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[CCMZone](#)>

createDnsSec

public javax.xml.bind.JAXBElement<[DnsSec](#)> createDnsSec([DnsSec](#) value)

Create an instance of JAXBElement<[DnsSec](#)>

Parameters:
value - Java instance representing xml element's value.

Returns:
the new instance of JAXBElement<[DnsSec](#)>

---

createDNSServerIPv6Stats

public javax.xml.bind.JAXBElement<[DNSServerIPv6Stats](#)> createDNSServerIPv6Stats([DNSServerIPv6Stats](#) value)

Create an instance of JAXBElement<[DNSServerIPv6Stats](#)>

Parameters:
value - Java instance representing xml element's value.

Returns:
the new instance of JAXBElement<[DNSServerIPv6Stats](#)>

---

createDnsForwarder

public javax.xml.bind.JAXBElement<[DnsForwarder](#)> createDnsForwarder([DnsForwarder](#) value)

Create an instance of JAXBElement<[DnsForwarder](#)>

Parameters:
value - Java instance representing xml element's value.

Returns:
the new instance of JAXBElement<[DnsForwarder](#)>

---

createDNSCachingServerStats

public javax.xml.bind.JAXBElement<[DNSCachingServerStats](#)> createDNSCachingServerStats([DNSCachingServerStats](#) value)

Create an instance of JAXBElement<[DNSCachingServerStats](#)>

Parameters:
value - Java instance representing xml element's value.

Returns:
the new instance of JAXBElement<[DNSCachingServerStats](#)>

---

createPrefix

public javax.xml.bind.JAXBElement<[Prefix](#)> createPrefix([Prefix](#) value)

Create an instance of JAXBElement<[Prefix](#)>

Parameters:
value - Java instance representing xml element's value.

Returns:
the new instance of JAXBElement<[Prefix](#)>

---

createDNSRelatedServer

public javax.xml.bind.JAXBElement<[DNSRelatedServer](#)> createDNSRelatedServer([DNSRelatedServer](#) value)

Create an instance of JAXBElement<[DNSRelatedServer](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[DNSRelatedServer](#)>

---

createClientClass

public javax.xml.bind.JAXBElement<[ClientClass](#)> createClientClass([ClientClass](#) value)

Create an instance of JAXBElement<[ClientClass](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[ClientClass](#)>

---

createCCMSecondaryZone

public javax.xml.bind.JAXBElement<[CCMSecondaryZone](#)> createCCMSecondaryZone([CCMSecondaryZone](#) value)

Create an instance of JAXBElement<[CCMSecondaryZone](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[CCMSecondaryZone](#)>

---

createDnsTrustAnchor

public javax.xml.bind.JAXBElement<[DnsTrustAnchor](#)> createDnsTrustAnchor([DnsTrustAnchor](#) value)

Create an instance of JAXBElement<[DnsTrustAnchor](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[DnsTrustAnchor](#)>

---

createSystemStats

public javax.xml.bind.JAXBElement<[SystemStats](#)> createSystemStats([SystemStats](#) value)

Create an instance of JAXBElement<[SystemStats](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[SystemStats](#)>

---

createServerSystemStats

public javax.xml.bind.JAXBElement<[ServerSystemStats](#)> createServerSystemStats([ServerSystemStats](#) value)

Create an instance of JAXBElement<ServerSystemStats>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<ServerSystemStats>

createLease6

public javax.xml.bind.JAXBElement<Lease6> createLease6(Lease6 value)

Create an instance of JAXBElement<Lease6>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<Lease6>

createCCMServerInfo

public javax.xml.bind.JAXBElement<CCMServerInfo> createCCMServerInfo(CCMServerInfo value)

Create an instance of JAXBElement<CCMServerInfo>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<CCMServerInfo>

createDnsEnumDomain

public javax.xml.bind.JAXBElement<DnsEnumDomain> createDnsEnumDomain(DnsEnumDomain value)

Create an instance of JAXBElement<DnsEnumDomain>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<DnsEnumDomain>

createVPN

public javax.xml.bind.JAXBElement<VPN> createVPN(VPN value)

Create an instance of JAXBElement<VPN>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<VPN>

createClientEntry

public javax.xml.bind.JAXBElement<ClientEntry> createClientEntry(ClientEntry value)

Create an instance of JAXBElement<ClientEntry>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<ClientEntry>

createLDAPRelatedServer

public javax.xml.bind.JAXBElement<LDAPRelatedServer> createLDAPRelatedServer(LDAPRelatedServer value)

Create an instance of JAXBElement<LDAPRelatedServer>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<LDAPRelatedServer>

createCCMFailoverPair

public javax.xml.bind.JAXBElement<CCMFailoverPair> createCCMFailoverPair(CCMFailoverPair value)

Create an instance of JAXBElement<CCMFailoverPair>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<CCMFailoverPair>

createCCMScopeTemplate

public javax.xml.bind.JAXBElement<CCMScopeTemplate> createCCMScopeTemplate(CCMScopeTemplate value)

Create an instance of JAXBElement<CCMScopeTemplate>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<CCMScopeTemplate>

createDnsHAStatus

public javax.xml.bind.JAXBElement<DnsHAStatus> createDnsHAStatus(DnsHAStatus value)

Create an instance of JAXBElement<DnsHAStatus>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<DnsHAStatus>

createCCMReverseZone

public javax.xml.bind.JAXBElement<CCMReverseZone> createCCMReverseZone(CCMReverseZone value)

Create an instance of JAXBElement<CCMReverseZone>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[CCMReverseZone](#)>

createDNSServerQueryStats

public javax.xml.bind.JAXBElement<[DNSServerQueryStats](#)> createDNSServerQueryStats([DNSServerQueryStats](#) value)

Create an instance of JAXBElement<[DNSServerQueryStats](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[DNSServerQueryStats](#)>

createLease

public javax.xml.bind.JAXBElement<[Lease](#)> createLease([Lease](#) value)

Create an instance of JAXBElement<[Lease](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[Lease](#)>

createDNSServerSecurityStats

public javax.xml.bind.JAXBElement<[DNSServerSecurityStats](#)> createDNSServerSecurityStats([DNSServerSecurityStats](#) value)

Create an instance of JAXBElement<[DNSServerSecurityStats](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[DNSServerSecurityStats](#)>

createDNSCachingServer

public javax.xml.bind.JAXBElement<[DNSCachingServer](#)> createDNSCachingServer([DNSCachingServer](#) value)

Create an instance of JAXBElement<[DNSCachingServer](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[DNSCachingServer](#)>

createDNSCachingServerRateLimitStats

public javax.xml.bind.JAXBElement<[DNSCachingServerRateLimitStats](#)> createDNSCachingServerRateLimitStats([DNSCachingServerRateLimitStats](#) value)

Create an instance of JAXBElement<[DNSCachingServerRateLimitStats](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[DNSCachingServerRateLimitStats](#)>

createDNSTopNameStats

public javax.xml.bind.JAXBElement<[DNSTopNameStats](#)> createDNSTopNameStats([DNSTopNameStats](#) value)

Create an instance of JAXBElement<[DNSTopNameStats](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[DNSTopNameStats](#)>

---

createPrefixTemplate

public javax.xml.bind.JAXBElement<[PrefixTemplate](#)> createPrefixTemplate([PrefixTemplate](#) value)

Create an instance of JAXBElement<[PrefixTemplate](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[PrefixTemplate](#)>

---

createCdnsRateLimit

public javax.xml.bind.JAXBElement<[CdnsRateLimit](#)> createCdnsRateLimit([CdnsRateLimit](#) value)

Create an instance of JAXBElement<[CdnsRateLimit](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[CdnsRateLimit](#)>

---

createACL

public javax.xml.bind.JAXBElement<[ACL](#)> createACL([ACL](#) value)

Create an instance of JAXBElement<[ACL](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[ACL](#)>

---

createDHCPServerStats

public javax.xml.bind.JAXBElement<[DHCPServerStats](#)> createDHCPServerStats([DHCPServerStats](#) value)

Create an instance of JAXBElement<[DHCPServerStats](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[DHCPServerStats](#)>

---

createTCPListenerRelatedServer

public javax.xml.bind.JAXBElement<TCPListenerRelatedServer> createTCPListenerRelatedServer(TCPListenerRelatedServer value)

Create an instance of JAXBElement<TCPListenerRelatedServer>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<TCPListenerRelatedServer>

---

createCCMZoneTemplate

public javax.xml.bind.JAXBElement<CCMZoneTemplate> createCCMZoneTemplate(CCMZoneTemplate value)

Create an instance of JAXBElement<CCMZoneTemplate>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<CCMZoneTemplate>

---

createCCMSubnet

public javax.xml.bind.JAXBElement<CCMSubnet> createCCMSubnet(CCMSubnet value)

Create an instance of JAXBElement<CCMSubnet>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<CCMSubnet>

---

createDnsException

public javax.xml.bind.JAXBElement<DnsException> createDnsException(DnsException value)

Create an instance of JAXBElement<DnsException>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<DnsException>

---

createScope

public javax.xml.bind.JAXBElement<Scope> createScope(Scope value)

Create an instance of JAXBElement<Scope>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<Scope>

---

createFilter

public javax.xml.bind.JAXBElement<Filter> createFilter(Filter value)

Create an instance of JAXBElement<Filter>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[Filter](#)>

createDns64

public javax.xml.bind.JAXBElement<[Dns64](#)> createDns64([Dns64](#) value)

Create an instance of JAXBElement<[Dns64](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[Dns64](#)>

createDHCPTopUtilizedStats

public javax.xml.bind.JAXBElement<[DHCPTopUtilizedStats](#)> createDHCPTopUtilizedStats([DHCPTopUtilizedStats](#) value)

Create an instance of JAXBElement<[DHCPTopUtilizedStats](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[DHCPTopUtilizedStats](#)>

createDNSServer

public javax.xml.bind.JAXBElement<[DNSServer](#)> createDNSServer([DNSServer](#) value)

Create an instance of JAXBElement<[DNSServer](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[DNSServer](#)>

createRelayAgentState

public javax.xml.bind.JAXBElement<[RelayAgentState](#)> createRelayAgentState([RelayAgentState](#) value)

Create an instance of JAXBElement<[RelayAgentState](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[RelayAgentState](#)>

createDNSCachingServerConfig

public javax.xml.bind.JAXBElement<[DNSCachingServerConfig](#)> createDNSCachingServerConfig([DNSCachingServerConfig](#) value)

Create an instance of JAXBElement<[DNSCachingServerConfig](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[DNSCachingServerConfig](#)>

createDNSServerPushNotificationStats

public javax.xml.bind.JAXBElement<[DNSServerPushNotificationStats](#)> createDNSServerPushNotificationStats([DNSServerPushNotificationStats](#) value)

Create an instance of JAXBElement<[DNSServerPushNotificationStats](#)>

Parameters:
value - Java instance representing xml element's value.
Returns:
the new instance of JAXBElement<[DNSServerPushNotificationStats](#)>

createLinkTemplate

public javax.xml.bind.JAXBElement<[LinkTemplate](#)> createLinkTemplate([LinkTemplate](#) value)

Create an instance of JAXBElement<[LinkTemplate](#)>

Parameters:
value - Java instance representing xml element's value.
Returns:
the new instance of JAXBElement<[LinkTemplate](#)>

createCCMRR

public javax.xml.bind.JAXBElement<[CCMRR](#)> createCCMRR([CCMRR](#) value)

Create an instance of JAXBElement<[CCMRR](#)>

Parameters:
value - Java instance representing xml element's value.
Returns:
the new instance of JAXBElement<[CCMRR](#)>

createRange

public javax.xml.bind.JAXBElement<[Range](#)> createRange([Range](#) value)

Create an instance of JAXBElement<[Range](#)>

Parameters:
value - Java instance representing xml element's value.
Returns:
the new instance of JAXBElement<[Range](#)>

createCCMServer

public javax.xml.bind.JAXBElement<[CCMServer](#)> createCCMServer([CCMServer](#) value)

Create an instance of JAXBElement<[CCMServer](#)>

Parameters:
value - Java instance representing xml element's value.
Returns:
the new instance of JAXBElement<[CCMServer](#)>

createDnsIPnPort

public javax.xml.bind.JAXBElement<[DnsIPnPort](#)> createDnsIPnPort([DnsIPnPort](#) value)

Create an instance of JAXBElement<[DnsIPnPort](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[DnsIPnPort](#)>

createFilterElement

public javax.xml.bind.JAXBElement<[FilterElement](#)> createFilterElement([FilterElement](#) value)

Create an instance of JAXBElement<[FilterElement](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[FilterElement](#)>

createCCMZDCaching

public javax.xml.bind.JAXBElement<[CCMZDCaching](#)> createCCMZDCaching([CCMZDCaching](#) value)

Create an instance of JAXBElement<[CCMZDCaching](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[CCMZDCaching](#)>

createCCMZDSecondary

public javax.xml.bind.JAXBElement<[CCMZDSecondary](#)> createCCMZDSecondary([CCMZDSecondary](#) value)

Create an instance of JAXBElement<[CCMZDSecondary](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[CCMZDSecondary](#)>

createOption

public javax.xml.bind.JAXBElement<[Option](#)> createOption([Option](#) value)

Create an instance of JAXBElement<[Option](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[Option](#)>

createAddrSet

public javax.xml.bind.JAXBElement<AddrSet> createAddrSet(AddrSet value)

Create an instance of JAXBElement<AddrSet>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<AddrSet>

---

createList

public javax.xml.bind.JAXBElement<java.lang.Object> createList(java.lang.Object value)

Create an instance of JAXBElement<Object>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<Object>

---

createClassBaseArray

public javax.xml.bind.JAXBElement<ClassBaseArray> createClassBaseArray(ClassBaseArray value)

Create an instance of JAXBElement<ClassBaseArray>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<ClassBaseArray>

---

createDnsEnumEntrySetArray

public javax.xml.bind.JAXBElement<DnsEnumEntrySetArray> createDnsEnumEntrySetArray(DnsEnumEntrySetArray value)

Create an instance of JAXBElement<DnsEnumEntrySetArray>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<DnsEnumEntrySetArray>

---

createDnsEnumEntrySetItem

public javax.xml.bind.JAXBElement<DnsEnumEntrySet> createDnsEnumEntrySetItem(DnsEnumEntrySet value)

Create an instance of JAXBElement<DnsEnumEntrySet>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<DnsEnumEntrySet>

---

createPolicyArray

public javax.xml.bind.JAXBElement<PolicyArray> createPolicyArray(PolicyArray value)

Create an instance of JAXBElement<PolicyArray>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[PolicyArray](#)>

---

createPolicyItem

public javax.xml.bind.JAXBElement<[Policy](#)> createPolicyItem([Policy](#) value)

Create an instance of JAXBElement<[Policy](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[Policy](#)>

---

createDnsZoneStatusArray

public javax.xml.bind.JAXBElement<[DnsZoneStatusArray](#)> createDnsZoneStatusArray([DnsZoneStatusArray](#) value)

Create an instance of JAXBElement<[DnsZoneStatusArray](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[DnsZoneStatusArray](#)>

---

createDnsZoneStatusItem

public javax.xml.bind.JAXBElement<[DnsZoneStatus](#)> createDnsZoneStatusItem([DnsZoneStatus](#) value)

Create an instance of JAXBElement<[DnsZoneStatus](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[DnsZoneStatus](#)>

---

createCurrentPrefixUtilizationArray

public javax.xml.bind.JAXBElement<[CurrentPrefixUtilizationArray](#)> createCurrentPrefixUtilizationArray([CurrentPrefixUtilizationArray](#) value)

Create an instance of JAXBElement<[CurrentPrefixUtilizationArray](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[CurrentPrefixUtilizationArray](#)>

---

createCurrentPrefixUtilizationItem

public javax.xml.bind.JAXBElement<[CurrentPrefixUtilization](#)> createCurrentPrefixUtilizationItem([CurrentPrefixUtilization](#) value)

Create an instance of JAXBElement<[CurrentPrefixUtilization](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[CurrentPrefixUtilization](#)>

---

createDHCPServerActivityStatsArray

public javax.xml.bind.JAXBElement<[DHCPServerActivityStatsArray](#)> createDHCPServerActivityStatsArray([DHCPServerActivityStatsArray](#) value)

Create an instance of JAXBElement<[DHCPServerActivityStatsArray](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[DHCPServerActivityStatsArray](#)>

---

createDHCPServerActivityStatsItem

public javax.xml.bind.JAXBElement<[DHCPServerActivityStats](#)> createDHCPServerActivityStatsItem([DHCPServerActivityStats](#) value)

Create an instance of JAXBElement<[DHCPServerActivityStats](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[DHCPServerActivityStats](#)>

---

createCCMZoneDistributionArray

public javax.xml.bind.JAXBElement<[CCMZoneDistributionArray](#)> createCCMZoneDistributionArray([CCMZoneDistributionArray](#) value)

Create an instance of JAXBElement<[CCMZoneDistributionArray](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[CCMZoneDistributionArray](#)>

---

createCCMZoneDistributionItem

public javax.xml.bind.JAXBElement<[CCMZoneDistribution](#)> createCCMZoneDistributionItem([CCMZoneDistribution](#) value)

Create an instance of JAXBElement<[CCMZoneDistribution](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[CCMZoneDistribution](#)>

---

createCCMRRSetArray

public javax.xml.bind.JAXBElement<[CCMRRSetArray](#)> createCCMRRSetArray([CCMRRSetArray](#) value)

Create an instance of JAXBElement<[CCMRRSetArray](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[CCMRRSetArray](#)>

createCCMRRSetItem

public javax.xml.bind.JAXBElement<[CCMRRSet](#)> createCCMRRSetItem([CCMRRSet](#) value)

Create an instance of JAXBElement<[CCMRRSet](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[CCMRRSet](#)>

createFailoverRelatedServerArray

public javax.xml.bind.JAXBElement<[FailoverRelatedServerArray](#)> createFailoverRelatedServerArray([FailoverRelatedServerArray](#) value)

Create an instance of JAXBElement<[FailoverRelatedServerArray](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[FailoverRelatedServerArray](#)>

createFailoverRelatedServerItem

public javax.xml.bind.JAXBElement<[FailoverRelatedServer](#)> createFailoverRelatedServerItem([FailoverRelatedServer](#) value)

Create an instance of JAXBElement<[FailoverRelatedServer](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[FailoverRelatedServer](#)>

createDnsSecKeyArray

public javax.xml.bind.JAXBElement<[DnsSecKeyArray](#)> createDnsSecKeyArray([DnsSecKeyArray](#) value)

Create an instance of JAXBElement<[DnsSecKeyArray](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[DnsSecKeyArray](#)>

createDnsSecKeyItem

public javax.xml.bind.JAXBElement<[DnsSecKey](#)> createDnsSecKeyItem([DnsSecKey](#) value)

Create an instance of JAXBElement<[DnsSecKey](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[DnsSecKey](#)>

createDNSServerDBStatsArray

public javax.xml.bind.JAXBElement<DNSServerDBStatsArray> createDNSServerDBStatsArray(DNSServerDBStatsArray value)

Create an instance of JAXBElement<DNSServerDBStatsArray>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<DNSServerDBStatsArray>

---

createDNSServerDBStatsItem

public javax.xml.bind.JAXBElement<DNSServerDBStats> createDNSServerDBStatsItem(DNSServerDBStats value)

Create an instance of JAXBElement<DNSServerDBStats>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<DNSServerDBStats>

---

createDHCPScopeStatusArray

public javax.xml.bind.JAXBElement<DHCPScopeStatusArray> createDHCPScopeStatusArray(DHCPScopeStatusArray value)

Create an instance of JAXBElement<DHCPScopeStatusArray>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<DHCPScopeStatusArray>

---

createDHCPScopeStatusItem

public javax.xml.bind.JAXBElement<DHCPScopeStatus> createDHCPScopeStatusItem(DHCPScopeStatus value)

Create an instance of JAXBElement<DHCPScopeStatus>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<DHCPScopeStatus>

---

createDnsUpdateConfigArray

public javax.xml.bind.JAXBElement<DnsUpdateConfigArray> createDnsUpdateConfigArray(DnsUpdateConfigArray value)

Create an instance of JAXBElement<DnsUpdateConfigArray>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<DnsUpdateConfigArray>

---

createDnsUpdateConfigItem

public javax.xml.bind.JAXBElement<DnsUpdateConfig> createDnsUpdateConfigItem(DnsUpdateConfig value)

Create an instance of JAXBElement<[DnsUpdateConfig](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[DnsUpdateConfig](#)>

---

createDNSCachingServerRateLimitItemArray

public javax.xml.bind.JAXBElement<[DNSCachingServerRateLimitItemArray](#)> createDNSCachingServerRateLimitItemArray([DNSCachingServerRateLimitItemArray](#) value)

Create an instance of JAXBElement<[DNSCachingServerRateLimitItemArray](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[DNSCachingServerRateLimitItemArray](#)>

---

createDNSCachingServerRateLimitItemItem

public javax.xml.bind.JAXBElement<[DNSCachingServerRateLimitItem](#)> createDNSCachingServerRateLimitItemItem([DNSCachingServerRateLimitItem](#) value)

Create an instance of JAXBElement<[DNSCachingServerRateLimitItem](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[DNSCachingServerRateLimitItem](#)>

---

createFilterElementArray

public javax.xml.bind.JAXBElement<[FilterElementArray](#)> createFilterElementArray([FilterElementArray](#) value)

Create an instance of JAXBElement<[FilterElementArray](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[FilterElementArray](#)>

---

createFilterElementItem

public javax.xml.bind.JAXBElement<[FilterElement](#)> createFilterElementItem([FilterElement](#) value)

Create an instance of JAXBElement<[FilterElement](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[FilterElement](#)>

---

createDHCPScopeAggregationStatsArray

public javax.xml.bind.JAXBElement<[DHCPScopeAggregationStatsArray](#)> createDHCPScopeAggregationStatsArray([DHCPScopeAggregationStatsArray](#) value)

Create an instance of JAXBElement<[DHCPScopeAggregationStatsArray](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[DHCPScopeAggregationStatsArray](#)>

---

createDHCPScopeAggregationStatsItem

public javax.xml.bind.JAXBElement<[DHCPScopeAggregationStats](#)> createDHCPScopeAggregationStatsItem([DHCPScopeAggregationStats](#) value)

Create an instance of JAXBElement<[DHCPScopeAggregationStats](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[DHCPScopeAggregationStats](#)>

---

createReservationArray

public javax.xml.bind.JAXBElement<[ReservationArray](#)> createReservationArray([ReservationArray](#) value)

Create an instance of JAXBElement<[ReservationArray](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[ReservationArray](#)>

---

createReservationItem

public javax.xml.bind.JAXBElement<[Reservation](#)> createReservationItem([Reservation](#) value)

Create an instance of JAXBElement<[Reservation](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[Reservation](#)>

---

createDnsViewArray

public javax.xml.bind.JAXBElement<[DnsViewArray](#)> createDnsViewArray([DnsViewArray](#) value)

Create an instance of JAXBElement<[DnsViewArray](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[DnsViewArray](#)>

---

createDnsViewItem

public javax.xml.bind.JAXBElement<[DnsView](#)> createDnsViewItem([DnsView](#) value)

Create an instance of JAXBElement<[DnsView](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[DnsView](#)>

createReservation6Array

public javax.xml.bind.JAXBElement<[Reservation6Array](#)> createReservation6Array([Reservation6Array](#) value)

Create an instance of JAXBElement<[Reservation6Array](#)>

Parameters:
value - Java instance representing xml element's value.

Returns:
the new instance of JAXBElement<[Reservation6Array](#)>

createReservation6Item

public javax.xml.bind.JAXBElement<[Reservation6](#)> createReservation6Item([Reservation6](#) value)

Create an instance of JAXBElement<[Reservation6](#)>

Parameters:
value - Java instance representing xml element's value.

Returns:
the new instance of JAXBElement<[Reservation6](#)>

createDNSServerMaxCounterStatsArray

public javax.xml.bind.JAXBElement<[DNSServerMaxCounterStatsArray](#)> createDNSServerMaxCounterStatsArray([DNSServerMaxCounterStatsArray](#) value)

Create an instance of JAXBElement<[DNSServerMaxCounterStatsArray](#)>

Parameters:
value - Java instance representing xml element's value.

Returns:
the new instance of JAXBElement<[DNSServerMaxCounterStatsArray](#)>

createDNSServerMaxCounterStatsItem

public javax.xml.bind.JAXBElement<[DNSServerMaxCounterStats](#)> createDNSServerMaxCounterStatsItem([DNSServerMaxCounterStats](#) value)

Create an instance of JAXBElement<[DNSServerMaxCounterStats](#)>

Parameters:
value - Java instance representing xml element's value.

Returns:
the new instance of JAXBElement<[DNSServerMaxCounterStats](#)>

createDNSServerCacheStatsArray

public javax.xml.bind.JAXBElement<[DNSServerCacheStatsArray](#)> createDNSServerCacheStatsArray([DNSServerCacheStatsArray](#) value)

Create an instance of JAXBElement<[DNSServerCacheStatsArray](#)>

Parameters:
value - Java instance representing xml element's value.

Returns:
the new instance of JAXBElement<[DNSServerCacheStatsArray](#)>

createDNSServerCacheStatsItem

public javax.xml.bind.JAXBElement<[DNSServerCacheStats](#)> createDNSServerCacheStatsItem([DNSServerCacheStats](#) value)

Create an instance of JAXBElement<[DNSServerCacheStats](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[DNSServerCacheStats](#)>

---

createResourceValueArray

public javax.xml.bind.JAXBElement<[ResourceValueArray](#)> createResourceValueArray([ResourceValueArray](#) value)

Create an instance of JAXBElement<[ResourceValueArray](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[ResourceValueArray](#)>

---

createResourceValueItem

public javax.xml.bind.JAXBElement<[ResourceValue](#)> createResourceValueItem([ResourceValue](#) value)

Create an instance of JAXBElement<[ResourceValue](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[ResourceValue](#)>

---

createResourceStatusArray

public javax.xml.bind.JAXBElement<[ResourceStatusArray](#)> createResourceStatusArray([ResourceStatusArray](#) value)

Create an instance of JAXBElement<[ResourceStatusArray](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[ResourceStatusArray](#)>

---

createResourceStatusItem

public javax.xml.bind.JAXBElement<[ResourceStatus](#)> createResourceStatusItem([ResourceStatus](#) value)

Create an instance of JAXBElement<[ResourceStatus](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[ResourceStatus](#)>

---

createTCPConnectionRelatedServerArray

public javax.xml.bind.JAXBElement<[TCPConnectionRelatedServerArray](#)> createTCPConnectionRelatedServerArray([TCPConnectionRelatedServerArray](#) value)

Create an instance of JAXBElement<[TCPConnectionRelatedServerArray](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[TCPConnectionRelatedServerArray](#)>

createTCPConnectionRelatedServerItem

public javax.xml.bind.JAXBElement<[TCPConnectionRelatedServer](#)> createTCPConnectionRelatedServerItem([TCPConnectionRelatedServer](#) value)

Create an instance of JAXBElement<[TCPConnectionRelatedServer](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[TCPConnectionRelatedServer](#)>

createAttrDescArray

public javax.xml.bind.JAXBElement<[AttrDescArray](#)> createAttrDescArray([AttrDescArray](#) value)

Create an instance of JAXBElement<[AttrDescArray](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[AttrDescArray](#)>

createAttrDescItem

public javax.xml.bind.JAXBElement<[AttrDesc](#)> createAttrDescItem([AttrDesc](#) value)

Create an instance of JAXBElement<[AttrDesc](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[AttrDesc](#)>

createDNSServerPerformanceStatsArray

public javax.xml.bind.JAXBElement<[DNSServerPerformanceStatsArray](#)> createDNSServerPerformanceStatsArray([DNSServerPerformanceStatsArray](#) value)

Create an instance of JAXBElement<[DNSServerPerformanceStatsArray](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[DNSServerPerformanceStatsArray](#)>

createDNSServerPerformanceStatsItem

public javax.xml.bind.JAXBElement<[DNSServerPerformanceStats](#)> createDNSServerPerformanceStatsItem([DNSServerPerformanceStats](#) value)

Create an instance of JAXBElement<[DNSServerPerformanceStats](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[DNSServerPerformanceStats](#)>

---

createDHCPRenewalDataArray

public javax.xml.bind.JAXBElement<[DHCPRenewalDataArray](#)> createDHCPRenewalDataArray([DHCPRenewalDataArray](#) value)

Create an instance of JAXBElement<[DHCPRenewalDataArray](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[DHCPRenewalDataArray](#)>

---

createDHCPRenewalDataItem

public javax.xml.bind.JAXBElement<[DHCPRenewalData](#)> createDHCPRenewalDataItem([DHCPRenewalData](#) value)

Create an instance of JAXBElement<[DHCPRenewalData](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[DHCPRenewalData](#)>

---

createOptionDefinitionSetArray

public javax.xml.bind.JAXBElement<[OptionDefinitionSetArray](#)> createOptionDefinitionSetArray([OptionDefinitionSetArray](#) value)

Create an instance of JAXBElement<[OptionDefinitionSetArray](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[OptionDefinitionSetArray](#)>

---

createOptionDefinitionSetItem

public javax.xml.bind.JAXBElement<[OptionDefinitionSet](#)> createOptionDefinitionSetItem([OptionDefinitionSet](#) value)

Create an instance of JAXBElement<[OptionDefinitionSet](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[OptionDefinitionSet](#)>

---

createCCMRRArray

public javax.xml.bind.JAXBElement<[CCMRRArray](#)> createCCMRRArray([CCMRRArray](#) value)

Create an instance of JAXBElement<[CCMRRArray](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[CCMRRArray](#)>

---

createCCMRRItem

public javax.xml.bind.JAXBElement<[CCMRR](#)> createCCMRRItem([CCMRR](#) value)

Create an instance of JAXBElement<[CCMRR](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[CCMRR](#)>

---

createUpdatePolicyArray

public javax.xml.bind.JAXBElement<[UpdatePolicyArray](#)> createUpdatePolicyArray([UpdatePolicyArray](#) value)

Create an instance of JAXBElement<[UpdatePolicyArray](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[UpdatePolicyArray](#)>

---

createUpdatePolicyItem

public javax.xml.bind.JAXBElement<[UpdatePolicy](#)> createUpdatePolicyItem([UpdatePolicy](#) value)

Create an instance of JAXBElement<[UpdatePolicy](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[UpdatePolicy](#)>

---

createDNSServerStatsArray

public javax.xml.bind.JAXBElement<[DNSServerStatsArray](#)> createDNSServerStatsArray([DNSServerStatsArray](#) value)

Create an instance of JAXBElement<[DNSServerStatsArray](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[DNSServerStatsArray](#)>

---

createDNSServerStatsItem

public javax.xml.bind.JAXBElement<[DNSServerStats](#)> createDNSServerStatsItem([DNSServerStats](#) value)

Create an instance of JAXBElement<[DNSServerStats](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[DNSServerStats](#)>

createCCMHaDnsPairArray

public javax.xml.bind.JAXBElement<[CCMHaDnsPairArray](#)> createCCMHaDnsPairArray([CCMHaDnsPairArray](#) value)

Create an instance of JAXBElement<[CCMHaDnsPairArray](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[CCMHaDnsPairArray](#)>

createCCMHaDnsPairItem

public javax.xml.bind.JAXBElement<[CCMHaDnsPair](#)> createCCMHaDnsPairItem([CCMHaDnsPair](#) value)

Create an instance of JAXBElement<[CCMHaDnsPair](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[CCMHaDnsPair](#)>

createDNSServerErrorsStatsArray

public javax.xml.bind.JAXBElement<[DNSServerErrorsStatsArray](#)> createDNSServerErrorsStatsArray([DNSServerErrorsStatsArray](#) value)

Create an instance of JAXBElement<[DNSServerErrorsStatsArray](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[DNSServerErrorsStatsArray](#)>

createDNSServerErrorsStatsItem

public javax.xml.bind.JAXBElement<[DNSServerErrorsStats](#)> createDNSServerErrorsStatsItem([DNSServerErrorsStats](#) value)

Create an instance of JAXBElement<[DNSServerErrorsStats](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[DNSServerErrorsStats](#)>

createDHCP6StatsArray

public javax.xml.bind.JAXBElement<[DHCP6StatsArray](#)> createDHCP6StatsArray([DHCP6StatsArray](#) value)

Create an instance of JAXBElement<[DHCP6StatsArray](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[DHCP6StatsArray](#)>

createDHCP6StatsItem

public javax.xml.bind.JAXBElement<[DHCP6Stats](#)> createDHCP6StatsItem([DHCP6Stats](#) value)

Create an instance of JAXBElement<[DHCP6Stats](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[DHCP6Stats](#)>

---

createRangeArray

public javax.xml.bind.JAXBElement<[RangeArray](#)> createRangeArray([RangeArray](#) value)

Create an instance of JAXBElement<[RangeArray](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[RangeArray](#)>

---

createRangeItem

public javax.xml.bind.JAXBElement<[Range](#)> createRangeItem([Range](#) value)

Create an instance of JAXBElement<[Range](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[Range](#)>

---

createCurrentUtilizationArray

public javax.xml.bind.JAXBElement<[CurrentUtilizationArray](#)> createCurrentUtilizationArray([CurrentUtilizationArray](#) value)

Create an instance of JAXBElement<[CurrentUtilizationArray](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[CurrentUtilizationArray](#)>

---

createCurrentUtilizationItem

public javax.xml.bind.JAXBElement<[CurrentUtilization](#)> createCurrentUtilizationItem([CurrentUtilization](#) value)

Create an instance of JAXBElement<[CurrentUtilization](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[CurrentUtilization](#)>

---

createCdnsRedirectArray

public javax.xml.bind.JAXBElement<[CdnsRedirectArray](#)> createCdnsRedirectArray([CdnsRedirectArray](#) value)

Create an instance of JAXBElement<[CdnsRedirectArray](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[CdnsRedirectArray](#)>

---

createCdnsRedirectItem

public javax.xml.bind.JAXBElement<[CdnsRedirect](#)> createCdnsRedirectItem([CdnsRedirect](#) value)

Create an instance of JAXBElement<[CdnsRedirect](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[CdnsRedirect](#)>

---

createDHCPFailoverStatsArray

public javax.xml.bind.JAXBElement<[DHCPFailoverStatsArray](#)> createDHCPFailoverStatsArray([DHCPFailoverStatsArray](#) value)

Create an instance of JAXBElement<[DHCPFailoverStatsArray](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[DHCPFailoverStatsArray](#)>

---

createDHCPFailoverStatsItem

public javax.xml.bind.JAXBElement<[DHCPFailoverStats](#)> createDHCPFailoverStatsItem([DHCPFailoverStats](#) value)

Create an instance of JAXBElement<[DHCPFailoverStats](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[DHCPFailoverStats](#)>

---

createDnsEnumEntryArray

public javax.xml.bind.JAXBElement<[DnsEnumEntryArray](#)> createDnsEnumEntryArray([DnsEnumEntryArray](#) value)

Create an instance of JAXBElement<[DnsEnumEntryArray](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[DnsEnumEntryArray](#)>

---

createDnsEnumEntryItem

public javax.xml.bind.JAXBElement<[DnsEnumEntry](#)> createDnsEnumEntryItem([DnsEnumEntry](#) value)

Create an instance of JAXBElement<[DnsEnumEntry](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[DnsEnumEntry](#)>

---

createDHCPMaintenanceWindowArray

public javax.xml.bind.JAXBElement<[DHCPMaintenanceWindowArray](#)> createDHCPMaintenanceWindowArray([DHCPMaintenanceWindowArray](#) value)

Create an instance of JAXBElement<[DHCPMaintenanceWindowArray](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[DHCPMaintenanceWindowArray](#)>

---

createDHCPMaintenanceWindowItem

public javax.xml.bind.JAXBElement<[DHCPMaintenanceWindow](#)> createDHCPMaintenanceWindowItem([DHCPMaintenanceWindow](#) value)

Create an instance of JAXBElement<[DHCPMaintenanceWindow](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[DHCPMaintenanceWindow](#)>

---

createCCMZDSecondaryArray

public javax.xml.bind.JAXBElement<[CCMZDSecondaryArray](#)> createCCMZDSecondaryArray([CCMZDSecondaryArray](#) value)

Create an instance of JAXBElement<[CCMZDSecondaryArray](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[CCMZDSecondaryArray](#)>

---

createCCMZDSecondaryItem

public javax.xml.bind.JAXBElement<[CCMZDSecondary](#)> createCCMZDSecondaryItem([CCMZDSecondary](#) value)

Create an instance of JAXBElement<[CCMZDSecondary](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[CCMZDSecondary](#)>

---

createOptionArray

public javax.xml.bind.JAXBElement<[OptionArray](#)> createOptionArray([OptionArray](#) value)

Create an instance of JAXBElement<[OptionArray](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[OptionArray](#)>

createOptionItem

public javax.xml.bind.JAXBElement<Option> createOptionItem(Option value)

Create an instance of JAXBElement<Option>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<Option>

---

createCdnsDomainRateLimitArray

public javax.xml.bind.JAXBElement<CdnsDomainRateLimitArray> createCdnsDomainRateLimitArray(CdnsDomainRateLimitArray value)

Create an instance of JAXBElement<CdnsDomainRateLimitArray>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<CdnsDomainRateLimitArray>

---

createCdnsDomainRateLimitItem

public javax.xml.bind.JAXBElement<CdnsDomainRateLimit> createCdnsDomainRateLimitItem(CdnsDomainRateLimit value)

Create an instance of JAXBElement<CdnsDomainRateLimit>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<CdnsDomainRateLimit>

---

createLinkArray

public javax.xml.bind.JAXBElement<LinkArray> createLinkArray(LinkArray value)

Create an instance of JAXBElement<LinkArray>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<LinkArray>

---

createLinkItem

public javax.xml.bind.JAXBElement<Link> createLinkItem(Link value)

Create an instance of JAXBElement<Link>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<Link>

---

createKeyArray

public javax.xml.bind.JAXBElement<[KeyArray](#)> createKeyArray([KeyArray](#) value)

Create an instance of JAXBElement<[KeyArray](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[KeyArray](#)>

---

createKeyItem

public javax.xml.bind.JAXBElement<[Key](#)> createKeyItem([Key](#) value)

Create an instance of JAXBElement<[Key](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[Key](#)>

---

createCertificateArray

public javax.xml.bind.JAXBElement<[CertificateArray](#)> createCertificateArray([CertificateArray](#) value)

Create an instance of JAXBElement<[CertificateArray](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[CertificateArray](#)>

---

createCertificateItem

public javax.xml.bind.JAXBElement<[Certificate](#)> createCertificateItem([Certificate](#) value)

Create an instance of JAXBElement<[Certificate](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[Certificate](#)>

---

createCCMHostArray

public javax.xml.bind.JAXBElement<[CCMHostArray](#)> createCCMHostArray([CCMHostArray](#) value)

Create an instance of JAXBElement<[CCMHostArray](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[CCMHostArray](#)>

---

createCCMHostItem

public javax.xml.bind.JAXBElement<[CCMHost](#)> createCCMHostItem([CCMHost](#) value)

Create an instance of JAXBElement<[CCMHost](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[CCMHost](#)>

---

createCCMClusterArray

public javax.xml.bind.JAXBElement<[CCMClusterArray](#)> createCCMClusterArray([CCMClusterArray](#) value)

Create an instance of JAXBElement<[CCMClusterArray](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[CCMClusterArray](#)>

---

createCCMClusterItem

public javax.xml.bind.JAXBElement<[CCMCluster](#)> createCCMClusterItem([CCMCluster](#) value)

Create an instance of JAXBElement<[CCMCluster](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[CCMCluster](#)>

---

createDNSServerHaStatsArray

public javax.xml.bind.JAXBElement<[DNSServerHaStatsArray](#)> createDNSServerHaStatsArray([DNSServerHaStatsArray](#) value)

Create an instance of JAXBElement<[DNSServerHaStatsArray](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[DNSServerHaStatsArray](#)>

---

createDNSServerHaStatsItem

public javax.xml.bind.JAXBElement<[DNSServerHaStats](#)> createDNSServerHaStatsItem([DNSServerHaStats](#) value)

Create an instance of JAXBElement<[DNSServerHaStats](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[DNSServerHaStats](#)>

---

createCCMZoneArray

public javax.xml.bind.JAXBElement<[CCMZoneArray](#)> createCCMZoneArray([CCMZoneArray](#) value)

Create an instance of JAXBElement<[CCMZoneArray](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[CCMZoneArray](#)>

---

createCCMZoneItem

public javax.xml.bind.JAXBElement<[CCMZone](#)> createCCMZoneItem([CCMZone](#) value)

Create an instance of JAXBElement<[CCMZone](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[CCMZone](#)>

---

createDNSServerIPv6StatsArray

public javax.xml.bind.JAXBElement<[DNSServerIPv6StatsArray](#)> createDNSServerIPv6StatsArray([DNSServerIPv6StatsArray](#) value)

Create an instance of JAXBElement<[DNSServerIPv6StatsArray](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[DNSServerIPv6StatsArray](#)>

---

createDNSServerIPv6StatsItem

public javax.xml.bind.JAXBElement<[DNSServerIPv6Stats](#)> createDNSServerIPv6StatsItem([DNSServerIPv6Stats](#) value)

Create an instance of JAXBElement<[DNSServerIPv6Stats](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[DNSServerIPv6Stats](#)>

---

createDnsForwarderArray

public javax.xml.bind.JAXBElement<[DnsForwarderArray](#)> createDnsForwarderArray([DnsForwarderArray](#) value)

Create an instance of JAXBElement<[DnsForwarderArray](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[DnsForwarderArray](#)>

---

createDnsForwarderItem

public javax.xml.bind.JAXBElement<[DnsForwarder](#)> createDnsForwarderItem([DnsForwarder](#) value)

Create an instance of JAXBElement<[DnsForwarder](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[DnsForwarder](#)>

---

createDNSCachingServerStatsArray

public javax.xml.bind.JAXBElement<[DNSCachingServerStatsArray](#)> createDNSCachingServerStatsArray([DNSCachingServerStatsArray](#) value)

Create an instance of JAXBElement<[DNSCachingServerStatsArray](#)>

Parameters:
value - Java instance representing xml element's value.

Returns:
the new instance of JAXBElement<[DNSCachingServerStatsArray](#)>

---

createDNSCachingServerStatsItem

public javax.xml.bind.JAXBElement<[DNSCachingServerStats](#)> createDNSCachingServerStatsItem([DNSCachingServerStats](#) value)

Create an instance of JAXBElement<[DNSCachingServerStats](#)>

Parameters:
value - Java instance representing xml element's value.

Returns:
the new instance of JAXBElement<[DNSCachingServerStats](#)>

---

createPrefixArray

public javax.xml.bind.JAXBElement<[PrefixArray](#)> createPrefixArray([PrefixArray](#) value)

Create an instance of JAXBElement<[PrefixArray](#)>

Parameters:
value - Java instance representing xml element's value.

Returns:
the new instance of JAXBElement<[PrefixArray](#)>

---

createPrefixItem

public javax.xml.bind.JAXBElement<[Prefix](#)> createPrefixItem([Prefix](#) value)

Create an instance of JAXBElement<[Prefix](#)>

Parameters:
value - Java instance representing xml element's value.

Returns:
the new instance of JAXBElement<[Prefix](#)>

---

createDNSRelatedServerArray

public javax.xml.bind.JAXBElement<[DNSRelatedServerArray](#)> createDNSRelatedServerArray([DNSRelatedServerArray](#) value)

Create an instance of JAXBElement<[DNSRelatedServerArray](#)>

Parameters:
value - Java instance representing xml element's value.

Returns:
the new instance of JAXBElement<[DNSRelatedServerArray](#)>

createDNSRelatedServerItem

public javax.xml.bind.JAXBElement<DNSRelatedServer> createDNSRelatedServerItem(DNSRelatedServer value)

Create an instance of JAXBElement<DNSRelatedServer>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<DNSRelatedServer>

createClientClassArray

public javax.xml.bind.JAXBElement<ClientClassArray> createClientClassArray(ClientClassArray value)

Create an instance of JAXBElement<ClientClassArray>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<ClientClassArray>

createClientClassItem

public javax.xml.bind.JAXBElement<ClientClass> createClientClassItem(ClientClass value)

Create an instance of JAXBElement<ClientClass>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<ClientClass>

createCCMSecondaryZoneArray

public javax.xml.bind.JAXBElement<CCMSecondaryZoneArray> createCCMSecondaryZoneArray(CCMSecondaryZoneArray value)

Create an instance of JAXBElement<CCMSecondaryZoneArray>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<CCMSecondaryZoneArray>

createCCMSecondaryZoneItem

public javax.xml.bind.JAXBElement<CCMSecondaryZone> createCCMSecondaryZoneItem(CCMSecondaryZone value)

Create an instance of JAXBElement<CCMSecondaryZone>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<CCMSecondaryZone>

createDnsTrustAnchorArray

public javax.xml.bind.JAXBElement<DnsTrustAnchorArray> createDnsTrustAnchorArray(DnsTrustAnchorArray value)

Create an instance of JAXBElement<DnsTrustAnchorArray>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<DnsTrustAnchorArray>

---

createDnsTrustAnchorItem

public javax.xml.bind.JAXBElement<DnsTrustAnchor> createDnsTrustAnchorItem(DnsTrustAnchor value)

Create an instance of JAXBElement<DnsTrustAnchor>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<DnsTrustAnchor>

---

createSystemStatsArray

public javax.xml.bind.JAXBElement<SystemStatsArray> createSystemStatsArray(SystemStatsArray value)

Create an instance of JAXBElement<SystemStatsArray>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<SystemStatsArray>

---

createSystemStatsItem

public javax.xml.bind.JAXBElement<SystemStats> createSystemStatsItem(SystemStats value)

Create an instance of JAXBElement<SystemStats>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<SystemStats>

---

createServerSystemStatsArray

public javax.xml.bind.JAXBElement<ServerSystemStatsArray> createServerSystemStatsArray(ServerSystemStatsArray value)

Create an instance of JAXBElement<ServerSystemStatsArray>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<ServerSystemStatsArray>

---

createServerSystemStatsItem

public javax.xml.bind.JAXBElement<ServerSystemStats> createServerSystemStatsItem(ServerSystemStats value)

Create an instance of JAXBElement<ServerSystemStats>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[ServerSystemStats](#)>

---

createLease6Array

public javax.xml.bind.JAXBElement<[Lease6Array](#)> createLease6Array([Lease6Array](#) value)

Create an instance of JAXBElement<[Lease6Array](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[Lease6Array](#)>

---

createLease6Item

public javax.xml.bind.JAXBElement<[Lease6](#)> createLease6Item([Lease6](#) value)

Create an instance of JAXBElement<[Lease6](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[Lease6](#)>

---

createCCMZDCachingArray

public javax.xml.bind.JAXBElement<[CCMZDCachingArray](#)> createCCMZDCachingArray([CCMZDCachingArray](#) value)

Create an instance of JAXBElement<[CCMZDCachingArray](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[CCMZDCachingArray](#)>

---

createCCMZDCachingItem

public javax.xml.bind.JAXBElement<[CCMZDCaching](#)> createCCMZDCachingItem([CCMZDCaching](#) value)

Create an instance of JAXBElement<[CCMZDCaching](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[CCMZDCaching](#)>

---

createCCMServerInfoArray

public javax.xml.bind.JAXBElement<[CCMServerInfoArray](#)> createCCMServerInfoArray([CCMServerInfoArray](#) value)

Create an instance of JAXBElement<[CCMServerInfoArray](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[CCMServerInfoArray](#)>

createCCMServerInfoItem

public javax.xml.bind.JAXBElement<[CCMServerInfo](#)> createCCMServerInfoItem([CCMServerInfo](#) value)

Create an instance of JAXBElement<[CCMServerInfo](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[CCMServerInfo](#)>

createDnsEnumDomainArray

public javax.xml.bind.JAXBElement<[DnsEnumDomainArray](#)> createDnsEnumDomainArray([DnsEnumDomainArray](#) value)

Create an instance of JAXBElement<[DnsEnumDomainArray](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[DnsEnumDomainArray](#)>

createDnsEnumDomainItem

public javax.xml.bind.JAXBElement<[DnsEnumDomain](#)> createDnsEnumDomainItem([DnsEnumDomain](#) value)

Create an instance of JAXBElement<[DnsEnumDomain](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[DnsEnumDomain](#)>

createVPNArray

public javax.xml.bind.JAXBElement<[VPNArray](#)> createVPNArray([VPNArray](#) value)

Create an instance of JAXBElement<[VPNArray](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[VPNArray](#)>

createVPNItem

public javax.xml.bind.JAXBElement<[VPN](#)> createVPNItem([VPN](#) value)

Create an instance of JAXBElement<[VPN](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[VPN](#)>

createClientEntryArray

public javax.xml.bind.JAXBElement<[ClientEntryArray](#)> createClientEntryArray([ClientEntryArray](#) value)

Create an instance of JAXBElement<[ClientEntryArray](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[ClientEntryArray](#)>

createClientEntryItem

public javax.xml.bind.JAXBElement<[ClientEntry](#)> createClientEntryItem([ClientEntry](#) value)

Create an instance of JAXBElement<[ClientEntry](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[ClientEntry](#)>

createLDAPRelatedServerArray

public javax.xml.bind.JAXBElement<[LDAPRelatedServerArray](#)> createLDAPRelatedServerArray([LDAPRelatedServerArray](#) value)

Create an instance of JAXBElement<[LDAPRelatedServerArray](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[LDAPRelatedServerArray](#)>

createLDAPRelatedServerItem

public javax.xml.bind.JAXBElement<[LDAPRelatedServer](#)> createLDAPRelatedServerItem([LDAPRelatedServer](#) value)

Create an instance of JAXBElement<[LDAPRelatedServer](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[LDAPRelatedServer](#)>

createCCMFailoverPairArray

public javax.xml.bind.JAXBElement<[CCMFailoverPairArray](#)> createCCMFailoverPairArray([CCMFailoverPairArray](#) value)

Create an instance of JAXBElement<[CCMFailoverPairArray](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[CCMFailoverPairArray](#)>

createCCMFailoverPairItem

public javax.xml.bind.JAXBElement<CCMFailoverPair> createCCMFailoverPairItem(CCMFailoverPair value)

Create an instance of JAXBElement<CCMFailoverPair>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<CCMFailoverPair>

---

createCCMScopeTemplateArray

public javax.xml.bind.JAXBElement<CCMScopeTemplateArray> createCCMScopeTemplateArray(CCMScopeTemplateArray value)

Create an instance of JAXBElement<CCMScopeTemplateArray>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<CCMScopeTemplateArray>

---

createCCMScopeTemplateItem

public javax.xml.bind.JAXBElement<CCMScopeTemplate> createCCMScopeTemplateItem(CCMScopeTemplate value)

Create an instance of JAXBElement<CCMScopeTemplate>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<CCMScopeTemplate>

---

createDnsHAStatusArray

public javax.xml.bind.JAXBElement<DnsHAStatusArray> createDnsHAStatusArray(DnsHAStatusArray value)

Create an instance of JAXBElement<DnsHAStatusArray>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<DnsHAStatusArray>

---

createDnsHAStatusItem

public javax.xml.bind.JAXBElement<DnsHAStatus> createDnsHAStatusItem(DnsHAStatus value)

Create an instance of JAXBElement<DnsHAStatus>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<DnsHAStatus>

---

createCCMReverseZoneArray

public javax.xml.bind.JAXBElement<CCMReverseZoneArray> createCCMReverseZoneArray(CCMReverseZoneArray value)

Create an instance of JAXBElement<CCMReverseZoneArray>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<CCMReverseZoneArray>

---

createCCMReverseZoneItem

public javax.xml.bind.JAXBElement<CCMReverseZone> createCCMReverseZoneItem(CCMReverseZone value)

Create an instance of JAXBElement<CCMReverseZone>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<CCMReverseZone>

---

createDNSServerQueryStatsArray

public javax.xml.bind.JAXBElement<DNSServerQueryStatsArray> createDNSServerQueryStatsArray(DNSServerQueryStatsArray value)

Create an instance of JAXBElement<DNSServerQueryStatsArray>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<DNSServerQueryStatsArray>

---

createDNSServerQueryStatsItem

public javax.xml.bind.JAXBElement<DNSServerQueryStats> createDNSServerQueryStatsItem(DNSServerQueryStats value)

Create an instance of JAXBElement<DNSServerQueryStats>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<DNSServerQueryStats>

---

createAddrSetArray

public javax.xml.bind.JAXBElement<AddrSetArray> createAddrSetArray(AddrSetArray value)

Create an instance of JAXBElement<AddrSetArray>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<AddrSetArray>

---

createAddrSetItem

public javax.xml.bind.JAXBElement<AddrSet> createAddrSetItem(AddrSet value)

Create an instance of JAXBElement<AddrSet>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[AddrSet](#)>

---

createLeaseArray

public javax.xml.bind.JAXBElement<[LeaseArray](#)> createLeaseArray([LeaseArray](#) value)

Create an instance of JAXBElement<[LeaseArray](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[LeaseArray](#)>

---

createLeaseItem

public javax.xml.bind.JAXBElement<[Lease](#)> createLeaseItem([Lease](#) value)

Create an instance of JAXBElement<[Lease](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[Lease](#)>

---

createDNSServerSecurityStatsArray

public javax.xml.bind.JAXBElement<[DNSServerSecurityStatsArray](#)> createDNSServerSecurityStatsArray([DNSServerSecurityStatsArray](#) value)

Create an instance of JAXBElement<[DNSServerSecurityStatsArray](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[DNSServerSecurityStatsArray](#)>

---

createDNSServerSecurityStatsItem

public javax.xml.bind.JAXBElement<[DNSServerSecurityStats](#)> createDNSServerSecurityStatsItem([DNSServerSecurityStats](#) value)

Create an instance of JAXBElement<[DNSServerSecurityStats](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[DNSServerSecurityStats](#)>

---

createDNSCachingServerRateLimitStatsArray

public javax.xml.bind.JAXBElement<[DNSCachingServerRateLimitStatsArray](#)> createDNSCachingServerRateLimitStatsArray([DNSCachingServerRateLimitStatsArray](#) value)

Create an instance of JAXBElement<[DNSCachingServerRateLimitStatsArray](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[DNSCachingServerRateLimitStatsArray](#)>

createDNSCachingServerRateLimitStatsItem

public javax.xml.bind.JAXBElement<[DNSCachingServerRateLimitStats](#)> createDNSCachingServerRateLimitStatsItem([DNSCachingServerRateLimitStats](#) value)

Create an instance of JAXBElement<[DNSCachingServerRateLimitStats](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[DNSCachingServerRateLimitStats](#)>

---

createDNSTopNameStatsArray

public javax.xml.bind.JAXBElement<[DNSTopNameStatsArray](#)> createDNSTopNameStatsArray([DNSTopNameStatsArray](#) value)

Create an instance of JAXBElement<[DNSTopNameStatsArray](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[DNSTopNameStatsArray](#)>

---

createDNSTopNameStatsItem

public javax.xml.bind.JAXBElement<[DNSTopNameStats](#)> createDNSTopNameStatsItem([DNSTopNameStats](#) value)

Create an instance of JAXBElement<[DNSTopNameStats](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[DNSTopNameStats](#)>

---

createPrefixTemplateArray

public javax.xml.bind.JAXBElement<[PrefixTemplateArray](#)> createPrefixTemplateArray([PrefixTemplateArray](#) value)

Create an instance of JAXBElement<[PrefixTemplateArray](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[PrefixTemplateArray](#)>

---

createPrefixTemplateItem

public javax.xml.bind.JAXBElement<[PrefixTemplate](#)> createPrefixTemplateItem([PrefixTemplate](#) value)

Create an instance of JAXBElement<[PrefixTemplate](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[PrefixTemplate](#)>

---

createACLArray

public javax.xml.bind.JAXBElement<ACLArray> createACLArray(ACLArray value)

Create an instance of JAXBElement<ACLArray>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<ACLArray>

---

createACLItem

public javax.xml.bind.JAXBElement<[ACL](ACL)> createACLItem([ACL](ACL) value)

Create an instance of JAXBElement<[ACL](ACL)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[ACL](ACL)>

---

createDHCPServerStatsArray

public javax.xml.bind.JAXBElement<DHCPServerStatsArray> createDHCPServerStatsArray(DHCPServerStatsArray value)

Create an instance of JAXBElement<DHCPServerStatsArray>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<DHCPServerStatsArray>

---

createDHCPServerStatsItem

public javax.xml.bind.JAXBElement<DHCPServerStats> createDHCPServerStatsItem(DHCPServerStats value)

Create an instance of JAXBElement<DHCPServerStats>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<DHCPServerStats>

---

createCCMServerArray

public javax.xml.bind.JAXBElement<CCMServerArray> createCCMServerArray(CCMServerArray value)

Create an instance of JAXBElement<CCMServerArray>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<CCMServerArray>

---

createCCMServerItem

public javax.xml.bind.JAXBElement<CCMServer> createCCMServerItem(CCMServer value)

Create an instance of JAXBElement<CCMServer>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<CCMServer>

---

createTCPListenerRelatedServerArray

public javax.xml.bind.JAXBElement<TCPListenerRelatedServerArray> createTCPListenerRelatedServerArray(TCPListenerRelatedServerArray value)

Create an instance of JAXBElement<TCPListenerRelatedServerArray>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<TCPListenerRelatedServerArray>

---

createTCPListenerRelatedServerItem

public javax.xml.bind.JAXBElement<TCPListenerRelatedServer> createTCPListenerRelatedServerItem(TCPListenerRelatedServer value)

Create an instance of JAXBElement<TCPListenerRelatedServer>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<TCPListenerRelatedServer>

---

createDnsIPnPortArray

public javax.xml.bind.JAXBElement<DnsIPnPortArray> createDnsIPnPortArray(DnsIPnPortArray value)

Create an instance of JAXBElement<DnsIPnPortArray>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<DnsIPnPortArray>

---

createDnsIPnPortItem

public javax.xml.bind.JAXBElement<DnsIPnPort> createDnsIPnPortItem(DnsIPnPort value)

Create an instance of JAXBElement<DnsIPnPort>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<DnsIPnPort>

---

createCCMZoneTemplateArray

public javax.xml.bind.JAXBElement<CCMZoneTemplateArray> createCCMZoneTemplateArray(CCMZoneTemplateArray value)

Create an instance of JAXBElement<CCMZoneTemplateArray>

Parameters:

value - Java instance representing xml element's value.

Returns:
the new instance of JAXBElement<[CCMZoneTemplateArray](#)>

---

createCCMZoneTemplateItem

public javax.xml.bind.JAXBElement<[CCMZoneTemplate](#)> createCCMZoneTemplateItem([CCMZoneTemplate](#) value)

Create an instance of JAXBElement<[CCMZoneTemplate](#)>

Parameters:
value - Java instance representing xml element's value.

Returns:
the new instance of JAXBElement<[CCMZoneTemplate](#)>

---

createCCMSubnetArray

public javax.xml.bind.JAXBElement<[CCMSubnetArray](#)> createCCMSubnetArray([CCMSubnetArray](#) value)

Create an instance of JAXBElement<[CCMSubnetArray](#)>

Parameters:
value - Java instance representing xml element's value.

Returns:
the new instance of JAXBElement<[CCMSubnetArray](#)>

---

createCCMSubnetItem

public javax.xml.bind.JAXBElement<[CCMSubnet](#)> createCCMSubnetItem([CCMSubnet](#) value)

Create an instance of JAXBElement<[CCMSubnet](#)>

Parameters:
value - Java instance representing xml element's value.

Returns:
the new instance of JAXBElement<[CCMSubnet](#)>

---

createDnsExceptionArray

public javax.xml.bind.JAXBElement<[DnsExceptionArray](#)> createDnsExceptionArray([DnsExceptionArray](#) value)

Create an instance of JAXBElement<[DnsExceptionArray](#)>

Parameters:
value - Java instance representing xml element's value.

Returns:
the new instance of JAXBElement<[DnsExceptionArray](#)>

---

createDnsExceptionItem

public javax.xml.bind.JAXBElement<[DnsException](#)> createDnsExceptionItem([DnsException](#) value)

Create an instance of JAXBElement<[DnsException](#)>

Parameters:
value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[DnsException](#)>

createScopeArray

public javax.xml.bind.JAXBElement<[ScopeArray](#)> createScopeArray([ScopeArray](#) value)

Create an instance of JAXBElement<[ScopeArray](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[ScopeArray](#)>

createScopeItem

public javax.xml.bind.JAXBElement<[Scope](#)> createScopeItem([Scope](#) value)

Create an instance of JAXBElement<[Scope](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[Scope](#)>

createFilterArray

public javax.xml.bind.JAXBElement<[FilterArray](#)> createFilterArray([FilterArray](#) value)

Create an instance of JAXBElement<[FilterArray](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[FilterArray](#)>

createFilterItem

public javax.xml.bind.JAXBElement<[Filter](#)> createFilterItem([Filter](#) value)

Create an instance of JAXBElement<[Filter](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[Filter](#)>

createDns64Array

public javax.xml.bind.JAXBElement<[Dns64Array](#)> createDns64Array([Dns64Array](#) value)

Create an instance of JAXBElement<[Dns64Array](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[Dns64Array](#)>

createDns64Item

public javax.xml.bind.JAXBElement<[Dns64](#)> createDns64Item([Dns64](#) value)

Create an instance of JAXBElement<[Dns64](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[Dns64](#)>

createDHCPTopUtilizedStatsArray

public javax.xml.bind.JAXBElement<[DHCPTopUtilizedStatsArray](#)> createDHCPTopUtilizedStatsArray([DHCPTopUtilizedStatsArray](#) value)

Create an instance of JAXBElement<[DHCPTopUtilizedStatsArray](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[DHCPTopUtilizedStatsArray](#)>

createDHCPTopUtilizedStatsItem

public javax.xml.bind.JAXBElement<[DHCPTopUtilizedStats](#)> createDHCPTopUtilizedStatsItem([DHCPTopUtilizedStats](#) value)

Create an instance of JAXBElement<[DHCPTopUtilizedStats](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[DHCPTopUtilizedStats](#)>

createRelayAgentStateArray

public javax.xml.bind.JAXBElement<[RelayAgentStateArray](#)> createRelayAgentStateArray([RelayAgentStateArray](#) value)

Create an instance of JAXBElement<[RelayAgentStateArray](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[RelayAgentStateArray](#)>

createRelayAgentStateItem

public javax.xml.bind.JAXBElement<[RelayAgentState](#)> createRelayAgentStateItem([RelayAgentState](#) value)

Create an instance of JAXBElement<[RelayAgentState](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[RelayAgentState](#)>

createDNSServerPushNotificationStatsArray

public javax.xml.bind.JAXBElement<DNSServerPushNotificationStatsArray> createDNSServerPushNotificationStatsArray(DNSServerPushNotificationStatsArray value)

Create an instance of JAXBElement<DNSServerPushNotificationStatsArray>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<DNSServerPushNotificationStatsArray>

---

createDNSServerPushNotificationStatsItem

public javax.xml.bind.JAXBElement<DNSServerPushNotificationStats> createDNSServerPushNotificationStatsItem(DNSServerPushNotificationStats value)

Create an instance of JAXBElement<DNSServerPushNotificationStats>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<DNSServerPushNotificationStats>

---

createLinkTemplateArray

public javax.xml.bind.JAXBElement<LinkTemplateArray> createLinkTemplateArray(LinkTemplateArray value)

Create an instance of JAXBElement<LinkTemplateArray>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<LinkTemplateArray>

---

createLinkTemplateItem

public javax.xml.bind.JAXBElement<LinkTemplate> createLinkTemplateItem(LinkTemplate value)

Create an instance of JAXBElement<LinkTemplate>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<LinkTemplate>

---

createStringArray

public javax.xml.bind.JAXBElement<StringArray> createStringArray(StringArray value)

Create an instance of JAXBElement<StringArray>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<StringArray>

---

createStringItem

public javax.xml.bind.JAXBElement<java.lang.String> createStringItem(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createClassBaseObjectOid

public javax.xml.bind.JAXBElement<java.lang.String> createClassBaseObjectOid(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createAddrSetIpaddrs

public javax.xml.bind.JAXBElement<StringArray> createAddrSetIpaddrs(StringArray value)

Create an instance of JAXBElement<StringArray>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<StringArray>

createAddrSetName

public javax.xml.bind.JAXBElement<java.lang.String> createAddrSetName(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createOptionExpression

public javax.xml.bind.JAXBElement<java.lang.String> createOptionExpression(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createOptionNumber

public javax.xml.bind.JAXBElement<java.lang.String> createOptionNumber(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createOptionOptionDefinitionSetName

public javax.xml.bind.JAXBElement<java.lang.String> createOptionOptionDefinitionSetName(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createOptionOptionDesc

public javax.xml.bind.JAXBElement<java.lang.String> createOptionOptionDesc(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createOptionRoundRobin

public javax.xml.bind.JAXBElement<java.lang.String> createOptionRoundRobin(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createOptionSubOptions

public javax.xml.bind.JAXBElement<OptionArray> createOptionSubOptions(OptionArray value)

Create an instance of JAXBElement<OptionArray>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<OptionArray>

---

createOptionValue

public javax.xml.bind.JAXBElement<java.lang.String> createOptionValue(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createCCMZDSecondaryNotify

public javax.xml.bind.JAXBElement<java.lang.String> createCCMZDSecondaryNotify(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createCCMZDSecondaryNotifyList

public javax.xml.bind.JAXBElement<StringArray> createCCMZDSecondaryNotifyList(StringArray value)

Create an instance of JAXBElement<StringArray>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<StringArray>

createCCMZDSecondaryPrimaryServers

public javax.xml.bind.JAXBElement<StringArray> createCCMZDSecondaryPrimaryServers(StringArray value)

Create an instance of JAXBElement<StringArray>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<StringArray>

createCCMZDSecondaryMasterServers

public javax.xml.bind.JAXBElement<StringArray> createCCMZDSecondaryMasterServers(StringArray value)

Create an instance of JAXBElement<StringArray>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<StringArray>

createCCMZDSecondaryRestrictQuery

public javax.xml.bind.JAXBElement<java.lang.String> createCCMZDSecondaryRestrictQuery(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createCCMZDSecondaryRestrictQueryAcl

public javax.xml.bind.JAXBElement<java.lang.String> createCCMZDSecondaryRestrictQueryAcl(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMZDSecondaryRestrictXfer

public javax.xml.bind.JAXBElement<java.lang.String> createCCMZDSecondaryRestrictXfer(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMZDSecondaryRestrictXferAcl

public javax.xml.bind.JAXBElement<java.lang.String> createCCMZDSecondaryRestrictXferAcl(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMZDSecondaryRoundRobin

public javax.xml.bind.JAXBElement<java.lang.String> createCCMZDSecondaryRoundRobin(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMZDSecondaryUseGssTsig

public javax.xml.bind.JAXBElement<java.lang.String> createCCMZDSecondaryUseGssTsig(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMZDCachingPrimaryServers

public javax.xml.bind.JAXBElement<DnsIPnPortArray> createCCMZDCachingPrimaryServers(DnsIPnPortArray value)

Create an instance of JAXBElement<DnsIPnPortArray>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[DnsIPnPortArray](#)>

---

createCCMZDCachingMasterServers

public javax.xml.bind.JAXBElement<[DnsIPnPortArray](#)> createCCMZDCachingMasterServers([DnsIPnPortArray](#) value)

Create an instance of JAXBElement<[DnsIPnPortArray](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[DnsIPnPortArray](#)>

---

createFilterElementAnyMatchSublist

public javax.xml.bind.JAXBElement<[FilterElementArray](#)> createFilterElementAnyMatchSublist([FilterElementArray](#) value)

Create an instance of JAXBElement<[FilterElementArray](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[FilterElementArray](#)>

---

createFilterElementBlobVal

public javax.xml.bind.JAXBElement<java.lang.String> createFilterElementBlobVal(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createFilterElementDateEnd

public javax.xml.bind.JAXBElement<java.lang.String> createFilterElementDateEnd(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createFilterElementDateStart

public javax.xml.bind.JAXBElement<java.lang.String> createFilterElementDateStart(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createFilterElementIntEnd

`public javax.xml.bind.JAXBElement<java.lang.String> createFilterElementIntEnd(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createFilterElementIntStart

`public javax.xml.bind.JAXBElement<java.lang.String> createFilterElementIntStart(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createFilterElementIntVal

`public javax.xml.bind.JAXBElement<java.lang.String> createFilterElementIntVal(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createFilterElementIpAddr

`public javax.xml.bind.JAXBElement<java.lang.String> createFilterElementIpAddr(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createFilterElementIpRange

`public javax.xml.bind.JAXBElement<java.lang.String> createFilterElementIpRange(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createFilterElementIpSubnet

public javax.xml.bind.JAXBElement<java.lang.String> createFilterElementIpSubnet(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createFilterElementIp6Addr

public javax.xml.bind.JAXBElement<java.lang.String> createFilterElementIp6Addr(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createFilterElementIp6Prefix

public javax.xml.bind.JAXBElement<java.lang.String> createFilterElementIp6Prefix(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createFilterElementNegativeTest

public javax.xml.bind.JAXBElement<java.lang.String> createFilterElementNegativeTest(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createFilterElementRegexpStr

public javax.xml.bind.JAXBElement<java.lang.String> createFilterElementRegexpStr(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createFilterElementStringVal

```
public javax.xml.bind.JAXBElement<java.lang.String> createFilterElementStringVal(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDnsIPnPortPort

```
public javax.xml.bind.JAXBElement<java.lang.String> createDnsIPnPortPort(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMServerCCMServerType

```
public javax.xml.bind.JAXBElement<java.lang.String> createCCMServerCCMServerType(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMServerAdmin

```
public javax.xml.bind.JAXBElement<java.lang.String> createCCMServerAdmin(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMServerFqdn

```
public javax.xml.bind.JAXBElement<java.lang.String> createCCMServerFqdn(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMServerIpaddr

```
public javax.xml.bind.JAXBElement<java.lang.String> createCCMServerIpaddr(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMServerLocal

public javax.xml.bind.JAXBElement<java.lang.String> createCCMServerLocal(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMServerPassword

public javax.xml.bind.JAXBElement<java.lang.String> createCCMServerPassword(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMServerPasswordSecret

public javax.xml.bind.JAXBElement<java.lang.String> createCCMServerPasswordSecret(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMServerScpPort

public javax.xml.bind.JAXBElement<java.lang.String> createCCMServerScpPort(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMServerScpReadTimeout

public javax.xml.bind.JAXBElement<java.lang.String> createCCMServerScpReadTimeout(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMServerUseSsl

public javax.xml.bind.JAXBElement<java.lang.String> createCCMServerUseSsl(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createRangeEnd

public javax.xml.bind.JAXBElement<java.lang.String> createRangeEnd(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createRangeStart

public javax.xml.bind.JAXBElement<java.lang.String> createRangeStart(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMRRAxfrVersion

public javax.xml.bind.JAXBElement<java.lang.String> createCCMRRAxfrVersion(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMRROrder

public javax.xml.bind.JAXBElement<java.lang.String> createCCMRROrder(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createCCMRRRdata

`public javax.xml.bind.JAXBElement<java.lang.String> createCCMRRRdata(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createCCMRRRrClass

`public javax.xml.bind.JAXBElement<java.lang.String> createCCMRRRrClass(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createCCMRRRrType

`public javax.xml.bind.JAXBElement<java.lang.String> createCCMRRRrType(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createCCMRRTimestamp

`public javax.xml.bind.JAXBElement<java.lang.String> createCCMRRTimestamp(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createCCMRRTtl

`public javax.xml.bind.JAXBElement<java.lang.String> createCCMRRTtl(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createCCMRRWeight

public javax.xml.bind.JAXBElement<java.lang.String> createCCMRRWeight(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:
value - Java instance representing xml element's value.

Returns:
the new instance of JAXBElement<String>

createLinkTemplateLinkTemplateType

public javax.xml.bind.JAXBElement<java.lang.String> createLinkTemplateLinkTemplateType(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:
value - Java instance representing xml element's value.

Returns:
the new instance of JAXBElement<String>

createLinkTemplateDescription

public javax.xml.bind.JAXBElement<java.lang.String> createLinkTemplateDescription(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:
value - Java instance representing xml element's value.

Returns:
the new instance of JAXBElement<String>

createLinkTemplateEmbeddedPolicy

public javax.xml.bind.JAXBElement<Policy> createLinkTemplateEmbeddedPolicy(Policy value)

Create an instance of JAXBElement<Policy>

Parameters:
value - Java instance representing xml element's value.

Returns:
the new instance of JAXBElement<Policy>

createLinkTemplateFreeAddressConfig

public javax.xml.bind.JAXBElement<java.lang.String> createLinkTemplateFreeAddressConfig(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:
value - Java instance representing xml element's value.

Returns:
the new instance of JAXBElement<String>

createLinkTemplateGroupName

public javax.xml.bind.JAXBElement<java.lang.String> createLinkTemplateGroupName(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createLinkTemplateLinkDescriptionExpr

public javax.xml.bind.JAXBElement<java.lang.String> createLinkTemplateLinkDescriptionExpr(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createLinkTemplateLinkNameExpr

public javax.xml.bind.JAXBElement<java.lang.String> createLinkTemplateLinkNameExpr(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createLinkTemplateOptionsExpr

public javax.xml.bind.JAXBElement<java.lang.String> createLinkTemplateOptionsExpr(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createLinkTemplateOwner

public javax.xml.bind.JAXBElement<java.lang.String> createLinkTemplateOwner(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createLinkTemplatePolicy

public javax.xml.bind.JAXBElement<java.lang.String> createLinkTemplatePolicy(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createLinkTemplatePrefixExpr

public javax.xml.bind.JAXBElement<java.lang.String> createLinkTemplatePrefixExpr(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createLinkTemplateRegion

public javax.xml.bind.JAXBElement<java.lang.String> createLinkTemplateRegion(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createLinkTemplateTenantId

public javax.xml.bind.JAXBElement<java.lang.String> createLinkTemplateTenantId(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSServerPushNotificationStatsPnConn

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerPushNotificationStatsPnConn(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSServerPushNotificationStatsPnConnClosed

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerPushNotificationStatsPnConnClosed(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSServerPushNotificationStatsPnConnCurrent

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerPushNotificationStatsPnConnCurrent(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:
value - Java instance representing xml element's value.

Returns:
the new instance of JAXBElement<String>

createDNSServerPushNotificationStatsPnConnMaxConns

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerPushNotificationStatsPnConnMaxConns(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:
value - Java instance representing xml element's value.

Returns:
the new instance of JAXBElement<String>

createDNSServerPushNotificationStatsPnConnRefused

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerPushNotificationStatsPnConnRefused(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:
value - Java instance representing xml element's value.

Returns:
the new instance of JAXBElement<String>

createDNSServerPushNotificationStatsPnConnTerminated

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerPushNotificationStatsPnConnTerminated(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:
value - Java instance representing xml element's value.

Returns:
the new instance of JAXBElement<String>

createDNSServerPushNotificationStatsPnConnTerminatedConnTtl

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerPushNotificationStatsPnConnTerminatedConnTtl(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:
value - Java instance representing xml element's value.

Returns:
the new instance of JAXBElement<String>

createDNSServerPushNotificationStatsPnConnTerminatedError

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerPushNotificationStatsPnConnTerminatedError(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSServerPushNotificationStatsPnKeepalive

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerPushNotificationStatsPnKeepalive(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSServerPushNotificationStatsPnReconfirm

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerPushNotificationStatsPnReconfirm(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSServerPushNotificationStatsPnReqMalformed

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerPushNotificationStatsPnReqMalformed(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSServerPushNotificationStatsPnSubscribe

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerPushNotificationStatsPnSubscribe(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSServerPushNotificationStatsPnSubscribeFormerr

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerPushNotificationStatsPnSubscribeFormerr(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerPushNotificationStatsPnSubscribeNoerror

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerPushNotificationStatsPnSubscribeNoerror(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerPushNotificationStatsPnSubscribeNotauth

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerPushNotificationStatsPnSubscribeNotauth(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerPushNotificationStatsPnSubscribeRefused

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerPushNotificationStatsPnSubscribeRefused(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerPushNotificationStatsPnSubscribeServfail

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerPushNotificationStatsPnSubscribeServfail(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerPushNotificationStatsPnUnsubscribe

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerPushNotificationStatsPnUnsubscribe(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerPushNotificationStatsPnUpdate

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerPushNotificationStatsPnUpdate(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerConfigAclBlocklist

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerConfigAclBlocklist(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerConfigAclBlacklist

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerConfigAclBlacklist(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerConfigAclDoNotQuery

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerConfigAclDoNotQuery(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerConfigAclQuery

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerConfigAclQuery(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerConfigActivitySummaryInterval

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerConfigActivitySummaryInterval(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerConfigActivitySummarySettings

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerConfigActivitySummarySettings(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerConfigActivitySummaryType

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerConfigActivitySummaryType(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerConfigAllowAnyQueryAcl

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerConfigAllowAnyQueryAcl(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerConfigCacheMaxNegativeTtl

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerConfigCacheMaxNegativeTtl(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSCachingServerConfigCacheMaxTtl

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerConfigCacheMaxTtl(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSCachingServerConfigCacheMinTtl

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerConfigCacheMinTtl(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSCachingServerConfigConntrackUsageWarning

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerConfigConntrackUsageWarning(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSCachingServerConfigEcsAlwaysForward

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerConfigEcsAlwaysForward(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSCachingServerConfigEcsDestination

public javax.xml.bind.JAXBElement<StringArray> createDNSCachingServerConfigEcsDestination(StringArray value)

Create an instance of JAXBElement<StringArray>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<StringArray>

createDNSCachingServerConfigEcsEnable

```
public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerConfigEcsEnable(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerConfigHardenGlue

```
public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerConfigHardenGlue(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerConfigHttps

```
public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerConfigHttps(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerConfigHttpsPort

```
public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerConfigHttpsPort(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerConfigImmediateResponseStats

```
public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerConfigImmediateResponseStats(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerConfigListenIpVersion

```
public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerConfigListenIpVersion(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerConfigListenProtocol

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerConfigListenProtocol(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerConfigLogSettings

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerConfigLogSettings(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerConfigMinimalResponses

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerConfigMinimalResponses(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerConfigMsgCacheSize

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerConfigMsgCacheSize(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerConfigName

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerConfigName(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerConfigPacketLogSettings

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerConfigPacketLogSettings(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerConfigPacketLogging

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerConfigPacketLogging(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerConfigPacketLoggingFile

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerConfigPacketLoggingFile(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerConfigPort

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerConfigPort(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerConfigPrefetch

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerConfigPrefetch(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSCachingServerConfigQueryNameMinimisation

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerConfigQueryNameMinimisation(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSCachingServerConfigRandomizeQueryCase

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerConfigRandomizeQueryCase(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSCachingServerConfigRandomizeQueryCaseExclusion

public javax.xml.bind.JAXBElement<StringArray> createDNSCachingServerConfigRandomizeQueryCaseExclusion(StringArray value)

Create an instance of JAXBElement<StringArray>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<StringArray>

createDNSCachingServerConfigRemoteNsCacheNumhosts

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerConfigRemoteNsCacheNumhosts(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSCachingServerConfigRemoteNsHostTtl

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerConfigRemoteNsHostTtl(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSCachingServerConfigRootHints

public javax.xml.bind.JAXBElement<AddrSetArray> createDNSCachingServerConfigRootHints(AddrSetArray value)

Create an instance of JAXBElement<AddrSetArray>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<AddrSetArray>

createDNSCachingServerConfigRoundRobin

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerConfigRoundRobin(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSCachingServerConfigRrsetCacheSize

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerConfigRrsetCacheSize(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSCachingServerConfigSecurityEventAlarmSettings

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerConfigSecurityEventAlarmSettings(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSCachingServerConfigSecurityEventLogSettings

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerConfigSecurityEventLogSettings(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSCachingServerConfigSecurityEventLogging

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerConfigSecurityEventLogging(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerConfigSecurityEventMaxQnameSize

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerConfigSecurityEventMaxQnameSize(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerConfigSecurityEventMaxQps

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerConfigSecurityEventMaxQps(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerConfigSmartCache

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerConfigSmartCache(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerConfigSmartCacheExpiration

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerConfigSmartCacheExpiration(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerConfigSmartCacheExpirationReset

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerConfigSmartCacheExpirationReset(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerConfigSmartCacheExpiredReplyTtl

`public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerConfigSmartCacheExpiredReplyTtl(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerConfigTls

`public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerConfigTls(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerConfigTlsCertificate

`public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerConfigTlsCertificate(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerConfigTlsPort

`public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerConfigTlsPort(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerConfigTlsSystemCertBundle

`public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerConfigTlsSystemCertBundle(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSCachingServerConfigTlsUpstreamCertBundle

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerConfigTlsUpstreamCertBundle(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSCachingServerConfigTopNames

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerConfigTopNames(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSCachingServerConfigTopNamesMaxAge

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerConfigTopNamesMaxAge(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSCachingServerConfigTopNamesMaxCount

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerConfigTopNamesMaxCount(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSCachingServerConfigTrapsEnabled

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerConfigTrapsEnabled(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createRelayAgentStateCommState

public javax.xml.bind.JAXBElement<java.lang.String> createRelayAgentStateCommState(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createRelayAgentStateCurrentResponsesForPartner

public javax.xml.bind.JAXBElement<java.lang.String> createRelayAgentStateCurrentResponsesForPartner(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createRelayAgentStateCurrentStateDuration

public javax.xml.bind.JAXBElement<java.lang.String> createRelayAgentStateCurrentStateDuration(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createRelayAgentStateGiaddr

public javax.xml.bind.JAXBElement<java.lang.String> createRelayAgentStateGiaddr(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createRelayAgentStateIp6Address

public javax.xml.bind.JAXBElement<java.lang.String> createRelayAgentStateIp6Address(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createRelayAgentStateLastOkTime

```
public javax.xml.bind.JAXBElement<java.lang.String> createRelayAgentStateLastOkTime(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createRelayAgentStateLastRelayIp6Address

```
public javax.xml.bind.JAXBElement<java.lang.String> createRelayAgentStateLastRelayIp6Address(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createRelayAgentStatePartnerLastDiscoverSolicitTime

```
public javax.xml.bind.JAXBElement<java.lang.String> createRelayAgentStatePartnerLastDiscoverSolicitTime(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createRelayAgentStatePartnerRequestCount

```
public javax.xml.bind.JAXBElement<java.lang.String> createRelayAgentStatePartnerRequestCount(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createRelayAgentStatePartnerUnresponsiveDuration

```
public javax.xml.bind.JAXBElement<java.lang.String> createRelayAgentStatePartnerUnresponsiveDuration(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createRelayAgentStateTotalResponsesForPartner

```
public javax.xml.bind.JAXBElement<java.lang.String> createRelayAgentStateTotalResponsesForPartner(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSServerAclBlocklist

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerAclBlocklist(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSServerBlackholeAcl

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerBlackholeAcl(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSServerActivityCounterLogSettings

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerActivityCounterLogSettings(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSServerActivitySummaryInterval

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerActivitySummaryInterval(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSServerActivitySummaryType

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerActivitySummaryType(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerAllowAnyQueryAcl

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerAllowAnyQueryAcl(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerConntrackUsageWarning

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerConntrackUsageWarning(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerDropRecursiveQueries

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerDropRecursiveQueries(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerEdnsMaxPayload

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerEdnsMaxPayload(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerMaxUdpPayloadSize

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerMaxUdpPayloadSize(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSServerGssTsigConfig

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerGssTsigConfig(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerGssTsigProcessing

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerGssTsigProcessing(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerHhcInterval

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerHhcInterval(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerHhcMaxInitTtl

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerHhcMaxInitTtl(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerHhcMaxTtl

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerHhcMaxTtl(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerHostHealthCheck

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerHostHealthCheck(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:
value - Java instance representing xml element's value.

Returns:
the new instance of JAXBElement<String>

---

createDNSServerHybridAdnsAddrs

public javax.xml.bind.JAXBElement<StringArray> createDNSServerHybridAdnsAddrs(StringArray value)

Create an instance of JAXBElement<StringArray>

Parameters:
value - Java instance representing xml element's value.

Returns:
the new instance of JAXBElement<StringArray>

---

createDNSServerHybridMode

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerHybridMode(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:
value - Java instance representing xml element's value.

Returns:
the new instance of JAXBElement<String>

---

createDNSServerHybridOverride

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerHybridOverride(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:
value - Java instance representing xml element's value.

Returns:
the new instance of JAXBElement<String>

---

createDNSServerHybridUseAdnsAddrs

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerHybridUseAdnsAddrs(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:
value - Java instance representing xml element's value.

Returns:
the new instance of JAXBElement<String>

---

createDNSServerHybridLocalhostOnly

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerHybridLocalhostOnly(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerMaxDnsPackets

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerMaxDnsPackets(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerMemCacheSize

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerMemCacheSize(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerMinimalResponses

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerMinimalResponses(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerMinimizeTtls

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerMinimizeTtls(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerName

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerName(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:
the new instance of JAXBElement<String>

---

createDNSServerNotify

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerNotify(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:
value - Java instance representing xml element's value.

Returns:
the new instance of JAXBElement<String>

---

createDNSServerNotifyMinInterval

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerNotifyMinInterval(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:
value - Java instance representing xml element's value.

Returns:
the new instance of JAXBElement<String>

---

createDNSServerNotifyRcvInterval

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerNotifyRcvInterval(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:
value - Java instance representing xml element's value.

Returns:
the new instance of JAXBElement<String>

---

createDNSServerNotifySendStagger

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerNotifySendStagger(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:
value - Java instance representing xml element's value.

Returns:
the new instance of JAXBElement<String>

---

createDNSServerNotifySourceAddress

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerNotifySourceAddress(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:
value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerNotifySourceIp6Address

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerNotifySourceIp6Address(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:
value - Java instance representing xml element's value.

Returns:
the new instance of JAXBElement<String>

---

createDNSServerNotifySourcePort

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerNotifySourcePort(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:
value - Java instance representing xml element's value.

Returns:
the new instance of JAXBElement<String>

---

createDNSServerNotifyWait

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerNotifyWait(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:
value - Java instance representing xml element's value.

Returns:
the new instance of JAXBElement<String>

---

createDNSServerPacketLogSettings

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerPacketLogSettings(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:
value - Java instance representing xml element's value.

Returns:
the new instance of JAXBElement<String>

---

createDNSServerPacketLogging

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerPacketLogging(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:
value - Java instance representing xml element's value.

Returns:
the new instance of JAXBElement<String>

createDNSServerPacketLoggingFile

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerPacketLoggingFile(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSServerPort

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerPort(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSServerLocalPortNum

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerLocalPortNum(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSServerQueryTypesUnwanted

public javax.xml.bind.JAXBElement<StringArray> createDNSServerQueryTypesUnwanted(StringArray value)

Create an instance of JAXBElement<StringArray>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<StringArray>

createDNSServerRelaxDelegationRules

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerRelaxDelegationRules(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSServerRemotePortNum

```
public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerRemotePortNum(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerRestrictQueryAcl

```
public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerRestrictQueryAcl(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerRestrictXfer

```
public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerRestrictXfer(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerRestrictXferAcl

```
public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerRestrictXferAcl(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerRoundRobin

```
public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerRoundRobin(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerSaveNegativeCacheEntries

```
public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerSaveNegativeCacheEntries(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerScvgIgnoreRestartInterval

`public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerScvgIgnoreRestartInterval(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerScvgInterval

`public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerScvgInterval(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerScvgRefreshInterval

`public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerScvgRefreshInterval(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerSecurityEventAlarmSettings

`public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerSecurityEventAlarmSettings(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerSecurityEventLogSettings

`public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerSecurityEventLogSettings(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSServerSecurityEventLogging

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerSecurityEventLogging(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSServerSecurityEventMaxQnameSize

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerSecurityEventMaxQnameSize(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSServerSecurityEventMaxQps

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerSecurityEventMaxQps(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSServerServerLogSettings

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerServerLogSettings(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSServerSimulateZoneTopDynupdate

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerSimulateZoneTopDynupdate(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSServerTls

`public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerTls(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSServerTlsCertificate

`public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerTlsCertificate(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSServerTlsPort

`public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerTlsPort(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSServerTopNames

`public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerTopNames(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSServerTopNamesMaxAge

`public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerTopNamesMaxAge(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSServerTopNamesMaxCount

```
public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerTopNamesMaxCount(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerTransferSourceAddress

```
public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerTransferSourceAddress(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerTransferSourceIp6Address

```
public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerTransferSourceIp6Address(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerTransferSourcePort

```
public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerTransferSourcePort(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerTrapsEnabled

```
public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerTrapsEnabled(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerTsigProcessing

```
public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerTsigProcessing(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerUpdateAcl

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerUpdateAcl(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerUpdateRelaxZoneName

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerUpdateRelaxZoneName(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerXferIgnoreSerialDecrease

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerXferIgnoreSerialDecrease(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerXferRrMetaData

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerXferRrMetaData(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPTopUtilizedStatsList

public javax.xml.bind.JAXBElement<DHCPScopeAggregationStatsArray> createDHCPTopUtilizedStatsList(DHCPScopeAggregationStatsArray value)

Create an instance of JAXBElement<DHCPScopeAggregationStatsArray>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[DHCPScopeAggregationStatsArray](#)>

---

createDns64AclMatchClients

public javax.xml.bind.JAXBElement<java.lang.String> createDns64AclMatchClients(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDns64Description

public javax.xml.bind.JAXBElement<java.lang.String> createDns64Description(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDns64Dns64

public javax.xml.bind.JAXBElement<java.lang.String> createDns64Dns64(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDns64Prefix

public javax.xml.bind.JAXBElement<java.lang.String> createDns64Prefix(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDns64Priority

public javax.xml.bind.JAXBElement<java.lang.String> createDns64Priority(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createFilterDescription

public javax.xml.bind.JAXBElement<java.lang.String> createFilterDescription(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createFilterFilterElementList

public javax.xml.bind.JAXBElement<FilterElementArray> createFilterFilterElementList(FilterElementArray value)

Create an instance of JAXBElement<FilterElementArray>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<FilterElementArray>

---

createFilterNegativeTest

public javax.xml.bind.JAXBElement<java.lang.String> createFilterNegativeTest(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createScopeAllocateFirstAvailable

public javax.xml.bind.JAXBElement<java.lang.String> createScopeAllocateFirstAvailable(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createScopeAllocationPriority

public javax.xml.bind.JAXBElement<java.lang.String> createScopeAllocationPriority(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createScopeBackupPct

```
public javax.xml.bind.JAXBElement<java.lang.String> createScopeBackupPct(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createScopeBootp

```
public javax.xml.bind.JAXBElement<java.lang.String> createScopeBootp(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createScopeDeactivated

```
public javax.xml.bind.JAXBElement<java.lang.String> createScopeDeactivated(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createScopeDescription

```
public javax.xml.bind.JAXBElement<java.lang.String> createScopeDescription(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createScopeDhcp

```
public javax.xml.bind.JAXBElement<java.lang.String> createScopeDhcp(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createScopeDnsHostBytes

```
public javax.xml.bind.JAXBElement<java.lang.String> createScopeDnsHostBytes(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createScopeDynamicBootp

public javax.xml.bind.JAXBElement<java.lang.String> createScopeDynamicBootp(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createScopeEmbeddedPolicy

public javax.xml.bind.JAXBElement<Policy> createScopeEmbeddedPolicy(Policy value)

Create an instance of JAXBElement<Policy>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<Policy>

---

createScopeFailoverBackupAllocationBoundary

public javax.xml.bind.JAXBElement<java.lang.String> createScopeFailoverBackupAllocationBoundary(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createScopeFreeAddressConfig

public javax.xml.bind.JAXBElement<java.lang.String> createScopeFreeAddressConfig(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createScopeIgnoreDeclines

public javax.xml.bind.JAXBElement<java.lang.String> createScopeIgnoreDeclines(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createScopeMaintenance

public javax.xml.bind.JAXBElement<java.lang.String> createScopeMaintenance(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createScopePingClients

public javax.xml.bind.JAXBElement<java.lang.String> createScopePingClients(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createScopePingTimeout

public javax.xml.bind.JAXBElement<java.lang.String> createScopePingTimeout(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createScopePolicy

public javax.xml.bind.JAXBElement<java.lang.String> createScopePolicy(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createScopePrimarySubnet

public javax.xml.bind.JAXBElement<java.lang.String> createScopePrimarySubnet(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createScopeRangeList

public javax.xml.bind.JAXBElement<[RangeArray]> createScopeRangeList([RangeArray] value)

Create an instance of JAXBElement<[RangeArray]>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[RangeArray]>

---

createScopeRenewOnly

public javax.xml.bind.JAXBElement<java.lang.String> createScopeRenewOnly(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createScopeRestrictToAdminAllocation

public javax.xml.bind.JAXBElement<java.lang.String> createScopeRestrictToAdminAllocation(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createScopeRestrictToReservations

public javax.xml.bind.JAXBElement<java.lang.String> createScopeRestrictToReservations(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createScopeSelectionTagList

public javax.xml.bind.JAXBElement<[StringArray]> createScopeSelectionTagList([StringArray] value)

Create an instance of JAXBElement<[StringArray]>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[StringArray]>

createScopeTenantId

public javax.xml.bind.JAXBElement<java.lang.String> createScopeTenantId(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createScopeVpnId

public javax.xml.bind.JAXBElement<java.lang.String> createScopeVpnId(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDnsExceptionAddr

public javax.xml.bind.JAXBElement<DnsIPnPortArray> createDnsExceptionAddr(DnsIPnPortArray value)

Create an instance of JAXBElement<DnsIPnPortArray>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<DnsIPnPortArray>

createDnsExceptionDescription

public javax.xml.bind.JAXBElement<java.lang.String> createDnsExceptionDescription(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDnsExceptionHost

public javax.xml.bind.JAXBElement<StringArray> createDnsExceptionHost(StringArray value)

Create an instance of JAXBElement<StringArray>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<StringArray>

createDnsExceptionPrime

```
public javax.xml.bind.JAXBElement<java.lang.String> createDnsExceptionPrime(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDnsExceptionTls

```
public javax.xml.bind.JAXBElement<java.lang.String> createDnsExceptionTls(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDnsExceptionTlsAuthName

```
public javax.xml.bind.JAXBElement<java.lang.String> createDnsExceptionTlsAuthName(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDnsExceptionUsesViews

```
public javax.xml.bind.JAXBElement<java.lang.String> createDnsExceptionUsesViews(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMSubnetCCMSubnetType

```
public javax.xml.bind.JAXBElement<java.lang.String> createCCMSubnetCCMSubnetType(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMSubnetDescription

```
public javax.xml.bind.JAXBElement<java.lang.String> createCCMSubnetDescription(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createCCMSubnetDnsHostBytes

public javax.xml.bind.JAXBElement<java.lang.String> createCCMSubnetDnsHostBytes(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createCCMSubnetFailoverpair

public javax.xml.bind.JAXBElement<java.lang.String> createCCMSubnetFailoverpair(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createCCMSubnetForwardZoneName

public javax.xml.bind.JAXBElement<java.lang.String> createCCMSubnetForwardZoneName(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createCCMSubnetInterface

public javax.xml.bind.JAXBElement<java.lang.String> createCCMSubnetInterface(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createCCMSubnetOwner

public javax.xml.bind.JAXBElement<java.lang.String> createCCMSubnetOwner(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMSubnetParent

public javax.xml.bind.JAXBElement<java.lang.String> createCCMSubnetParent(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMSubnetPrimarySubnet

public javax.xml.bind.JAXBElement<java.lang.String> createCCMSubnetPrimarySubnet(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMSubnetRegion

public javax.xml.bind.JAXBElement<java.lang.String> createCCMSubnetRegion (java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMSubnetReverseZoneName

public javax.xml.bind.JAXBElement<java.lang.String> createCCMSubnetReverseZoneName(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMSubnetScopeList

public javax.xml.bind.JAXBElement<ScopeArray> createCCMSubnetScopeList(ScopeArray value)

Create an instance of JAXBElement<ScopeArray>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<ScopeArray>

createCCMSubnetSubnetState

public javax.xml.bind.JAXBElement<java.lang.String> createCCMSubnetSubnetState(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createCCMSubnetTenantId

public javax.xml.bind.JAXBElement<java.lang.String> createCCMSubnetTenantId(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createCCMSubnetVpnId

public javax.xml.bind.JAXBElement<java.lang.String> createCCMSubnetVpnId(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createCCMZoneTemplateAlternateViewIds

public javax.xml.bind.JAXBElement<StringArray> createCCMZoneTemplateAlternateViewIds(StringArray value)

Create an instance of JAXBElement<StringArray>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<StringArray>

createCCMZoneTemplateDefttl

public javax.xml.bind.JAXBElement<java.lang.String> createCCMZoneTemplateDefttl(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createCCMZoneTemplateDescription

```
public javax.xml.bind.JAXBElement<java.lang.String> createCCMZoneTemplateDescription(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMZoneTemplateDistMap

```
public javax.xml.bind.JAXBElement<java.lang.String> createCCMZoneTemplateDistMap(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMZoneTemplateDnssec

```
public javax.xml.bind.JAXBElement<java.lang.String> createCCMZoneTemplateDnssec(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMZoneTemplateExpire

```
public javax.xml.bind.JAXBElement<java.lang.String> createCCMZoneTemplateExpire(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMZoneTemplateKeyGroup

```
public javax.xml.bind.JAXBElement<java.lang.String> createCCMZoneTemplateKeyGroup(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMZoneTemplateMinttl

```
public javax.xml.bind.JAXBElement<java.lang.String> createCCMZoneTemplateMinttl(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMZoneTemplateNameservers

public javax.xml.bind.JAXBElement<[StringArray](#)> createCCMZoneTemplateNameservers([StringArray](#) value)

Create an instance of JAXBElement<[StringArray](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[StringArray](#)>

---

createCCMZoneTemplateNotify

public javax.xml.bind.JAXBElement<java.lang.String> createCCMZoneTemplateNotify(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMZoneTemplateNotifyList

public javax.xml.bind.JAXBElement<[StringArray](#)> createCCMZoneTemplateNotifyList([StringArray](#) value)

Create an instance of JAXBElement<[StringArray](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[StringArray](#)>

---

createCCMZoneTemplateNs

public javax.xml.bind.JAXBElement<java.lang.String> createCCMZoneTemplateNs(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMZoneTemplateNsttl

public javax.xml.bind.JAXBElement<java.lang.String> createCCMZoneTemplateNsttl(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMZoneTemplateOwner

public javax.xml.bind.JAXBElement<java.lang.String> createCCMZoneTemplateOwner(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMZoneTemplatePerson

public javax.xml.bind.JAXBElement<java.lang.String> createCCMZoneTemplatePerson(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMZoneTemplateRefresh

public javax.xml.bind.JAXBElement<java.lang.String> createCCMZoneTemplateRefresh(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMZoneTemplateRegion

public javax.xml.bind.JAXBElement<java.lang.String> createCCMZoneTemplateRegion(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMZoneTemplateRestrictQueryAcl

public javax.xml.bind.JAXBElement<java.lang.String> createCCMZoneTemplateRestrictQueryAcl(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createCCMZoneTemplateRestrictXfer

public javax.xml.bind.JAXBElement<java.lang.String> createCCMZoneTemplateRestrictXfer(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMZoneTemplateRestrictXferAcl

public javax.xml.bind.JAXBElement<java.lang.String> createCCMZoneTemplateRestrictXferAcl(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMZoneTemplateRetry

public javax.xml.bind.JAXBElement<java.lang.String> createCCMZoneTemplateRetry(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMZoneTemplateRoundRobin

public javax.xml.bind.JAXBElement<java.lang.String> createCCMZoneTemplateRoundRobin(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMZoneTemplateScvgEnabled

public javax.xml.bind.JAXBElement<java.lang.String> createCCMZoneTemplateScvgEnabled(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMZoneTemplateScvgInterval

```
public javax.xml.bind.JAXBElement<java.lang.String> createCCMZoneTemplateScvgInterval(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMZoneTemplateScvgMaxRecords

```
public javax.xml.bind.JAXBElement<java.lang.String> createCCMZoneTemplateScvgMaxRecords(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMZoneTemplateScvgRefreshInterval

```
public javax.xml.bind.JAXBElement<java.lang.String> createCCMZoneTemplateScvgRefreshInterval(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMZoneTemplateSerial

```
public javax.xml.bind.JAXBElement<java.lang.String> createCCMZoneTemplateSerial(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMZoneTemplateSoattl

```
public javax.xml.bind.JAXBElement<java.lang.String> createCCMZoneTemplateSoattl(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMZoneTemplateTenantId

```
public javax.xml.bind.JAXBElement<java.lang.String> createCCMZoneTemplateTenantId(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMZoneTemplateUpdateAcl

public javax.xml.bind.JAXBElement<java.lang.String> createCCMZoneTemplateUpdateAcl(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMZoneTemplateUpdatePolicyList

public javax.xml.bind.JAXBElement<StringArray> createCCMZoneTemplateUpdatePolicyList(StringArray value)

Create an instance of JAXBElement<StringArray>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<StringArray>

---

createCCMZoneTemplateViewId

public javax.xml.bind.JAXBElement<java.lang.String> createCCMZoneTemplateViewId(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createTCPListenerRelatedServerCommState

public javax.xml.bind.JAXBElement<java.lang.String> createTCPListenerRelatedServerCommState(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createTCPListenerRelatedServerCurrentConnections

public javax.xml.bind.JAXBElement<java.lang.String> createTCPListenerRelatedServerCurrentConnections(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createTCPListenerRelatedServerIp6Address

`public javax.xml.bind.JAXBElement<java.lang.String> createTCPListenerRelatedServerIp6Address(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createTCPListenerRelatedServerIpaddr

`public javax.xml.bind.JAXBElement<java.lang.String> createTCPListenerRelatedServerIpaddr(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createTCPListenerRelatedServerName

`public javax.xml.bind.JAXBElement<java.lang.String> createTCPListenerRelatedServerName(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createTCPListenerRelatedServerPort

`public javax.xml.bind.JAXBElement<java.lang.String> createTCPListenerRelatedServerPort(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createTCPListenerRelatedServerRejectedConnections

`public javax.xml.bind.JAXBElement<java.lang.String> createTCPListenerRelatedServerRejectedConnections(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createTCPListenerRelatedServerTotalConnections

public javax.xml.bind.JAXBElement<java.lang.String> createTCPListenerRelatedServerTotalConnections(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDHCPServerStatsLastConfigReadTime

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerStatsLastConfigReadTime(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDHCPServerStatsSampleDeltaTime

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerStatsSampleDeltaTime(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDHCPServerStatsSampleEndTime

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerStatsSampleEndTime(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDHCPServerStatsServerReloadTime

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerStatsServerReloadTime(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDHCPServerStatsServerStartTime

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerStatsServerStartTime(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPServerStatsServerUpTime

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerStatsServerUpTime(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPServerStatsStartTime

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerStatsStartTime(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPServerStatsStartTimeStr

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerStatsStartTimeStr(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPServerStatsStatisticsRequestTime

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerStatsStatisticsRequestTime(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPServerStatsStatisticsResetTime

```
public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerStatsStatisticsResetTime(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPServerStatsTotalAcks

```
public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerStatsTotalAcks(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPServerStatsTotalDeclines

```
public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerStatsTotalDeclines(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPServerStatsTotalDiscovers

```
public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerStatsTotalDiscovers(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPServerStatsTotalNaks

```
public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerStatsTotalNaks(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPServerStatsTotalOffers

```
public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerStatsTotalOffers(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDHCPServerStatsTotalReleases

`public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerStatsTotalReleases(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDHCPServerStatsTotalRequests

`public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerStatsTotalRequests(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createACLDescription

`public javax.xml.bind.JAXBElement<java.lang.String> createACLDescription(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createACLMatchList

`public javax.xml.bind.JAXBElement<java.lang.String> createACLMatchList(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createACLTenantId

`public javax.xml.bind.JAXBElement<java.lang.String> createACLTenantId(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createCdnsRateLimitClientRateLimiting

`public javax.xml.bind.JAXBElement<java.lang.String> createCdnsRateLimitClientRateLimiting(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createCdnsRateLimitClientRateLimitingFactor

`public javax.xml.bind.JAXBElement<java.lang.String> createCdnsRateLimitClientRateLimitingFactor(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createCdnsRateLimitClientRateLimitingQps

`public javax.xml.bind.JAXBElement<java.lang.String> createCdnsRateLimitClientRateLimitingQps(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createCdnsRateLimitClientReportMaxCount

`public javax.xml.bind.JAXBElement<java.lang.String> createCdnsRateLimitClientReportMaxCount(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createCdnsRateLimitDescription

`public javax.xml.bind.JAXBElement<java.lang.String> createCdnsRateLimitDescription(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createCdnsRateLimitDomainRateLimiting

public javax.xml.bind.JAXBElement<java.lang.String> createCdnsRateLimitDomainRateLimiting(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCdnsRateLimitDomainRateLimitingFactor

public javax.xml.bind.JAXBElement<java.lang.String> createCdnsRateLimitDomainRateLimitingFactor(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCdnsRateLimitDomainRateLimitingList

public javax.xml.bind.JAXBElement<CdnsDomainRateLimitArray> createCdnsRateLimitDomainRateLimitingList(CdnsDomainRateLimitArray value)

Create an instance of JAXBElement<CdnsDomainRateLimitArray>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<CdnsDomainRateLimitArray>

---

createCdnsRateLimitDomainRateLimitingQps

public javax.xml.bind.JAXBElement<java.lang.String> createCdnsRateLimitDomainRateLimitingQps(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCdnsRateLimitDomainReportMaxCount

public javax.xml.bind.JAXBElement<java.lang.String> createCdnsRateLimitDomainReportMaxCount(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCdnsRateLimitName

```
public javax.xml.bind.JAXBElement<java.lang.String> createCdnsRateLimitName(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createPrefixTemplateAllocationAlgorithms

```
public javax.xml.bind.JAXBElement<java.lang.String> createPrefixTemplateAllocationAlgorithms(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createPrefixTemplateAllocationGroup

```
public javax.xml.bind.JAXBElement<java.lang.String> createPrefixTemplateAllocationGroup(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createPrefixTemplateAllocationGroupPriority

```
public javax.xml.bind.JAXBElement<java.lang.String> createPrefixTemplateAllocationGroupPriority(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createPrefixTemplateDeactivated

```
public javax.xml.bind.JAXBElement<java.lang.String> createPrefixTemplateDeactivated(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createPrefixTemplateDescription

```
public javax.xml.bind.JAXBElement<java.lang.String> createPrefixTemplateDescription(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createPrefixTemplateDhcpType

public javax.xml.bind.JAXBElement<java.lang.String> createPrefixTemplateDhcpType(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createPrefixTemplateEmbeddedPolicy

public javax.xml.bind.JAXBElement<Policy> createPrefixTemplateEmbeddedPolicy(Policy value)

Create an instance of JAXBElement<Policy>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<Policy>

---

createPrefixTemplateExpirationTime

public javax.xml.bind.JAXBElement<java.lang.String> createPrefixTemplateExpirationTime(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createPrefixTemplateFreeAddressConfig

public javax.xml.bind.JAXBElement<java.lang.String> createPrefixTemplateFreeAddressConfig(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createPrefixTemplateIgnoreDeclines

public javax.xml.bind.JAXBElement<java.lang.String> createPrefixTemplateIgnoreDeclines(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createPrefixTemplateMaxLeases

public javax.xml.bind.JAXBElement<java.lang.String> createPrefixTemplateMaxLeases(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createPrefixTemplateMaxPdBalancingLength

public javax.xml.bind.JAXBElement<java.lang.String> createPrefixTemplateMaxPdBalancingLength(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createPrefixTemplateOptionsExpr

public javax.xml.bind.JAXBElement<java.lang.String> createPrefixTemplateOptionsExpr(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createPrefixTemplateOwner

public javax.xml.bind.JAXBElement<java.lang.String> createPrefixTemplateOwner(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createPrefixTemplatePolicy

public javax.xml.bind.JAXBElement<java.lang.String> createPrefixTemplatePolicy(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createPrefixTemplatePrefixDescriptionExpr

`public javax.xml.bind.JAXBElement<java.lang.String> createPrefixTemplatePrefixDescriptionExpr(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createPrefixTemplatePrefixNameExpr

`public javax.xml.bind.JAXBElement<java.lang.String> createPrefixTemplatePrefixNameExpr(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createPrefixTemplateRangeEndExpr

`public javax.xml.bind.JAXBElement<java.lang.String> createPrefixTemplateRangeEndExpr(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createPrefixTemplateRangeExpr

`public javax.xml.bind.JAXBElement<java.lang.String> createPrefixTemplateRangeExpr(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createPrefixTemplateRangeStartExpr

`public javax.xml.bind.JAXBElement<java.lang.String> createPrefixTemplateRangeStartExpr(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createPrefixTemplateRegion

```
public javax.xml.bind.JAXBElement<java.lang.String> createPrefixTemplateRegion(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createPrefixTemplateRestrictToAdminAllocation

```
public javax.xml.bind.JAXBElement<java.lang.String> createPrefixTemplateRestrictToAdminAllocation(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createPrefixTemplateRestrictToReservations

```
public javax.xml.bind.JAXBElement<java.lang.String> createPrefixTemplateRestrictToReservations(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createPrefixTemplateReverseZonePrefixLength

```
public javax.xml.bind.JAXBElement<java.lang.String> createPrefixTemplateReverseZonePrefixLength(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createPrefixTemplateSelectionTags

```
public javax.xml.bind.JAXBElement<StringArray> createPrefixTemplateSelectionTags(StringArray value)
```

Create an instance of JAXBElement<StringArray>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<StringArray>

---

createPrefixTemplateTenantId

```
public javax.xml.bind.JAXBElement<java.lang.String> createPrefixTemplateTenantId(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSTopNameStatsLastAccessTime

public javax.xml.bind.JAXBElement<java.lang.String> createDNSTopNameStatsLastAccessTime(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSTopNameStatsLastResetTime

public javax.xml.bind.JAXBElement<java.lang.String> createDNSTopNameStatsLastResetTime(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSTopNameStatsTimestamp

public javax.xml.bind.JAXBElement<java.lang.String> createDNSTopNameStatsTimestamp(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSTopNameStatsTopNames

public javax.xml.bind.JAXBElement<CCMRRSetArray> createDNSTopNameStatsTopNames(CCMRRSetArray value)

Create an instance of JAXBElement<CCMRRSetArray>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<CCMRRSetArray>

---

createDNSTopNameStatsTotalCounted

public javax.xml.bind.JAXBElement<java.lang.String> createDNSTopNameStatsTotalCounted(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerRateLimitStatsClientRatelimited

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerRateLimitStatsClientRatelimited(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerRateLimitStatsClients

public javax.xml.bind.JAXBElement<DNSCachingServerRateLimitItemArray> createDNSCachingServerRateLimitStatsClients(DNSCachingServerRateLimitItemArray value)

Create an instance of JAXBElement<DNSCachingServerRateLimitItemArray>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<DNSCachingServerRateLimitItemArray>

---

createDNSCachingServerRateLimitStatsDomainRatelimited

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerRateLimitStatsDomainRatelimited(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerRateLimitStatsDomains

public javax.xml.bind.JAXBElement<DNSCachingServerRateLimitItemArray> createDNSCachingServerRateLimitStatsDomains(DNSCachingServerRateLimitItemArray value)

Create an instance of JAXBElement<DNSCachingServerRateLimitItemArray>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<DNSCachingServerRateLimitItemArray>

---

createDNSCachingServerRateLimitStatsEndTime

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerRateLimitStatsEndTime(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSCachingServerRateLimitStatsNumClientsRatelimited

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerRateLimitStatsNumClientsRatelimited(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSCachingServerRateLimitStatsNumDomainsRatelimited

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerRateLimitStatsNumDomainsRatelimited(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSCachingServerRateLimitStatsStartTime

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerRateLimitStatsStartTime(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSCachingServerRateLimitStatsTimestamp

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerRateLimitStatsTimestamp(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSCachingServerAclBlocklist

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerAclBlocklist(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSCachingServerAclBlacklist

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerAclBlacklist(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSCachingServerAclDoNotQuery

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerAclDoNotQuery(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSCachingServerAclQuery

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerAclQuery(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSCachingServerActivitySummaryInterval

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerActivitySummaryInterval(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSCachingServerActivitySummarySettings

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerActivitySummarySettings(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSCachingServerActivitySummaryType

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerActivitySummaryType(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerAllowAnyQueryAcl

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerAllowAnyQueryAcl(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerCacheMaxNegativeTtl

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerCacheMaxNegativeTtl(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerCacheMaxTtl

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerCacheMaxTtl(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerCacheMinTtl

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerCacheMinTtl(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerConntrackUsageWarning

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerConntrackUsageWarning(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSCachingServerEcsAlwaysForward

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerEcsAlwaysForward(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSCachingServerEcsDestination

public javax.xml.bind.JAXBElement<StringArray> createDNSCachingServerEcsDestination(StringArray value)

Create an instance of JAXBElement<StringArray>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<StringArray>

createDNSCachingServerEcsEnable

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerEcsEnable(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSCachingServerHardenGlue

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerHardenGlue(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSCachingServerHttps

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerHttps(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSCachingServerHttpsPort

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerHttpsPort(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSCachingServerImmediateResponseStats

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerImmediateResponseStats(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSCachingServerListenIpVersion

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerListenIpVersion(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSCachingServerListenProtocol

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerListenProtocol(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSCachingServerLogSettings

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerLogSettings(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSCachingServerMinimalResponses

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerMinimalResponses(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSCachingServerMsgCacheSize

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerMsgCacheSize(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSCachingServerName

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerName(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSCachingServerPacketLogSettings

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerPacketLogSettings(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSCachingServerPacketLogging

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerPacketLogging(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSCachingServerPacketLoggingFile

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerPacketLoggingFile(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerPort

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerPort(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerPrefetch

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerPrefetch(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerQueryNameMinimisation

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerQueryNameMinimisation(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerRandomizeQueryCase

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerRandomizeQueryCase(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerRandomizeQueryCaseExclusion

public javax.xml.bind.JAXBElement<StringArray> createDNSCachingServerRandomizeQueryCaseExclusion(StringArray value)

Create an instance of JAXBElement<StringArray>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[StringArray](#)>

---

createDNSCachingServerRemoteNsCacheNumhosts

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerRemoteNsCacheNumhosts(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerRemoteNsHostTtl

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerRemoteNsHostTtl(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerRootHints

public javax.xml.bind.JAXBElement<[AddrSetArray](#)> createDNSCachingServerRootHints([AddrSetArray](#) value)

Create an instance of JAXBElement<[AddrSetArray](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[AddrSetArray](#)>

---

createDNSCachingServerRoundRobin

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerRoundRobin(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerRrsetCacheSize

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerRrsetCacheSize(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerSecurityEventAlarmSettings

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerSecurityEventAlarmSettings(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerSecurityEventLogSettings

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerSecurityEventLogSettings(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerSecurityEventLogging

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerSecurityEventLogging(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerSecurityEventMaxQnameSize

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerSecurityEventMaxQnameSize(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerSecurityEventMaxQps

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerSecurityEventMaxQps(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSCachingServerSmartCache

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerSmartCache(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerSmartCacheExpiration

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerSmartCacheExpiration(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerSmartCacheExpirationReset

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerSmartCacheExpirationReset(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerSmartCacheExpiredReplyTtl

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerSmartCacheExpiredReplyTtl(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerTls

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerTls(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerTlsCertificate

```
public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerTlsCertificate(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerTlsPort

```
public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerTlsPort(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerTlsSystemCertBundle

```
public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerTlsSystemCertBundle(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerTlsUpstreamCertBundle

```
public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerTlsUpstreamCertBundle(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerTopNames

```
public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerTopNames(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerTopNamesMaxAge

```
public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerTopNamesMaxAge(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerTopNamesMaxCount

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerTopNamesMaxCount(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerTrapsEnabled

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerTrapsEnabled(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerSecurityStatsAclBlocklistDroppedRequests

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerSecurityStatsAclBlocklistDroppedRequests(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerSecurityStatsBlackholeAclDroppedRequests

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerSecurityStatsBlackholeAclDroppedRequests(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerSecurityStatsDetectedTsigBadKey

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerSecurityStatsDetectedTsigBadKey(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerSecurityStatsDetectedTsigBadSig

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerSecurityStatsDetectedTsigBadSig(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerSecurityStatsDetectedTsigBadTime

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerSecurityStatsDetectedTsigBadTime(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerSecurityStatsDnssecQueries

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerSecurityStatsDnssecQueries(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerSecurityStatsDnssecRequestsDropped

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerSecurityStatsDnssecRequestsDropped(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerSecurityStatsDnssecResponses

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerSecurityStatsDnssecResponses(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSServerSecurityStatsDnssecSignZone

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerSecurityStatsDnssecSignZone(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSServerSecurityStatsDnssecZones

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerSecurityStatsDnssecZones(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSServerSecurityStatsRcvdTsigBadKey

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerSecurityStatsRcvdTsigBadKey(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSServerSecurityStatsRcvdTsigBadSig

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerSecurityStatsRcvdTsigBadSig(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSServerSecurityStatsRcvdTsigBadTime

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerSecurityStatsRcvdTsigBadTime(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSServerSecurityStatsRcvdTsigPackets

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerSecurityStatsRcvdTsigPackets(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerSecurityStatsRestrictQueryAcl

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerSecurityStatsRestrictQueryAcl(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerSecurityStatsSecurityEvents

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerSecurityStatsSecurityEvents(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerSecurityStatsSecurityEventsAlarm

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerSecurityStatsSecurityEventsAlarm(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerSecurityStatsSecurityEventsPeriodic

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerSecurityStatsSecurityEventsPeriodic(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerSecurityStatsSecurityEventsAmplificationAttack

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerSecurityStatsSecurityEventsAmplificationAttack(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerSecurityStatsSecurityEventsDnsTunneling

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerSecurityStatsSecurityEventsDnsTunneling(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerSecurityStatsSecurityEventsDos

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerSecurityStatsSecurityEventsDos(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerSecurityStatsDosPotential

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerSecurityStatsDosPotential(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerSecurityStatsSecurityEventsPoisoning

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerSecurityStatsSecurityEventsPoisoning(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerSecurityStatsSecurityEventsSnooping

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerSecurityStatsSecurityEventsSnooping(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerSecurityStatsTlsQueries

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerSecurityStatsTlsQueries(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerSecurityStatsTlsQueriesFailed

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerSecurityStatsTlsQueriesFailed(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerSecurityStatsUnauthUpdateReqs

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerSecurityStatsUnauthUpdateReqs(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerSecurityStatsUnauthXferReqs

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerSecurityStatsUnauthXferReqs(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createLeaseAddress

public javax.xml.bind.JAXBElement<java.lang.String> createLeaseAddress(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createLeaseBindingEndTime

public javax.xml.bind.JAXBElement<java.lang.String> createLeaseBindingEndTime(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createLeaseBindingStartTime

public javax.xml.bind.JAXBElement<java.lang.String> createLeaseBindingStartTime(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createLeaseClientBinaryClientId

public javax.xml.bind.JAXBElement<java.lang.String> createLeaseClientBinaryClientId(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createLeaseClientDnsName

public javax.xml.bind.JAXBElement<java.lang.String> createLeaseClientDnsName(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createLeaseClientDomainName

public javax.xml.bind.JAXBElement<java.lang.String> createLeaseClientDomainName(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createLeaseClientDuid

public javax.xml.bind.JAXBElement<java.lang.String> createLeaseClientDuid(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createLeaseClientFlags

public javax.xml.bind.JAXBElement<java.lang.String> createLeaseClientFlags(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createLeaseClientHostName

public javax.xml.bind.JAXBElement<java.lang.String> createLeaseClientHostName(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createLeaseClientIaid

public javax.xml.bind.JAXBElement<java.lang.String> createLeaseClientIaid(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createLeaseClientLastTransactionTime

public javax.xml.bind.JAXBElement<java.lang.String> createLeaseClientLastTransactionTime(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createLeaseClientMacAddr

```java
public javax.xml.bind.JAXBElement<java.lang.String> createLeaseClientMacAddr(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createLeaseClientOsType

```java
public javax.xml.bind.JAXBElement<java.lang.String> createLeaseClientOsType(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createLeaseClientOverrideClientId

```java
public javax.xml.bind.JAXBElement<java.lang.String> createLeaseClientOverrideClientId(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createLeaseClientVendorClass

```java
public javax.xml.bind.JAXBElement<java.lang.String> createLeaseClientVendorClass(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createLeaseClientVendorInfo

```java
public javax.xml.bind.JAXBElement<java.lang.String> createLeaseClientVendorInfo(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createLeaseDataSource

```java
public javax.xml.bind.JAXBElement<java.lang.String> createLeaseDataSource(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createLeaseDbtxnGeneration

public javax.xml.bind.JAXBElement<java.lang.String> createLeaseDbtxnGeneration(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createLeaseDbtxnSeq

public javax.xml.bind.JAXBElement<java.lang.String> createLeaseDbtxnSeq(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createLeaseExpiration

public javax.xml.bind.JAXBElement<java.lang.String> createLeaseExpiration(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createLeaseFailoverExpirationTime

public javax.xml.bind.JAXBElement<java.lang.String> createLeaseFailoverExpirationTime(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createLeaseFlags

public javax.xml.bind.JAXBElement<java.lang.String> createLeaseFlags(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createLeaseFwdDnsUpdateConfigName

public javax.xml.bind.JAXBElement<java.lang.String> createLeaseFwdDnsUpdateConfigName(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createLeaseGiaddr

public javax.xml.bind.JAXBElement<java.lang.String> createLeaseGiaddr(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createLeaseLeaseRebindingTime

public javax.xml.bind.JAXBElement<java.lang.String> createLeaseLeaseRebindingTime(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createLeaseLeaseRenewalTime

public javax.xml.bind.JAXBElement<java.lang.String> createLeaseLeaseRenewalTime(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createLeaseLimitationId

public javax.xml.bind.JAXBElement<java.lang.String> createLeaseLimitationId(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createLeaseParameterRequestList

public javax.xml.bind.JAXBElement<java.lang.String> createLeaseParameterRequestList(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createLeaseRelayAgentAuth

public javax.xml.bind.JAXBElement<java.lang.String> createLeaseRelayAgentAuth(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createLeaseRelayAgentCircuitId

public javax.xml.bind.JAXBElement<java.lang.String> createLeaseRelayAgentCircuitId(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createLeaseRelayAgentDeviceClass

public javax.xml.bind.JAXBElement<java.lang.String> createLeaseRelayAgentDeviceClass(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createLeaseRelayAgentOption

public javax.xml.bind.JAXBElement<java.lang.String> createLeaseRelayAgentOption(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createLeaseRelayAgentRadiusClass

public javax.xml.bind.JAXBElement<java.lang.String> createLeaseRelayAgentRadiusClass(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createLeaseRelayAgentRadiusOptions

public javax.xml.bind.JAXBElement<java.lang.String> createLeaseRelayAgentRadiusOptions(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createLeaseRelayAgentRadiusPoolName

public javax.xml.bind.JAXBElement<java.lang.String> createLeaseRelayAgentRadiusPoolName(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createLeaseRelayAgentRadiusSessionTimeout

public javax.xml.bind.JAXBElement<java.lang.String> createLeaseRelayAgentRadiusSessionTimeout(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createLeaseRelayAgentRadiusUser

public javax.xml.bind.JAXBElement<java.lang.String> createLeaseRelayAgentRadiusUser(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createLeaseRelayAgentRadiusV6PoolName

public javax.xml.bind.JAXBElement<java.lang.String> createLeaseRelayAgentRadiusV6PoolName(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createLeaseRelayAgentRadiusVendorSpecific

public javax.xml.bind.JAXBElement<java.lang.String> createLeaseRelayAgentRadiusVendorSpecific(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createLeaseRelayAgentRemoteId

public javax.xml.bind.JAXBElement<java.lang.String> createLeaseRelayAgentRemoteId(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createLeaseRelayAgentServerIdOverride

public javax.xml.bind.JAXBElement<java.lang.String> createLeaseRelayAgentServerIdOverride(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createLeaseRelayAgentSubnetSelection

public javax.xml.bind.JAXBElement<java.lang.String> createLeaseRelayAgentSubnetSelection(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createLeaseRelayAgentSubscriberId

public javax.xml.bind.JAXBElement<java.lang.String> createLeaseRelayAgentSubscriberId(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createLeaseRelayAgentVIVendorClass

public javax.xml.bind.JAXBElement<java.lang.String> createLeaseRelayAgentVIVendorClass(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createLeaseRelayAgentVpnId

public javax.xml.bind.JAXBElement<java.lang.String> createLeaseRelayAgentVpnId(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createLeaseReservationLookupKey

public javax.xml.bind.JAXBElement<java.lang.String> createLeaseReservationLookupKey(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createLeaseReservationLookupKeyType

public javax.xml.bind.JAXBElement<java.lang.String> createLeaseReservationLookupKeyType(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createLeaseReservationRelayAgentOption

public javax.xml.bind.JAXBElement<java.lang.String> createLeaseReservationRelayAgentOption(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createLeaseRevDnsUpdateConfigName

public javax.xml.bind.JAXBElement<java.lang.String> createLeaseRevDnsUpdateConfigName(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createLeaseScopeName

public javax.xml.bind.JAXBElement<java.lang.String> createLeaseScopeName(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createLeaseStartTimeOfState

public javax.xml.bind.JAXBElement<java.lang.String> createLeaseStartTimeOfState(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createLeaseState

public javax.xml.bind.JAXBElement<java.lang.String> createLeaseState(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createLeaseStateExpirationTime

public javax.xml.bind.JAXBElement<java.lang.String> createLeaseStateExpirationTime(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createLeaseTenantId

public javax.xml.bind.JAXBElement<java.lang.String> createLeaseTenantId(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createLeaseUserDefinedData

public javax.xml.bind.JAXBElement<java.lang.String> createLeaseUserDefinedData(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createLeaseVendorClassId

public javax.xml.bind.JAXBElement<java.lang.String> createLeaseVendorClassId(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createLeaseVendorSpecificInformation

public javax.xml.bind.JAXBElement<java.lang.String> createLeaseVendorSpecificInformation(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createLeaseVpnId

public javax.xml.bind.JAXBElement<java.lang.String> createLeaseVpnId(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerQueryStatsCacheHits

```
public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerQueryStatsCacheHits(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerQueryStatsMemCacheHits

```
public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerQueryStatsMemCacheHits(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerQueryStatsCacheMisses

```
public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerQueryStatsCacheMisses(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerQueryStatsMemCacheMisses

```
public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerQueryStatsMemCacheMisses(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerQueryStatsQueriesDnssec

```
public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerQueryStatsQueriesDnssec(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerQueryStatsQueriesDropped

```
public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerQueryStatsQueriesDropped(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerQueryStatsQueriesDroppedRecursive

`public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerQueryStatsQueriesDroppedRecursive(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerQueryStatsQueriesDroppedUnwantedClass

`public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerQueryStatsQueriesDroppedUnwantedClass(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerQueryStatsQueriesDroppedUnwantedType

`public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerQueryStatsQueriesDroppedUnwantedType(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerQueryStatsQueriesFailedAcl

`public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerQueryStatsQueriesFailedAcl(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerQueryStatsQueriesOverIpv4

`public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerQueryStatsQueriesOverIpv4(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSServerQueryStatsQueriesOverIpv6

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerQueryStatsQueriesOverIpv6(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSServerQueryStatsQueriesOverTcp

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerQueryStatsQueriesOverTcp(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSServerQueryStatsQueriesOverTls

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerQueryStatsQueriesOverTls(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSServerQueryStatsQueriesOverTlsFailed

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerQueryStatsQueriesOverTlsFailed(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSServerQueryStatsQueriesOverUdp

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerQueryStatsQueriesOverUdp(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSServerQueryStatsQueriesPerSecond

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerQueryStatsQueriesPerSecond(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerQueryStatsQueriesRpz

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerQueryStatsQueriesRpz(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerQueryStatsQueriesTotal

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerQueryStatsQueriesTotal(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerQueryStatsQueriesTypeA

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerQueryStatsQueriesTypeA(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerQueryStatsQueriesTypeAaaa

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerQueryStatsQueriesTypeAaaa(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerQueryStatsQueriesTypeAny

```
public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerQueryStatsQueriesTypeAny(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerQueryStatsQueriesTypeCaa

```
public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerQueryStatsQueriesTypeCaa(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerQueryStatsQueriesTypeCname

```
public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerQueryStatsQueriesTypeCname(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerQueryStatsQueriesTypeDnskey

```
public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerQueryStatsQueriesTypeDnskey(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerQueryStatsQueriesTypeDs

```
public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerQueryStatsQueriesTypeDs(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerQueryStatsQueriesTypeHttps

```
public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerQueryStatsQueriesTypeHttps(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerQueryStatsQueriesTypeMx

`public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerQueryStatsQueriesTypeMx(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerQueryStatsQueriesTypeNaptr

`public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerQueryStatsQueriesTypeNaptr(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerQueryStatsQueriesTypeNs

`public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerQueryStatsQueriesTypeNs(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerQueryStatsQueriesTypeNsec

`public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerQueryStatsQueriesTypeNsec(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerQueryStatsQueriesTypePtr

`public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerQueryStatsQueriesTypePtr(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerQueryStatsQueriesTypeRrsig

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerQueryStatsQueriesTypeRrsig(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerQueryStatsQueriesTypeSoa

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerQueryStatsQueriesTypeSoa(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerQueryStatsQueriesTypeSrv

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerQueryStatsQueriesTypeSrv(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerQueryStatsQueriesTypeSvcb

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerQueryStatsQueriesTypeSvcb(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerQueryStatsQueriesTypeTxt

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerQueryStatsQueriesTypeTxt(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSServerQueryStatsQueriesTypeUri

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerQueryStatsQueriesTypeUri(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerQueryStatsQueriesTypeOther

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerQueryStatsQueriesTypeOther(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerQueryStatsQueriesWithEdns

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerQueryStatsQueriesWithEdns(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerQueryStatsQueryAnswersRpzHits

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerQueryStatsQueryAnswersRpzHits(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerQueryStatsQueryAnswersRpzMisses

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerQueryStatsQueryAnswersRpzMisses(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerQueryStatsQueryAnswersTotal

```
public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerQueryStatsQueryAnswersTotal(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerQueryStatsQueryAnswersWithFormerr

```
public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerQueryStatsQueryAnswersWithFormerr(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerQueryStatsQueryAnswersWithNodata

```
public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerQueryStatsQueryAnswersWithNodata(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerQueryStatsQueryAnswersWithNoerror

```
public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerQueryStatsQueryAnswersWithNoerror(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerQueryStatsQueryAnswersWithNotauth

```
public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerQueryStatsQueryAnswersWithNotauth(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerQueryStatsQueryAnswersWithNxdomain

```
public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerQueryStatsQueryAnswersWithNxdomain(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerQueryStatsQueryAnswersWithRefused

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerQueryStatsQueryAnswersWithRefused(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerQueryStatsQueryAnswersWithServfail

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerQueryStatsQueryAnswersWithServfail(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerQueryStatsQueryAnswersWithOtherErrors

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerQueryStatsQueryAnswersWithOtherErrors(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerQueryStatsQueryAnswersWithReferral

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerQueryStatsQueryAnswersWithReferral(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMReverseZoneAlternateViewIds

public javax.xml.bind.JAXBElement<StringArray> createCCMReverseZoneAlternateViewIds(StringArray value)

Create an instance of JAXBElement<StringArray>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[StringArray](#)>

---

createCCMReverseZoneDefttl

public javax.xml.bind.JAXBElement<java.lang.String> createCCMReverseZoneDefttl(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMReverseZoneDescription

public javax.xml.bind.JAXBElement<java.lang.String> createCCMReverseZoneDescription(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMReverseZoneDistMap

public javax.xml.bind.JAXBElement<java.lang.String> createCCMReverseZoneDistMap(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMReverseZoneDnssec

public javax.xml.bind.JAXBElement<java.lang.String> createCCMReverseZoneDnssec(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMReverseZoneDsRr

public javax.xml.bind.JAXBElement<java.lang.String> createCCMReverseZoneDsRr(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createCCMReverseZoneExpire

`public javax.xml.bind.JAXBElement<java.lang.String> createCCMReverseZoneExpire(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createCCMReverseZoneKeyGroup

`public javax.xml.bind.JAXBElement<java.lang.String> createCCMReverseZoneKeyGroup(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createCCMReverseZoneMinttl

`public javax.xml.bind.JAXBElement<java.lang.String> createCCMReverseZoneMinttl(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createCCMReverseZoneNotify

`public javax.xml.bind.JAXBElement<java.lang.String> createCCMReverseZoneNotify(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createCCMReverseZoneNotifyList

`public javax.xml.bind.JAXBElement<StringArray> createCCMReverseZoneNotifyList(StringArray value)`

Create an instance of JAXBElement<StringArray>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<StringArray>

createCCMReverseZoneNsttl

public javax.xml.bind.JAXBElement<java.lang.String> createCCMReverseZoneNsttl(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMReverseZoneOwner

public javax.xml.bind.JAXBElement<java.lang.String> createCCMReverseZoneOwner(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMReverseZoneRefresh

public javax.xml.bind.JAXBElement<java.lang.String> createCCMReverseZoneRefresh(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMReverseZoneRegion

public javax.xml.bind.JAXBElement<java.lang.String> createCCMReverseZoneRegion(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMReverseZoneRestrictQueryAcl

public javax.xml.bind.JAXBElement<java.lang.String> createCCMReverseZoneRestrictQueryAcl(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMReverseZoneRestrictXfer

public javax.xml.bind.JAXBElement<java.lang.String> createCCMReverseZoneRestrictXfer(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMReverseZoneRestrictXferAcl

public javax.xml.bind.JAXBElement<java.lang.String> createCCMReverseZoneRestrictXferAcl(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMReverseZoneRetry

public javax.xml.bind.JAXBElement<java.lang.String> createCCMReverseZoneRetry(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMReverseZoneRoundRobin

public javax.xml.bind.JAXBElement<java.lang.String> createCCMReverseZoneRoundRobin(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMReverseZoneRpz

public javax.xml.bind.JAXBElement<java.lang.String> createCCMReverseZoneRpz(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMReverseZoneScvgEnabled

public javax.xml.bind.JAXBElement<java.lang.String> createCCMReverseZoneScvgEnabled(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMReverseZoneScvgInterval

`public javax.xml.bind.JAXBElement<java.lang.String> createCCMReverseZoneScvgInterval(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMReverseZoneScvgMaxRecords

`public javax.xml.bind.JAXBElement<java.lang.String> createCCMReverseZoneScvgMaxRecords(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMReverseZoneScvgRefreshInterval

`public javax.xml.bind.JAXBElement<java.lang.String> createCCMReverseZoneScvgRefreshInterval(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMReverseZoneSoattl

`public javax.xml.bind.JAXBElement<java.lang.String> createCCMReverseZoneSoattl(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMReverseZoneTenantId

`public javax.xml.bind.JAXBElement<java.lang.String> createCCMReverseZoneTenantId(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMReverseZoneUpdateAcl

public javax.xml.bind.JAXBElement<java.lang.String> createCCMReverseZoneUpdateAcl(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMReverseZoneUpdatePolicyList

public javax.xml.bind.JAXBElement<StringArray> createCCMReverseZoneUpdatePolicyList(StringArray value)

Create an instance of JAXBElement<StringArray>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<StringArray>

---

createCCMReverseZoneViewId

public javax.xml.bind.JAXBElement<java.lang.String> createCCMReverseZoneViewId(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDnsHAStatusRole

public javax.xml.bind.JAXBElement<java.lang.String> createDnsHAStatusRole(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDnsHAStatusState

public javax.xml.bind.JAXBElement<java.lang.String> createDnsHAStatusState(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDnsHAStatusClusterName

public javax.xml.bind.JAXBElement<java.lang.String> createDnsHAStatusClusterName(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDnsHAStatusHaZoneCount

public javax.xml.bind.JAXBElement<java.lang.String> createDnsHAStatusHaZoneCount(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDnsHAStatusZoneSyncCompleteCount

public javax.xml.bind.JAXBElement<java.lang.String> createDnsHAStatusZoneSyncCompleteCount(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDnsHAStatusZoneSyncCompleteList

public javax.xml.bind.JAXBElement<CCMZoneArray> createDnsHAStatusZoneSyncCompleteList(CCMZoneArray value)

Create an instance of JAXBElement<CCMZoneArray>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<CCMZoneArray>

createDnsHAStatusZoneSyncFailedCount

public javax.xml.bind.JAXBElement<java.lang.String> createDnsHAStatusZoneSyncFailedCount(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDnsHAStatusZoneSyncFailedList

public javax.xml.bind.JAXBElement<CCMZoneArray> createDnsHAStatusZoneSyncFailedList(CCMZoneArray value)

Create an instance of JAXBElement<CCMZoneArray>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<CCMZoneArray>

---

createDnsHAStatusZoneSyncPendingCount

public javax.xml.bind.JAXBElement<java.lang.String> createDnsHAStatusZoneSyncPendingCount(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDnsHAStatusZoneSyncPendingList

public javax.xml.bind.JAXBElement<CCMZoneArray> createDnsHAStatusZoneSyncPendingList(CCMZoneArray value)

Create an instance of JAXBElement<CCMZoneArray>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<CCMZoneArray>

---

createCCMScopeTemplateAllocateFirstAvailable

public javax.xml.bind.JAXBElement<java.lang.String> createCCMScopeTemplateAllocateFirstAvailable(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMScopeTemplateAllocationPriority

public javax.xml.bind.JAXBElement<java.lang.String> createCCMScopeTemplateAllocationPriority(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMScopeTemplateBackupPct

public javax.xml.bind.JAXBElement<java.lang.String> createCCMScopeTemplateBackupPct(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMScopeTemplateBootp

```
public javax.xml.bind.JAXBElement<java.lang.String> createCCMScopeTemplateBootp(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMScopeTemplateDeactivated

```
public javax.xml.bind.JAXBElement<java.lang.String> createCCMScopeTemplateDeactivated(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMScopeTemplateDescription

```
public javax.xml.bind.JAXBElement<java.lang.String> createCCMScopeTemplateDescription(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMScopeTemplateDhcp

```
public javax.xml.bind.JAXBElement<java.lang.String> createCCMScopeTemplateDhcp(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMScopeTemplateDnsHostBytes

```
public javax.xml.bind.JAXBElement<java.lang.String> createCCMScopeTemplateDnsHostBytes(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMScopeTemplateDynamicBootp

public javax.xml.bind.JAXBElement<java.lang.String> createCCMScopeTemplateDynamicBootp(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMScopeTemplateEmbeddedPolicy

public javax.xml.bind.JAXBElement<Policy> createCCMScopeTemplateEmbeddedPolicy(Policy value)

Create an instance of JAXBElement<Policy>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<Policy>

---

createCCMScopeTemplateFreeAddressConfig

public javax.xml.bind.JAXBElement<java.lang.String> createCCMScopeTemplateFreeAddressConfig(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMScopeTemplateGracePeriod

public javax.xml.bind.JAXBElement<java.lang.String> createCCMScopeTemplateGracePeriod(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMScopeTemplateIgnoreDeclines

public javax.xml.bind.JAXBElement<java.lang.String> createCCMScopeTemplateIgnoreDeclines(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createCCMScopeTemplateOfferTimeout

`public javax.xml.bind.JAXBElement<java.lang.String> createCCMScopeTemplateOfferTimeout(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMScopeTemplateOptionsExpr

`public javax.xml.bind.JAXBElement<java.lang.String> createCCMScopeTemplateOptionsExpr(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMScopeTemplatePingClients

`public javax.xml.bind.JAXBElement<java.lang.String> createCCMScopeTemplatePingClients(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMScopeTemplatePingTimeout

`public javax.xml.bind.JAXBElement<java.lang.String> createCCMScopeTemplatePingTimeout(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMScopeTemplatePolicy

`public javax.xml.bind.JAXBElement<java.lang.String> createCCMScopeTemplatePolicy(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMScopeTemplateRangesExpr

public javax.xml.bind.JAXBElement<java.lang.String> createCCMScopeTemplateRangesExpr(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMScopeTemplateRenewOnly

public javax.xml.bind.JAXBElement<java.lang.String> createCCMScopeTemplateRenewOnly(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMScopeTemplateRestrictToReservations

public javax.xml.bind.JAXBElement<java.lang.String> createCCMScopeTemplateRestrictToReservations(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMScopeTemplateRouterHost

public javax.xml.bind.JAXBElement<java.lang.String> createCCMScopeTemplateRouterHost(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMScopeTemplateScopeDescriptionExpr

public javax.xml.bind.JAXBElement<java.lang.String> createCCMScopeTemplateScopeDescriptionExpr(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMScopeTemplateScopeName

public javax.xml.bind.JAXBElement<java.lang.String> createCCMScopeTemplateScopeName(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMScopeTemplateSelectionTagList

public javax.xml.bind.JAXBElement<[StringArray](#)> createCCMScopeTemplateSelectionTagList([StringArray](#) value)

Create an instance of JAXBElement<[StringArray](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[StringArray](#)>

---

createCCMScopeTemplateTenantId

public javax.xml.bind.JAXBElement<java.lang.String> createCCMScopeTemplateTenantId(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMScopeTemplateUpdateDnsForBootp

public javax.xml.bind.JAXBElement<java.lang.String> createCCMScopeTemplateUpdateDnsForBootp(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMFailoverPairBackupIp6Address

public javax.xml.bind.JAXBElement<java.lang.String> createCCMFailoverPairBackupIp6Address(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMFailoverPairBackupPct

public javax.xml.bind.JAXBElement<java.lang.String> createCCMFailoverPairBackupPct(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMFailoverPairBackupServer

public javax.xml.bind.JAXBElement<java.lang.String> createCCMFailoverPairBackupServer(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMFailoverPairDynamicBootpBackupPct

public javax.xml.bind.JAXBElement<java.lang.String> createCCMFailoverPairDynamicBootpBackupPct(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMFailoverPairFailover

public javax.xml.bind.JAXBElement<java.lang.String> createCCMFailoverPairFailover(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMFailoverPairLoadBalancing

public javax.xml.bind.JAXBElement<java.lang.String> createCCMFailoverPairLoadBalancing(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMFailoverPairMainIp6Address

public javax.xml.bind.JAXBElement<java.lang.String> createCCMFailoverPairMainIp6Address(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createCCMFailoverPairMainServer

public javax.xml.bind.JAXBElement<java.lang.String> createCCMFailoverPairMainServer(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createCCMFailoverPairMclt

public javax.xml.bind.JAXBElement<java.lang.String> createCCMFailoverPairMclt(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createCCMFailoverPairRebindLimit

public javax.xml.bind.JAXBElement<java.lang.String> createCCMFailoverPairRebindLimit(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createCCMFailoverPairRelayHealthCheck

public javax.xml.bind.JAXBElement<java.lang.String> createCCMFailoverPairRelayHealthCheck(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createCCMFailoverPairRhcElapsedTime

public javax.xml.bind.JAXBElement<java.lang.String> createCCMFailoverPairRhcElapsedTime(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createCCMFailoverPairRhcMonitorFirstRelay

public javax.xml.bind.JAXBElement<java.lang.String> createCCMFailoverPairRhcMonitorFirstRelay(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:
value - Java instance representing xml element's value.

Returns:
the new instance of JAXBElement<String>

---

createCCMFailoverPairRhcRequestCount

public javax.xml.bind.JAXBElement<java.lang.String> createCCMFailoverPairRhcRequestCount(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:
value - Java instance representing xml element's value.

Returns:
the new instance of JAXBElement<String>

---

createCCMFailoverPairRhcResponseTime

public javax.xml.bind.JAXBElement<java.lang.String> createCCMFailoverPairRhcResponseTime(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:
value - Java instance representing xml element's value.

Returns:
the new instance of JAXBElement<String>

---

createCCMFailoverPairRhcRestartTime

public javax.xml.bind.JAXBElement<java.lang.String> createCCMFailoverPairRhcRestartTime(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:
value - Java instance representing xml element's value.

Returns:
the new instance of JAXBElement<String>

---

createCCMFailoverPairRhcServerPreference

public javax.xml.bind.JAXBElement<java.lang.String> createCCMFailoverPairRhcServerPreference(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:
value - Java instance representing xml element's value.

Returns:
the new instance of JAXBElement<String>

---

createCCMFailoverPairRhcUnresponsiveTime

public javax.xml.bind.JAXBElement<java.lang.String> createCCMFailoverPairRhcUnresponsiveTime(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMFailoverPairRhcWarningInterval

public javax.xml.bind.JAXBElement<java.lang.String> createCCMFailoverPairRhcWarningInterval(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMFailoverPairSafePeriod

public javax.xml.bind.JAXBElement<java.lang.String> createCCMFailoverPairSafePeriod(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMFailoverPairScopetemplate

public javax.xml.bind.JAXBElement<java.lang.String> createCCMFailoverPairScopetemplate(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMFailoverPairSyncFailureTrap

public javax.xml.bind.JAXBElement<java.lang.String> createCCMFailoverPairSyncFailureTrap(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMFailoverPairTenantId

public javax.xml.bind.JAXBElement<java.lang.String> createCCMFailoverPairTenantId(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createCCMFailoverPairUseSafePeriod

`public javax.xml.bind.JAXBElement<java.lang.String> createCCMFailoverPairUseSafePeriod(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createLDAPRelatedServerAcknowledgedRequests

`public javax.xml.bind.JAXBElement<java.lang.String> createLDAPRelatedServerAcknowledgedRequests(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createLDAPRelatedServerCommState

`public javax.xml.bind.JAXBElement<java.lang.String> createLDAPRelatedServerCommState(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createLDAPRelatedServerInFlightRequests

`public javax.xml.bind.JAXBElement<java.lang.String> createLDAPRelatedServerInFlightRequests(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createLDAPRelatedServerIp6Address

`public javax.xml.bind.JAXBElement<java.lang.String> createLDAPRelatedServerIp6Address(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createLDAPRelatedServerIpaddr

public javax.xml.bind.JAXBElement<java.lang.String> createLDAPRelatedServerIpaddr(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:
value - Java instance representing xml element's value.

Returns:
the new instance of JAXBElement<String>

---

createLDAPRelatedServerMaxRequests

public javax.xml.bind.JAXBElement<java.lang.String> createLDAPRelatedServerMaxRequests(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:
value - Java instance representing xml element's value.

Returns:
the new instance of JAXBElement<String>

---

createLDAPRelatedServerRequests

public javax.xml.bind.JAXBElement<java.lang.String> createLDAPRelatedServerRequests(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:
value - Java instance representing xml element's value.

Returns:
the new instance of JAXBElement<String>

---

createLDAPRelatedServerServerDeactivatedCount

public javax.xml.bind.JAXBElement<java.lang.String> createLDAPRelatedServerServerDeactivatedCount(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:
value - Java instance representing xml element's value.

Returns:
the new instance of JAXBElement<String>

---

createLDAPRelatedServerTimedOutRequests

public javax.xml.bind.JAXBElement<java.lang.String> createLDAPRelatedServerTimedOutRequests(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:
value - Java instance representing xml element's value.

Returns:
the new instance of JAXBElement<String>

createClientEntryAction

public javax.xml.bind.JAXBElement<java.lang.String> createClientEntryAction(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createClientEntryAddToEnvironmentDictionary

public javax.xml.bind.JAXBElement<java.lang.String> createClientEntryAddToEnvironmentDictionary(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createClientEntryAuthenticateUntil

public javax.xml.bind.JAXBElement<java.lang.String> createClientEntryAuthenticateUntil(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createClientEntryClientClassName

public javax.xml.bind.JAXBElement<java.lang.String> createClientEntryClientClassName(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createClientEntryDefaultVpn

public javax.xml.bind.JAXBElement<java.lang.String> createClientEntryDefaultVpn(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createClientEntryDomainName

public javax.xml.bind.JAXBElement<java.lang.String> createClientEntryDomainName(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createClientEntryEmbeddedPolicy

public javax.xml.bind.JAXBElement<Policy> createClientEntryEmbeddedPolicy(Policy value)

Create an instance of JAXBElement<Policy>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<Policy>

---

createClientEntryHostName

public javax.xml.bind.JAXBElement<java.lang.String> createClientEntryHostName(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createClientEntryOverLimitClientClassName

public javax.xml.bind.JAXBElement<java.lang.String> createClientEntryOverLimitClientClassName(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createClientEntryOverrideVpn

public javax.xml.bind.JAXBElement<java.lang.String> createClientEntryOverrideVpn(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createClientEntryPolicyName

public javax.xml.bind.JAXBElement<java.lang.String> createClientEntryPolicyName(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createClientEntryReservedAddresses

public javax.xml.bind.JAXBElement<[StringArray](#)> createClientEntryReservedAddresses([StringArray](#) value)

Create an instance of JAXBElement<[StringArray](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[StringArray](#)>

---

createClientEntryReservedIp6Addresses

public javax.xml.bind.JAXBElement<[StringArray](#)> createClientEntryReservedIp6Addresses([StringArray](#) value)

Create an instance of JAXBElement<[StringArray](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[StringArray](#)>

---

createClientEntryReservedPrefixes

public javax.xml.bind.JAXBElement<[StringArray](#)> createClientEntryReservedPrefixes([StringArray](#) value)

Create an instance of JAXBElement<[StringArray](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[StringArray](#)>

---

createClientEntrySelectionCriteria

public javax.xml.bind.JAXBElement<[StringArray](#)> createClientEntrySelectionCriteria([StringArray](#) value)

Create an instance of JAXBElement<[StringArray](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[StringArray](#)>

---

createClientEntryTenantId

public javax.xml.bind.JAXBElement<java.lang.String> createClientEntryTenantId(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createClientEntryUnauthenticatedClientClassName

public javax.xml.bind.JAXBElement<java.lang.String> createClientEntryUnauthenticatedClientClassName(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createClientEntryUserDefined

public javax.xml.bind.JAXBElement<java.lang.String> createClientEntryUserDefined(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createClientEntryUserid

public javax.xml.bind.JAXBElement<java.lang.String> createClientEntryUserid(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createVPNAddrBlocksDefaultSelectionTags

public javax.xml.bind.JAXBElement<StringArray> createVPNAddrBlocksDefaultSelectionTags(StringArray value)

Create an instance of JAXBElement<StringArray>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<StringArray>

---

createVPNAddrBlocksUseClientAffinity

public javax.xml.bind.JAXBElement<java.lang.String> createVPNAddrBlocksUseClientAffinity(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createVPNAddrBlocksUseLanSegments

public javax.xml.bind.JAXBElement<java.lang.String> createVPNAddrBlocksUseLanSegments(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createVPNAddrBlocksUseSelectionTags

public javax.xml.bind.JAXBElement<java.lang.String> createVPNAddrBlocksUseSelectionTags(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createVPNDescription

public javax.xml.bind.JAXBElement<java.lang.String> createVPNDescription(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createVPNTenantId

public javax.xml.bind.JAXBElement<java.lang.String> createVPNTenantId(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createVPNTenantPrivateNetwork

public javax.xml.bind.JAXBElement<java.lang.String> createVPNTenantPrivateNetwork(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createVPNVpnId

public javax.xml.bind.JAXBElement<java.lang.String> createVPNVpnId(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createVPNVrfName

public javax.xml.bind.JAXBElement<java.lang.String> createVPNVrfName(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDnsEnumDomainDescription

public javax.xml.bind.JAXBElement<java.lang.String> createDnsEnumDomainDescription(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDnsEnumDomainNameservers

public javax.xml.bind.JAXBElement<StringArray> createDnsEnumDomainNameservers(StringArray value)

Create an instance of JAXBElement<StringArray>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<StringArray>

---

createDnsEnumDomainPerson

public javax.xml.bind.JAXBElement<java.lang.String> createDnsEnumDomainPerson(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDnsEnumDomainSerial

public javax.xml.bind.JAXBElement<java.lang.String> createDnsEnumDomainSerial(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDnsEnumDomainTenantId

public javax.xml.bind.JAXBElement<java.lang.String> createDnsEnumDomainTenantId(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDnsEnumDomainTtl

public javax.xml.bind.JAXBElement<java.lang.String> createDnsEnumDomainTtl(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDnsEnumDomainViewId

public javax.xml.bind.JAXBElement<java.lang.String> createDnsEnumDomainViewId(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDnsEnumDomainZoneTemplate

public javax.xml.bind.JAXBElement<java.lang.String> createDnsEnumDomainZoneTemplate(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMServerInfoClassid

public javax.xml.bind.JAXBElement<java.lang.String> createCCMServerInfoClassid(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMServerInfoHealth

public javax.xml.bind.JAXBElement<java.lang.String> createCCMServerInfoHealth(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMServerInfoPid

public javax.xml.bind.JAXBElement<java.lang.String> createCCMServerInfoPid(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMServerInfoState

public javax.xml.bind.JAXBElement<java.lang.String> createCCMServerInfoState(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createLease6BindingEndTime

public javax.xml.bind.JAXBElement<java.lang.String> createLease6BindingEndTime(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createLease6BindingFlags

public javax.xml.bind.JAXBElement<java.lang.String> createLease6BindingFlags(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createLease6BindingIaid

public javax.xml.bind.JAXBElement<java.lang.String> createLease6BindingIaid(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createLease6BindingRebindingTime

public javax.xml.bind.JAXBElement<java.lang.String> createLease6BindingRebindingTime(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createLease6BindingRenewalTime

public javax.xml.bind.JAXBElement<java.lang.String> createLease6BindingRenewalTime(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createLease6BindingStartTime

public javax.xml.bind.JAXBElement<java.lang.String> createLease6BindingStartTime(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createLease6BindingType

public javax.xml.bind.JAXBElement<java.lang.String> createLease6BindingType(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createLease6ClientActiveLeases

public javax.xml.bind.JAXBElement<java.lang.String> createLease6ClientActiveLeases(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createLease6ClientClassName

public javax.xml.bind.JAXBElement<java.lang.String> createLease6ClientClassName(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createLease6ClientFlags

public javax.xml.bind.JAXBElement<java.lang.String> createLease6ClientFlags(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createLease6ClientId

public javax.xml.bind.JAXBElement<java.lang.String> createLease6ClientId(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createLease6ClientLastTransactionTime

public javax.xml.bind.JAXBElement<java.lang.String> createLease6ClientLastTransactionTime(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createLease6ClientLookupKey

public javax.xml.bind.JAXBElement<java.lang.String> createLease6ClientLookupKey(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createLease6ClientLookupKeyType

public javax.xml.bind.JAXBElement<java.lang.String> createLease6ClientLookupKeyType(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createLease6ClientOro

public javax.xml.bind.JAXBElement<java.lang.String> createLease6ClientOro(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createLease6ClientReconfigureKey

public javax.xml.bind.JAXBElement<java.lang.String> createLease6ClientReconfigureKey(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createLease6ClientReconfigureKeyGenerationTime

public javax.xml.bind.JAXBElement<java.lang.String> createLease6ClientReconfigureKeyGenerationTime(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createLease6ClientRelayAddress

public javax.xml.bind.JAXBElement<java.lang.String> createLease6ClientRelayAddress(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createLease6ClientRelayMessage

public javax.xml.bind.JAXBElement<java.lang.String> createLease6ClientRelayMessage(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createLease6ClientRelayPort

public javax.xml.bind.JAXBElement<java.lang.String> createLease6ClientRelayPort(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createLease6ClientUserDefinedData

public javax.xml.bind.JAXBElement<java.lang.String> createLease6ClientUserDefinedData(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createLease6ClientVendorClass

public javax.xml.bind.JAXBElement<StringArray> createLease6ClientVendorClass(StringArray value)

Create an instance of JAXBElement<StringArray>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<StringArray>

createLease6ClientVendorInfo

public javax.xml.bind.JAXBElement<StringArray> createLease6ClientVendorInfo(StringArray value)

Create an instance of JAXBElement<StringArray>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[StringArray](#)>

createLease6CmMacAddress

public javax.xml.bind.JAXBElement<java.lang.String> createLease6CmMacAddress(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createLease6CreationTime

public javax.xml.bind.JAXBElement<java.lang.String> createLease6CreationTime(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createLease6DataSource

public javax.xml.bind.JAXBElement<java.lang.String> createLease6DataSource(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createLease6DbtxnGeneration

public javax.xml.bind.JAXBElement<java.lang.String> createLease6DbtxnGeneration(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createLease6DbtxnSeq

public javax.xml.bind.JAXBElement<java.lang.String> createLease6DbtxnSeq(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createLease6DnsUpdateFlags

`public javax.xml.bind.JAXBElement<java.lang.String> createLease6DnsUpdateFlags(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createLease6ExcludedPrefix

`public javax.xml.bind.JAXBElement<java.lang.String> createLease6ExcludedPrefix(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createLease6FailoverExpirationTime

`public javax.xml.bind.JAXBElement<java.lang.String> createLease6FailoverExpirationTime(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createLease6Flags

`public javax.xml.bind.JAXBElement<java.lang.String> createLease6Flags(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createLease6ForwardDnsupdate

`public javax.xml.bind.JAXBElement<java.lang.String> createLease6ForwardDnsupdate(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createLease6Fqdn

public javax.xml.bind.JAXBElement<java.lang.String> createLease6Fqdn(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createLease6FqdnHostLabelCount

public javax.xml.bind.JAXBElement<java.lang.String> createLease6FqdnHostLabelCount(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createLease6Ip6Address

public javax.xml.bind.JAXBElement<java.lang.String> createLease6Ip6Address(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createLease6NameNumber

public javax.xml.bind.JAXBElement<java.lang.String> createLease6NameNumber(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createLease6PreferredLifetime

public javax.xml.bind.JAXBElement<java.lang.String> createLease6PreferredLifetime(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createLease6PrefixName

public javax.xml.bind.JAXBElement<java.lang.String> createLease6PrefixName(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createLease6RequestedFqdn

`public javax.xml.bind.JAXBElement<java.lang.String> createLease6RequestedFqdn(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createLease6RequestedPrefixLength

`public javax.xml.bind.JAXBElement<java.lang.String> createLease6RequestedPrefixLength(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createLease6ReservationCmMacAddress

`public javax.xml.bind.JAXBElement<java.lang.String> createLease6ReservationCmMacAddress(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createLease6ReservationLookupKey

`public javax.xml.bind.JAXBElement<java.lang.String> createLease6ReservationLookupKey(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createLease6ReservationLookupKeyType

`public javax.xml.bind.JAXBElement<java.lang.String> createLease6ReservationLookupKeyType(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createLease6ReverseDnsupdate

public javax.xml.bind.JAXBElement<java.lang.String> createLease6ReverseDnsupdate(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createLease6StartTimeOfState

public javax.xml.bind.JAXBElement<java.lang.String> createLease6StartTimeOfState(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createLease6State

public javax.xml.bind.JAXBElement<java.lang.String> createLease6State(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createLease6StateExpirationTime

public javax.xml.bind.JAXBElement<java.lang.String> createLease6StateExpirationTime(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createLease6TenantId

public javax.xml.bind.JAXBElement<java.lang.String> createLease6TenantId(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createLease6ValidLifetime

public javax.xml.bind.JAXBElement<java.lang.String> createLease6ValidLifetime(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createLease6VpnId

public javax.xml.bind.JAXBElement<java.lang.String> createLease6VpnId(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createServerSystemStatsCpuUtilization

public javax.xml.bind.JAXBElement<java.lang.String> createServerSystemStatsCpuUtilization(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createServerSystemStatsMemoryUtilization

public javax.xml.bind.JAXBElement<java.lang.String> createServerSystemStatsMemoryUtilization(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createServerSystemStatsName

public javax.xml.bind.JAXBElement<java.lang.String> createServerSystemStatsName(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createServerSystemStatsPid

```
public javax.xml.bind.JAXBElement<java.lang.String> createServerSystemStatsPid(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createServerSystemStatsServerType

```
public javax.xml.bind.JAXBElement<java.lang.String> createServerSystemStatsServerType(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createServerSystemStatsStatisticsRequestTime

```
public javax.xml.bind.JAXBElement<java.lang.String> createServerSystemStatsStatisticsRequestTime(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createServerSystemStatsVmUtilization

```
public javax.xml.bind.JAXBElement<java.lang.String> createServerSystemStatsVmUtilization(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createSystemStatsDataFreeSpace

```
public javax.xml.bind.JAXBElement<java.lang.String> createSystemStatsDataFreeSpace(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createSystemStatsDataPath

```
public javax.xml.bind.JAXBElement<java.lang.String> createSystemStatsDataPath(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createSystemStatsDataTotalSpace

public javax.xml.bind.JAXBElement<java.lang.String> createSystemStatsDataTotalSpace(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createSystemStatsLastBackupBytes

public javax.xml.bind.JAXBElement<java.lang.String> createSystemStatsLastBackupBytes(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createSystemStatsLastBackupElapsedTime

public javax.xml.bind.JAXBElement<java.lang.String> createSystemStatsLastBackupElapsedTime(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createSystemStatsLastGoodBackup

public javax.xml.bind.JAXBElement<java.lang.String> createSystemStatsLastGoodBackup(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createSystemStatsLogsFreeSpace

public javax.xml.bind.JAXBElement<java.lang.String> createSystemStatsLogsFreeSpace(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createSystemStatsLogsPath

public javax.xml.bind.JAXBElement<java.lang.String> createSystemStatsLogsPath(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createSystemStatsLogsTotalSpace

public javax.xml.bind.JAXBElement<java.lang.String> createSystemStatsLogsTotalSpace(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createSystemStatsServerStats

public javax.xml.bind.JAXBElement<[ServerSystemStatsArray](#)> createSystemStatsServerStats([ServerSystemStatsArray](#) value)

Create an instance of JAXBElement<[ServerSystemStatsArray](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[ServerSystemStatsArray](#)>

createSystemStatsStatisticsRequestTime

public javax.xml.bind.JAXBElement<java.lang.String> createSystemStatsStatisticsRequestTime(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDnsTrustAnchorAutoUpdate

public javax.xml.bind.JAXBElement<java.lang.String> createDnsTrustAnchorAutoUpdate(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDnsTrustAnchorDescription

`public javax.xml.bind.JAXBElement<java.lang.String> createDnsTrustAnchorDescription(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDnsTrustAnchorTimestamp

`public javax.xml.bind.JAXBElement<java.lang.String> createDnsTrustAnchorTimestamp(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMSecondaryZoneAlternateViewIds

`public javax.xml.bind.JAXBElement<StringArray> createCCMSecondaryZoneAlternateViewIds(StringArray value)`

Create an instance of JAXBElement<StringArray>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<StringArray>

---

createCCMSecondaryZoneDescription

`public javax.xml.bind.JAXBElement<java.lang.String> createCCMSecondaryZoneDescription(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMSecondaryZoneDnssec

`public javax.xml.bind.JAXBElement<java.lang.String> createCCMSecondaryZoneDnssec(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createCCMSecondaryZoneNotify

public javax.xml.bind.JAXBElement<java.lang.String> createCCMSecondaryZoneNotify(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createCCMSecondaryZoneNotifyList

public javax.xml.bind.JAXBElement<StringArray> createCCMSecondaryZoneNotifyList(StringArray value)

Create an instance of JAXBElement<StringArray>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<StringArray>

createCCMSecondaryZoneRestrictQueryAcl

public javax.xml.bind.JAXBElement<java.lang.String> createCCMSecondaryZoneRestrictQueryAcl(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createCCMSecondaryZoneRestrictXfer

public javax.xml.bind.JAXBElement<java.lang.String> createCCMSecondaryZoneRestrictXfer(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createCCMSecondaryZoneRestrictXferAcl

public javax.xml.bind.JAXBElement<java.lang.String> createCCMSecondaryZoneRestrictXferAcl(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createCCMSecondaryZoneRoundRobin

public javax.xml.bind.JAXBElement<java.lang.String> createCCMSecondaryZoneRoundRobin(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMSecondaryZoneRpz

public javax.xml.bind.JAXBElement<java.lang.String> createCCMSecondaryZoneRpz(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMSecondaryZoneTenantId

public javax.xml.bind.JAXBElement<java.lang.String> createCCMSecondaryZoneTenantId(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMSecondaryZoneUseGssTsig

public javax.xml.bind.JAXBElement<java.lang.String> createCCMSecondaryZoneUseGssTsig(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMSecondaryZoneViewId

public javax.xml.bind.JAXBElement<java.lang.String> createCCMSecondaryZoneViewId(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createClientClassAction

public javax.xml.bind.JAXBElement<java.lang.String> createClientClassAction(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createClientClassAddToEnvironmentDictionary

public javax.xml.bind.JAXBElement<java.lang.String> createClientClassAddToEnvironmentDictionary(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createClientClassClientLookupId

public javax.xml.bind.JAXBElement<java.lang.String> createClientClassClientLookupId(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createClientClassDefaultVpn

public javax.xml.bind.JAXBElement<java.lang.String> createClientClassDefaultVpn(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createClientClassDomainName

public javax.xml.bind.JAXBElement<java.lang.String> createClientClassDomainName(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createClientClassEmbeddedPolicy

public javax.xml.bind.JAXBElement<Policy> createClientClassEmbeddedPolicy(Policy value)

Create an instance of JAXBElement<Policy>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[Policy](#)>

createClientClassHostName

public javax.xml.bind.JAXBElement<java.lang.String> createClientClassHostName(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createClientClassLimitationId

public javax.xml.bind.JAXBElement<java.lang.String> createClientClassLimitationId(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createClientClassOverLimitClientClassName

public javax.xml.bind.JAXBElement<java.lang.String> createClientClassOverLimitClientClassName(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createClientClassOverrideClientId

public javax.xml.bind.JAXBElement<java.lang.String> createClientClassOverrideClientId(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createClientClassOverrideVpn

public javax.xml.bind.JAXBElement<java.lang.String> createClientClassOverrideVpn(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createClientClassPolicyName

public javax.xml.bind.JAXBElement<java.lang.String> createClientClassPolicyName(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createClientClassSelectionCriteria

public javax.xml.bind.JAXBElement<StringArray> createClientClassSelectionCriteria(StringArray value)

Create an instance of JAXBElement<StringArray>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<StringArray>

createClientClassTenantId

public javax.xml.bind.JAXBElement<java.lang.String> createClientClassTenantId(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createClientClassUnauthenticatedClientClassName

public javax.xml.bind.JAXBElement<java.lang.String> createClientClassUnauthenticatedClientClassName(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createClientClassUserDefined

public javax.xml.bind.JAXBElement<java.lang.String> createClientClassUserDefined(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createClientClassV6ClientLookupId

```
public javax.xml.bind.JAXBElement<java.lang.String> createClientClassV6ClientLookupId(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createClientClassV6OverrideClientId

```
public javax.xml.bind.JAXBElement<java.lang.String> createClientClassV6OverrideClientId(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSRelatedServerAcknowledgedRequests

```
public javax.xml.bind.JAXBElement<java.lang.String> createDNSRelatedServerAcknowledgedRequests(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSRelatedServerCommState

```
public javax.xml.bind.JAXBElement<java.lang.String> createDNSRelatedServerCommState(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSRelatedServerCurrentTime

```
public javax.xml.bind.JAXBElement<java.lang.String> createDNSRelatedServerCurrentTime(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSRelatedServerDeactivatedCount

```
public javax.xml.bind.JAXBElement<java.lang.String> createDNSRelatedServerDeactivatedCount(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSRelatedServerDnsServerFlags

public javax.xml.bind.JAXBElement<java.lang.String> createDNSRelatedServerDnsServerFlags(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSRelatedServerDnsServerState

public javax.xml.bind.JAXBElement<java.lang.String> createDNSRelatedServerDnsServerState(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSRelatedServerDnsTimeout

public javax.xml.bind.JAXBElement<java.lang.String> createDNSRelatedServerDnsTimeout(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSRelatedServerHaDnsFailoverTimeout

public javax.xml.bind.JAXBElement<java.lang.String> createDNSRelatedServerHaDnsFailoverTimeout(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSRelatedServerHaDnsProbeRetry

public javax.xml.bind.JAXBElement<java.lang.String> createDNSRelatedServerHaDnsProbeRetry(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSRelatedServerHaDnsProbeTimeout

public javax.xml.bind.JAXBElement<java.lang.String> createDNSRelatedServerHaDnsProbeTimeout(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSRelatedServerHaDnsRole

public javax.xml.bind.JAXBElement<java.lang.String> createDNSRelatedServerHaDnsRole(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSRelatedServerInFlightRequests

public javax.xml.bind.JAXBElement<java.lang.String> createDNSRelatedServerInFlightRequests(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSRelatedServerIp6Address

public javax.xml.bind.JAXBElement<java.lang.String> createDNSRelatedServerIp6Address(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSRelatedServerIpaddr

public javax.xml.bind.JAXBElement<java.lang.String> createDNSRelatedServerIpaddr(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSRelatedServerLastHaDnsRoleSwitchTime

public javax.xml.bind.JAXBElement<java.lang.String> createDNSRelatedServerLastHaDnsRoleSwitchTime(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSRelatedServerLastProbeSentTime

public javax.xml.bind.JAXBElement<java.lang.String> createDNSRelatedServerLastProbeSentTime(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSRelatedServerLastReplyReceivedTime

public javax.xml.bind.JAXBElement<java.lang.String> createDNSRelatedServerLastReplyReceivedTime(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSRelatedServerMaxDnsRetries

public javax.xml.bind.JAXBElement<java.lang.String> createDNSRelatedServerMaxDnsRetries(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSRelatedServerMaxRequests

public javax.xml.bind.JAXBElement<java.lang.String> createDNSRelatedServerMaxRequests(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSRelatedServerProbePollingEventId

```
public javax.xml.bind.JAXBElement<java.lang.String> createDNSRelatedServerProbePollingEventId(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSRelatedServerRequests

```
public javax.xml.bind.JAXBElement<java.lang.String> createDNSRelatedServerRequests(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSRelatedServerServerDeactivatedCount

```
public javax.xml.bind.JAXBElement<java.lang.String> createDNSRelatedServerServerDeactivatedCount(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSRelatedServerTimedOutRequests

```
public javax.xml.bind.JAXBElement<java.lang.String> createDNSRelatedServerTimedOutRequests(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createPrefixAllocationAlgorithms

```
public javax.xml.bind.JAXBElement<java.lang.String> createPrefixAllocationAlgorithms(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createPrefixAllocationGroup

```
public javax.xml.bind.JAXBElement<java.lang.String> createPrefixAllocationGroup(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createPrefixAllocationGroupPriority

public javax.xml.bind.JAXBElement<java.lang.String> createPrefixAllocationGroupPriority(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createPrefixDeactivated

public javax.xml.bind.JAXBElement<java.lang.String> createPrefixDeactivated(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createPrefixDescription

public javax.xml.bind.JAXBElement<java.lang.String> createPrefixDescription(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createPrefixDhcpType

public javax.xml.bind.JAXBElement<java.lang.String> createPrefixDhcpType(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createPrefixEmbeddedPolicy

public javax.xml.bind.JAXBElement<Policy> createPrefixEmbeddedPolicy(Policy value)

Create an instance of JAXBElement<Policy>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[Policy](#)>

---

createPrefixExpirationTime

`public javax.xml.bind.JAXBElement<java.lang.String> createPrefixExpirationTime(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createPrefixFreeAddressConfig

`public javax.xml.bind.JAXBElement<java.lang.String> createPrefixFreeAddressConfig(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createPrefixIgnoreDeclines

`public javax.xml.bind.JAXBElement<java.lang.String> createPrefixIgnoreDeclines(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createPrefixLink

`public javax.xml.bind.JAXBElement<java.lang.String> createPrefixLink(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createPrefixLocalCluster

`public javax.xml.bind.JAXBElement<java.lang.String> createPrefixLocalCluster(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createPrefixMaintenance

public javax.xml.bind.JAXBElement<java.lang.String> createPrefixMaintenance(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createPrefixMaxLeases

public javax.xml.bind.JAXBElement<java.lang.String> createPrefixMaxLeases(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createPrefixMaxPdBalancingLength

public javax.xml.bind.JAXBElement<java.lang.String> createPrefixMaxPdBalancingLength(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createPrefixOwner

public javax.xml.bind.JAXBElement<java.lang.String> createPrefixOwner(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createPrefixPolicy

public javax.xml.bind.JAXBElement<java.lang.String> createPrefixPolicy(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createPrefixRange

`public javax.xml.bind.JAXBElement<java.lang.String> createPrefixRange(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createPrefixRangeEnd

`public javax.xml.bind.JAXBElement<java.lang.String> createPrefixRangeEnd(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createPrefixRangeStart

`public javax.xml.bind.JAXBElement<java.lang.String> createPrefixRangeStart(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createPrefixRegion

`public javax.xml.bind.JAXBElement<java.lang.String> createPrefixRegion(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createPrefixRestrictToAdminAllocation

`public javax.xml.bind.JAXBElement<java.lang.String> createPrefixRestrictToAdminAllocation(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createPrefixRestrictToReservations

public javax.xml.bind.JAXBElement<java.lang.String> createPrefixRestrictToReservations(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createPrefixReverseZonePrefixLength

public javax.xml.bind.JAXBElement<java.lang.String> createPrefixReverseZonePrefixLength(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createPrefixSelectionTags

public javax.xml.bind.JAXBElement<StringArray> createPrefixSelectionTags(StringArray value)

Create an instance of JAXBElement<StringArray>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<StringArray>

---

createPrefixTenantId

public javax.xml.bind.JAXBElement<java.lang.String> createPrefixTenantId(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createPrefixVpnId

public javax.xml.bind.JAXBElement<java.lang.String> createPrefixVpnId(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerStatsAnswersRrsetUnsecure

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsAnswersRrsetUnsecure(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSCachingServerStatsAnswersSecure

`public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsAnswersSecure(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSCachingServerStatsAnswersTotal

`public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsAnswersTotal(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSCachingServerStatsAnswersUnsecure

`public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsAnswersUnsecure(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSCachingServerStatsAnswersUnwanted

`public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsAnswersUnwanted(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSCachingServerStatsAnswersWithFormerr

`public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsAnswersWithFormerr(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSCachingServerStatsAnswersWithNodata

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsAnswersWithNodata(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSCachingServerStatsAnswersWithNoerror

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsAnswersWithNoerror(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSCachingServerStatsAnswersWithNotauth

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsAnswersWithNotauth(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSCachingServerStatsAnswersWithNotimp

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsAnswersWithNotimp(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSCachingServerStatsAnswersWithNxdomain

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsAnswersWithNxdomain(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSCachingServerStatsAnswersWithRefused

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsAnswersWithRefused(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSCachingServerStatsAnswersWithServfail

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsAnswersWithServfail(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSCachingServerStatsAnswersWithOtherErrors

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsAnswersWithOtherErrors(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSCachingServerStatsCacheHits

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsCacheHits(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSCachingServerStatsCacheMisses

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsCacheMisses(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSCachingServerStatsCachePrefetches

```
public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsCachePrefetches(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerStatsClientRateLimit

```
public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsClientRateLimit(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerStatsConfigRecurs

```
public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsConfigRecurs(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerStatsDns64A2AaaaConversions

```
public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsDns64A2AaaaConversions(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerStatsDns64PtrConversions

```
public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsDns64PtrConversions(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerStatsDomainRateLimit

```
public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsDomainRateLimit(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerStatsExceededMaxTargetCount

`public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsExceededMaxTargetCount(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerStatsFirewallDropped

`public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsFirewallDropped(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerStatsFirewallRedirectNxdomain

`public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsFirewallRedirectNxdomain(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerStatsFirewallRedirected

`public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsFirewallRedirected(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerStatsFirewallRefused

`public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsFirewallRefused(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerStatsFirewallRpz

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsFirewallRpz(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerStatsHttpsQueryBuffer

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsHttpsQueryBuffer(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerStatsHttpsResponseBuffer

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsHttpsResponseBuffer(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerStatsImmediateResponseAverage

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsImmediateResponseAverage(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerStatsImmediateResponseCount

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsImmediateResponseCount(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSCachingServerStatsImmediateResponseMedian

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsImmediateResponseMedian(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSCachingServerStatsKeyCacheExceeded

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsKeyCacheExceeded(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSCachingServerStatsMemCache

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsMemCache(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSCachingServerStatsMemCacheExceeded

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsMemCacheExceeded(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSCachingServerStatsMemIterator

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsMemIterator(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSCachingServerStatsMemProcess

```
public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsMemProcess(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerStatsMemQueryCache

```
public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsMemQueryCache(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerStatsMemQueryCacheExceeded

```
public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsMemQueryCacheExceeded(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerStatsMemValidator

```
public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsMemValidator(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerStatsName

```
public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsName(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerStatsQueriesFailingAcl

```
public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsQueriesFailingAcl(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerStatsQueriesOverHttps

```
public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsQueriesOverHttps(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerStatsQueriesOverHttpsFailed

```
public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsQueriesOverHttpsFailed(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerStatsQueriesOverIpv6

```
public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsQueriesOverIpv6(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerStatsQueriesOverTcp

```
public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsQueriesOverTcp(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerStatsQueriesOverTls

```
public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsQueriesOverTls(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerStatsQueriesPerSecond

`public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsQueriesPerSecond(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerStatsQueriesTotal

`public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsQueriesTotal(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerStatsQueriesTypeA

`public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsQueriesTypeA(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerStatsQueriesTypeAaaa

`public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsQueriesTypeAaaa(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerStatsQueriesTypeAny

`public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsQueriesTypeAny(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSCachingServerStatsQueriesTypeCname

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsQueriesTypeCname(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSCachingServerStatsQueriesTypeDnskey

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsQueriesTypeDnskey (java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSCachingServerStatsQueriesTypeDs

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsQueriesTypeDs(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSCachingServerStatsQueriesTypeHttps

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsQueriesTypeHttps(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSCachingServerStatsQueriesTypeMx

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsQueriesTypeMx(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSCachingServerStatsQueriesTypeNaptr

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsQueriesTypeNaptr(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerStatsQueriesTypeNs

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsQueriesTypeNs(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerStatsQueriesTypeNsec

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsQueriesTypeNsec(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerStatsQueriesTypeNsec3

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsQueriesTypeNsec3(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerStatsQueriesTypePtr

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsQueriesTypePtr(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerStatsQueriesTypeRrsig

```
public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsQueriesTypeRrsig(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerStatsQueriesTypeSoa

```
public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsQueriesTypeSoa(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerStatsQueriesTypeSrv

```
public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsQueriesTypeSrv(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerStatsQueriesTypeSvcb

```
public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsQueriesTypeSvcb(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerStatsQueriesTypeTxt

```
public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsQueriesTypeTxt(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerStatsQueriesTypeOther

```
public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsQueriesTypeOther(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerStatsQueriesUnwantedClass

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsQueriesUnwantedClass(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerStatsQueriesWithEdns

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsQueriesWithEdns(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerStatsQueriesWithEdnsDo

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsQueriesWithEdnsDo(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerStatsQueriesWithFlagAa

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsQueriesWithFlagAa(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerStatsQueriesWithFlagAd

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsQueriesWithFlagAd(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSCachingServerStatsQueriesWithFlagCd

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsQueriesWithFlagCd(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSCachingServerStatsQueriesWithFlagQr

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsQueriesWithFlagQr(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSCachingServerStatsQueriesWithFlagRa

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsQueriesWithFlagRa(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSCachingServerStatsQueriesWithFlagRd

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsQueriesWithFlagRd(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSCachingServerStatsQueriesWithFlagTc

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsQueriesWithFlagTc(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSCachingServerStatsQueriesWithFlagZ

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsQueriesWithFlagZ(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSCachingServerStatsRecursiveRepliesTotal

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsRecursiveRepliesTotal(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSCachingServerStatsRecursiveTimeAverage

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsRecursiveTimeAverage(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSCachingServerStatsRecursiveTimeMedian

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsRecursiveTimeMedian(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSCachingServerStatsRemoteNsCacheExceeded

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsRemoteNsCacheExceeded(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSCachingServerStatsRequestlistTotal

```
public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsRequestlistTotal(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerStatsRequestlistTotalAverage

```
public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsRequestlistTotalAverage(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerStatsRequestlistTotalExceeded

```
public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsRequestlistTotalExceeded(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerStatsRequestlistTotalMax

```
public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsRequestlistTotalMax(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerStatsRequestlistTotalOverwritten

```
public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsRequestlistTotalOverwritten(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerStatsRequestlistTotalSystem

```
public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsRequestlistTotalSystem(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerStatsRequestlistTotalUser

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsRequestlistTotalUser(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerStatsResetTime

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsResetTime(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerStatsRestartTime

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsRestartTime(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerStatsConfigResetTime

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsConfigResetTime(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerStatsRpzAxfrs

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsRpzAxfrs(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

createDNSCachingServerStatsRpzCname

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsRpzCname(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSCachingServerStatsRpzDisabled

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsRpzDisabled(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSCachingServerStatsRpzDrop

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsRpzDrop(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSCachingServerStatsRpzInvalid

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsRpzInvalid(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSCachingServerStatsRpzIxfrs

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsRpzIxfrs(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSCachingServerStatsRpzLocal

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsRpzLocal(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerStatsRpzNoOverride

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsRpzNoOverride(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerStatsRpzNodata

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsRpzNodata(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerStatsRpzNotifys

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsRpzNotifys(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerStatsRpzNotifysInvalid

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsRpzNotifysInvalid(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerStatsRpzNxdomain

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsRpzNxdomain(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerStatsRpzPassthru

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsRpzPassthru(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerStatsRpzRrsAdded

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsRpzRrsAdded(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerStatsRpzRrsRemoved

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsRpzRrsRemoved(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerStatsRpzRrsetCount

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsRpzRrsetCount(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerStatsRpzTcp

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsRpzTcp(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerStatsSampleInterval

`public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsSampleInterval(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerStatsSampleTime

`public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsSampleTime(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerStatsSecurityEvents

`public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsSecurityEvents(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerStatsSecurityEventsAlarm

`public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsSecurityEventsAlarm(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerStatsSecurityEventsPeriodic

`public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsSecurityEventsPeriodic(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerStatsSecurityEventsAmplificationAttack

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsSecurityEventsAmplificationAttack(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerStatsSecurityEventsDnsTunneling

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsSecurityEventsDnsTunneling(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerStatsSecurityEventsDos

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsSecurityEventsDos(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerStatsSecurityEventsFirewall

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsSecurityEventsFirewall(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerStatsSecurityEventsMalware

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsSecurityEventsMalware(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSCachingServerStatsSecurityEventsPhishing

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsSecurityEventsPhishing(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSCachingServerStatsSecurityEventsPoisoning

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsSecurityEventsPoisoning(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSCachingServerStatsSecurityEventsSnooping

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsSecurityEventsSnooping(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSCachingServerStatsSmartCache

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsSmartCache(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSCachingServerStatsTimeCurrent

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsTimeCurrent(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSCachingServerStatsTimeElapsed

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsTimeElapsed(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSCachingServerStatsTimeUp

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsTimeUp(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSCachingServerStatsTlsErrorsIn

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsTlsErrorsIn(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSCachingServerStatsTlsErrorsOut

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsTlsErrorsOut(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSCachingServerStatsUpstreamQueriesTcp

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsUpstreamQueriesTcp(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSCachingServerStatsUpstreamQueriesTls

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsUpstreamQueriesTls(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSCachingServerStatsUpstreamQueriesUdp

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerStatsUpstreamQueriesUdp(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDnsForwarderAddr

public javax.xml.bind.JAXBElement<DnsIPnPortArray> createDnsForwarderAddr(DnsIPnPortArray value)

Create an instance of JAXBElement<DnsIPnPortArray>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<DnsIPnPortArray>

---

createDnsForwarderCiscoUmbrella

public javax.xml.bind.JAXBElement<java.lang.String> createDnsForwarderCiscoUmbrella(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDnsForwarderDescription

public javax.xml.bind.JAXBElement<java.lang.String> createDnsForwarderDescription(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDnsForwarderHost

public javax.xml.bind.JAXBElement<StringArray> createDnsForwarderHost(StringArray value)

Create an instance of JAXBElement<StringArray>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[StringArray](#)>

createDnsForwarderTls

public javax.xml.bind.JAXBElement<java.lang.String> createDnsForwarderTls(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDnsForwarderTlsAuthName

public javax.xml.bind.JAXBElement<java.lang.String> createDnsForwarderTlsAuthName(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSServerIPv6StatsIpv6PacketsIn

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerIPv6StatsIpv6PacketsIn(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSServerIPv6StatsIpv6PacketsOut

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerIPv6StatsIpv6PacketsOut(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDnsSecAggressiveNsec

public javax.xml.bind.JAXBElement<java.lang.String> createDnsSecAggressiveNsec(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDnsSecDnssec

public javax.xml.bind.JAXBElement<java.lang.String> createDnsSecDnssec(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDnsSecDomainInsecure

public javax.xml.bind.JAXBElement<StringArray> createDnsSecDomainInsecure(StringArray value)

Create an instance of JAXBElement<StringArray>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<StringArray>

---

createDnsSecKeyCacheSize

public javax.xml.bind.JAXBElement<java.lang.String> createDnsSecKeyCacheSize(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDnsSecNegCacheSize

public javax.xml.bind.JAXBElement<java.lang.String> createDnsSecNegCacheSize(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDnsSecPrefetchKey

public javax.xml.bind.JAXBElement<java.lang.String> createDnsSecPrefetchKey(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDnsSecTrustAnchorList

public javax.xml.bind.JAXBElement<[StringArray](#)> createDnsSecTrustAnchorList([StringArray](#) value)

Create an instance of JAXBElement<[StringArray](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[StringArray](#)>

createCCMZoneAlternateViewIds

public javax.xml.bind.JAXBElement<[StringArray](#)> createCCMZoneAlternateViewIds([StringArray](#) value)

Create an instance of JAXBElement<[StringArray](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[StringArray](#)>

createCCMZoneDefttl

public javax.xml.bind.JAXBElement<java.lang.String> createCCMZoneDefttl(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createCCMZoneDescription

public javax.xml.bind.JAXBElement<java.lang.String> createCCMZoneDescription(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createCCMZoneDistMap

public javax.xml.bind.JAXBElement<java.lang.String> createCCMZoneDistMap(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createCCMZoneDnssec

public javax.xml.bind.JAXBElement<java.lang.String> createCCMZoneDnssec(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMZoneDsRr

public javax.xml.bind.JAXBElement<java.lang.String> createCCMZoneDsRr(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMZoneExpire

public javax.xml.bind.JAXBElement<java.lang.String> createCCMZoneExpire(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMZoneKeyGroup

public javax.xml.bind.JAXBElement<java.lang.String> createCCMZoneKeyGroup(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMZoneMinttl

public javax.xml.bind.JAXBElement<java.lang.String> createCCMZoneMinttl(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMZoneNotify

public javax.xml.bind.JAXBElement<java.lang.String> createCCMZoneNotify(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMZoneNotifyList

public javax.xml.bind.JAXBElement<StringArray> createCCMZoneNotifyList(StringArray value)

Create an instance of JAXBElement<StringArray>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<StringArray>

---

createCCMZoneNsttl

public javax.xml.bind.JAXBElement<java.lang.String> createCCMZoneNsttl(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMZoneOwner

public javax.xml.bind.JAXBElement<java.lang.String> createCCMZoneOwner(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMZoneRefresh

public javax.xml.bind.JAXBElement<java.lang.String> createCCMZoneRefresh(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMZoneRegion

public javax.xml.bind.JAXBElement<java.lang.String> createCCMZoneRegion(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMZoneRestrictQueryAcl

public javax.xml.bind.JAXBElement<java.lang.String> createCCMZoneRestrictQueryAcl(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMZoneRestrictXfer

public javax.xml.bind.JAXBElement<java.lang.String> createCCMZoneRestrictXfer(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMZoneRestrictXferAcl

public javax.xml.bind.JAXBElement<java.lang.String> createCCMZoneRestrictXferAcl(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMZoneRetry

public javax.xml.bind.JAXBElement<java.lang.String> createCCMZoneRetry(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMZoneRoundRobin

public javax.xml.bind.JAXBElement<java.lang.String> createCCMZoneRoundRobin(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createCCMZoneRpz

public javax.xml.bind.JAXBElement<java.lang.String> createCCMZoneRpz(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMZoneScvgEnabled

public javax.xml.bind.JAXBElement<java.lang.String> createCCMZoneScvgEnabled(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMZoneScvgInterval

public javax.xml.bind.JAXBElement<java.lang.String> createCCMZoneScvgInterval(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMZoneScvgMaxRecords

public javax.xml.bind.JAXBElement<java.lang.String> createCCMZoneScvgMaxRecords(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMZoneScvgRefreshInterval

public javax.xml.bind.JAXBElement<java.lang.String> createCCMZoneScvgRefreshInterval(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMZoneSoattl

```java
public javax.xml.bind.JAXBElement<java.lang.String> createCCMZoneSoattl(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMZoneTenantId

```java
public javax.xml.bind.JAXBElement<java.lang.String> createCCMZoneTenantId(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMZoneUpdateAcl

```java
public javax.xml.bind.JAXBElement<java.lang.String> createCCMZoneUpdateAcl(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMZoneUpdatePolicyList

```java
public javax.xml.bind.JAXBElement<StringArray> createCCMZoneUpdatePolicyList(StringArray value)
```

Create an instance of JAXBElement<StringArray>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<StringArray>

---

createCCMZoneViewId

```java
public javax.xml.bind.JAXBElement<java.lang.String> createCCMZoneViewId(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerHaStatsHaFullZoneResync

```java
public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerHaStatsHaFullZoneResync(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerHaStatsHaMsgConnectRecv

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerHaStatsHaMsgConnectRecv(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerHaStatsHaMsgConnectSent

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerHaStatsHaMsgConnectSent(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerHaStatsHaMsgHeartbeatRecv

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerHaStatsHaMsgHeartbeatRecv(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerHaStatsHaMsgHeartbeatSent

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerHaStatsHaMsgHeartbeatSent(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerHaStatsHaMsgReconcileRecv

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerHaStatsHaMsgReconcileRecv(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerHaStatsHaMsgReconcileSent

`public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerHaStatsHaMsgReconcileSent(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerHaStatsHaMsgReqRecv

`public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerHaStatsHaMsgReqRecv(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerHaStatsHaMsgReqRecvTime

`public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerHaStatsHaMsgReqRecvTime(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerHaStatsHaMsgReqSent

`public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerHaStatsHaMsgReqSent(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerHaStatsHaMsgReqSentTime

`public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerHaStatsHaMsgReqSentTime(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSServerHaStatsHaMsgRespRecv

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerHaStatsHaMsgRespRecv(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSServerHaStatsHaMsgRespSent

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerHaStatsHaMsgRespSent(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSServerHaStatsHaMsgRrsyncRecv

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerHaStatsHaMsgRrsyncRecv(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSServerHaStatsHaMsgRrsyncSent

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerHaStatsHaMsgRrsyncSent(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSServerHaStatsHaMsgRrupdateRecv

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerHaStatsHaMsgRrupdateRecv(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSServerHaStatsHaMsgRrupdateSent

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerHaStatsHaMsgRrupdateSent(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerHaStatsHaMsgShutdownRecv

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerHaStatsHaMsgShutdownRecv(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerHaStatsHaMsgShutdownSent

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerHaStatsHaMsgShutdownSent(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerHaStatsHaMsgZonesyncRecv

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerHaStatsHaMsgZonesyncRecv(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerHaStatsHaMsgZonesyncSent

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerHaStatsHaMsgZonesyncSent(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerHaStatsHaRespInconsistent

```
public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerHaStatsHaRespInconsistent(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerHaStatsHaRespServfail

```
public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerHaStatsHaRespServfail(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerHaStatsHaRespUnknown

```
public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerHaStatsHaRespUnknown(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerHaStatsHaStateCommInterrupted

```
public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerHaStatsHaStateCommInterrupted(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerHaStatsHaCommInterrupted

```
public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerHaStatsHaCommInterrupted(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerHaStatsHaStateCurrent

```
public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerHaStatsHaStateCurrent(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerHaStatsHaCurrentState

`public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerHaStatsHaCurrentState(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerHaStatsHaStateLastChangeTime

`public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerHaStatsHaStateLastChangeTime(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerHaStatsHaLastTimeStateChanged

`public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerHaStatsHaLastTimeStateChanged(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerHaStatsHaStateNegotiating

`public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerHaStatsHaStateNegotiating(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerHaStatsHaSync

`public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerHaStatsHaSync(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerHaStatsHaStateNormal

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerHaStatsHaStateNormal(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerHaStatsHaStatePartnerDown

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerHaStatsHaStatePartnerDown(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerHaStatsHaPartnerDown

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerHaStatsHaPartnerDown(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerHaStatsHaStateStartup

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerHaStatsHaStateStartup(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerHaStatsHaSyncConflict

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerHaStatsHaSyncConflict(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSServerHaStatsHaSyncDiscardName

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerHaStatsHaSyncDiscardName(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSServerHaStatsHaSyncMergeName

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerHaStatsHaSyncMergeName(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSServerHaStatsHaUpdateReject

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerHaStatsHaUpdateReject(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSServerHaStatsHaZoneMismatch

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerHaStatsHaZoneMismatch(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createCCMClusterAddrutilPollInterval

public javax.xml.bind.JAXBElement<java.lang.String> createCCMClusterAddrutilPollInterval(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createCCMClusterPollSubnetUtilInterval

```
public javax.xml.bind.JAXBElement<java.lang.String> createCCMClusterPollSubnetUtilInterval(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMClusterAddrutilPollOffset

```
public javax.xml.bind.JAXBElement<java.lang.String> createCCMClusterAddrutilPollOffset(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMClusterPollSubnetUtilOffset

```
public javax.xml.bind.JAXBElement<java.lang.String> createCCMClusterPollSubnetUtilOffset(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMClusterAddrutilPollRetry

```
public javax.xml.bind.JAXBElement<java.lang.String> createCCMClusterAddrutilPollRetry(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMClusterPollSubnetUtilRetry

```
public javax.xml.bind.JAXBElement<java.lang.String> createCCMClusterPollSubnetUtilRetry(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMClusterAdmin

```
public javax.xml.bind.JAXBElement<java.lang.String> createCCMClusterAdmin(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMClusterClusterId

`public javax.xml.bind.JAXBElement<java.lang.String> createCCMClusterClusterId(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMClusterFqdn

`public javax.xml.bind.JAXBElement<java.lang.String> createCCMClusterFqdn(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMClusterHttpPort

`public javax.xml.bind.JAXBElement<java.lang.String> createCCMClusterHttpPort(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMClusterHttpsPort

`public javax.xml.bind.JAXBElement<java.lang.String> createCCMClusterHttpsPort(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMClusterIp6Address

`public javax.xml.bind.JAXBElement<java.lang.String> createCCMClusterIp6Address(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMClusterIpaddr

`public javax.xml.bind.JAXBElement<java.lang.String> createCCMClusterIpaddr(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMClusterLeaseHistPollInterval

`public javax.xml.bind.JAXBElement<java.lang.String> createCCMClusterLeaseHistPollInterval(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMClusterPollLeaseHistInterval

`public javax.xml.bind.JAXBElement<java.lang.String> createCCMClusterPollLeaseHistInterval(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMClusterLeaseHistPollOffset

`public javax.xml.bind.JAXBElement<java.lang.String> createCCMClusterLeaseHistPollOffset(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMClusterPollLeaseHistOffset

`public javax.xml.bind.JAXBElement<java.lang.String> createCCMClusterPollLeaseHistOffset(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createCCMClusterLeaseHistPollRetry

public javax.xml.bind.JAXBElement<java.lang.String> createCCMClusterLeaseHistPollRetry(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:
value - Java instance representing xml element's value.

Returns:
the new instance of JAXBElement<String>

createCCMClusterPollLeaseHistRetry

public javax.xml.bind.JAXBElement<java.lang.String> createCCMClusterPollLeaseHistRetry(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:
value - Java instance representing xml element's value.

Returns:
the new instance of JAXBElement<String>

createCCMClusterLicensedServices

public javax.xml.bind.JAXBElement<java.lang.String> createCCMClusterLicensedServices(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:
value - Java instance representing xml element's value.

Returns:
the new instance of JAXBElement<String>

createCCMClusterLocalServers

public javax.xml.bind.JAXBElement<CCMServerArray> createCCMClusterLocalServers(CCMServerArray value)

Create an instance of JAXBElement<CCMServerArray>

Parameters:
value - Java instance representing xml element's value.

Returns:
the new instance of JAXBElement<CCMServerArray>

createCCMClusterPassword

public javax.xml.bind.JAXBElement<java.lang.String> createCCMClusterPassword(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:
value - Java instance representing xml element's value.

Returns:
the new instance of JAXBElement<String>

createCCMClusterPasswordSecret

public javax.xml.bind.JAXBElement<java.lang.String> createCCMClusterPasswordSecret(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMClusterPollReplicaRrs

public javax.xml.bind.JAXBElement<java.lang.String> createCCMClusterPollReplicaRrs(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMClusterProductVersion

public javax.xml.bind.JAXBElement<java.lang.String> createCCMClusterProductVersion(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMClusterRemoteId

public javax.xml.bind.JAXBElement<java.lang.String> createCCMClusterRemoteId(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMClusterReplicaPollInterval

public javax.xml.bind.JAXBElement<java.lang.String> createCCMClusterReplicaPollInterval(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMClusterPollReplicaInterval

public javax.xml.bind.JAXBElement<java.lang.String> createCCMClusterPollReplicaInterval(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMClusterReplicaPollOffset

public javax.xml.bind.JAXBElement<java.lang.String> createCCMClusterReplicaPollOffset(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMClusterPollReplicaOffset

public javax.xml.bind.JAXBElement<java.lang.String> createCCMClusterPollReplicaOffset(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMClusterReplicationInitialized

public javax.xml.bind.JAXBElement<java.lang.String> createCCMClusterReplicationInitialized(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMClusterRestoreState

public javax.xml.bind.JAXBElement<java.lang.String> createCCMClusterRestoreState(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMClusterScpPort

public javax.xml.bind.JAXBElement<java.lang.String> createCCMClusterScpPort(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createCCMClusterScpReadTimeout

public javax.xml.bind.JAXBElement<java.lang.String> createCCMClusterScpReadTimeout(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createCCMClusterSharedSecret

public javax.xml.bind.JAXBElement<java.lang.String> createCCMClusterSharedSecret(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createCCMClusterTenantId

public javax.xml.bind.JAXBElement<java.lang.String> createCCMClusterTenantId(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createCCMClusterUseHttpsPort

public javax.xml.bind.JAXBElement<java.lang.String> createCCMClusterUseHttpsPort(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createCCMClusterUseSsl

public javax.xml.bind.JAXBElement<java.lang.String> createCCMClusterUseSsl(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMHostAddrs

public javax.xml.bind.JAXBElement<StringArray> createCCMHostAddrs(StringArray value)

Create an instance of JAXBElement<StringArray>

Parameters:
value - Java instance representing xml element's value.

Returns:
the new instance of JAXBElement<StringArray>

---

createCCMHostAliases

public javax.xml.bind.JAXBElement<StringArray> createCCMHostAliases(StringArray value)

Create an instance of JAXBElement<StringArray>

Parameters:
value - Java instance representing xml element's value.

Returns:
the new instance of JAXBElement<StringArray>

---

createCCMHostCreatePtrRecords

public javax.xml.bind.JAXBElement<java.lang.String> createCCMHostCreatePtrRecords(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:
value - Java instance representing xml element's value.

Returns:
the new instance of JAXBElement<String>

---

createCCMHostIp6AddressList

public javax.xml.bind.JAXBElement<StringArray> createCCMHostIp6AddressList(StringArray value)

Create an instance of JAXBElement<StringArray>

Parameters:
value - Java instance representing xml element's value.

Returns:
the new instance of JAXBElement<StringArray>

---

createCCMHostName

public javax.xml.bind.JAXBElement<java.lang.String> createCCMHostName(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:
value - Java instance representing xml element's value.

Returns:
the new instance of JAXBElement<String>

createCCMHostTenantId

public javax.xml.bind.JAXBElement<java.lang.String> createCCMHostTenantId(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMHostViewId

public javax.xml.bind.JAXBElement<java.lang.String> createCCMHostViewId(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMHostZone

public javax.xml.bind.JAXBElement<java.lang.String> createCCMHostZone(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMHostZoneOrigin

public javax.xml.bind.JAXBElement<java.lang.String> createCCMHostZoneOrigin(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCertificateCertificateContents

public javax.xml.bind.JAXBElement<java.lang.String> createCertificateCertificateContents(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCertificateConfiguredBy

```
public javax.xml.bind.JAXBElement<java.lang.String> createCertificateConfiguredBy(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCertificateDescription

```
public javax.xml.bind.JAXBElement<java.lang.String> createCertificateDescription(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCertificateIssuer

```
public javax.xml.bind.JAXBElement<java.lang.String> createCertificateIssuer(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCertificateKeyContents

```
public javax.xml.bind.JAXBElement<java.lang.String> createCertificateKeyContents(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCertificatePublicKeyAlgorithm

```
public javax.xml.bind.JAXBElement<java.lang.String> createCertificatePublicKeyAlgorithm(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCertificateSerialNumber

```
public javax.xml.bind.JAXBElement<java.lang.String> createCertificateSerialNumber(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCertificateSignatureAlgorithm

public javax.xml.bind.JAXBElement<java.lang.String> createCertificateSignatureAlgorithm(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCertificateSubject

public javax.xml.bind.JAXBElement<java.lang.String> createCertificateSubject(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCertificateValidityNotAfter

public javax.xml.bind.JAXBElement<java.lang.String> createCertificateValidityNotAfter(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCertificateValidityNotBefore

public javax.xml.bind.JAXBElement<java.lang.String> createCertificateValidityNotBefore(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCertificateValidityPeriod

public javax.xml.bind.JAXBElement<java.lang.String> createCertificateValidityPeriod(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createCertificateVersion

public javax.xml.bind.JAXBElement<java.lang.String> createCertificateVersion(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:
value - Java instance representing xml element's value.

Returns:
the new instance of JAXBElement<String>

createKeyAlgorithm

public javax.xml.bind.JAXBElement<java.lang.String> createKeyAlgorithm(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:
value - Java instance representing xml element's value.

Returns:
the new instance of JAXBElement<String>

createKeyDescription

public javax.xml.bind.JAXBElement<java.lang.String> createKeyDescription(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:
value - Java instance representing xml element's value.

Returns:
the new instance of JAXBElement<String>

createKeyId

public javax.xml.bind.JAXBElement<java.lang.String> createKeyId(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:
value - Java instance representing xml element's value.

Returns:
the new instance of JAXBElement<String>

createKeySecurityType

public javax.xml.bind.JAXBElement<java.lang.String> createKeySecurityType(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:
value - Java instance representing xml element's value.

Returns:
the new instance of JAXBElement<String>

createKeyTenantId

public javax.xml.bind.JAXBElement<java.lang.String> createKeyTenantId(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createKeyTimeSkew

public javax.xml.bind.JAXBElement<java.lang.String> createKeyTimeSkew(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createLinkLinkType

public javax.xml.bind.JAXBElement<java.lang.String> createLinkLinkType(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createLinkDescription

public javax.xml.bind.JAXBElement<java.lang.String> createLinkDescription(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createLinkEmbeddedPolicy

public javax.xml.bind.JAXBElement<Policy> createLinkEmbeddedPolicy(Policy value)

Create an instance of JAXBElement<Policy>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<Policy>

---

createLinkFreeAddressConfig

```
public javax.xml.bind.JAXBElement<java.lang.String> createLinkFreeAddressConfig(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createLinkGroupName

```
public javax.xml.bind.JAXBElement<java.lang.String> createLinkGroupName(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createLinkInterface

```
public javax.xml.bind.JAXBElement<java.lang.String> createLinkInterface(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createLinkLocalCluster

```
public javax.xml.bind.JAXBElement<java.lang.String> createLinkLocalCluster(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createLinkMaintenance

```
public javax.xml.bind.JAXBElement<java.lang.String> createLinkMaintenance(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createLinkOwner

```
public javax.xml.bind.JAXBElement<java.lang.String> createLinkOwner(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createLinkPolicy

public javax.xml.bind.JAXBElement<java.lang.String> createLinkPolicy(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createLinkPrefixList

public javax.xml.bind.JAXBElement<[PrefixArray](#)> createLinkPrefixList([PrefixArray](#) value)

Create an instance of JAXBElement<[PrefixArray](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[PrefixArray](#)>

---

createLinkRegion

public javax.xml.bind.JAXBElement<java.lang.String> createLinkRegion(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createLinkTemplateRootPrefix

public javax.xml.bind.JAXBElement<java.lang.String> createLinkTemplateRootPrefix(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createLinkTenantId

public javax.xml.bind.JAXBElement<java.lang.String> createLinkTenantId(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createLinkVpnId

`public javax.xml.bind.JAXBElement<java.lang.String> createLinkVpnId(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCdnsDomainRateLimitAppliesTo

`public javax.xml.bind.JAXBElement<java.lang.String> createCdnsDomainRateLimitAppliesTo(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCdnsDomainRateLimitRateLimit

`public javax.xml.bind.JAXBElement<java.lang.String> createCdnsDomainRateLimitRateLimit(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPMaintenanceWindowAllPrefixesLinks

`public javax.xml.bind.JAXBElement<java.lang.String> createDHCPMaintenanceWindowAllPrefixesLinks(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPMaintenanceWindowAllScopes

`public javax.xml.bind.JAXBElement<java.lang.String> createDHCPMaintenanceWindowAllScopes(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDHCPMaintenanceWindowEnd

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPMaintenanceWindowEnd(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPMaintenanceWindowRefreshPeriod

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPMaintenanceWindowRefreshPeriod(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPMaintenanceWindowStart

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPMaintenanceWindowStart(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDnsEnumEntryDnsEnumEntryType

public javax.xml.bind.JAXBElement<java.lang.String> createDnsEnumEntryDnsEnumEntryType(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDnsEnumEntryOrder

public javax.xml.bind.JAXBElement<java.lang.String> createDnsEnumEntryOrder(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDnsEnumEntryPreference

public javax.xml.bind.JAXBElement<java.lang.String> createDnsEnumEntryPreference(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDnsEnumEntrySubtype

public javax.xml.bind.JAXBElement<java.lang.String> createDnsEnumEntrySubtype(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPFailoverStatsActiveBindingUpdateLatencyAverage

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPFailoverStatsActiveBindingUpdateLatencyAverage(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPFailoverStatsActiveBindingUpdateLatencyCounts

public javax.xml.bind.JAXBElement<StringArray> createDHCPFailoverStatsActiveBindingUpdateLatencyCounts(StringArray value)

Create an instance of JAXBElement<StringArray>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<StringArray>

---

createDHCPFailoverStatsActiveBindingUpdateLatencyMaximum

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPFailoverStatsActiveBindingUpdateLatencyMaximum(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPFailoverStatsBindingAcksReceived

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPFailoverStatsBindingAcksReceived(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPFailoverStatsBindingAcksSent

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPFailoverStatsBindingAcksSent(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPFailoverStatsBindingNaksReceived

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPFailoverStatsBindingNaksReceived(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPFailoverStatsBindingNaksSent

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPFailoverStatsBindingNaksSent(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPFailoverStatsBindingUpdatesReceived

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPFailoverStatsBindingUpdatesReceived(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPFailoverStatsBindingUpdatesSent

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPFailoverStatsBindingUpdatesSent(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPFailoverStatsConnectAcksReceived

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPFailoverStatsConnectAcksReceived(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPFailoverStatsConnectAcksSent

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPFailoverStatsConnectAcksSent(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPFailoverStatsConnectionsTerminatedByPartner

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPFailoverStatsConnectionsTerminatedByPartner(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPFailoverStatsConnectionsTerminatedByServer

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPFailoverStatsConnectionsTerminatedByServer(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPFailoverStatsConnectsReceived

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPFailoverStatsConnectsReceived(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDHCPFailoverStatsConnectsSent

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPFailoverStatsConnectsSent(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDHCPFailoverStatsContactsReceived

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPFailoverStatsContactsReceived(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDHCPFailoverStatsContactsSent

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPFailoverStatsContactsSent(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDHCPFailoverStatsDecayingMaxRequestBuffersInUse

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPFailoverStatsDecayingMaxRequestBuffersInUse(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDHCPFailoverStatsDiscardedMessages

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPFailoverStatsDiscardedMessages(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDHCPFailoverStatsDisconnectsReceived

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPFailoverStatsDisconnectsReceived(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:
value - Java instance representing xml element's value.

Returns:
the new instance of JAXBElement<String>

---

createDHCPFailoverStatsDisconnectsSent

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPFailoverStatsDisconnectsSent(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:
value - Java instance representing xml element's value.

Returns:
the new instance of JAXBElement<String>

---

createDHCPFailoverStatsFailedConnections

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPFailoverStatsFailedConnections(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:
value - Java instance representing xml element's value.

Returns:
the new instance of JAXBElement<String>

---

createDHCPFailoverStatsInvalidConnections

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPFailoverStatsInvalidConnections(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:
value - Java instance representing xml element's value.

Returns:
the new instance of JAXBElement<String>

---

createDHCPFailoverStatsInvalidMessagesReceived

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPFailoverStatsInvalidMessagesReceived(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:
value - Java instance representing xml element's value.

Returns:
the new instance of JAXBElement<String>

---

createDHCPFailoverStatsPacketsReceived

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPFailoverStatsPacketsReceived(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDHCPFailoverStatsPacketsSent

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPFailoverStatsPacketsSent(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDHCPFailoverStatsPoolRequestsReceived

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPFailoverStatsPoolRequestsReceived(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDHCPFailoverStatsPoolResponsesSent

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPFailoverStatsPoolResponsesSent(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDHCPFailoverStatsQueuedBindingUpdateLatencyAverage

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPFailoverStatsQueuedBindingUpdateLatencyAverage(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDHCPFailoverStatsQueuedBindingUpdateLatencyCounts

public javax.xml.bind.JAXBElement<StringArray> createDHCPFailoverStatsQueuedBindingUpdateLatencyCounts(StringArray value)

Create an instance of JAXBElement<StringArray>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<StringArray>

createDHCPFailoverStatsQueuedBindingUpdateLatencyMaximum

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPFailoverStatsQueuedBindingUpdateLatencyMaximum(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDHCPFailoverStatsQueuedBindingUpdates

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPFailoverStatsQueuedBindingUpdates(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDHCPFailoverStatsRequestBuffersAllocated

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPFailoverStatsRequestBuffersAllocated(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDHCPFailoverStatsRequestBuffersInUse

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPFailoverStatsRequestBuffersInUse(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDHCPFailoverStatsStateReceived

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPFailoverStatsStateReceived(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDHCPFailoverStatsStateSent

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPFailoverStatsStateSent(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDHCPFailoverStatsSuccessfulConnections

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPFailoverStatsSuccessfulConnections(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDHCPFailoverStatsUnavailableRequests

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPFailoverStatsUnavailableRequests(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDHCPFailoverStatsUpdateDoneReceived

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPFailoverStatsUpdateDoneReceived(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDHCPFailoverStatsUpdateDoneSent

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPFailoverStatsUpdateDoneSent(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDHCPFailoverStatsUpdateRequestsReceived

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPFailoverStatsUpdateRequestsReceived(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDHCPFailoverStatsUpdateRequestsSent

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPFailoverStatsUpdateRequestsSent(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDHCPFailoverStatsV6BindingAcksReceived

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPFailoverStatsV6BindingAcksReceived(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDHCPFailoverStatsV6BindingAcksSent

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPFailoverStatsV6BindingAcksSent(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDHCPFailoverStatsV6BindingNacksReceived

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPFailoverStatsV6BindingNacksReceived(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDHCPFailoverStatsV6BindingNacksSent

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPFailoverStatsV6BindingNacksSent(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPFailoverStatsV6BindingUpdatesReceived

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPFailoverStatsV6BindingUpdatesReceived(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPFailoverStatsV6BindingUpdatesSent

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPFailoverStatsV6BindingUpdatesSent(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPFailoverStatsV6PoolRequestsReceived

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPFailoverStatsV6PoolRequestsReceived(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPFailoverStatsV6PoolRequestsSent

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPFailoverStatsV6PoolRequestsSent(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPFailoverStatsV6PoolResponsesReceived

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPFailoverStatsV6PoolResponsesReceived(java.lang.String value)

Create an instance of JAXBElement<String>

createDHCPFailoverStatsV6PoolResponsesSent

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPFailoverStatsV6PoolResponsesSent(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDHCPFailoverStatsV6UpdateDoneReceived

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPFailoverStatsV6UpdateDoneReceived(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDHCPFailoverStatsV6UpdateDoneSent

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPFailoverStatsV6UpdateDoneSent(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDHCPFailoverStatsV6UpdateRequestsReceived

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPFailoverStatsV6UpdateRequestsReceived(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDHCPFailoverStatsV6UpdateRequestsSent

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPFailoverStatsV6UpdateRequestsSent(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCdnsRedirectAResponse

public javax.xml.bind.JAXBElement<java.lang.String> createCdnsRedirectAResponse(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCdnsRedirectAaaaResponse

public javax.xml.bind.JAXBElement<java.lang.String> createCdnsRedirectAaaaResponse(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCdnsRedirectAction

public javax.xml.bind.JAXBElement<java.lang.String> createCdnsRedirectAction(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCdnsRedirectClientAcl

public javax.xml.bind.JAXBElement<java.lang.String> createCdnsRedirectClientAcl(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCdnsRedirectDescription

public javax.xml.bind.JAXBElement<java.lang.String> createCdnsRedirectDescription(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createCdnsRedirectDomains

public javax.xml.bind.JAXBElement<StringArray> createCdnsRedirectDomains(StringArray value)

Create an instance of JAXBElement<StringArray>

Parameters:
value - Java instance representing xml element's value.

Returns:
the new instance of JAXBElement<StringArray>

createCdnsRedirectPriority

public javax.xml.bind.JAXBElement<java.lang.String> createCdnsRedirectPriority(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:
value - Java instance representing xml element's value.

Returns:
the new instance of JAXBElement<String>

createCdnsRedirectRpzOverride

public javax.xml.bind.JAXBElement<java.lang.String> createCdnsRedirectRpzOverride(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:
value - Java instance representing xml element's value.

Returns:
the new instance of JAXBElement<String>

createCdnsRedirectRpzOverrideRedirect

public javax.xml.bind.JAXBElement<java.lang.String> createCdnsRedirectRpzOverrideRedirect(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:
value - Java instance representing xml element's value.

Returns:
the new instance of JAXBElement<String>

createCdnsRedirectRpzServerAddrs

public javax.xml.bind.JAXBElement<DnsIPnPortArray> createCdnsRedirectRpzServerAddrs(DnsIPnPortArray value)

Create an instance of JAXBElement<DnsIPnPortArray>

Parameters:
value - Java instance representing xml element's value.

Returns:
the new instance of JAXBElement<DnsIPnPortArray>

createCdnsRedirectRpzTls

```
public javax.xml.bind.JAXBElement<java.lang.String> createCdnsRedirectRpzTls(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCdnsRedirectRpzTlsAuthName

```
public javax.xml.bind.JAXBElement<java.lang.String> createCdnsRedirectRpzTlsAuthName(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCdnsRedirectRpzZoneName

```
public javax.xml.bind.JAXBElement<java.lang.String> createCdnsRedirectRpzZoneName(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCurrentUtilizationActiveDynamic

```
public javax.xml.bind.JAXBElement<java.lang.String> createCurrentUtilizationActiveDynamic(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCurrentUtilizationAggregationLevel

```
public javax.xml.bind.JAXBElement<java.lang.String> createCurrentUtilizationAggregationLevel(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCurrentUtilizationAvail

```
public javax.xml.bind.JAXBElement<java.lang.String> createCurrentUtilizationAvail(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCurrentUtilizationClusterId

public javax.xml.bind.JAXBElement<java.lang.String> createCurrentUtilizationClusterId(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCurrentUtilizationDeactivated

public javax.xml.bind.JAXBElement<java.lang.String> createCurrentUtilizationDeactivated(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCurrentUtilizationExpired

public javax.xml.bind.JAXBElement<java.lang.String> createCurrentUtilizationExpired(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCurrentUtilizationFailoverRole

public javax.xml.bind.JAXBElement<java.lang.String> createCurrentUtilizationFailoverRole(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCurrentUtilizationFailoverState

public javax.xml.bind.JAXBElement<java.lang.String> createCurrentUtilizationFailoverState(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createCurrentUtilizationFreeDynamic

public javax.xml.bind.JAXBElement<java.lang.String> createCurrentUtilizationFreeDynamic(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createCurrentUtilizationHistoryList

public javax.xml.bind.JAXBElement<CurrentUtilizationArray> createCurrentUtilizationHistoryList(CurrentUtilizationArray value)

Create an instance of JAXBElement<CurrentUtilizationArray>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<CurrentUtilizationArray>

createCurrentUtilizationLeased

public javax.xml.bind.JAXBElement<java.lang.String> createCurrentUtilizationLeased(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createCurrentUtilizationLeasedDeactivated

public javax.xml.bind.JAXBElement<java.lang.String> createCurrentUtilizationLeasedDeactivated(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createCurrentUtilizationOffered

public javax.xml.bind.JAXBElement<java.lang.String> createCurrentUtilizationOffered(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createCurrentUtilizationOtherAvail

public javax.xml.bind.JAXBElement<java.lang.String> createCurrentUtilizationOtherAvail(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createCurrentUtilizationOwner

public javax.xml.bind.JAXBElement<java.lang.String> createCurrentUtilizationOwner(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createCurrentUtilizationPendAvail

public javax.xml.bind.JAXBElement<java.lang.String> createCurrentUtilizationPendAvail(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createCurrentUtilizationPrimarySubnet

public javax.xml.bind.JAXBElement<java.lang.String> createCurrentUtilizationPrimarySubnet(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createCurrentUtilizationRegion

public javax.xml.bind.JAXBElement<java.lang.String> createCurrentUtilizationRegion(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createCurrentUtilizationReservedActive

public javax.xml.bind.JAXBElement<java.lang.String> createCurrentUtilizationReservedActive(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createCurrentUtilizationReservedInactive

public javax.xml.bind.JAXBElement<java.lang.String> createCurrentUtilizationReservedInactive(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createCurrentUtilizationReservedLeasedDeactivated

public javax.xml.bind.JAXBElement<java.lang.String> createCurrentUtilizationReservedLeasedDeactivated(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createCurrentUtilizationReservedUnavail

public javax.xml.bind.JAXBElement<java.lang.String> createCurrentUtilizationReservedUnavail(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createCurrentUtilizationScopeDeactivated

public javax.xml.bind.JAXBElement<java.lang.String> createCurrentUtilizationScopeDeactivated(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createCurrentUtilizationScopeName

public javax.xml.bind.JAXBElement<java.lang.String> createCurrentUtilizationScopeName(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCurrentUtilizationSelectionTags

public javax.xml.bind.JAXBElement<java.lang.String> createCurrentUtilizationSelectionTags(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCurrentUtilizationSubnet

public javax.xml.bind.JAXBElement<java.lang.String> createCurrentUtilizationSubnet(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCurrentUtilizationTenantId

public javax.xml.bind.JAXBElement<java.lang.String> createCurrentUtilizationTenantId(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCurrentUtilizationTimestamp

public javax.xml.bind.JAXBElement<java.lang.String> createCurrentUtilizationTimestamp(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCurrentUtilizationTotalDynamic

public javax.xml.bind.JAXBElement<java.lang.String> createCurrentUtilizationTotalDynamic(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createCurrentUtilizationTotalReserved

`public javax.xml.bind.JAXBElement<java.lang.String> createCurrentUtilizationTotalReserved(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createCurrentUtilizationUnavail

`public javax.xml.bind.JAXBElement<java.lang.String> createCurrentUtilizationUnavail(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createCurrentUtilizationVpnId

`public javax.xml.bind.JAXBElement<java.lang.String> createCurrentUtilizationVpnId(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDnsEnumConfigDefaultServices

`public javax.xml.bind.JAXBElement<DnsEnumEntryArray> createDnsEnumConfigDefaultServices(DnsEnumEntryArray value)`

Create an instance of JAXBElement<DnsEnumEntryArray>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<DnsEnumEntryArray>

createDnsEnumConfigName

`public javax.xml.bind.JAXBElement<java.lang.String> createDnsEnumConfigName(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDnsEnumConfigNumberPrefix

public javax.xml.bind.JAXBElement<java.lang.String> createDnsEnumConfigNumberPrefix(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDnsEnumConfigTopLevelDomain

public javax.xml.bind.JAXBElement<java.lang.String> createDnsEnumConfigTopLevelDomain(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDnsEnumConfigZoneTemplate

public javax.xml.bind.JAXBElement<java.lang.String> createDnsEnumConfigZoneTemplate(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDHCP6StatsActiveLeasequeries

public javax.xml.bind.JAXBElement<java.lang.String> createDHCP6StatsActiveLeasequeries(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDHCP6StatsActiveLeasequeryData

public javax.xml.bind.JAXBElement<java.lang.String> createDHCP6StatsActiveLeasequeryData(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDHCP6StatsActiveLeasequeryDone

public javax.xml.bind.JAXBElement<java.lang.String> createDHCP6StatsActiveLeasequeryDone(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCP6StatsActiveLeasequeryReplies

public javax.xml.bind.JAXBElement<java.lang.String> createDHCP6StatsActiveLeasequeryReplies(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCP6StatsActiveLeases

public javax.xml.bind.JAXBElement<java.lang.String> createDHCP6StatsActiveLeases(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCP6StatsAdvertises

public javax.xml.bind.JAXBElement<java.lang.String> createDHCP6StatsAdvertises(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCP6StatsAllocatedLeases

public javax.xml.bind.JAXBElement<java.lang.String> createDHCP6StatsAllocatedLeases(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCP6StatsAuthFails

```
public javax.xml.bind.JAXBElement<java.lang.String> createDHCP6StatsAuthFails(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCP6StatsBulkLeasequeries

```
public javax.xml.bind.JAXBElement<java.lang.String> createDHCP6StatsBulkLeasequeries(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCP6StatsBulkLeasequeryData

```
public javax.xml.bind.JAXBElement<java.lang.String> createDHCP6StatsBulkLeasequeryData(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCP6StatsBulkLeasequeryDone

```
public javax.xml.bind.JAXBElement<java.lang.String> createDHCP6StatsBulkLeasequeryDone(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCP6StatsBulkLeasequeryReplies

```
public javax.xml.bind.JAXBElement<java.lang.String> createDHCP6StatsBulkLeasequeryReplies(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCP6StatsClientClassFails

```
public javax.xml.bind.JAXBElement<java.lang.String> createDHCP6StatsClientClassFails(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCP6StatsClientReservedActiveLeases

public javax.xml.bind.JAXBElement<java.lang.String> createDHCP6StatsClientReservedActiveLeases(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCP6StatsClientReservedLeases

public javax.xml.bind.JAXBElement<java.lang.String> createDHCP6StatsClientReservedLeases(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCP6StatsConfirms

public javax.xml.bind.JAXBElement<java.lang.String> createDHCP6StatsConfirms(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCP6StatsDeclines

public javax.xml.bind.JAXBElement<java.lang.String> createDHCP6StatsDeclines(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCP6StatsDiscards

public javax.xml.bind.JAXBElement<java.lang.String> createDHCP6StatsDiscards(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCP6StatsDroppedTotal

`public javax.xml.bind.JAXBElement<java.lang.String> createDHCP6StatsDroppedTotal(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCP6StatsDuplicates

`public javax.xml.bind.JAXBElement<java.lang.String> createDHCP6StatsDuplicates(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCP6StatsExtensionDrops

`public javax.xml.bind.JAXBElement<java.lang.String> createDHCP6StatsExtensionDrops(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCP6StatsExtensionErrors

`public javax.xml.bind.JAXBElement<java.lang.String> createDHCP6StatsExtensionErrors(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCP6StatsGraceExpirations

`public javax.xml.bind.JAXBElement<java.lang.String> createDHCP6StatsGraceExpirations(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDHCP6StatsInfoRequests

public javax.xml.bind.JAXBElement<java.lang.String> createDHCP6StatsInfoRequests(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCP6StatsInvalidClients

public javax.xml.bind.JAXBElement<java.lang.String> createDHCP6StatsInvalidClients(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCP6StatsInvalidPackets

public javax.xml.bind.JAXBElement<java.lang.String> createDHCP6StatsInvalidPackets(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCP6StatsLeasequeries

public javax.xml.bind.JAXBElement<java.lang.String> createDHCP6StatsLeasequeries(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCP6StatsLeasequeryReplies

public javax.xml.bind.JAXBElement<java.lang.String> createDHCP6StatsLeasequeryReplies(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCP6StatsOfferTimeouts

public javax.xml.bind.JAXBElement<java.lang.String> createDHCP6StatsOfferTimeouts(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCP6StatsOtherServer

public javax.xml.bind.JAXBElement<java.lang.String> createDHCP6StatsOtherServer(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCP6StatsOverMaxWaiting

public javax.xml.bind.JAXBElement<java.lang.String> createDHCP6StatsOverMaxWaiting(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCP6StatsPacketsReceived

public javax.xml.bind.JAXBElement<java.lang.String> createDHCP6StatsPacketsReceived(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCP6StatsPacketsReceivedRelay

public javax.xml.bind.JAXBElement<java.lang.String> createDHCP6StatsPacketsReceivedRelay(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCP6StatsPacketsSent

public javax.xml.bind.JAXBElement<java.lang.String> createDHCP6StatsPacketsSent(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCP6StatsPacketsSentRelay

public javax.xml.bind.JAXBElement<java.lang.String> createDHCP6StatsPacketsSentRelay(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCP6StatsQueueLimitedSolicitsDropped

public javax.xml.bind.JAXBElement<java.lang.String> createDHCP6StatsQueueLimitedSolicitsDropped(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCP6StatsRebinds

public javax.xml.bind.JAXBElement<java.lang.String> createDHCP6StatsRebinds(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCP6StatsReconfigures

public javax.xml.bind.JAXBElement<java.lang.String> createDHCP6StatsReconfigures(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCP6StatsReleases

public javax.xml.bind.JAXBElement<java.lang.String> createDHCP6StatsReleases(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDHCP6StatsRenews

public javax.xml.bind.JAXBElement<java.lang.String> createDHCP6StatsRenews(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDHCP6StatsReplies

public javax.xml.bind.JAXBElement<java.lang.String> createDHCP6StatsReplies(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDHCP6StatsReplyLatencyCounts

public javax.xml.bind.JAXBElement<StringArray> createDHCP6StatsReplyLatencyCounts(StringArray value)

Create an instance of JAXBElement<StringArray>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<StringArray>

createDHCP6StatsRequestDroppedOld

public javax.xml.bind.JAXBElement<java.lang.String> createDHCP6StatsRequestDroppedOld(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDHCP6StatsRequestDroppedOthers

public javax.xml.bind.JAXBElement<java.lang.String> createDHCP6StatsRequestDroppedOthers(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDHCP6StatsRequests

`public javax.xml.bind.JAXBElement<java.lang.String> createDHCP6StatsRequests(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDHCP6StatsReservedActiveLeases

`public javax.xml.bind.JAXBElement<java.lang.String> createDHCP6StatsReservedActiveLeases(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDHCP6StatsReservedLeases

`public javax.xml.bind.JAXBElement<java.lang.String> createDHCP6StatsReservedLeases(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDHCP6StatsResponseDroppedOld

`public javax.xml.bind.JAXBElement<java.lang.String> createDHCP6StatsResponseDroppedOld(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDHCP6StatsResponseDroppedOthers

`public javax.xml.bind.JAXBElement<java.lang.String> createDHCP6StatsResponseDroppedOthers(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDHCP6StatsServerDuid

public javax.xml.bind.JAXBElement<java.lang.String> createDHCP6StatsServerDuid(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCP6StatsSolicits

public javax.xml.bind.JAXBElement<java.lang.String> createDHCP6StatsSolicits(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCP6StatsTcpConnectionsDropped

public javax.xml.bind.JAXBElement<java.lang.String> createDHCP6StatsTcpConnectionsDropped(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCP6StatsTcpCurrentConnections

public javax.xml.bind.JAXBElement<java.lang.String> createDHCP6StatsTcpCurrentConnections(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCP6StatsTcpLqStatusCatchUpComplete

public javax.xml.bind.JAXBElement<java.lang.String> createDHCP6StatsTcpLqStatusCatchUpComplete(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCP6StatsTcpLqStatusDataMissing

```
public javax.xml.bind.JAXBElement<java.lang.String> createDHCP6StatsTcpLqStatusDataMissing(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCP6StatsTcpLqStatusMalformedQuery

```
public javax.xml.bind.JAXBElement<java.lang.String> createDHCP6StatsTcpLqStatusMalformedQuery(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCP6StatsTcpLqStatusNotAllowed

```
public javax.xml.bind.JAXBElement<java.lang.String> createDHCP6StatsTcpLqStatusNotAllowed(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCP6StatsTcpLqStatusNotConfigured

```
public javax.xml.bind.JAXBElement<java.lang.String> createDHCP6StatsTcpLqStatusNotConfigured(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCP6StatsTcpLqStatusQueryTerminated

```
public javax.xml.bind.JAXBElement<java.lang.String> createDHCP6StatsTcpLqStatusQueryTerminated(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCP6StatsTcpLqStatusUnknownQuery

```
public javax.xml.bind.JAXBElement<java.lang.String> createDHCP6StatsTcpLqStatusUnknownQuery(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDHCP6StatsTcpLqStatusUnspecFail

public javax.xml.bind.JAXBElement<java.lang.String> createDHCP6StatsTcpLqStatusUnspecFail(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDHCP6StatsTcpTotalConnections

public javax.xml.bind.JAXBElement<java.lang.String> createDHCP6StatsTcpTotalConnections(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDHCP6StatsTotalPrefixes

public javax.xml.bind.JAXBElement<java.lang.String> createDHCP6StatsTotalPrefixes(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDHCP6StatsUnknownLinks

public javax.xml.bind.JAXBElement<java.lang.String> createDHCP6StatsUnknownLinks(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSServerErrorsStatsAxfrInErrors

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerErrorsStatsAxfrInErrors(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSServerErrorsStatsAxfrOutErrors

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerErrorsStatsAxfrOutErrors(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSServerErrorsStatsExceededMaxDnsPackets

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerErrorsStatsExceededMaxDnsPackets(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSServerErrorsStatsIxfrInErrors

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerErrorsStatsIxfrInErrors(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSServerErrorsStatsIxfrOutErrors

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerErrorsStatsIxfrOutErrors(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSServerErrorsStatsSentFormatErrors

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerErrorsStatsSentFormatErrors(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSServerErrorsStatsSentRefusalErrors

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerErrorsStatsSentRefusalErrors(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerErrorsStatsSentTotalErrors

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerErrorsStatsSentTotalErrors(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerErrorsStatsUpdateErrors

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerErrorsStatsUpdateErrors(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerErrorsStatsUpdatePrereqFailures

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerErrorsStatsUpdatePrereqFailures(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerErrorsStatsUpdatePrereqFail

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerErrorsStatsUpdatePrereqFail(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerErrorsStatsXferFailedAttempts

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerErrorsStatsXferFailedAttempts(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerErrorsStatsXferInAuthErrors

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerErrorsStatsXferInAuthErrors(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMHaDnsPairDescription

public javax.xml.bind.JAXBElement<java.lang.String> createCCMHaDnsPairDescription(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMHaDnsPairHaDns

public javax.xml.bind.JAXBElement<java.lang.String> createCCMHaDnsPairHaDns(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMHaDnsPairHaDnsBackupAddress

public javax.xml.bind.JAXBElement<java.lang.String> createCCMHaDnsPairHaDnsBackupAddress(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMHaDnsPairHaDnsBackupServer

public javax.xml.bind.JAXBElement<java.lang.String> createCCMHaDnsPairHaDnsBackupServer(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMHaDnsPairHaDnsBackupIp6Address

public javax.xml.bind.JAXBElement<java.lang.String> createCCMHaDnsPairHaDnsBackupIp6Address(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMHaDnsPairHaDnsBackupMname

public javax.xml.bind.JAXBElement<java.lang.String> createCCMHaDnsPairHaDnsBackupMname(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMHaDnsPairHaDnsMainAddress

public javax.xml.bind.JAXBElement<java.lang.String> createCCMHaDnsPairHaDnsMainAddress(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMHaDnsPairHaDnsMainServer

public javax.xml.bind.JAXBElement<java.lang.String> createCCMHaDnsPairHaDnsMainServer(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMHaDnsPairHaDnsMainIp6Address

public javax.xml.bind.JAXBElement<java.lang.String> createCCMHaDnsPairHaDnsMainIp6Address(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMHaDnsPairHaDnsMainMname

public javax.xml.bind.JAXBElement<java.lang.String> createCCMHaDnsPairHaDnsMainMname(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMHaDnsPairHaDnsPort

public javax.xml.bind.JAXBElement<java.lang.String> createCCMHaDnsPairHaDnsPort(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMHaDnsPairHaDnsSoaMnameUpdate

public javax.xml.bind.JAXBElement<java.lang.String> createCCMHaDnsPairHaDnsSoaMnameUpdate(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMHaDnsPairHaDnsSyncQuietPeriod

public javax.xml.bind.JAXBElement<java.lang.String> createCCMHaDnsPairHaDnsSyncQuietPeriod(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMHaDnsPairTenantId

public javax.xml.bind.JAXBElement<java.lang.String> createCCMHaDnsPairTenantId(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSServerStatsConfigRecurs

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerStatsConfigRecurs(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerStatsConfigReset

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerStatsConfigReset(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerStatsConfigResetTime

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerStatsConfigResetTime(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerStatsConfigUpTime

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerStatsConfigUpTime(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerStatsCounterResetTime

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerStatsCounterResetTime(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerStatsId

```java
public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerStatsId(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerStatsSampleInterval

```java
public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerStatsSampleInterval(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerStatsSampleTime

```java
public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerStatsSampleTime(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerStatsStatisticsRequestTime

```java
public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerStatsStatisticsRequestTime(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerStatsTotalRrs

```java
public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerStatsTotalRrs(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerStatsTotalZones

```java
public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerStatsTotalZones(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createUpdatePolicyDescription

public javax.xml.bind.JAXBElement<java.lang.String> createUpdatePolicyDescription(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createUpdatePolicyRules

public javax.xml.bind.JAXBElement<StringArray> createUpdatePolicyRules(StringArray value)

Create an instance of JAXBElement<StringArray>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<StringArray>

---

createUpdatePolicyTenantId

public javax.xml.bind.JAXBElement<java.lang.String> createUpdatePolicyTenantId(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createOptionDefinitionSetDesc

public javax.xml.bind.JAXBElement<java.lang.String> createOptionDefinitionSetDesc(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createOptionDefinitionSetFlags

public javax.xml.bind.JAXBElement<java.lang.String> createOptionDefinitionSetFlags(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createOptionDefinitionSetOptionList

public javax.xml.bind.JAXBElement<[AttrDescArray](#)> createOptionDefinitionSetOptionList([AttrDescArray](#) value)

Create an instance of JAXBElement<[AttrDescArray](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[AttrDescArray](#)>

---

createOptionDefinitionSetChildren

public javax.xml.bind.JAXBElement<[AttrDescArray](#)> createOptionDefinitionSetChildren([AttrDescArray](#) value)

Create an instance of JAXBElement<[AttrDescArray](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[AttrDescArray](#)>

---

createOptionDefinitionSetTenantId

public javax.xml.bind.JAXBElement<java.lang.String> createOptionDefinitionSetTenantId(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createOptionDefinitionSetVendorOptionEnterpriseId

public javax.xml.bind.JAXBElement<java.lang.String> createOptionDefinitionSetVendorOptionEnterpriseId(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createOptionDefinitionSetVendorOptionRegex

public javax.xml.bind.JAXBElement<java.lang.String> createOptionDefinitionSetVendorOptionRegex(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createOptionDefinitionSetVendorOptionString

public javax.xml.bind.JAXBElement<java.lang.String> createOptionDefinitionSetVendorOptionString(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPRenewalDataBucketInterval

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPRenewalDataBucketInterval(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPRenewalDataBuckets

public javax.xml.bind.JAXBElement<StringArray> createDHCPRenewalDataBuckets(StringArray value)

Create an instance of JAXBElement<StringArray>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<StringArray>

---

createDHCPRenewalDataClients

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPRenewalDataClients(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPRenewalDataClientsAdjusted

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPRenewalDataClientsAdjusted(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDHCPRenewalDataConfiguredBucketInterval

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPRenewalDataConfiguredBucketInterval(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPRenewalDataConfiguredMaxRenewalTime

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPRenewalDataConfiguredMaxRenewalTime(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPRenewalDataEndTime

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPRenewalDataEndTime(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPRenewalDataInterval

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPRenewalDataInterval(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPRenewalDataLateRenewals

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPRenewalDataLateRenewals(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPRenewalDataMaxBuckets

```
public javax.xml.bind.JAXBElement<java.lang.String> createDHCPRenewalDataMaxBuckets(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPRenewalDataMaxLeaseTime

```
public javax.xml.bind.JAXBElement<java.lang.String> createDHCPRenewalDataMaxLeaseTime(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPRenewalDataMaxPreferredLifetime

```
public javax.xml.bind.JAXBElement<java.lang.String> createDHCPRenewalDataMaxPreferredLifetime(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPRenewalDataStartTime

```
public javax.xml.bind.JAXBElement<java.lang.String> createDHCPRenewalDataStartTime(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPRenewalDataTrackedRenewalPeriod

```
public javax.xml.bind.JAXBElement<java.lang.String> createDHCPRenewalDataTrackedRenewalPeriod(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPServerActivitySummaryInterval

```
public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerActivitySummaryInterval(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPServerAddrBlocksDefaultSelectionTags

public javax.xml.bind.JAXBElement<StringArray> createDHCPServerAddrBlocksDefaultSelectionTags(StringArray value)

Create an instance of JAXBElement<StringArray>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<StringArray>

---

createDHCPServerAddrBlocksUseClientAffinity

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerAddrBlocksUseClientAffinity(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPServerAddrBlocksUseLanSegments

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerAddrBlocksUseLanSegments(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPServerAddrBlocksUseSelectionTags

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerAddrBlocksUseSelectionTags(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPServerCacheClientForRequests

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerCacheClientForRequests(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPServerClientCacheCount

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerClientCacheCount(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPServerClientCacheTtl

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerClientCacheTtl(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPServerClientClass

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerClientClass(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPServerClientClassLookupId

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerClientClassLookupId(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPServerCollectPerformanceStatistics

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerCollectPerformanceStatistics(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDHCPServerCollectSampleCounters

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerCollectSampleCounters(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDHCPServerDefaultFreeAddressConfig

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerDefaultFreeAddressConfig(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDHCPServerDeferLeaseExtensions

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerDeferLeaseExtensions(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDHCPServerDeleteOrphanedLeases

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerDeleteOrphanedLeases(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDHCPServerDeleteOrphanedSubnets

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerDeleteOrphanedSubnets(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDHCPServerDistributeRenewals

```java
public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerDistributeRenewals(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPServerDistributeRenewalsBucketInterval

```java
public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerDistributeRenewalsBucketInterval(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPServerDistributeRenewalsMaxRenewalTime

```java
public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerDistributeRenewalsMaxRenewalTime(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPServerDnsClientIdentity

```java
public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerDnsClientIdentity(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPServerDnsTimeout

```java
public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerDnsTimeout(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPServerDocsisVersionIdMissing

```java
public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerDocsisVersionIdMissing(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPServerDropOldPackets

`public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerDropOldPackets(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPServerDropPacketOnExtensionFailure

`public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerDropPacketOnExtensionFailure(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPServerEnhancedSampleCounters

`public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerEnhancedSampleCounters(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPServerEqualPriorityMostAvailable

`public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerEqualPriorityMostAvailable(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPServerExpressionConfigurationTraceLevel

`public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerExpressionConfigurationTraceLevel(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPServerExpressionTraceLevel

`public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerExpressionTraceLevel(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPServerExtensionTraceLevel

`public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerExtensionTraceLevel(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPServerFailoverRecover

`public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerFailoverRecover(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPServerForceDnsUpdates

`public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerForceDnsUpdates(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPServerGetSubnetMaskFromPolicy

`public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerGetSubnetMaskFromPolicy(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDHCPServerGssTsigConfig

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerGssTsigConfig(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPServerHaDnsFailoverTimeout

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerHaDnsFailoverTimeout(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPServerHardwareUnicast

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerHardwareUnicast(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPServerIgnoreCiscoOptions

public javax.xml.bind.JAXBElement<StringArray> createDHCPServerIgnoreCiscoOptions(StringArray value)

Create an instance of JAXBElement<StringArray>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<StringArray>

---

createDHCPServerIgnoreIcmpErrors

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerIgnoreIcmpErrors(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPServerIgnoreRequestsForOtherServers

```
public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerIgnoreRequestsForOtherServers(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPServerImportMode

```
public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerImportMode(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPServerInhibitBusyOptimization

```
public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerInhibitBusyOptimization(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPServerInitialEnvironmentDictionary

```
public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerInitialEnvironmentDictionary(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPServerIpHistory

```
public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerIpHistory(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPServerIpHistoryMaxAge

```
public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerIpHistoryMaxAge(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPServerLastTransactionTimeGranularity

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerLastTransactionTimeGranularity(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPServerLdapMode

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerLdapMode(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPServerLeaseRetentionMaxAge

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerLeaseRetentionMaxAge(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPServerLeaseRetentionMinAge

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerLeaseRetentionMinAge(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPServerLogFormat

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerLogFormat(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPServerLogSettings

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerLogSettings(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPServerMacAddressOnly

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerMacAddressOnly(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPServerMapRadiusClass

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerMapRadiusClass(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPServerMapRadiusPoolName

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerMapRadiusPoolName(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPServerMapUserClassId

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerMapUserClassId(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDHCPServerMaxClientLeases

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerMaxClientLeases(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDHCPServerMaxDhcpRequests

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerMaxDhcpRequests(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDHCPServerMaxDhcpResponses

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerMaxDhcpResponses(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDHCPServerMaxDnsRenamingRetries

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerMaxDnsRenamingRetries(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDHCPServerMaxDnsRetries

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerMaxDnsRetries(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDHCPServerMaxDnsTtl

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerMaxDnsTtl(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDHCPServerMaxPingPackets

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerMaxPingPackets(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDHCPServerMaxWaitingPackets

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerMaxWaitingPackets(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDHCPServerMinDnsTtl

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerMinDnsTtl(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDHCPServerMulticastAddresses

public javax.xml.bind.JAXBElement<StringArray> createDHCPServerMulticastAddresses(StringArray value)

Create an instance of JAXBElement<StringArray>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<StringArray>

createDHCPServerName

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerName(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPServerOneLeasePerClient

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerOneLeasePerClient(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPServerPingClients

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerPingClients(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPServerPingTimeout

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerPingTimeout(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPServerPriorityAddressAllocation

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerPriorityAddressAllocation(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPServerReturnClientFqdnIfAsked

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerReturnClientFqdnIfAsked(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPServerSaveVendorClassId

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerSaveVendorClassId(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPServerServerFlags

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerServerFlags(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPServerSkipClientLookup

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerSkipClientLookup(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPServerSmsLeaseInterval

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerSmsLeaseInterval(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPServerSmsLibraryPath

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerSmsLibraryPath(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPServerSmsNetworkDiscovery

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerSmsNetworkDiscovery(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:
value - Java instance representing xml element's value.

Returns:
the new instance of JAXBElement<String>

---

createDHCPServerSmsSiteCode

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerSmsSiteCode(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:
value - Java instance representing xml element's value.

Returns:
the new instance of JAXBElement<String>

---

createDHCPServerSynthesizeReverseZone

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerSynthesizeReverseZone(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:
value - Java instance representing xml element's value.

Returns:
the new instance of JAXBElement<String>

---

createDHCPServerTrapsEnabled

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerTrapsEnabled(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:
value - Java instance representing xml element's value.

Returns:
the new instance of JAXBElement<String>

---

createDHCPServerTrimHostName

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerTrimHostName(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:
value - Java instance representing xml element's value.

Returns:
the new instance of JAXBElement<String>

createDHCPServerUpdateDnsForBootp

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerUpdateDnsForBootp(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDHCPServerUpgradeUnavailableTimeout

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerUpgradeUnavailableTimeout(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDHCPServerUseClientFqdn

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerUseClientFqdn(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDHCPServerUseClientFqdnFirst

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerUseClientFqdnFirst(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDHCPServerUseDnsUpdatePrereqs

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerUseDnsUpdatePrereqs(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDHCPServerUseHostName

```
public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerUseHostName(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPServerUseLdapClientData

```
public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerUseLdapClientData(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPServerV6ClientClassLookupId

```
public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerV6ClientClassLookupId(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPServerV6DefaultFreeAddressConfig

```
public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerV6DefaultFreeAddressConfig(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPServerValidateClientNameAsMac

```
public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerValidateClientNameAsMac(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPServerVpnCommunication

```
public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerVpnCommunication(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSServerPerformanceStatsAxfrsIn

`public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerPerformanceStatsAxfrsIn(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSServerPerformanceStatsAxfrsOut

`public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerPerformanceStatsAxfrsOut(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSServerPerformanceStatsIpv4PacketsIn

`public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerPerformanceStatsIpv4PacketsIn(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSServerPerformanceStatsIpv4PacketsOut

`public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerPerformanceStatsIpv4PacketsOut(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSServerPerformanceStatsIpv6PacketsIn

`public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerPerformanceStatsIpv6PacketsIn(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerPerformanceStatsIpv6PacketsOut

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerPerformanceStatsIpv6PacketsOut(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerPerformanceStatsIxfrsFullResp

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerPerformanceStatsIxfrsFullResp(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerPerformanceStatsIxfrsIn

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerPerformanceStatsIxfrsIn(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerPerformanceStatsIxfrsOut

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerPerformanceStatsIxfrsOut(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerPerformanceStatsNotifiesIn

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerPerformanceStatsNotifiesIn(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSServerPerformanceStatsNotifiesOut

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerPerformanceStatsNotifiesOut(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerPerformanceStatsPacketsIn

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerPerformanceStatsPacketsIn(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerPerformanceStatsPacketsInTcp

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerPerformanceStatsPacketsInTcp(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerPerformanceStatsPacketsInUdp

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerPerformanceStatsPacketsInUdp(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerPerformanceStatsPacketsOut

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerPerformanceStatsPacketsOut(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerPerformanceStatsPacketsOutTcp

```
public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerPerformanceStatsPacketsOutTcp(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerPerformanceStatsPacketsOutUdp

```
public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerPerformanceStatsPacketsOutUdp(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerPerformanceStatsResponsesWithNotimp

```
public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerPerformanceStatsResponsesWithNotimp(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerPerformanceStatsUpdatePackets

```
public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerPerformanceStatsUpdatePackets(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerPerformanceStatsUpdatedRrs

```
public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerPerformanceStatsUpdatedRrs(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerPerformanceStatsXfrsInAtLimit

```
public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerPerformanceStatsXfrsInAtLimit(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerPerformanceStatsXfrsOutAtLimit

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerPerformanceStatsXfrsOutAtLimit(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createAttrDescBaseType

public javax.xml.bind.JAXBElement<java.lang.String> createAttrDescBaseType(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createAttrDescDesc

public javax.xml.bind.JAXBElement<java.lang.String> createAttrDescDesc(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createAttrDescFlags

public javax.xml.bind.JAXBElement<java.lang.String> createAttrDescFlags(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createAttrDescId

public javax.xml.bind.JAXBElement<java.lang.String> createAttrDescId(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createAttrDescName

`public javax.xml.bind.JAXBElement<java.lang.String> createAttrDescName(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createAttrDescOptionList

`public javax.xml.bind.JAXBElement<`*AttrDescArray*`> createAttrDescOptionList(`*AttrDescArray* `value)`

Create an instance of JAXBElement<*AttrDescArray*>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<*AttrDescArray*>

---

createAttrDescChildren

`public javax.xml.bind.JAXBElement<`*AttrDescArray*`> createAttrDescChildren(`*AttrDescArray* `value)`

Create an instance of JAXBElement<*AttrDescArray*>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<*AttrDescArray*>

---

createAttrDescOptionSet

`public javax.xml.bind.JAXBElement<java.lang.String> createAttrDescOptionSet(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createAttrDescSpec

`public javax.xml.bind.JAXBElement<java.lang.String> createAttrDescSpec(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createAttrDescRepeat

`public javax.xml.bind.JAXBElement<java.lang.String> createAttrDescRepeat(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createAuthDnsSecDescription

`public javax.xml.bind.JAXBElement<java.lang.String> createAuthDnsSecDescription(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createAuthDnsSecKeyRollover

`public javax.xml.bind.JAXBElement<java.lang.String> createAuthDnsSecKeyRollover(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createAuthDnsSecKskAlgorithm

`public javax.xml.bind.JAXBElement<java.lang.String> createAuthDnsSecKskAlgorithm(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createAuthDnsSecKskBits

`public javax.xml.bind.JAXBElement<java.lang.String> createAuthDnsSecKskBits(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createAuthDnsSecKskRolloverInterval

public javax.xml.bind.JAXBElement<java.lang.String> createAuthDnsSecKskRolloverInterval(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createAuthDnsSecName

public javax.xml.bind.JAXBElement<java.lang.String> createAuthDnsSecName(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createAuthDnsSecZskAlgorithm

public javax.xml.bind.JAXBElement<java.lang.String> createAuthDnsSecZskAlgorithm(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createAuthDnsSecZskBits

public javax.xml.bind.JAXBElement<java.lang.String> createAuthDnsSecZskBits(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createAuthDnsSecZskLifetime

public javax.xml.bind.JAXBElement<java.lang.String> createAuthDnsSecZskLifetime(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createAuthDnsSecZskRolloverInterval

```
public javax.xml.bind.JAXBElement<java.lang.String> createAuthDnsSecZskRolloverInterval(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createTCPConnectionRelatedServerCommState

```
public javax.xml.bind.JAXBElement<java.lang.String> createTCPConnectionRelatedServerCommState(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createTCPConnectionRelatedServerCurrentRequests

```
public javax.xml.bind.JAXBElement<java.lang.String> createTCPConnectionRelatedServerCurrentRequests(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createTCPConnectionRelatedServerCurrentState

```
public javax.xml.bind.JAXBElement<java.lang.String> createTCPConnectionRelatedServerCurrentState(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createTCPConnectionRelatedServerIp6Address

```
public javax.xml.bind.JAXBElement<java.lang.String> createTCPConnectionRelatedServerIp6Address(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createTCPConnectionRelatedServerIpaddr

```
public javax.xml.bind.JAXBElement<java.lang.String> createTCPConnectionRelatedServerIpaddr(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createTCPConnectionRelatedServerLastReceiveTime

public javax.xml.bind.JAXBElement<java.lang.String> createTCPConnectionRelatedServerLastReceiveTime(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createTCPConnectionRelatedServerLastSendTime

public javax.xml.bind.JAXBElement<java.lang.String> createTCPConnectionRelatedServerLastSendTime(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createTCPConnectionRelatedServerName

public javax.xml.bind.JAXBElement<java.lang.String> createTCPConnectionRelatedServerName(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createTCPConnectionRelatedServerOurIp6Address

public javax.xml.bind.JAXBElement<java.lang.String> createTCPConnectionRelatedServerOurIp6Address(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createTCPConnectionRelatedServerOurIpaddr

public javax.xml.bind.JAXBElement<java.lang.String> createTCPConnectionRelatedServerOurIpaddr(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createTCPConnectionRelatedServerOurPort

public javax.xml.bind.JAXBElement<java.lang.String> createTCPConnectionRelatedServerOurPort(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createTCPConnectionRelatedServerPort

public javax.xml.bind.JAXBElement<java.lang.String> createTCPConnectionRelatedServerPort(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createTCPConnectionRelatedServerStartTime

public javax.xml.bind.JAXBElement<java.lang.String> createTCPConnectionRelatedServerStartTime(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createTCPConnectionRelatedServerTotalBytesReceived

public javax.xml.bind.JAXBElement<java.lang.String> createTCPConnectionRelatedServerTotalBytesReceived(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createTCPConnectionRelatedServerTotalBytesSent

public javax.xml.bind.JAXBElement<java.lang.String> createTCPConnectionRelatedServerTotalBytesSent(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createTCPConnectionRelatedServerTotalReplies

public javax.xml.bind.JAXBElement<java.lang.String> createTCPConnectionRelatedServerTotalReplies(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createTCPConnectionRelatedServerTotalRequests

public javax.xml.bind.JAXBElement<java.lang.String> createTCPConnectionRelatedServerTotalRequests(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createResourceStatusCritical

public javax.xml.bind.JAXBElement<java.lang.String> createResourceStatusCritical(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createResourceStatusOk

public javax.xml.bind.JAXBElement<java.lang.String> createResourceStatusOk(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createResourceStatusWarning

public javax.xml.bind.JAXBElement<java.lang.String> createResourceStatusWarning(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createResourceValueAscendingOrdered

public javax.xml.bind.JAXBElement<java.lang.String> createResourceValueAscendingOrdered(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createResourceValueEventClearMessage

public javax.xml.bind.JAXBElement<java.lang.String> createResourceValueEventClearMessage(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createResourceValueEventReportMessage

public javax.xml.bind.JAXBElement<java.lang.String> createResourceValueEventReportMessage(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createResourceValueEventState

public javax.xml.bind.JAXBElement<java.lang.String> createResourceValueEventState(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createResourceValueEventTimestamp

public javax.xml.bind.JAXBElement<java.lang.String> createResourceValueEventTimestamp(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createResourceValueIntCriticalLevel

public javax.xml.bind.JAXBElement<java.lang.String> createResourceValueIntCriticalLevel(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createResourceValueIntDataType

public javax.xml.bind.JAXBElement<java.lang.String> createResourceValueIntDataType(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createResourceValueIntWarningLevel

public javax.xml.bind.JAXBElement<java.lang.String> createResourceValueIntWarningLevel(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createResourceValueLastEventTime

public javax.xml.bind.JAXBElement<java.lang.String> createResourceValueLastEventTime(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createResourceValueLastIntValue

public javax.xml.bind.JAXBElement<java.lang.String> createResourceValueLastIntValue(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createResourceValueLastResetTime

public javax.xml.bind.JAXBElement<java.lang.String> createResourceValueLastResetTime(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createResourceValueLastUpdatedTime

public javax.xml.bind.JAXBElement<java.lang.String> createResourceValueLastUpdatedTime(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createResourceValueLastValueMessage

public javax.xml.bind.JAXBElement<java.lang.String> createResourceValueLastValueMessage(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createResourceValueLastValueState

public javax.xml.bind.JAXBElement<java.lang.String> createResourceValueLastValueState(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createResourceValueName

public javax.xml.bind.JAXBElement<java.lang.String> createResourceValueName(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createResourceValuePeakIntValue

public javax.xml.bind.JAXBElement<java.lang.String> createResourceValuePeakIntValue(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createResourceValuePeakTime

public javax.xml.bind.JAXBElement<java.lang.String> createResourceValuePeakTime(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createResourceValuePeakValueMessage

public javax.xml.bind.JAXBElement<java.lang.String> createResourceValuePeakValueMessage(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createResourceValueResourceType

public javax.xml.bind.JAXBElement<java.lang.String> createResourceValueResourceType(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createResourceValueServerClass

public javax.xml.bind.JAXBElement<java.lang.String> createResourceValueServerClass(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createResourceValueState

public javax.xml.bind.JAXBElement<java.lang.String> createResourceValueState(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createResourceValueTenantId

```
public javax.xml.bind.JAXBElement<java.lang.String> createResourceValueTenantId(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerCacheStatsCacheFull

```
public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerCacheStatsCacheFull(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerCacheStatsCacheHits

```
public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerCacheStatsCacheHits(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerCacheStatsCacheMisses

```
public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerCacheStatsCacheMisses(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerCacheStatsCacheNxdomain

```
public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerCacheStatsCacheNxdomain(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerCacheStatsCacheRecords

```
public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerCacheStatsCacheRecords(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerCacheStatsCacheRrs

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerCacheStatsCacheRrs(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerCacheStatsCacheSize

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerCacheStatsCacheSize(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerMaxCounterStatsConcurrentXfrsIn

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerMaxCounterStatsConcurrentXfrsIn(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerMaxCounterStatsConcurrentXfrsOut

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerMaxCounterStatsConcurrentXfrsOut(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerMaxCounterStatsDnsConcurrentPackets

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerMaxCounterStatsDnsConcurrentPackets(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerMaxCounterStatsHaBatchCountLimit

`public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerMaxCounterStatsHaBatchCountLimit(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerMaxCounterStatsHaPersistedEditList

`public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerMaxCounterStatsHaPersistedEditList(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerMaxCounterStatsHaRrActiveList

`public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerMaxCounterStatsHaRrActiveList(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerMaxCounterStatsHaRrPendingList

`public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerMaxCounterStatsHaRrPendingList(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerMaxCounterStatsHaUpdateLatencyMax

`public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerMaxCounterStatsHaUpdateLatencyMax(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createReservation6ClientClass

public javax.xml.bind.JAXBElement<java.lang.String> createReservation6ClientClass(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createReservation6CmMacAddress

public javax.xml.bind.JAXBElement<java.lang.String> createReservation6CmMacAddress(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createReservation6Description

public javax.xml.bind.JAXBElement<java.lang.String> createReservation6Description(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createReservation6DeviceName

public javax.xml.bind.JAXBElement<java.lang.String> createReservation6DeviceName(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createReservation6IncludeTags

public javax.xml.bind.JAXBElement<StringArray> createReservation6IncludeTags(StringArray value)

Create an instance of JAXBElement<StringArray>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<StringArray>

createReservation6Prefix

public javax.xml.bind.JAXBElement<java.lang.String> createReservation6Prefix(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createReservation6TenantId

public javax.xml.bind.JAXBElement<java.lang.String> createReservation6TenantId(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createReservation6VpnId

public javax.xml.bind.JAXBElement<java.lang.String> createReservation6VpnId(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDnsViewAclMatchClients

public javax.xml.bind.JAXBElement<java.lang.String> createDnsViewAclMatchClients(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDnsViewDescription

public javax.xml.bind.JAXBElement<java.lang.String> createDnsViewDescription(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDnsViewPriority

public javax.xml.bind.JAXBElement<java.lang.String> createDnsViewPriority(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDnsViewTenantId

public javax.xml.bind.JAXBElement<java.lang.String> createDnsViewTenantId(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDnsViewViewId

public javax.xml.bind.JAXBElement<java.lang.String> createDnsViewViewId(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createReservationClientClass

public javax.xml.bind.JAXBElement<java.lang.String> createReservationClientClass(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createReservationCmMacAddress

public javax.xml.bind.JAXBElement<java.lang.String> createReservationCmMacAddress(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createReservationDescription

public javax.xml.bind.JAXBElement<java.lang.String> createReservationDescription(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createReservationDeviceName

`public javax.xml.bind.JAXBElement<java.lang.String> createReservationDeviceName(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createReservationIncludeTags

`public javax.xml.bind.JAXBElement<StringArray> createReservationIncludeTags(StringArray value)`

Create an instance of JAXBElement<StringArray>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<StringArray>

---

createReservationScope

`public javax.xml.bind.JAXBElement<java.lang.String> createReservationScope(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createReservationTenantId

`public javax.xml.bind.JAXBElement<java.lang.String> createReservationTenantId(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createReservationVpnId

`public javax.xml.bind.JAXBElement<java.lang.String> createReservationVpnId(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDHCPScopeAggregationStatsInUseAddresses

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPScopeAggregationStatsInUseAddresses(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDHCPScopeAggregationStatsMode

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPScopeAggregationStatsMode(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDHCPScopeAggregationStatsName

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPScopeAggregationStatsName(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDHCPScopeAggregationStatsTotalAddresses

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPScopeAggregationStatsTotalAddresses(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDHCPScopeAggregationStatsUtilizedPct

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPScopeAggregationStatsUtilizedPct(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSCachingServerRateLimitItemCount

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerRateLimitItemCount(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSCachingServerRateLimitItemLimit

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerRateLimitItemLimit(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSCachingServerRateLimitItemName

public javax.xml.bind.JAXBElement<java.lang.String> createDNSCachingServerRateLimitItemName(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDnsUpdateConfigBackupServerAddr

public javax.xml.bind.JAXBElement<java.lang.String> createDnsUpdateConfigBackupServerAddr(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDnsUpdateConfigBackupServerIp6Address

public javax.xml.bind.JAXBElement<java.lang.String> createDnsUpdateConfigBackupServerIp6Address(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDnsUpdateConfigBackupServerKey

```
public javax.xml.bind.JAXBElement<java.lang.String> createDnsUpdateConfigBackupServerKey(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDnsUpdateConfigDnsClientIdentity

```
public javax.xml.bind.JAXBElement<java.lang.String> createDnsUpdateConfigDnsClientIdentity(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDnsUpdateConfigDnsHostBytes

```
public javax.xml.bind.JAXBElement<java.lang.String> createDnsUpdateConfigDnsHostBytes(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDnsUpdateConfigDynamicDns

```
public javax.xml.bind.JAXBElement<java.lang.String> createDnsUpdateConfigDynamicDns(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDnsUpdateConfigForceDnsUpdates

```
public javax.xml.bind.JAXBElement<java.lang.String> createDnsUpdateConfigForceDnsUpdates(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDnsUpdateConfigForwardZoneName

```
public javax.xml.bind.JAXBElement<java.lang.String> createDnsUpdateConfigForwardZoneName(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDnsUpdateConfigHostNameGenerator

`public javax.xml.bind.JAXBElement<java.lang.String> createDnsUpdateConfigHostNameGenerator(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDnsUpdateConfigMaxDnsTtl

`public javax.xml.bind.JAXBElement<java.lang.String> createDnsUpdateConfigMaxDnsTtl(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDnsUpdateConfigMinDnsTtl

`public javax.xml.bind.JAXBElement<java.lang.String> createDnsUpdateConfigMinDnsTtl(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDnsUpdateConfigPrefixDelegationUpdates

`public javax.xml.bind.JAXBElement<java.lang.String> createDnsUpdateConfigPrefixDelegationUpdates(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDnsUpdateConfigReverseZoneName

`public javax.xml.bind.JAXBElement<java.lang.String> createDnsUpdateConfigReverseZoneName(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDnsUpdateConfigReverseZonePrefixLength

public javax.xml.bind.JAXBElement<java.lang.String> createDnsUpdateConfigReverseZonePrefixLength(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDnsUpdateConfigServerAddr

public javax.xml.bind.JAXBElement<java.lang.String> createDnsUpdateConfigServerAddr(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDnsUpdateConfigServerIp6Address

public javax.xml.bind.JAXBElement<java.lang.String> createDnsUpdateConfigServerIp6Address(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDnsUpdateConfigServerKey

public javax.xml.bind.JAXBElement<java.lang.String> createDnsUpdateConfigServerKey(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDnsUpdateConfigSynthesizeName

public javax.xml.bind.JAXBElement<java.lang.String> createDnsUpdateConfigSynthesizeName(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDnsUpdateConfigSyntheticNameStem

public javax.xml.bind.JAXBElement<java.lang.String> createDnsUpdateConfigSyntheticNameStem(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDnsUpdateConfigTenantId

public javax.xml.bind.JAXBElement<java.lang.String> createDnsUpdateConfigTenantId(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDnsUpdateConfigUpdateDnsForBootp

public javax.xml.bind.JAXBElement<java.lang.String> createDnsUpdateConfigUpdateDnsForBootp(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDnsUpdateConfigUseDnsUpdatePrereqs

public javax.xml.bind.JAXBElement<java.lang.String> createDnsUpdateConfigUseDnsUpdatePrereqs(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDnsUpdateConfigUseGssTsig

public javax.xml.bind.JAXBElement<java.lang.String> createDnsUpdateConfigUseGssTsig(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDnsUpdateConfigV4SyntheticNameGenerator

public javax.xml.bind.JAXBElement<java.lang.String> createDnsUpdateConfigV4SyntheticNameGenerator(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDnsUpdateConfigV6HostNameGenerator

public javax.xml.bind.JAXBElement<java.lang.String> createDnsUpdateConfigV6HostNameGenerator(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDnsUpdateConfigV6SyntheticNameGenerator

public javax.xml.bind.JAXBElement<java.lang.String> createDnsUpdateConfigV6SyntheticNameGenerator(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDnsUpdateConfigViewId

public javax.xml.bind.JAXBElement<java.lang.String> createDnsUpdateConfigViewId(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPScopeStatusName

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPScopeStatusName(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPScopeStatusScopeStatus

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPScopeStatusScopeStatus(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerDBStatsCsetdbCheckPts

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerDBStatsCsetdbCheckPts(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerDBStatsCsetdbCsetsTrimmed

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerDBStatsCsetdbCsetsTrimmed(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerDBStatsCsetdbDeletes

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerDBStatsCsetdbDeletes(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerDBStatsCsetdbLogPurges

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerDBStatsCsetdbLogPurges(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerDBStatsCsetdbLogPurgesCount

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerDBStatsCsetdbLogPurgesCount(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerDBStatsCsetdbReads

`public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerDBStatsCsetdbReads(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerDBStatsCsetdbTxn

`public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerDBStatsCsetdbTxn(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerDBStatsCsetdbTxnAborts

`public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerDBStatsCsetdbTxnAborts(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerDBStatsCsetdbTxnCommits

`public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerDBStatsCsetdbTxnCommits(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerDBStatsCsetdbWrites

`public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerDBStatsCsetdbWrites(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSServerDBStatsCsetqCount

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerDBStatsCsetqCount(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSServerDBStatsRrdbCheckPts

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerDBStatsRrdbCheckPts(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSServerDBStatsRrdbDeletes

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerDBStatsRrdbDeletes(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSServerDBStatsRrdbLogPurges

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerDBStatsRrdbLogPurges(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSServerDBStatsRrdbLogPurgesCount

public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerDBStatsRrdbLogPurgesCount(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDNSServerDBStatsRrdbReads

`public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerDBStatsRrdbReads(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerDBStatsRrdbTxn

`public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerDBStatsRrdbTxn(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerDBStatsRrdbTxnAborts

`public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerDBStatsRrdbTxnAborts(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerDBStatsRrdbTxnCommits

`public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerDBStatsRrdbTxnCommits(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDNSServerDBStatsRrdbWrites

`public javax.xml.bind.JAXBElement<java.lang.String> createDNSServerDBStatsRrdbWrites(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDnsSecKeyDnsSecKeyType

public javax.xml.bind.JAXBElement<java.lang.String> createDnsSecKeyDnsSecKeyType(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDnsSecKeyActivationDate

public javax.xml.bind.JAXBElement<java.lang.String> createDnsSecKeyActivationDate(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDnsSecKeyAlgorithm

public javax.xml.bind.JAXBElement<java.lang.String> createDnsSecKeyAlgorithm(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDnsSecKeyBits

public javax.xml.bind.JAXBElement<java.lang.String> createDnsSecKeyBits(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDnsSecKeyDeactivationDate

public javax.xml.bind.JAXBElement<java.lang.String> createDnsSecKeyDeactivationDate(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDnsSecKeyDescription

public javax.xml.bind.JAXBElement<java.lang.String> createDnsSecKeyDescription(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDnsSecKeyEnableSigning

`public javax.xml.bind.JAXBElement<java.lang.String> createDnsSecKeyEnableSigning(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDnsSecKeyExpirationDate

`public javax.xml.bind.JAXBElement<java.lang.String> createDnsSecKeyExpirationDate(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDnsSecKeyKeyGroup

`public javax.xml.bind.JAXBElement<java.lang.String> createDnsSecKeyKeyGroup(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDnsSecKeyRolloverDueDate

`public javax.xml.bind.JAXBElement<java.lang.String> createDnsSecKeyRolloverDueDate(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDnsSecKeyStatus

`public javax.xml.bind.JAXBElement<java.lang.String> createDnsSecKeyStatus(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDnsSecKeyTenantId

public javax.xml.bind.JAXBElement<java.lang.String> createDnsSecKeyTenantId(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createFailoverRelatedServerBindingAcksReceived

public javax.xml.bind.JAXBElement<java.lang.String> createFailoverRelatedServerBindingAcksReceived(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createFailoverRelatedServerBindingAcksReceivedTotal

public javax.xml.bind.JAXBElement<java.lang.String> createFailoverRelatedServerBindingAcksReceivedTotal(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createFailoverRelatedServerBindingAcksSent

public javax.xml.bind.JAXBElement<java.lang.String> createFailoverRelatedServerBindingAcksSent(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createFailoverRelatedServerBindingAcksSentTotal

public javax.xml.bind.JAXBElement<java.lang.String> createFailoverRelatedServerBindingAcksSentTotal(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createFailoverRelatedServerBindingUpdatesReceived

public javax.xml.bind.JAXBElement<java.lang.String> createFailoverRelatedServerBindingUpdatesReceived(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createFailoverRelatedServerBindingUpdatesReceivedTotal

public javax.xml.bind.JAXBElement<java.lang.String> createFailoverRelatedServerBindingUpdatesReceivedTotal(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createFailoverRelatedServerBindingUpdatesSent

public javax.xml.bind.JAXBElement<java.lang.String> createFailoverRelatedServerBindingUpdatesSent(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createFailoverRelatedServerBindingUpdatesSentTotal

public javax.xml.bind.JAXBElement<java.lang.String> createFailoverRelatedServerBindingUpdatesSentTotal(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createFailoverRelatedServerCommState

public javax.xml.bind.JAXBElement<java.lang.String> createFailoverRelatedServerCommState(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createFailoverRelatedServerConnectionEndTime

public javax.xml.bind.JAXBElement<java.lang.String> createFailoverRelatedServerConnectionEndTime(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createFailoverRelatedServerConnectionStartTime

public javax.xml.bind.JAXBElement<java.lang.String> createFailoverRelatedServerConnectionStartTime(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createFailoverRelatedServerCurrentBindingUpdatesInFlight

public javax.xml.bind.JAXBElement<java.lang.String> createFailoverRelatedServerCurrentBindingUpdatesInFlight(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createFailoverRelatedServerCurrentBindingUpdatesQueued

public javax.xml.bind.JAXBElement<java.lang.String> createFailoverRelatedServerCurrentBindingUpdatesQueued(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createFailoverRelatedServerCurrentTime

public javax.xml.bind.JAXBElement<java.lang.String> createFailoverRelatedServerCurrentTime(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createFailoverRelatedServerDecayingMaxRequestBuffersInUse

public javax.xml.bind.JAXBElement<java.lang.String> createFailoverRelatedServerDecayingMaxRequestBuffersInUse(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createFailoverRelatedServerEstEndRecoverTime

public javax.xml.bind.JAXBElement<java.lang.String> createFailoverRelatedServerEstEndRecoverTime(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createFailoverRelatedServerEstPartnerEndRecoverTime

public javax.xml.bind.JAXBElement<java.lang.String> createFailoverRelatedServerEstPartnerEndRecoverTime(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createFailoverRelatedServerFailoverPairName

public javax.xml.bind.JAXBElement<java.lang.String> createFailoverRelatedServerFailoverPairName(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createFailoverRelatedServerIp6Address

public javax.xml.bind.JAXBElement<java.lang.String> createFailoverRelatedServerIp6Address(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createFailoverRelatedServerIpaddr

public javax.xml.bind.JAXBElement<java.lang.String> createFailoverRelatedServerIpaddr(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createFailoverRelatedServerLastBindingAckReceivedTime

public javax.xml.bind.JAXBElement<java.lang.String> createFailoverRelatedServerLastBindingAckReceivedTime(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createFailoverRelatedServerLastBindingAckSentTime

public javax.xml.bind.JAXBElement<java.lang.String> createFailoverRelatedServerLastBindingAckSentTime(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createFailoverRelatedServerLastBindingUpdateReceivedTime

public javax.xml.bind.JAXBElement<java.lang.String> createFailoverRelatedServerLastBindingUpdateReceivedTime(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createFailoverRelatedServerLastBindingUpdateSentTime

public javax.xml.bind.JAXBElement<java.lang.String> createFailoverRelatedServerLastBindingUpdateSentTime(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createFailoverRelatedServerLastCommOkTime

public javax.xml.bind.JAXBElement<java.lang.String> createFailoverRelatedServerLastCommOkTime(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createFailoverRelatedServerLoadBalancingBackupPct

public javax.xml.bind.JAXBElement<java.lang.String> createFailoverRelatedServerLoadBalancingBackupPct(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createFailoverRelatedServerLoadBalancingDroppedRequests

public javax.xml.bind.JAXBElement<java.lang.String> createFailoverRelatedServerLoadBalancingDroppedRequests(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createFailoverRelatedServerLoadBalancingDroppedTotal

public javax.xml.bind.JAXBElement<java.lang.String> createFailoverRelatedServerLoadBalancingDroppedTotal(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createFailoverRelatedServerLoadBalancingLocalHba

public javax.xml.bind.JAXBElement<java.lang.String> createFailoverRelatedServerLoadBalancingLocalHba(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createFailoverRelatedServerLoadBalancingPartnerHba

public javax.xml.bind.JAXBElement<java.lang.String> createFailoverRelatedServerLoadBalancingPartnerHba(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createFailoverRelatedServerLoadBalancingProcessedRequests

```
public javax.xml.bind.JAXBElement<java.lang.String> createFailoverRelatedServerLoadBalancingProcessedRequests(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createFailoverRelatedServerLoadBalancingProcessedTotal

```
public javax.xml.bind.JAXBElement<java.lang.String> createFailoverRelatedServerLoadBalancingProcessedTotal(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createFailoverRelatedServerMaximumBindingUpdatesInFlight

```
public javax.xml.bind.JAXBElement<java.lang.String> createFailoverRelatedServerMaximumBindingUpdatesInFlight(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createFailoverRelatedServerMaximumBindingUpdatesQueued

```
public javax.xml.bind.JAXBElement<java.lang.String> createFailoverRelatedServerMaximumBindingUpdatesQueued(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createFailoverRelatedServerMaximumClientLeadTime

```
public javax.xml.bind.JAXBElement<java.lang.String> createFailoverRelatedServerMaximumClientLeadTime(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createFailoverRelatedServerOtherServerDownTime

```
public javax.xml.bind.JAXBElement<java.lang.String> createFailoverRelatedServerOtherServerDownTime(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createFailoverRelatedServerOurIp6Address

public javax.xml.bind.JAXBElement<java.lang.String> createFailoverRelatedServerOurIp6Address(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createFailoverRelatedServerOurIpaddr

public javax.xml.bind.JAXBElement<java.lang.String> createFailoverRelatedServerOurIpaddr(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createFailoverRelatedServerPartnerRole

public javax.xml.bind.JAXBElement<java.lang.String> createFailoverRelatedServerPartnerRole(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createFailoverRelatedServerPartnerState

public javax.xml.bind.JAXBElement<java.lang.String> createFailoverRelatedServerPartnerState(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createFailoverRelatedServerPartnerVendorMajorVersion

public javax.xml.bind.JAXBElement<java.lang.String> createFailoverRelatedServerPartnerVendorMajorVersion(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createFailoverRelatedServerPartnerVendorMinorVersion

public javax.xml.bind.JAXBElement<java.lang.String> createFailoverRelatedServerPartnerVendorMinorVersion(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createFailoverRelatedServerRequestBuffersAllocated

public javax.xml.bind.JAXBElement<java.lang.String> createFailoverRelatedServerRequestBuffersAllocated(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createFailoverRelatedServerRequestBuffersInUse

public javax.xml.bind.JAXBElement<java.lang.String> createFailoverRelatedServerRequestBuffersInUse(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createFailoverRelatedServerRole

public javax.xml.bind.JAXBElement<java.lang.String> createFailoverRelatedServerRole(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createFailoverRelatedServerSafePeriodRemaining

public javax.xml.bind.JAXBElement<java.lang.String> createFailoverRelatedServerSafePeriodRemaining(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createFailoverRelatedServerSequenceNumber

public javax.xml.bind.JAXBElement<java.lang.String> createFailoverRelatedServerSequenceNumber(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createFailoverRelatedServerSmoothedTimeDelta

public javax.xml.bind.JAXBElement<java.lang.String> createFailoverRelatedServerSmoothedTimeDelta(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createFailoverRelatedServerStartOfCommInterrupted

public javax.xml.bind.JAXBElement<java.lang.String> createFailoverRelatedServerStartOfCommInterrupted(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createFailoverRelatedServerStartTimeOfPartnerState

public javax.xml.bind.JAXBElement<java.lang.String> createFailoverRelatedServerStartTimeOfPartnerState(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createFailoverRelatedServerStartTimeOfState

public javax.xml.bind.JAXBElement<java.lang.String> createFailoverRelatedServerStartTimeOfState(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createFailoverRelatedServerState

public javax.xml.bind.JAXBElement<java.lang.String> createFailoverRelatedServerState(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createFailoverRelatedServerUpdateRequestDoneTime

public javax.xml.bind.JAXBElement<java.lang.String> createFailoverRelatedServerUpdateRequestDoneTime(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createFailoverRelatedServerUpdateRequestOutstanding

public javax.xml.bind.JAXBElement<java.lang.String> createFailoverRelatedServerUpdateRequestOutstanding(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createFailoverRelatedServerUpdateRequestStartTime

public javax.xml.bind.JAXBElement<java.lang.String> createFailoverRelatedServerUpdateRequestStartTime(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createFailoverRelatedServerUpdateResponseDoneTime

public javax.xml.bind.JAXBElement<java.lang.String> createFailoverRelatedServerUpdateResponseDoneTime(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createFailoverRelatedServerUpdateResponseInProgress

public javax.xml.bind.JAXBElement<java.lang.String> createFailoverRelatedServerUpdateResponseInProgress(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createFailoverRelatedServerUpdateResponsePercentComplete

public javax.xml.bind.JAXBElement<java.lang.String> createFailoverRelatedServerUpdateResponsePercentComplete(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createFailoverRelatedServerUpdateResponseStartTime

public javax.xml.bind.JAXBElement<java.lang.String> createFailoverRelatedServerUpdateResponseStartTime(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createFailoverRelatedServerUseOtherAvailable

public javax.xml.bind.JAXBElement<java.lang.String> createFailoverRelatedServerUseOtherAvailable(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createFailoverRelatedServerUseOtherAvailableTime

public javax.xml.bind.JAXBElement<java.lang.String> createFailoverRelatedServerUseOtherAvailableTime(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createFailoverRelatedServerV6BindingAcksReceived

public javax.xml.bind.JAXBElement<java.lang.String> createFailoverRelatedServerV6BindingAcksReceived(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createFailoverRelatedServerV6BindingAcksReceivedTotal

public javax.xml.bind.JAXBElement<java.lang.String> createFailoverRelatedServerV6BindingAcksReceivedTotal(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createFailoverRelatedServerV6BindingAcksSent

public javax.xml.bind.JAXBElement<java.lang.String> createFailoverRelatedServerV6BindingAcksSent(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createFailoverRelatedServerV6BindingAcksSentTotal

public javax.xml.bind.JAXBElement<java.lang.String> createFailoverRelatedServerV6BindingAcksSentTotal(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createFailoverRelatedServerV6BindingUpdatesReceived

public javax.xml.bind.JAXBElement<java.lang.String> createFailoverRelatedServerV6BindingUpdatesReceived(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createFailoverRelatedServerV6BindingUpdatesReceivedTotal

public javax.xml.bind.JAXBElement<java.lang.String> createFailoverRelatedServerV6BindingUpdatesReceivedTotal(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createFailoverRelatedServerV6BindingUpdatesSent

public javax.xml.bind.JAXBElement<java.lang.String> createFailoverRelatedServerV6BindingUpdatesSent(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createFailoverRelatedServerV6BindingUpdatesSentTotal

public javax.xml.bind.JAXBElement<java.lang.String> createFailoverRelatedServerV6BindingUpdatesSentTotal(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createFailoverRelatedServerV6UpdateRequestDoneTime

public javax.xml.bind.JAXBElement<java.lang.String> createFailoverRelatedServerV6UpdateRequestDoneTime(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createFailoverRelatedServerV6UpdateRequestOutstanding

public javax.xml.bind.JAXBElement<java.lang.String> createFailoverRelatedServerV6UpdateRequestOutstanding(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createFailoverRelatedServerV6UpdateRequestStartTime

public javax.xml.bind.JAXBElement<java.lang.String> createFailoverRelatedServerV6UpdateRequestStartTime(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createFailoverRelatedServerV6UpdateResponseDoneTime

public javax.xml.bind.JAXBElement<java.lang.String> createFailoverRelatedServerV6UpdateResponseDoneTime(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createFailoverRelatedServerV6UpdateResponseInProgress

public javax.xml.bind.JAXBElement<java.lang.String> createFailoverRelatedServerV6UpdateResponseInProgress(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createFailoverRelatedServerV6UpdateResponsePercentComplete

public javax.xml.bind.JAXBElement<java.lang.String> createFailoverRelatedServerV6UpdateResponsePercentComplete(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createFailoverRelatedServerV6UpdateResponseStartTime

public javax.xml.bind.JAXBElement<java.lang.String> createFailoverRelatedServerV6UpdateResponseStartTime(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createCCMRRSetAxfrVersion

public javax.xml.bind.JAXBElement<java.lang.String> createCCMRRSetAxfrVersion(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createCCMRRSetDescription

public javax.xml.bind.JAXBElement<java.lang.String> createCCMRRSetDescription(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMRRSetHits

public javax.xml.bind.JAXBElement<java.lang.String> createCCMRRSetHits(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMRRSetHostHealthCheck

public javax.xml.bind.JAXBElement<java.lang.String> createCCMRRSetHostHealthCheck(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMRRSetLastAccessTime

public javax.xml.bind.JAXBElement<java.lang.String> createCCMRRSetLastAccessTime(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMRRSetLastResetTime

public javax.xml.bind.JAXBElement<java.lang.String> createCCMRRSetLastResetTime(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMRRSetProtectedState

public javax.xml.bind.JAXBElement<java.lang.String> createCCMRRSetProtectedState(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMRRSetRrList

public javax.xml.bind.JAXBElement<CCMRRArray> createCCMRRSetRrList(CCMRRArray value)

Create an instance of JAXBElement<CCMRRArray>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<CCMRRArray>

---

createCCMRRSetRrs

public javax.xml.bind.JAXBElement<StringArray> createCCMRRSetRrs(StringArray value)

Create an instance of JAXBElement<StringArray>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<StringArray>

---

createCCMRRSetTenantId

public javax.xml.bind.JAXBElement<java.lang.String> createCCMRRSetTenantId(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMRRSetViewId

public javax.xml.bind.JAXBElement<java.lang.String> createCCMRRSetViewId(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMRRSetViewQualifiedFqdn

public javax.xml.bind.JAXBElement<java.lang.String> createCCMRRSetViewQualifiedFqdn(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMRRSetZoneOrigin

public javax.xml.bind.JAXBElement<java.lang.String> createCCMRRSetZoneOrigin(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMZoneDistributionCachingServerList

public javax.xml.bind.JAXBElement<CCMZDCachingArray> createCCMZoneDistributionCachingServerList(CCMZDCachingArray value)

Create an instance of JAXBElement<CCMZDCachingArray>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<CCMZDCachingArray>

---

createCCMZoneDistributionDescription

public javax.xml.bind.JAXBElement<java.lang.String> createCCMZoneDistributionDescription(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMZoneDistributionNotify

public javax.xml.bind.JAXBElement<java.lang.String> createCCMZoneDistributionNotify(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCCMZoneDistributionNotifyList

public javax.xml.bind.JAXBElement<StringArray> createCCMZoneDistributionNotifyList(StringArray value)

Create an instance of JAXBElement<StringArray>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<StringArray>

createCCMZoneDistributionPrimaryServers

public javax.xml.bind.JAXBElement<StringArray> createCCMZoneDistributionPrimaryServers(StringArray value)

Create an instance of JAXBElement<StringArray>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<StringArray>

createCCMZoneDistributionMasterServers

public javax.xml.bind.JAXBElement<StringArray> createCCMZoneDistributionMasterServers(StringArray value)

Create an instance of JAXBElement<StringArray>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<StringArray>

createCCMZoneDistributionRestrictQuery

public javax.xml.bind.JAXBElement<java.lang.String> createCCMZoneDistributionRestrictQuery(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createCCMZoneDistributionRestrictQueryAcl

public javax.xml.bind.JAXBElement<java.lang.String> createCCMZoneDistributionRestrictQueryAcl(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createCCMZoneDistributionRestrictXfer

public javax.xml.bind.JAXBElement<java.lang.String> createCCMZoneDistributionRestrictXfer(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createCCMZoneDistributionRestrictXferAcl

public javax.xml.bind.JAXBElement<java.lang.String> createCCMZoneDistributionRestrictXferAcl(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:
value - Java instance representing xml element's value.

Returns:
the new instance of JAXBElement<String>

---

createCCMZoneDistributionRoundRobin

public javax.xml.bind.JAXBElement<java.lang.String> createCCMZoneDistributionRoundRobin(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:
value - Java instance representing xml element's value.

Returns:
the new instance of JAXBElement<String>

---

createCCMZoneDistributionSecondariesList

public javax.xml.bind.JAXBElement<CCMZDSecondaryArray> createCCMZoneDistributionSecondariesList(CCMZDSecondaryArray value)

Create an instance of JAXBElement<CCMZDSecondaryArray>

Parameters:
value - Java instance representing xml element's value.

Returns:
the new instance of JAXBElement<CCMZDSecondaryArray>

---

createCCMZoneDistributionTenantId

public javax.xml.bind.JAXBElement<java.lang.String> createCCMZoneDistributionTenantId(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:
value - Java instance representing xml element's value.

Returns:
the new instance of JAXBElement<String>

---

createCCMZoneDistributionUseGssTsig

public javax.xml.bind.JAXBElement<java.lang.String> createCCMZoneDistributionUseGssTsig(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:
value - Java instance representing xml element's value.

Returns:
the new instance of JAXBElement<String>

---

createDHCPServerActivityStatsAckLatencyCounts

public javax.xml.bind.JAXBElement<StringArray> createDHCPServerActivityStatsAckLatencyCounts(StringArray value)

Create an instance of JAXBElement<[StringArray]>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[StringArray]>

---

createDHCPServerActivityStatsAcks

`public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerActivityStatsAcks(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPServerActivityStatsAcksPerSecond

`public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerActivityStatsAcksPerSecond(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPServerActivityStatsActiveLeases

`public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerActivityStatsActiveLeases(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPServerActivityStatsBootpReceived

`public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerActivityStatsBootpReceived(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPServerActivityStatsBootpSent

`public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerActivityStatsBootpSent(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPServerActivityStatsClientClassFails

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerActivityStatsClientClassFails(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPServerActivityStatsClientReservedActiveLeases

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerActivityStatsClientReservedActiveLeases(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPServerActivityStatsClientReservedLeases

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerActivityStatsClientReservedLeases(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPServerActivityStatsConfiguredLeases

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerActivityStatsConfiguredLeases(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPServerActivityStatsDecayingMaxRequestBuffersInUse

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerActivityStatsDecayingMaxRequestBuffersInUse(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDHCPServerActivityStatsDeclines

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerActivityStatsDeclines(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDHCPServerActivityStatsDiscards

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerActivityStatsDiscards(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDHCPServerActivityStatsDiscovers

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerActivityStatsDiscovers(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDHCPServerActivityStatsDroppedTotal

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerActivityStatsDroppedTotal(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDHCPServerActivityStatsDuplicates

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerActivityStatsDuplicates(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDHCPServerActivityStatsExtensionDrops

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerActivityStatsExtensionDrops(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPServerActivityStatsExtensionErrors

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerActivityStatsExtensionErrors(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPServerActivityStatsGraceExpirations

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerActivityStatsGraceExpirations(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPServerActivityStatsInforms

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerActivityStatsInforms(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPServerActivityStatsInvalidClients

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerActivityStatsInvalidClients(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPServerActivityStatsInvalidPackets

```
public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerActivityStatsInvalidPackets(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPServerActivityStatsLeaseQueries

```
public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerActivityStatsLeaseQueries(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPServerActivityStatsLeaseQueriesActive

```
public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerActivityStatsLeaseQueriesActive(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPServerActivityStatsLeaseQueriesUnassigned

```
public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerActivityStatsLeaseQueriesUnassigned(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPServerActivityStatsLeaseQueriesUnknown

```
public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerActivityStatsLeaseQueriesUnknown(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPServerActivityStatsNaks

```
public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerActivityStatsNaks(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDHCPServerActivityStatsOfferTimeouts

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerActivityStatsOfferTimeouts(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDHCPServerActivityStatsOffers

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerActivityStatsOffers(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDHCPServerActivityStatsOverMaxWaiting

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerActivityStatsOverMaxWaiting(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDHCPServerActivityStatsPacketsDropped

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerActivityStatsPacketsDropped(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDHCPServerActivityStatsPacketsReceived

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerActivityStatsPacketsReceived(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDHCPServerActivityStatsPacketsSent

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerActivityStatsPacketsSent(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDHCPServerActivityStatsQueueLimitedDiscoversDropped

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerActivityStatsQueueLimitedDiscoversDropped(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDHCPServerActivityStatsReleases

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerActivityStatsReleases(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDHCPServerActivityStatsRequestBuffersAllocated

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerActivityStatsRequestBuffersAllocated(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDHCPServerActivityStatsRequestBuffersInUse

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerActivityStatsRequestBuffersInUse(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDHCPServerActivityStatsRequestDroppedOld

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerActivityStatsRequestDroppedOld(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDHCPServerActivityStatsRequestDroppedOthers

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerActivityStatsRequestDroppedOthers(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDHCPServerActivityStatsRequests

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerActivityStatsRequests(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDHCPServerActivityStatsReservedActiveLeases

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerActivityStatsReservedActiveLeases(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDHCPServerActivityStatsReservedLeases

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerActivityStatsReservedLeases(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDHCPServerActivityStatsResponseBuffersAllocated

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerActivityStatsResponseBuffersAllocated(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPServerActivityStatsResponseBuffersInUse

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerActivityStatsResponseBuffersInUse(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPServerActivityStatsResponseDroppedOld

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerActivityStatsResponseDroppedOld(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPServerActivityStatsResponseDroppedOthers

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerActivityStatsResponseDroppedOthers(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPServerActivityStatsResponsesDropped

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerActivityStatsResponsesDropped(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPServerActivityStatsTcpActiveLeaseQueries

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerActivityStatsTcpActiveLeaseQueries(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPServerActivityStatsTcpBulkLeaseQueries

`public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerActivityStatsTcpBulkLeaseQueries(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPServerActivityStatsTcpConnectionsDropped

`public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerActivityStatsTcpConnectionsDropped(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPServerActivityStatsTcpCurrentConnections

`public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerActivityStatsTcpCurrentConnections(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPServerActivityStatsTcpLqActive

`public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerActivityStatsTcpLqActive(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPServerActivityStatsTcpLqDone

`public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerActivityStatsTcpLqDone(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:
the new instance of JAXBElement<String>

---

createDHCPServerActivityStatsTcpLqStatus

`public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerActivityStatsTcpLqStatus(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:
value - Java instance representing xml element's value.

Returns:
the new instance of JAXBElement<String>

---

createDHCPServerActivityStatsTcpLqStatusCatchupComplete

`public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerActivityStatsTcpLqStatusCatchupComplete(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:
value - Java instance representing xml element's value.

Returns:
the new instance of JAXBElement<String>

---

createDHCPServerActivityStatsTcpLqStatusConnectionActive

`public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerActivityStatsTcpLqStatusConnectionActive(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:
value - Java instance representing xml element's value.

Returns:
the new instance of JAXBElement<String>

---

createDHCPServerActivityStatsTcpLqStatusDataMissing

`public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerActivityStatsTcpLqStatusDataMissing(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:
value - Java instance representing xml element's value.

Returns:
the new instance of JAXBElement<String>

---

createDHCPServerActivityStatsTcpLqStatusMalformedQuery

`public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerActivityStatsTcpLqStatusMalformedQuery(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:
value - Java instance representing xml element's value.

Returns:
the new instance of JAXBElement<String>

createDHCPServerActivityStatsTcpLqStatusNotAllowed

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerActivityStatsTcpLqStatusNotAllowed(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDHCPServerActivityStatsTcpLqStatusQueryTerminated

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerActivityStatsTcpLqStatusQueryTerminated(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDHCPServerActivityStatsTcpLqStatusUnspecFail

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerActivityStatsTcpLqStatusUnspecFail(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDHCPServerActivityStatsTcpLqUnassigned

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerActivityStatsTcpLqUnassigned(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDHCPServerActivityStatsTcpTotalConnections

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerActivityStatsTcpTotalConnections(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDHCPServerActivityStatsTimeouts

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerActivityStatsTimeouts(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPServerActivityStatsTotalScopes

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerActivityStatsTotalScopes(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDHCPServerActivityStatsUnknownScopes

public javax.xml.bind.JAXBElement<java.lang.String> createDHCPServerActivityStatsUnknownScopes(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCurrentPrefixUtilizationActiveDynamic

public javax.xml.bind.JAXBElement<java.lang.String> createCurrentPrefixUtilizationActiveDynamic(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCurrentPrefixUtilizationAggregationLevel

public javax.xml.bind.JAXBElement<java.lang.String> createCurrentPrefixUtilizationAggregationLevel(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCurrentPrefixUtilizationAvailable

public javax.xml.bind.JAXBElement<java.lang.String> createCurrentPrefixUtilizationAvailable(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCurrentPrefixUtilizationClusterId

public javax.xml.bind.JAXBElement<java.lang.String> createCurrentPrefixUtilizationClusterId(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCurrentPrefixUtilizationDeactivated

public javax.xml.bind.JAXBElement<java.lang.String> createCurrentPrefixUtilizationDeactivated(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCurrentPrefixUtilizationDhcpType

public javax.xml.bind.JAXBElement<java.lang.String> createCurrentPrefixUtilizationDhcpType(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCurrentPrefixUtilizationExpired

public javax.xml.bind.JAXBElement<java.lang.String> createCurrentPrefixUtilizationExpired(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCurrentPrefixUtilizationHistoryList

public javax.xml.bind.JAXBElement<CurrentPrefixUtilizationArray> createCurrentPrefixUtilizationHistoryList(CurrentPrefixUtilizationArray value)

Create an instance of JAXBElement<CurrentPrefixUtilizationArray>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[CurrentPrefixUtilizationArray](#)>

---

createCurrentPrefixUtilizationLeased

public javax.xml.bind.JAXBElement<java.lang.String> createCurrentPrefixUtilizationLeased(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCurrentPrefixUtilizationLeasedDeactivated

public javax.xml.bind.JAXBElement<java.lang.String> createCurrentPrefixUtilizationLeasedDeactivated(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCurrentPrefixUtilizationLinkName

public javax.xml.bind.JAXBElement<java.lang.String> createCurrentPrefixUtilizationLinkName(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCurrentPrefixUtilizationMaxPdBalancingLength

public javax.xml.bind.JAXBElement<java.lang.String> createCurrentPrefixUtilizationMaxPdBalancingLength(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCurrentPrefixUtilizationOffered

public javax.xml.bind.JAXBElement<java.lang.String> createCurrentPrefixUtilizationOffered(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createCurrentPrefixUtilizationOtherAvailable

`public javax.xml.bind.JAXBElement<java.lang.String> createCurrentPrefixUtilizationOtherAvailable(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createCurrentPrefixUtilizationOwner

`public javax.xml.bind.JAXBElement<java.lang.String> createCurrentPrefixUtilizationOwner(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createCurrentPrefixUtilizationPendingAvailable

`public javax.xml.bind.JAXBElement<java.lang.String> createCurrentPrefixUtilizationPendingAvailable(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createCurrentPrefixUtilizationPendingDelete

`public javax.xml.bind.JAXBElement<java.lang.String> createCurrentPrefixUtilizationPendingDelete(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createCurrentPrefixUtilizationPrefix

`public javax.xml.bind.JAXBElement<java.lang.String> createCurrentPrefixUtilizationPrefix(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createCurrentPrefixUtilizationPrefixCount

public javax.xml.bind.JAXBElement<java.lang.String> createCurrentPrefixUtilizationPrefixCount(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createCurrentPrefixUtilizationPrefixDeactivated

public javax.xml.bind.JAXBElement<java.lang.String> createCurrentPrefixUtilizationPrefixDeactivated(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createCurrentPrefixUtilizationPrefixDeactivatedCount

public javax.xml.bind.JAXBElement<java.lang.String> createCurrentPrefixUtilizationPrefixDeactivatedCount(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createCurrentPrefixUtilizationPrefixName

public javax.xml.bind.JAXBElement<java.lang.String> createCurrentPrefixUtilizationPrefixName(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createCurrentPrefixUtilizationPrefixRange

public javax.xml.bind.JAXBElement<java.lang.String> createCurrentPrefixUtilizationPrefixRange(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createCurrentPrefixUtilizationPrefixesAvailable

public javax.xml.bind.JAXBElement<java.lang.String> createCurrentPrefixUtilizationPrefixesAvailable(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCurrentPrefixUtilizationPrefixesInTransition

public javax.xml.bind.JAXBElement<java.lang.String> createCurrentPrefixUtilizationPrefixesInTransition(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCurrentPrefixUtilizationPrefixesInUse

public javax.xml.bind.JAXBElement<java.lang.String> createCurrentPrefixUtilizationPrefixesInUse(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCurrentPrefixUtilizationPrefixesOtherAvailable

public javax.xml.bind.JAXBElement<java.lang.String> createCurrentPrefixUtilizationPrefixesOtherAvailable(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCurrentPrefixUtilizationRegion

public javax.xml.bind.JAXBElement<java.lang.String> createCurrentPrefixUtilizationRegion(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createCurrentPrefixUtilizationReservedActive

public javax.xml.bind.JAXBElement<java.lang.String> createCurrentPrefixUtilizationReservedActive(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createCurrentPrefixUtilizationReservedInactive

public javax.xml.bind.JAXBElement<java.lang.String> createCurrentPrefixUtilizationReservedInactive(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createCurrentPrefixUtilizationReservedLeasedDeactivated

public javax.xml.bind.JAXBElement<java.lang.String> createCurrentPrefixUtilizationReservedLeasedDeactivated(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createCurrentPrefixUtilizationReservedUnavail

public javax.xml.bind.JAXBElement<java.lang.String> createCurrentPrefixUtilizationReservedUnavail(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createCurrentPrefixUtilizationRevoked

public javax.xml.bind.JAXBElement<java.lang.String> createCurrentPrefixUtilizationRevoked(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createCurrentPrefixUtilizationSelectionTags

public javax.xml.bind.JAXBElement<java.lang.String> createCurrentPrefixUtilizationSelectionTags(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createCurrentPrefixUtilizationTenantId

public javax.xml.bind.JAXBElement<java.lang.String> createCurrentPrefixUtilizationTenantId(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createCurrentPrefixUtilizationTimestamp

public javax.xml.bind.JAXBElement<java.lang.String> createCurrentPrefixUtilizationTimestamp(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createCurrentPrefixUtilizationTotalReserved

public javax.xml.bind.JAXBElement<java.lang.String> createCurrentPrefixUtilizationTotalReserved(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createCurrentPrefixUtilizationUnavail

public javax.xml.bind.JAXBElement<java.lang.String> createCurrentPrefixUtilizationUnavail(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createCurrentPrefixUtilizationVpnId

public javax.xml.bind.JAXBElement<java.lang.String> createCurrentPrefixUtilizationVpnId(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createDnsZoneStatusHaFailureCode

public javax.xml.bind.JAXBElement<java.lang.String> createDnsZoneStatusHaFailureCode(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDnsZoneStatusHaStatus

public javax.xml.bind.JAXBElement<java.lang.String> createDnsZoneStatusHaStatus(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDnsZoneStatusOrigin

public javax.xml.bind.JAXBElement<java.lang.String> createDnsZoneStatusOrigin(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDnsZoneStatusViewQualifiedName

public javax.xml.bind.JAXBElement<java.lang.String> createDnsZoneStatusViewQualifiedName(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDnsZoneStatusZoneStatus

public javax.xml.bind.JAXBElement<java.lang.String> createDnsZoneStatusZoneStatus(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createPolicyAffinityPeriod

public javax.xml.bind.JAXBElement<java.lang.String> createPolicyAffinityPeriod(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createPolicyAllowClientARecordUpdate

public javax.xml.bind.JAXBElement<java.lang.String> createPolicyAllowClientARecordUpdate(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createPolicyAllowDualZoneDnsUpdate

public javax.xml.bind.JAXBElement<java.lang.String> createPolicyAllowDualZoneDnsUpdate(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createPolicyAllowLeaseTimeOverride

public javax.xml.bind.JAXBElement<java.lang.String> createPolicyAllowLeaseTimeOverride(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createPolicyAllowNonTemporaryAddresses

public javax.xml.bind.JAXBElement<java.lang.String> createPolicyAllowNonTemporaryAddresses(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createPolicyAllowRapidCommit

public javax.xml.bind.JAXBElement<java.lang.String> createPolicyAllowRapidCommit(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createPolicyAllowTemporaryAddresses

public javax.xml.bind.JAXBElement<java.lang.String> createPolicyAllowTemporaryAddresses(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createPolicyDefaultPrefixLength

public javax.xml.bind.JAXBElement<java.lang.String> createPolicyDefaultPrefixLength(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createPolicyExcludedPrefix

public javax.xml.bind.JAXBElement<java.lang.String> createPolicyExcludedPrefix(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createPolicyForwardDnsupdate

public javax.xml.bind.JAXBElement<java.lang.String> createPolicyForwardDnsupdate(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createPolicyForwardZoneName

public javax.xml.bind.JAXBElement<java.lang.String> createPolicyForwardZoneName(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createPolicyGiaddrAsServerId

`public javax.xml.bind.JAXBElement<java.lang.String> createPolicyGiaddrAsServerId(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createPolicyGracePeriod

`public javax.xml.bind.JAXBElement<java.lang.String> createPolicyGracePeriod(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createPolicyInhibitAllRenews

`public javax.xml.bind.JAXBElement<java.lang.String> createPolicyInhibitAllRenews(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createPolicyInhibitRenewsAtReboot

`public javax.xml.bind.JAXBElement<java.lang.String> createPolicyInhibitRenewsAtReboot(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createPolicyLeaseRetentionLimit

`public javax.xml.bind.JAXBElement<java.lang.String> createPolicyLeaseRetentionLimit(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createPolicyLimitationCount

public javax.xml.bind.JAXBElement<java.lang.String> createPolicyLimitationCount(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createPolicyLongestPrefixLength

public javax.xml.bind.JAXBElement<java.lang.String> createPolicyLongestPrefixLength(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createPolicyMaxClientLeaseTime

public javax.xml.bind.JAXBElement<java.lang.String> createPolicyMaxClientLeaseTime(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createPolicyMaxClientRebindingTime

public javax.xml.bind.JAXBElement<java.lang.String> createPolicyMaxClientRebindingTime(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createPolicyMaxClientRenewalTime

public javax.xml.bind.JAXBElement<java.lang.String> createPolicyMaxClientRenewalTime(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createPolicyMaxLeasesPerBinding

```
public javax.xml.bind.JAXBElement<java.lang.String> createPolicyMaxLeasesPerBinding(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createPolicyOfferTimeout

```
public javax.xml.bind.JAXBElement<java.lang.String> createPolicyOfferTimeout(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createPolicyOptionList

```
public javax.xml.bind.JAXBElement<OptionArray> createPolicyOptionList(OptionArray value)
```

Create an instance of JAXBElement<OptionArray>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<OptionArray>

createPolicyPacketFileName

```
public javax.xml.bind.JAXBElement<java.lang.String> createPolicyPacketFileName(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createPolicyPacketServerName

```
public javax.xml.bind.JAXBElement<java.lang.String> createPolicyPacketServerName(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createPolicyPacketSiaddr

```
public javax.xml.bind.JAXBElement<java.lang.String> createPolicyPacketSiaddr(java.lang.String value)
```

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createPolicyPermanentLeases

public javax.xml.bind.JAXBElement<java.lang.String> createPolicyPermanentLeases(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createPolicyPreferredLifetime

public javax.xml.bind.JAXBElement<java.lang.String> createPolicyPreferredLifetime(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createPolicyReconfigure

public javax.xml.bind.JAXBElement<java.lang.String> createPolicyReconfigure(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createPolicyReconfigureViaRelay

public javax.xml.bind.JAXBElement<java.lang.String> createPolicyReconfigureViaRelay(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createPolicyReverseDnsupdate

public javax.xml.bind.JAXBElement<java.lang.String> createPolicyReverseDnsupdate(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createPolicyServerLeaseTime

public javax.xml.bind.JAXBElement<java.lang.String> createPolicyServerLeaseTime(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createPolicyShortestPrefixLength

public javax.xml.bind.JAXBElement<java.lang.String> createPolicyShortestPrefixLength(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createPolicySplitLeaseTimes

public javax.xml.bind.JAXBElement<java.lang.String> createPolicySplitLeaseTimes(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createPolicyTenantId

public javax.xml.bind.JAXBElement<java.lang.String> createPolicyTenantId(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createPolicyUnavailableTimeout

public javax.xml.bind.JAXBElement<java.lang.String> createPolicyUnavailableTimeout(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createPolicyUseClientIdForReservations

public javax.xml.bind.JAXBElement<java.lang.String> createPolicyUseClientIdForReservations(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createPolicyV4BootpReplyOptions

public javax.xml.bind.JAXBElement<StringArray> createPolicyV4BootpReplyOptions(StringArray value)

Create an instance of JAXBElement<StringArray>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<StringArray>

---

createPolicyV4ReplyOptions

public javax.xml.bind.JAXBElement<StringArray> createPolicyV4ReplyOptions(StringArray value)

Create an instance of JAXBElement<StringArray>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<StringArray>

---

createPolicyV6MaxClientPreferredLifetime

public javax.xml.bind.JAXBElement<java.lang.String> createPolicyV6MaxClientPreferredLifetime(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createPolicyV6MaxClientRebindingTime

public javax.xml.bind.JAXBElement<java.lang.String> createPolicyV6MaxClientRebindingTime(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

createPolicyV6MaxClientRenewalTime

public javax.xml.bind.JAXBElement<java.lang.String> createPolicyV6MaxClientRenewalTime(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createPolicyV6MaxClientValidLifetime

public javax.xml.bind.JAXBElement<java.lang.String> createPolicyV6MaxClientValidLifetime(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createPolicyV6Options

public javax.xml.bind.JAXBElement<OptionArray> createPolicyV6Options(OptionArray value)

Create an instance of JAXBElement<OptionArray>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<OptionArray>

---

createPolicyV6ReplyOptions

public javax.xml.bind.JAXBElement<StringArray> createPolicyV6ReplyOptions(StringArray value)

Create an instance of JAXBElement<StringArray>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<StringArray>

---

createPolicyV6RsooAllowedOptions

public javax.xml.bind.JAXBElement<StringArray> createPolicyV6RsooAllowedOptions(StringArray value)

Create an instance of JAXBElement<StringArray>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<StringArray>

---

createPolicyV6VendorOptions

public javax.xml.bind.JAXBElement<[OptionArray](#)> createPolicyV6VendorOptions([OptionArray](#) value)

Create an instance of JAXBElement<[OptionArray](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[OptionArray](#)>

---

createPolicyValidLifetime

public javax.xml.bind.JAXBElement<java.lang.String> createPolicyValidLifetime(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createPolicyVendorOptions

public javax.xml.bind.JAXBElement<[OptionArray](#)> createPolicyVendorOptions([OptionArray](#) value)

Create an instance of JAXBElement<[OptionArray](#)>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<[OptionArray](#)>

---

createPolicyViewId

public javax.xml.bind.JAXBElement<java.lang.String> createPolicyViewId(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDnsEnumEntrySetDescription

public javax.xml.bind.JAXBElement<java.lang.String> createDnsEnumEntrySetDescription(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDnsEnumEntrySetDomainPrefix

public javax.xml.bind.JAXBElement<java.lang.String> createDnsEnumEntrySetDomainPrefix(java.lang.String value)

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDnsEnumEntrySetPortedNameserver

`public javax.xml.bind.JAXBElement<java.lang.String> createDnsEnumEntrySetPortedNameserver(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDnsEnumEntrySetPortedNumber

`public javax.xml.bind.JAXBElement<java.lang.String> createDnsEnumEntrySetPortedNumber(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDnsEnumEntrySetTenantId

`public javax.xml.bind.JAXBElement<java.lang.String> createDnsEnumEntrySetTenantId(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDnsEnumEntrySetViewId

`public javax.xml.bind.JAXBElement<java.lang.String> createDnsEnumEntrySetViewId(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

---

createDnsEnumEntrySetZoneTemplate

`public javax.xml.bind.JAXBElement<java.lang.String> createDnsEnumEntrySetZoneTemplate(java.lang.String value)`

Create an instance of JAXBElement<String>

Parameters:

value - Java instance representing xml element's value.

Returns:

the new instance of JAXBElement<String>

Package com.cisco.cnr.ws.xsd

Class Option

java.lang.Object
    com.cisco.cnr.ws.xsd.ClassBase
        com.cisco.cnr.ws.xsd.Option

```
public class Option
extends ClassBase
```

The Network Registrar Option class.

A DHCP Option, used to hold configuration information for DHCP clients.

Java class for Option complex type.

The following schema fragment specifies the expected content contained within this class.

```
 <complexType name="Option">
   <complexContent>
     <extension base="{http://ws.cnr.cisco.com/xsd}ClassBase">
       <sequence>
         <element name="expression" type="{http://www.w3.org/2001/XMLSchema}string" minOccurs="0"/>
         <element name="number" type="{http://www.w3.org/2001/XMLSchema}string" minOccurs="0"/>
         <element name="optionDefinitionSetName" type="{http://www.w3.org/2001/XMLSchema}string" minOccurs="0"/>
         <element name="optionDesc" type="{http://www.w3.org/2001/XMLSchema}string" minOccurs="0"/>
         <element name="roundRobin" type="{http://www.w3.org/2001/XMLSchema}string" minOccurs="0"/>
         <element name="subOptions" type="{http://ws.cnr.cisco.com/xsd}OptionArray" minOccurs="0"/>
         <element name="value" type="{http://www.w3.org/2001/XMLSchema}string" minOccurs="0"/>
       </sequence>
     </extension>
   </complexContent>
 </complexType>
```

---

Constructor Detail

Option

public Option()

Method Detail

getExpression

public javax.xml.bind.JAXBElement<java.lang.String> getExpression()

Gets the value of the expression property.

Network Registrar Type: AT_EXPR

The expression which is evaluated to provide the option data.
 Note: That this is only used if there is no value attribute.

Returns:
possible object is JAXBElement<String>

---

setExpression

public void setExpression(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the expression property.

Parameters:
value - allowed object is JAXBElement<String>

---

getNumber

public javax.xml.bind.JAXBElement<java.lang.String> getNumber()

Gets the value of the number property.

Network Registrar Type: AT_INT

The option number (the T part of the TLV)

Returns:

possible object is JAXBElement<String>

setNumber

public void setNumber(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the number property.

Parameters:

value - allowed object is JAXBElement<String>

getOptionDefinitionSetName

public javax.xml.bind.JAXBElement<java.lang.String> getOptionDefinitionSetName()

Gets the value of the optionDefinitionSetName property.

Network Registrar Type: AT_NAMEREF

A reference to the option-definition-set used to create
 this option instance.

Returns:

possible object is JAXBElement<String>

setOptionDefinitionSetName

public void setOptionDefinitionSetName(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the optionDefinitionSetName property.

Parameters:

value - allowed object is JAXBElement<String>

getOptionDesc

public javax.xml.bind.JAXBElement<java.lang.String> getOptionDesc()

Gets the value of the optionDesc property.

Network Registrar Type: AT_OBJREF

The option description that provides the type and name
 for this specific option. This is a shortcut for a
 lookup by id in the appropriate TLV desc table.

Returns:

possible object is JAXBElement<String>

---

setOptionDesc

public void setOptionDesc(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the optionDesc property.

Parameters:

value - allowed object is JAXBElement<String>

---

getRoundRobin

public javax.xml.bind.JAXBElement<java.lang.String> getRoundRobin()

Gets the value of the roundRobin property.

Network Registrar Type: AT_BOOL
Default value: false

Determines whether round robin ordering should be enabled
 for this option. When enabled and option data is list of
 values, the list order will be rotated for each client
 based on hash of client's identifier. Thus, a client will
 always get same order.

Returns:

possible object is JAXBElement<String>

---

setRoundRobin

public void setRoundRobin(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the roundRobin property.

Parameters:

value - allowed object is JAXBElement<String>

---

getSubOptions

public javax.xml.bind.JAXBElement<OptionArray> getSubOptions()

Gets the value of the subOptions property.

Network Registrar Type: AT_NLIST(AT_OBJ(Option))

```
This attribute provides for the optional subdivision of
 option data into nested sub-option objects.  This is
 not used for storing DHCP server configuration, but may be
 useful in other uses of TLV based values.
```

Returns:

possible object is JAXBElement<OptionArray>

---

setSubOptions

public void setSubOptions(javax.xml.bind.JAXBElement<OptionArray> value)

Sets the value of the subOptions property.

Parameters:

value - allowed object is JAXBElement<OptionArray>

---

getValue

public javax.xml.bind.JAXBElement<java.lang.String> getValue()

Gets the value of the value property.

Network Registrar Type: AT_BLOB

```
The option value (the V part of the TLV)
```

Returns:

possible object is JAXBElement<String>

---

setValue

public void setValue(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the value property.

Parameters:

value - allowed object is JAXBElement<String>

Package com.cisco.cnr.ws.xsd

Class OptionArray

java.lang.Object
    com.cisco.cnr.ws.xsd.ClassBaseArray
        com.cisco.cnr.ws.xsd.OptionArray

---

public class **OptionArray**
extends ClassBaseArray

Java class for OptionArray complex type.

The following schema fragment specifies the expected content contained within this class.

```
<complexType name="OptionArray">
  <complexContent>
    <extension base="{http://ws.cnr.cisco.com/xsd}ClassBaseArray">

Class OptionDefinitionSet

java.lang.Object
    com.cisco.cnr.ws.xsd.ClassBase
        com.cisco.cnr.ws.xsd.OptionDefinitionSet

```
public class OptionDefinitionSet
extends ClassBase
```

The Network Registrar OptionDefinitionSet class.

Contains sets of DHCP option definitions. Define one set for DHCPv4, and another set for DHCPv6. Option definitions override a server's corresponding built-in definitions. Also use this class for vendor option definition sets. You can have as many vendor option definition sets as required.

Java class for OptionDefinitionSet complex type.

The following schema fragment specifies the expected content contained within this class.

```
 <complexType name="OptionDefinitionSet">
   <complexContent>
     <extension base="{http://ws.cnr.cisco.com/xsd}ClassBase">
       <sequence>

Constructor Detail

OptionDefinitionSet

public OptionDefinitionSet()

Method Detail

getDesc

public javax.xml.bind.JAXBElement<java.lang.String> getDesc()

Gets the value of the desc property.

Network Registrar Type: AT_STRING

Describes this option definition set.

Returns:

possible object is JAXBElement<String>

setDesc

public void setDesc(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the desc property.

Parameters:
value - allowed object is JAXBElement<String>

getFlags

public javax.xml.bind.JAXBElement<java.lang.String> getFlags()

Gets the value of the flags property.

Network Registrar Type: AT_FLAGSINT
Valid values: builtin, customized, vendor

Reports the flags for this set of options.

Returns:
possible object is JAXBElement<String>

setFlags

public void setFlags(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the flags property.

Parameters:
value - allowed object is JAXBElement<String>

getIdRange

public java.lang.String getIdRange()

Gets the value of the idRange property.

Network Registrar Type: AT_ENUMINT
Required.
Valid values: one-byte, two-bytes, four-bytes

Specifies the byte size of the type identifiers for all options
 in this set. Values can be:

```
1 - one byte
2 - two bytes
4 - four bytes
```

Returns:

possible object is String

---

setIdRange

public void setIdRange(java.lang.String value)

Sets the value of the idRange property.

Parameters:

value - allowed object is String

---

getName

public java.lang.String getName()

Gets the value of the name property.

Network Registrar Type: AT_STRING
Required. Unique.

```
Designates the name of this option definition set.
```

Returns:

possible object is String

---

setName

public void setName(java.lang.String value)

Sets the value of the name property.

Parameters:

value - allowed object is String

---

getOptionList

public javax.xml.bind.JAXBElement<AttrDescArray> getOptionList()

Gets the value of the optionList property.

Network Registrar Type: AT_NLIST(AT_OBJ(AttrDesc))

Lists the set of attribute descriptions that define each option
 in this option definition set.

Returns:

possible object is JAXBElement<[AttrDescArray](#)>

---

setOptionList

public void setOptionList(javax.xml.bind.JAXBElement<[AttrDescArray](#)> value)

Sets the value of the optionList property.

Parameters:

value - allowed object is JAXBElement<[AttrDescArray](#)>

---

getChildren

public javax.xml.bind.JAXBElement<[AttrDescArray](#)> getChildren()

Gets the value of the children property.

Network Registrar Type: AT_NLIST(AT_OBJ(AttrDesc))

Deprecated. See optionList

Returns:

possible object is JAXBElement<[AttrDescArray](#)>

---

setChildren

public void setChildren(javax.xml.bind.JAXBElement<[AttrDescArray](#)> value)

Sets the value of the children property.

Parameters:

value - allowed object is JAXBElement<[AttrDescArray](#)>

---

getTenantId

public javax.xml.bind.JAXBElement<java.lang.String> getTenantId()

Gets the value of the tenantId property.

Network Registrar Type: AT_SHORT
Immutable.
Default value: 0

Identifies the tenant owner of this object.

Returns:

possible object is JAXBElement<String>

---

setTenantId

public void setTenantId(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the tenantId property.

Parameters:

value - allowed object is JAXBElement<String>

---

getVendorOptionEnterpriseId

public javax.xml.bind.JAXBElement<java.lang.String> getVendorOptionEnterpriseId()

Gets the value of the vendorOptionEnterpriseId property.

Network Registrar Type: AT_INT

```
The enterprise identifier.
 If defined, contains definitions for any option with AT_VENDOR_OPTS
 or AT_VENDOR_CLASS type, such as
     DHCPv6 id 16
     DHCPv6 id 17
     DHCPv4 id 124
     DHCPv4 id 125
 This attribute is required for a DHCPv6 vendor option.
 This attribute optionally can be set in combination with the
 vendor-option-string for a DHCPv4 vendor option.
```

Returns:

possible object is JAXBElement<String>

---

setVendorOptionEnterpriseId

public void setVendorOptionEnterpriseId(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the vendorOptionEnterpriseId property.

Parameters:

value - allowed object is JAXBElement<String>

getVendorOptionRegex

public javax.xml.bind.JAXBElement<java.lang.String> getVendorOptionRegex()

Gets the value of the vendorOptionRegex property.

Network Registrar Type: AT_STRING

```
Contains the vendor option regex string to match with vendor class
 identifier string provided by the DHCP client device vendor in
 DHCPv4 option-60. The DHCP server uses this string to identify
 the DHCP client device and return appropriate vendor specific
 option data.
 The server ignores this attribute for DHCPv6.
```

Returns:

possible object is JAXBElement<String>

setVendorOptionRegex

public void setVendorOptionRegex(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the vendorOptionRegex property.

Parameters:

value - allowed object is JAXBElement<String>

getVendorOptionString

public javax.xml.bind.JAXBElement<java.lang.String> getVendorOptionString()

Gets the value of the vendorOptionString property.

Network Registrar Type: AT_STRING

```
Contains the vendor class identifier string provided by the DHCP
 client device vendor in DHCPv4 option-60. The DHCP server uses this
 string to identify the DHCP client device and return appropriate
 vendor specific option data.
 The server ignores this attribute for DHCPv6.
```

Returns:

possible object is JAXBElement<String>

setVendorOptionString

public void setVendorOptionString(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the vendorOptionString property.

Parameters:

value - allowed object is JAXBElement<String>

Class Summary

Class	Description
ACL	The Network Registrar ACL class.
ACLArray	Java class for ACLArray complex type.
AddrSet	The Network Registrar AddrSet class.
AddrSetArray	Java class for AddrSetArray complex type.
AttrDesc	The Network Registrar AttrDesc class.
AttrDescArray	Java class for AttrDescArray complex type.
AuthDnsSec	The Network Registrar AuthDnsSec class.
CCMCluster	The Network Registrar CCMCluster class.
CCMClusterArray	Java class for CCMClusterArray complex type.
CCMFailoverPair	The Network Registrar CCMFailoverPair class.
CCMFailoverPairArray	Java class for CCMFailoverPairArray complex type.
CCMHaDnsPair	The Network Registrar CCMHaDnsPair class.
CCMHaDnsPairArray	Java class for CCMHaDnsPairArray complex type.
CCMHost	The Network Registrar CCMHost class.
CCMHostArray	Java class for CCMHostArray complex type.
CCMReverseZone	The Network Registrar CCMReverseZone class.
CCMReverseZoneArray	Java class for CCMReverseZoneArray complex type.
CCMRR	The Network Registrar CCMRR class.
CCMRRArray	Java class for CCMRRArray complex type.
CCMRRSet	The Network Registrar CCMRRSet class.
CCMRRSetArray	Java class for CCMRRSetArray complex type.

CCMScopeTemplate	The Network Registrar CCMScopeTemplate class.
CCMScopeTemplateArray	Java class for CCMScopeTemplateArray complex type.
CCMSecondaryZone	The Network Registrar CCMSecondaryZone class.
CCMSecondaryZoneArray	Java class for CCMSecondaryZoneArray complex type.
CCMServer	The Network Registrar CCMServer class.
CCMServerArray	Java class for CCMServerArray complex type.
CCMServerInfo	The Network Registrar CCMServerInfo class.
CCMServerInfoArray	Java class for CCMServerInfoArray complex type.
CCMSubnet	The Network Registrar CCMSubnet class.
CCMSubnetArray	Java class for CCMSubnetArray complex type.
CCMZDCaching	The Network Registrar CCMZDCaching class.
CCMZDCachingArray	Java class for CCMZDCachingArray complex type.
CCMZDSecondary	The Network Registrar CCMZDSecondary class.
CCMZDSecondaryArray	Java class for CCMZDSecondaryArray complex type.
CCMZone	The Network Registrar CCMZone class.
CCMZoneArray	Java class for CCMZoneArray complex type.
CCMZoneDistribution	The Network Registrar CCMZoneDistribution class.
CCMZoneDistributionArray	Java class for CCMZoneDistributionArray complex type.
CCMZoneTemplate	The Network Registrar CCMZoneTemplate class.
CCMZoneTemplateArray	Java class for CCMZoneTemplateArray complex type.
CdnsDomainRateLimit	The Network Registrar CdnsDomainRateLimit class.
CdnsDomainRateLimitArray	Java class for CdnsDomainRateLimitArray complex type.
CdnsRateLimit	The Network Registrar CdnsRateLimit class.
CdnsRedirect	The Network Registrar CdnsRedirect class.
CdnsRedirectArray	Java class for CdnsRedirectArray complex type.
Certificate	The Network Registrar Certificate class.
CertificateArray	Java class for CertificateArray complex type.
ClassBase	Java class for ClassBase complex type.

ClassBaseArray	Java class for ClassBaseArray complex type.
ClientClass	The Network Registrar ClientClass class.
ClientClassArray	Java class for ClientClassArray complex type.
ClientEntry	The Network Registrar ClientEntry class.
ClientEntryArray	Java class for ClientEntryArray complex type.
CnrSoapAuth	Java class for CnrSoapAuth complex type.
CurrentPrefixUtilization	The Network Registrar CurrentPrefixUtilization class.
CurrentPrefixUtilizationArray	Java class for CurrentPrefixUtilizationArray complex type.
CurrentUtilization	The Network Registrar CurrentUtilization class.
CurrentUtilizationArray	Java class for CurrentUtilizationArray complex type.
DHCP6Stats	The Network Registrar DHCP6Stats class.
DHCP6StatsArray	Java class for DHCP6StatsArray complex type.
DHCPFailoverStats	The Network Registrar DHCPFailoverStats class.
DHCPFailoverStatsArray	Java class for DHCPFailoverStatsArray complex type.
DHCPMaintenanceWindow	The Network Registrar DHCPMaintenanceWindow class.
DHCPMaintenanceWindowArray	Java class for DHCPMaintenanceWindowArray complex type.
DHCPRenewalData	The Network Registrar DHCPRenewalData class.
DHCPRenewalDataArray	Java class for DHCPRenewalDataArray complex type.
DHCPScopeAggregationStats	The Network Registrar DHCPScopeAggregationStats class.
DHCPScopeAggregationStatsArray	Java class for DHCPScopeAggregationStatsArray complex type.
DHCPScopeStatus	The Network Registrar DHCPScopeStatus class.
DHCPScopeStatusArray	Java class for DHCPScopeStatusArray complex type.
DHCPServer	The Network Registrar DHCPServer class.
DHCPServerActivityStats	The Network Registrar DHCPServerActivityStats class.
DHCPServerActivityStatsArray	Java class for DHCPServerActivityStatsArray complex type.
DHCPServerStats	The Network Registrar DHCPServerStats class.
DHCPServerStatsArray	

	Java class for DHCPServerStatsArray complex type.
DHCPTopUtilizedStats	The Network Registrar DHCPTopUtilizedStats class.
DHCPTopUtilizedStatsArray	Java class for DHCPTopUtilizedStatsArray complex type.
Dns64	The Network Registrar Dns64 class.
Dns64Array	Java class for Dns64Array complex type.
DNSCachingServer	The Network Registrar DNSCachingServer class.
DNSCachingServerConfig	The Network Registrar DNSCachingServerConfig class.
DNSCachingServerRateLimitItem	The Network Registrar DNSCachingServerRateLimitItem class.
DNSCachingServerRateLimitItemArray	Java class for DNSCachingServerRateLimitItemArray complex type.
DNSCachingServerRateLimitStats	The Network Registrar DNSCachingServerRateLimitStats class.
DNSCachingServerRateLimitStatsArray	Java class for DNSCachingServerRateLimitStatsArray complex type.
DNSCachingServerStats	The Network Registrar DNSCachingServerStats class.
DNSCachingServerStatsArray	Java class for DNSCachingServerStatsArray complex type.
DnsEnumConfig	The Network Registrar DnsEnumConfig class.
DnsEnumDomain	The Network Registrar DnsEnumDomain class.
DnsEnumDomainArray	Java class for DnsEnumDomainArray complex type.
DnsEnumEntry	The Network Registrar DnsEnumEntry class.
DnsEnumEntryArray	Java class for DnsEnumEntryArray complex type.
DnsEnumEntrySet	The Network Registrar DnsEnumEntrySet class.
DnsEnumEntrySetArray	Java class for DnsEnumEntrySetArray complex type.
DnsException	The Network Registrar DnsException class.
DnsExceptionArray	Java class for DnsExceptionArray complex type.
DnsForwarder	The Network Registrar DnsForwarder class.
DnsForwarderArray	Java class for DnsForwarderArray complex type.
DnsHAStatus	The Network Registrar DnsHAStatus class.
DnsHAStatusArray	Java class for DnsHAStatusArray complex type.

DnsIPnPort	The Network Registrar DnsIPnPort class.
DnsIPnPortArray	Java class for DnsIPnPortArray complex type.
DNSRelatedServer	The Network Registrar DNSRelatedServer class.
DNSRelatedServerArray	Java class for DNSRelatedServerArray complex type.
DnsSec	The Network Registrar DnsSec class.
DnsSecKey	The Network Registrar DnsSecKey class.
DnsSecKeyArray	Java class for DnsSecKeyArray complex type.
DNSServer	The Network Registrar DNSServer class.
DNSServerCacheStats	The Network Registrar DNSServerCacheStats class.
DNSServerCacheStatsArray	Java class for DNSServerCacheStatsArray complex type.
DNSServerDBStats	The Network Registrar DNSServerDBStats class.
DNSServerDBStatsArray	Java class for DNSServerDBStatsArray complex type.
DNSServerErrorsStats	The Network Registrar DNSServerErrorsStats class.
DNSServerErrorsStatsArray	Java class for DNSServerErrorsStatsArray complex type.
DNSServerHaStats	The Network Registrar DNSServerHaStats class.
DNSServerHaStatsArray	Java class for DNSServerHaStatsArray complex type.
DNSServerIPv6Stats	The Network Registrar DNSServerIPv6Stats class.
DNSServerIPv6StatsArray	Java class for DNSServerIPv6StatsArray complex type.
DNSServerMaxCounterStats	The Network Registrar DNSServerMaxCounterStats class.
DNSServerMaxCounterStatsArray	Java class for DNSServerMaxCounterStatsArray complex type.
DNSServerPerformanceStats	The Network Registrar DNSServerPerformanceStats class.
DNSServerPerformanceStatsArray	Java class for DNSServerPerformanceStatsArray complex type.
DNSServerPushNotificationStats	The Network Registrar DNSServerPushNotificationStats class.
DNSServerPushNotificationStatsArray	Java class for DNSServerPushNotificationStatsArray complex type.
DNSServerQueryStats	The Network Registrar DNSServerQueryStats class.

DNSServerQueryStatsArray	Java class for DNSServerQueryStatsArray complex type.
DNSServerSecurityStats	The Network Registrar DNSServerSecurityStats class.
DNSServerSecurityStatsArray	Java class for DNSServerSecurityStatsArray complex type.
DNSServerStats	The Network Registrar DNSServerStats class.
DNSServerStatsArray	Java class for DNSServerStatsArray complex type.
DNSTopNameStats	The Network Registrar DNSTopNameStats class.
DNSTopNameStatsArray	Java class for DNSTopNameStatsArray complex type.
DnsTrustAnchor	The Network Registrar DnsTrustAnchor class.
DnsTrustAnchorArray	Java class for DnsTrustAnchorArray complex type.
DnsUpdateConfig	The Network Registrar DnsUpdateConfig class.
DnsUpdateConfigArray	Java class for DnsUpdateConfigArray complex type.
DnsView	The Network Registrar DnsView class.
DnsViewArray	Java class for DnsViewArray complex type.
DnsZoneStatus	The Network Registrar DnsZoneStatus class.
DnsZoneStatusArray	Java class for DnsZoneStatusArray complex type.
FailoverRelatedServer	The Network Registrar FailoverRelatedServer class.
FailoverRelatedServerArray	Java class for FailoverRelatedServerArray complex type.
Filter	The Network Registrar Filter class.
FilterArray	Java class for FilterArray complex type.
FilterElement	The Network Registrar FilterElement class.
FilterElementArray	Java class for FilterElementArray complex type.
Key	The Network Registrar Key class.
KeyArray	Java class for KeyArray complex type.
LDAPRelatedServer	The Network Registrar LDAPRelatedServer class.
LDAPRelatedServerArray	Java class for LDAPRelatedServerArray complex type.
Lease	The Network Registrar Lease class.
Lease6	The Network Registrar Lease6 class.
Lease6Array	Java class for Lease6Array complex type.

LeaseArray	Java class for LeaseArray complex type.
Link	The Network Registrar Link class.
LinkArray	Java class for LinkArray complex type.
LinkTemplate	The Network Registrar LinkTemplate class.
LinkTemplateArray	Java class for LinkTemplateArray complex type.
ObjectFactory	This object contains factory methods for each Java content interface and Java element interface generated in the com.cisco.cnr.ws.xsd package.
Option	The Network Registrar Option class.
OptionArray	Java class for OptionArray complex type.
OptionDefinitionSet	The Network Registrar OptionDefinitionSet class.
OptionDefinitionSetArray	Java class for OptionDefinitionSetArray complex type.
Policy	The Network Registrar Policy class.
PolicyArray	Java class for PolicyArray complex type.
Prefix	The Network Registrar Prefix class.
PrefixArray	Java class for PrefixArray complex type.
PrefixTemplate	The Network Registrar PrefixTemplate class.
PrefixTemplateArray	Java class for PrefixTemplateArray complex type.
Range	The Network Registrar Range class.
RangeArray	Java class for RangeArray complex type.
RelayAgentState	The Network Registrar RelayAgentState class.
RelayAgentStateArray	Java class for RelayAgentStateArray complex type.
Reservation	The Network Registrar Reservation class.
Reservation6	The Network Registrar Reservation6 class.
Reservation6Array	Java class for Reservation6Array complex type.
ReservationArray	Java class for ReservationArray complex type.
ResourceStatus	The Network Registrar ResourceStatus class.
ResourceStatusArray	Java class for ResourceStatusArray complex type.
ResourceValue	

	The Network Registrar ResourceValue class.
ResourceValueArray	Java class for ResourceValueArray complex type.
Scope	The Network Registrar Scope class.
ScopeArray	Java class for ScopeArray complex type.
ScpAndJavaConverter	Implements a utility class that facilitates conversion between Network Registrar generic objects in ScpObj form for use with the Network Registar Java SDK and XML-based Java classes for web services.
ServerSystemStats	The Network Registrar ServerSystemStats class.
ServerSystemStatsArray	Java class for ServerSystemStatsArray complex type.
StringArray	Java class for stringArray complex type.
SystemStats	The Network Registrar SystemStats class.
SystemStatsArray	Java class for SystemStatsArray complex type.
TCPConnectionRelatedServer	The Network Registrar TCPConnectionRelatedServer class.
TCPConnectionRelatedServerArray	Java class for TCPConnectionRelatedServerArray complex type.
TCPListenerRelatedServer	The Network Registrar TCPListenerRelatedServer class.
TCPListenerRelatedServerArray	Java class for TCPListenerRelatedServerArray complex type.
UpdatePolicy	The Network Registrar UpdatePolicy class.
UpdatePolicyArray	Java class for UpdatePolicyArray complex type.
VPN	The Network Registrar VPN class.
VPNArray	Java class for VPNArray complex type.

Package com.cisco.cnr.ws.xsd

Class Policy

java.lang.Object
    com.cisco.cnr.ws.xsd.ClassBase
        com.cisco.cnr.ws.xsd.Policy

```
public class Policy
extends ClassBase
```

The Network Registrar Policy class.

A DHCP Policy object. The policy defines the set of DHCP Options and server policy settings that should be applied when granting a lease.

Java class for Policy complex type.

The following schema fragment specifies the expected content contained within this class.

```
 <complexType name="Policy">
   <complexContent>
     <extension base="{http://ws.cnr.cisco.com/xsd}ClassBase">
       <sequence>
         <element name="affinityPeriod" type="{http://www.w3.org/2001/XMLSchema}string" minOccurs="0"/>

Method Summary

All Methods	Instance Methods	Concrete Methods

Modifier and Type	Method	Description
javax.xml.bind.JAXBElement<java.lang.String>	**getAffinityPeriod**()	Gets the value of the affinityPeriod property.
javax.xml.bind.JAXBElement<java.lang.String>	**getAllowClientARecordUpdate**()	Gets the value of the allowClientARecordUpdate property.
javax.xml.bind.JAXBElement<java.lang.String>	**getAllowDualZoneDnsUpdate**()	Gets the value of the allowDualZoneDnsUpdate property.
javax.xml.bind.JAXBElement<java.lang.String>	**getAllowLeaseTimeOverride**()	Gets the value of the

		allowLeaseTimeOverride property.
javax.xml.bind.JAXBElement<java.lang.String>	**getAllowNonTemporaryAddresses**()	Gets the value of the allowNonTemporaryAddresses property.
javax.xml.bind.JAXBElement<java.lang.String>	**getAllowRapidCommit**()	Gets the value of the allowRapidCommit property.
javax.xml.bind.JAXBElement<java.lang.String>	**getAllowTemporaryAddresses**()	Gets the value of the allowTemporaryAddresses property.
javax.xml.bind.JAXBElement<java.lang.String>	**getDefaultPrefixLength**()	Gets the value of the defaultPrefixLength property.
javax.xml.bind.JAXBElement<java.lang.String>	**getExcludedPrefix**()	Gets the value of the excludedPrefix property.
javax.xml.bind.JAXBElement<java.lang.String>	**getForwardDnsupdate**()	Gets the value of the forwardDnsupdate property.
javax.xml.bind.JAXBElement<java.lang.String>	**getForwardZoneName**()	Gets the value of the forwardZoneName property.
javax.xml.bind.JAXBElement<java.lang.String>	**getGiaddrAsServerId**()	Gets the value of the giaddrAsServerId property.
javax.xml.bind.JAXBElement<java.lang.String>	**getGracePeriod**()	Gets the value of the gracePeriod property.
javax.xml.bind.JAXBElement<java.lang.String>	**getInhibitAllRenews**()	Gets the value of the inhibitAllRenews property.
javax.xml.bind.JAXBElement<java.lang.String>	**getInhibitRenewsAtReboot**()	Gets the value of the inhibitRenewsAtReboot property.
javax.xml.bind.JAXBElement<java.lang.String>	**getLeaseRetentionLimit**()	Gets the value of the leaseRetentionLimit property.
javax.xml.bind.JAXBElement<java.lang.String>	**getLimitationCount**()	Gets the value of the limitationCount property.
javax.xml.bind.JAXBElement<java.lang.String>	**getLongestPrefixLength**()	Gets the value of the longestPrefixLength property.
javax.xml.bind.JAXBElement<java.lang.String>	**getMaxClientLeaseTime**()	Gets the value of the maxClientLeaseTime property.
javax.xml.bind.JAXBElement<java.lang.String>	**getMaxClientRebindingTime**()	Gets the value of the maxClientRebindingTime property.
javax.xml.bind.JAXBElement<java.lang.String>	**getMaxClientRenewalTime**()	Gets the value of the maxClientRenewalTime property.
javax.xml.bind.JAXBElement<java.lang.String>	**getMaxLeasesPerBinding**()	Gets the value of the

			maxLeasesPerBinding property.
java.lang.String	**getName**()		Gets the value of the name property.
javax.xml.bind.JAXBElement<java.lang.String>	**getOfferTimeout**()		Gets the value of the offerTimeout property.
javax.xml.bind.JAXBElement<**OptionArray**>	**getOptionList**()		Gets the value of the optionList property.
javax.xml.bind.JAXBElement<java.lang.String>	**getPacketFileName**()		Gets the value of the packetFileName property.
javax.xml.bind.JAXBElement<java.lang.String>	**getPacketServerName**()		Gets the value of the packetServerName property.
javax.xml.bind.JAXBElement<java.lang.String>	**getPacketSiaddr**()		Gets the value of the packetSiaddr property.
javax.xml.bind.JAXBElement<java.lang.String>	**getPermanentLeases**()		Gets the value of the permanentLeases property.
javax.xml.bind.JAXBElement<java.lang.String>	**getPreferredLifetime**()		Gets the value of the preferredLifetime property.
javax.xml.bind.JAXBElement<java.lang.String>	**getReconfigure**()		Gets the value of the reconfigure property.
javax.xml.bind.JAXBElement<java.lang.String>	**getReconfigureViaRelay**()		Gets the value of the reconfigureViaRelay property.
javax.xml.bind.JAXBElement<java.lang.String>	**getReverseDnsupdate**()		Gets the value of the reverseDnsupdate property.
javax.xml.bind.JAXBElement<java.lang.String>	**getServerLeaseTime**()		Gets the value of the serverLeaseTime property.
javax.xml.bind.JAXBElement<java.lang.String>	**getShortestPrefixLength**()		Gets the value of the shortestPrefixLength property.
javax.xml.bind.JAXBElement<java.lang.String>	**getSplitLeaseTimes**()		Gets the value of the splitLeaseTimes property.
javax.xml.bind.JAXBElement<java.lang.String>	**getTenantId**()		Gets the value of the tenantId property.
javax.xml.bind.JAXBElement<java.lang.String>	**getUnavailableTimeout**()		Gets the value of the unavailableTimeout property.
javax.xml.bind.JAXBElement<java.lang.String>	**getUseClientIdForReservations**()		Gets the value of the useClientIdForReservations property.
javax.xml.bind.JAXBElement<**StringArray**>	**getV4BootpReplyOptions**()		Gets the value of the v4BootpReplyOptions property.
javax.xml.bind.JAXBElement<**StringArray**>	**getV4ReplyOptions**()		Gets the value of the

		v4ReplyOptions property.
javax.xml.bind.JAXBElement<java.lang.String>	**getV6MaxClientPreferredLifetime**()	Gets the value of the v6MaxClientPreferredLifetime property.
javax.xml.bind.JAXBElement<java.lang.String>	**getV6MaxClientRebindingTime**()	Gets the value of the v6MaxClientRebindingTime property.
javax.xml.bind.JAXBElement<java.lang.String>	**getV6MaxClientRenewalTime**()	Gets the value of the v6MaxClientRenewalTime property.
javax.xml.bind.JAXBElement<java.lang.String>	**getV6MaxClientValidLifetime**()	Gets the value of the v6MaxClientValidLifetime property.
javax.xml.bind.JAXBElement<**OptionArray**>	**getV6Options**()	Gets the value of the v6Options property.
javax.xml.bind.JAXBElement<**StringArray**>	**getV6ReplyOptions**()	Gets the value of the v6ReplyOptions property.
javax.xml.bind.JAXBElement<**StringArray**>	**getV6RsooAllowedOptions**()	Gets the value of the v6RsooAllowedOptions property.
javax.xml.bind.JAXBElement<**OptionArray**>	**getV6VendorOptions**()	Gets the value of the v6VendorOptions property.
javax.xml.bind.JAXBElement<java.lang.String>	**getValidLifetime**()	Gets the value of the validLifetime property.
javax.xml.bind.JAXBElement<**OptionArray**>	**getVendorOptions**()	Gets the value of the vendorOptions property.
javax.xml.bind.JAXBElement<java.lang.String>	**getViewId**()	Gets the value of the viewId property.
void	**setAffinityPeriod**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the affinityPeriod property.
void	**setAllowClientARecordUpdate**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the allowClientARecordUpdate property.
void	**setAllowDualZoneDnsUpdate**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the allowDualZoneDnsUpdate property.
void	**setAllowLeaseTimeOverride**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the allowLeaseTimeOverride property.
void	**setAllowNonTemporaryAddresses**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the allowNonTemporaryAddresses property.
void	**setAllowRapidCommit**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the

			allowRapidCommit property.
void	**setAllowTemporaryAddresses**(javax.xml.bind.JAXBElement<java.lang.String> value)		Sets the value of the allowTemporaryAddresses property.
void	**setDefaultPrefixLength**(javax.xml.bind.JAXBElement<java.lang.String> value)		Sets the value of the defaultPrefixLength property.
void	**setExcludedPrefix**(javax.xml.bind.JAXBElement<java.lang.String> value)		Sets the value of the excludedPrefix property.
void	**setForwardDnsupdate**(javax.xml.bind.JAXBElement<java.lang.String> value)		Sets the value of the forwardDnsupdate property.
void	**setForwardZoneName**(javax.xml.bind.JAXBElement<java.lang.String> value)		Sets the value of the forwardZoneName property.
void	**setGiaddrAsServerId**(javax.xml.bind.JAXBElement<java.lang.String> value)		Sets the value of the giaddrAsServerId property.
void	**setGracePeriod**(javax.xml.bind.JAXBElement<java.lang.String> value)		Sets the value of the gracePeriod property.
void	**setInhibitAllRenews**(javax.xml.bind.JAXBElement<java.lang.String> value)		Sets the value of the inhibitAllRenews property.
void	**setInhibitRenewsAtReboot**(javax.xml.bind.JAXBElement<java.lang.String> value)		Sets the value of the inhibitRenewsAtReboot property.
void	**setLeaseRetentionLimit**(javax.xml.bind.JAXBElement<java.lang.String> value)		Sets the value of the leaseRetentionLimit property.
void	**setLimitationCount**(javax.xml.bind.JAXBElement<java.lang.String> value)		Sets the value of the limitationCount property.
void	**setLongestPrefixLength**(javax.xml.bind.JAXBElement<java.lang.String> value)		Sets the value of the longestPrefixLength property.
void	**setMaxClientLeaseTime**(javax.xml.bind.JAXBElement<java.lang.String> value)		Sets the value of the maxClientLeaseTime property.
void	**setMaxClientRebindingTime**(javax.xml.bind.JAXBElement<java.lang.String> value)		Sets the value of the maxClientRebindingTime property.
void	**setMaxClientRenewalTime**(javax.xml.bind.JAXBElement<java.lang.String> value)		Sets the value of the maxClientRenewalTime property.
void	**setMaxLeasesPerBinding**(javax.xml.bind.JAXBElement<java.lang.String> value)		Sets the value of the maxLeasesPerBinding property.
void	**setName**(java.lang.String value)		Sets the value of the name property.
void	**setOfferTimeout**(javax.xml.bind.JAXBElement<java.lang.String> value)		Sets the value of the offerTimeout property.

void	**setOptionList**(javax.xml.bind.JAXBElement<**OptionArray**> value)	Sets the value of the optionList property.
void	**setPacketFileName**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the packetFileName property.
void	**setPacketServerName**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the packetServerName property.
void	**setPacketSiaddr**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the packetSiaddr property.
void	**setPermanentLeases**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the permanentLeases property.
void	**setPreferredLifetime**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the preferredLifetime property.
void	**setReconfigure**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the reconfigure property.
void	**setReconfigureViaRelay**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the reconfigureViaRelay property.
void	**setReverseDnsupdate**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the reverseDnsupdate property.
void	**setServerLeaseTime**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the serverLeaseTime property.
void	**setShortestPrefixLength**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the shortestPrefixLength property.
void	**setSplitLeaseTimes**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the splitLeaseTimes property.
void	**setTenantId**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the tenantId property.
void	**setUnavailableTimeout**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the unavailableTimeout property.
void	**setUseClientIdForReservations**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the useClientIdForReservations property.
void	**setV4BootpReplyOptions**(javax.xml.bind.JAXBElement<**StringArray**> value)	Sets the value of the v4BootpReplyOptions property.
void	**setV4ReplyOptions**(javax.xml.bind.JAXBElement<**StringArray**> value)	Sets the value of the v4ReplyOptions property.
void	**setV6MaxClientPreferredLifetime**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the v6MaxClientPreferredLifetime property.
void	**setV6MaxClientRebindingTime**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the v6MaxClientRebindingTime

		property.
void	**setV6MaxClientRenewalTime**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the v6MaxClientRenewalTime property.
void	**setV6MaxClientValidLifetime**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the v6MaxClientValidLifetime property.
void	**setV6Options**(javax.xml.bind.JAXBElement<**OptionArray**> value)	Sets the value of the v6Options property.
void	**setV6ReplyOptions**(javax.xml.bind.JAXBElement<**StringArray**> value)	Sets the value of the v6ReplyOptions property.
void	**setV6RsooAllowedOptions**(javax.xml.bind.JAXBElement<**StringArray**> value)	Sets the value of the v6RsooAllowedOptions property.
void	**setV6VendorOptions**(javax.xml.bind.JAXBElement<**OptionArray**> value)	Sets the value of the v6VendorOptions property.
void	**setValidLifetime**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the validLifetime property.
void	**setVendorOptions**(javax.xml.bind.JAXBElement<**OptionArray**> value)	Sets the value of the vendorOptions property.
void	**setViewId**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the viewId property.

Constructor Detail

Policy

public Policy()

Method Detail

getAffinityPeriod

`public javax.xml.bind.JAXBElement<java.lang.String> getAffinityPeriod()`

Gets the value of the affinityPeriod property.

Network Registrar Type: AT_TIME

```
Associates a lease in the AVAILABLE state with the client that
 last held the lease. If the client requests a lease during the
 affinity period, it is granted the same lease; that is, unless
 renewals are prohibited, then it is explicitly not given the lease.
 Because of the vast IPv6 address space and depending on the address
 generation technique, it could be millions of years before an
 address ever needs reassignment to a different client, and there
 is no reason to hold on to this information for that long.
 To prohibit renewals enable either the inhibit-all-renews attribute
 or the inhibit-renews-at-reboot attribute.
```

Returns:

possible object is JAXBElement<String>

setAffinityPeriod

`public void setAffinityPeriod(javax.xml.bind.JAXBElement<java.lang.String> value)`

Sets the value of the affinityPeriod property.

Parameters:

value - allowed object is JAXBElement<String>

getAllowClientARecordUpdate

`public javax.xml.bind.JAXBElement<java.lang.String> getAllowClientARecordUpdate()`

Gets the value of the allowClientARecordUpdate property.

Network Registrar Type: AT_BOOL
Default value: disabled

```
Determines if a client is allowed to update A records.
 If the client sets the flags in the FQDN option to indicate that
 it wants to do the A record update in the request, and if this
 value is TRUE, the server allows the client to do the A record
 update; otherwise, based on other server configurations, the server
 does the A record update.
```

Returns:

possible object is JAXBElement<String>

setAllowClientARecordUpdate

public void setAllowClientARecordUpdate(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the allowClientARecordUpdate property.

Parameters:

value - allowed object is JAXBElement<String>

getAllowDualZoneDnsUpdate

public javax.xml.bind.JAXBElement<java.lang.String> getAllowDualZoneDnsUpdate()

Gets the value of the allowDualZoneDnsUpdate property.

Network Registrar Type: AT_BOOL
Default value: disabled

```
Enables DHCP clients to perform DNS updates into two DNS zones.
 To support these clients, you can configure the DHCP server to
 allow the client to perform an update, but also to perform a DNS
 update on the client's behalf.
```

Returns:

possible object is JAXBElement<String>

setAllowDualZoneDnsUpdate

public void setAllowDualZoneDnsUpdate(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the allowDualZoneDnsUpdate property.

Parameters:

value - allowed object is JAXBElement<String>

getAllowLeaseTimeOverride

public javax.xml.bind.JAXBElement<java.lang.String> getAllowLeaseTimeOverride()

Gets the value of the allowLeaseTimeOverride property.

Network Registrar Type: AT_BOOL
Default value: disabled

```
Gives the server control over the lease period.  Although a client
 can request a specific lease time, the server need not honor the
 request if this attribute is set to false (the default).
 Even if set to true, clients can request only lease times that are
 shorter than those configured for the server.
```

Returns:

possible object is JAXBElement<String>

setAllowLeaseTimeOverride

public void setAllowLeaseTimeOverride(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the allowLeaseTimeOverride property.

Parameters:
value - allowed object is JAXBElement<String>

getAllowNonTemporaryAddresses

public javax.xml.bind.JAXBElement<java.lang.String> getAllowNonTemporaryAddresses()

Gets the value of the allowNonTemporaryAddresses property.

Network Registrar Type: AT_BOOL
Default value: true

```
Determines whether DHCPv6 clients can request non-temporary
 (IA_NA) addresses.
 The default is to allow clients to request non-temporary addresses.
```

Returns:
possible object is JAXBElement<String>

setAllowNonTemporaryAddresses

public void setAllowNonTemporaryAddresses(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the allowNonTemporaryAddresses property.

Parameters:
value - allowed object is JAXBElement<String>

getAllowRapidCommit

public javax.xml.bind.JAXBElement<java.lang.String> getAllowRapidCommit()

Gets the value of the allowRapidCommit property.

Network Registrar Type: AT_BOOL
Default value: false

```
Determines whether DHCP clients can use a Discover/Solicit with
 the Rapid Commit option to obtain configuration information with
 fewer messages. To permit this, make sure that a single DHCP
 server is servicing clients.
 For DHCPv6, this attribute has special handling during the policy
```

hierarchy processing when checking the Prefix policies (embedded
or named) for the Prefixes on a Link. The Prefixes for the Link
are processed in alphabetic (case blind) order. For each Prefix,
the embedded and then named policy are checked. Only Prefixes to
which the client has access (based on selection tags, etc.) are
checked:
   - If any of the prefix policies has this attribute set to
     FALSE, Rapid Commit is not allowed.
   - If at least one has it set to TRUE, Rapid Commit is allowed.
   - Otherwise, the remaining policies in the hierarchy are
     checked.
The default is not to allow clients to use Rapid Commit.

Returns:

possible object is JAXBElement<String>

---

setAllowRapidCommit

public void setAllowRapidCommit(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the allowRapidCommit property.

Parameters:
value - allowed object is JAXBElement<String>

---

getAllowTemporaryAddresses

public javax.xml.bind.JAXBElement<java.lang.String> getAllowTemporaryAddresses()

Gets the value of the allowTemporaryAddresses property.

Network Registrar Type: AT_BOOL
Default value: true

Determines whether DHCPv6 clients can request temporary (IA_TA)
 addresses.
 The default is to allow clients to request temporary addresses.

Returns:
possible object is JAXBElement<String>

---

setAllowTemporaryAddresses

public void setAllowTemporaryAddresses(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the allowTemporaryAddresses property.

Parameters:
value - allowed object is JAXBElement<String>

getDefaultPrefixLength

public javax.xml.bind.JAXBElement<java.lang.String> getDefaultPrefixLength()

Gets the value of the defaultPrefixLength property.

Network Registrar Type: AT_RANGEINT
Default value: 64
Valid values: 0 - 128

```
For delegation, specifies the default length of the delegated prefix,
 if a router (client) does not explicitly request it.
 The default length must always be greater than or equal to the prefix
 length of the prefix range.
```

Returns:

possible object is JAXBElement<String>

setDefaultPrefixLength

public void setDefaultPrefixLength(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the defaultPrefixLength property.

Parameters:

value - allowed object is JAXBElement<String>

getExcludedPrefix

public javax.xml.bind.JAXBElement<java.lang.String> getExcludedPrefix()

Gets the value of the excludedPrefix property.

Network Registrar Type: AT_PREFIX

```
Specifies the excluded prefix (bits and prefix-length) to be sent
 to DHCPv6 clients that requested the PD Exclude Option (see RFC
  6603).
 Note that only the bits between the actual delegated prefix's
 prefix length and the excluded-prefix's prefix length are used
 from the prefix specified.
 Using the example in RFC 6603, this attribute would be set to
  0:0:0:f::/64.
 If configured, the server will determine the excluded prefix
 when a lease is assigned to a client; but it is only sent to the
 client if the client requests the PD Exclude option.
```

Returns:

possible object is JAXBElement<String>

setExcludedPrefix

public void setExcludedPrefix(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the excludedPrefix property.

Parameters:

value - allowed object is JAXBElement<String>

getForwardDnsupdate

public javax.xml.bind.JAXBElement<java.lang.String> getForwardDnsupdate()

Gets the value of the forwardDnsupdate property.

Network Registrar Type: AT_NAMEREF

```
Specifies the name of the update configuration that determines
 which forward zones to include in updates.
```

Returns:

possible object is JAXBElement<String>

setForwardDnsupdate

public void setForwardDnsupdate(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the forwardDnsupdate property.

Parameters:

value - allowed object is JAXBElement<String>

getForwardZoneName

public javax.xml.bind.JAXBElement<java.lang.String> getForwardZoneName()

Gets the value of the forwardZoneName property.

Network Registrar Type: AT_DNSNAME

```
Designates an optional forward zone for DNS updates that overrides
 the forward-zone-name configured in the forward (or reverse)
 DNS Update Configuration object.
 Note that a forward zone name is required for any DNS updates to
 occur (whether forward, reverse, or both).
```

Returns:

possible object is JAXBElement<String>

setForwardZoneName

public void setForwardZoneName(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the forwardZoneName property.

Parameters:

value - allowed object is JAXBElement<String>

getGiaddrAsServerId

public javax.xml.bind.JAXBElement<java.lang.String> getGiaddrAsServerId()

Gets the value of the giaddrAsServerId property.

Network Registrar Type: AT_BOOL
Default value: false

```
Enables the DHCP server to set the server-id option on a DHCPOFFER
 and a DHCPACK to the giaddr of the incoming packet, instead of the
 IP address of the server (the default action).
 This causes all unicast renews to be sent to the relay agent instead
 of directly to the DHCP server, and so renews arrive at the DHCP
 server with option-82 information appended to the packet.
 Some relay agents may not support this capability and, in some
 complex configurations, the giaddr might not actually be an address
 to which the DHCP client can send A unicast packet. In these cases,
 the DHCP client cannot renew a lease, and must always perform a
 rebind operation (where the DHCP client broadcasts a request instead
 of sending a unicast to what it believes is the DHCP server).
```

Returns:

possible object is JAXBElement<String>

setGiaddrAsServerId

public void setGiaddrAsServerId(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the giaddrAsServerId property.

Parameters:

value - allowed object is JAXBElement<String>

getGracePeriod

public javax.xml.bind.JAXBElement<java.lang.String> getGracePeriod()

Gets the value of the gracePeriod property.

Network Registrar Type: AT_TIME
Default value: 5m

Defines the length of time between the expiration of a lease
 and the time it is made available for reassignment.

Returns:

possible object is JAXBElement<String>

---

setGracePeriod

public void setGracePeriod(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the gracePeriod property.

Parameters:

value - allowed object is JAXBElement<String>

---

getInhibitAllRenews

public javax.xml.bind.JAXBElement<java.lang.String> getInhibitAllRenews()

Gets the value of the inhibitAllRenews property.

Network Registrar Type: AT_BOOL
Default value: false

Causes the server to reject all renewal requests, forcing the client
 to obtain a different address any time it contacts the DHCP server.

Returns:

possible object is JAXBElement<String>

---

setInhibitAllRenews

public void setInhibitAllRenews(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the inhibitAllRenews property.

Parameters:

value - allowed object is JAXBElement<String>

---

getInhibitRenewsAtReboot

public javax.xml.bind.JAXBElement<java.lang.String> getInhibitRenewsAtReboot()

Gets the value of the inhibitRenewsAtReboot property.

Network Registrar Type: AT_BOOL
Default value: false

Permits clients to renew their leases, but the server forces

them to obtain new addresses each time they reboot.

Returns:

possible object is JAXBElement<String>

---

setInhibitRenewsAtReboot

public void setInhibitRenewsAtReboot(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the inhibitRenewsAtReboot property.

Parameters:

value - allowed object is JAXBElement<String>

---

getLeaseRetentionLimit

public javax.xml.bind.JAXBElement<java.lang.String> getLeaseRetentionLimit()

Gets the value of the leaseRetentionLimit property.

Network Registrar Type: AT_BOOL
Default value: disabled

If enabled and the DHCP server's lease-retention-max-age is
 configured to a non-zero value, times in leases subject to this
 policy will not be allowed to grow older than
 lease-retention-max-age. As they progress toward
 lease-retention-max-age, they will periodically be reset to
 lease-retention-min-age in the past.

Returns:

possible object is JAXBElement<String>

---

setLeaseRetentionLimit

public void setLeaseRetentionLimit(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the leaseRetentionLimit property.

Parameters:

value - allowed object is JAXBElement<String>

---

getLimitationCount

public javax.xml.bind.JAXBElement<java.lang.String> getLimitationCount()

Gets the value of the limitationCount property.

Network Registrar Type: AT_INT

Specifies the maximum number of clients with the same limitation-id
 that are allowed to have currently active and valid leases.

Returns:

possible object is JAXBElement<String>

---

setLimitationCount

public void setLimitationCount(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the limitationCount property.

Parameters:

value - allowed object is JAXBElement<String>

---

getLongestPrefixLength

public javax.xml.bind.JAXBElement<java.lang.String> getLongestPrefixLength()

Gets the value of the longestPrefixLength property.

Network Registrar Type: AT_RANGEINT
Valid values: 0 - 128

For prefix delegation, specifies the longest prefix length allowed
 for delegated prefixes. If the requesting router (client) requests a
 prefix length that is longer than this, this length is used.
 The default is the value of the default-prefix-length.
 This prefix length must always be greater than or equal to the prefix
 length of the prefix range.

Returns:

possible object is JAXBElement<String>

---

setLongestPrefixLength

public void setLongestPrefixLength(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the longestPrefixLength property.

Parameters:

value - allowed object is JAXBElement<String>

---

getMaxClientLeaseTime

public javax.xml.bind.JAXBElement<java.lang.String> getMaxClientLeaseTime()

Gets the value of the maxClientLeaseTime property.

Network Registrar Type: AT_RANGETIME
Valid values: 60s - 2y

```
Specifies the maximum client lease time that the server is allowed to
 send to the client. If the calculated lease time is greater than this
 value, the client is sent this value.
 This attribute limits the time sent to the client, it does not impact
 any of the lease time calculations made by the server, including when
 it expects the client to renew (T1).
 The renewal (T1) and rebinding (T2) times given to the client will be
 based on the lease time actually sent to the client and may further be
 limited by the max-client-renewal-time and max-client-rebinding-time
 attributes.
```

Returns:

possible object is JAXBElement<String>

---

setMaxClientLeaseTime

public void setMaxClientLeaseTime(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the maxClientLeaseTime property.

Parameters:

value - allowed object is JAXBElement<String>

---

getMaxClientRebindingTime

public javax.xml.bind.JAXBElement<java.lang.String> getMaxClientRebindingTime()

Gets the value of the maxClientRebindingTime property.

Network Registrar Type: AT_RANGETIME
Valid values: 30s - 2y

```
Specifies the maximum client rebinding time (T2) that the server is
 allowed to send to the client. If the rebinding time is greater than
 this value, the client is sent this value.
 This attribute limits the time sent to the client, it does not impact
 any of the lease time calculations made by the server.
 The actual value sent to the client may be further limited by the
 max-client-lease-time as T2 must be less than or equal to the lease
 time.
```

Returns:

possible object is JAXBElement<String>

---

setMaxClientRebindingTime

public void setMaxClientRebindingTime(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the maxClientRebindingTime property.

Parameters:

value - allowed object is JAXBElement<String>

getMaxClientRenewalTime

public javax.xml.bind.JAXBElement<java.lang.String> getMaxClientRenewalTime()

Gets the value of the maxClientRenewalTime property.

Network Registrar Type: AT_RANGETIME
Valid values: 30s - 2y

```
Specifies the maximum client renewal time (T1) that the server is
 allowed to send to the client. If the renewal time is greater than
 this value, the client is sent this value.
 This attribute limits the time sent to the client, it does not impact
 any of the lease time calculations made by the server.
 The actual value sent to the client may be further limited by the
 max-client-rebinding-time or max-client-lease-time as T1 must be less
 than or equal to T2 (and the lease time).
```

Returns:

possible object is JAXBElement<String>

setMaxClientRenewalTime

public void setMaxClientRenewalTime(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the maxClientRenewalTime property.

Parameters:

value - allowed object is JAXBElement<String>

getMaxLeasesPerBinding

public javax.xml.bind.JAXBElement<java.lang.String> getMaxLeasesPerBinding()

Gets the value of the maxLeasesPerBinding property.

Network Registrar Type: AT_RANGEINT
Valid values: 0 - 65535

```
Specifies the maximum number of leases that a client may use per
 binding from an allocation group. This applies to DHCPv6 only.
 Explicit or implicit allocation groups only limit new server
 initiated allocations to a binding. They do not limit the overall
 leases a client may use. Leases may have been assigned because of
 differences in the configuration, reservations, communication with
 the failover partner, client requests, or from using extensions to
 alter lease acceptability (lease acceptability extensions can
```

still override the limits as well). This attribute can be used to
 limit the number of leases.
 The server only applies a configured limit for client Solicit,
 Request, Renew, and Rebind requests and the server will prefer the
 leases that were most recently provided to the client. However,
 when leases have the same time, the result will be random as to
 which lease(s) will be revoked.

Returns:

possible object is JAXBElement<String>

---

setMaxLeasesPerBinding

public void setMaxLeasesPerBinding(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the maxLeasesPerBinding property.

Parameters:

value - allowed object is JAXBElement<String>

---

getName

public java.lang.String getName()

Gets the value of the name property.

Network Registrar Type: AT_STRING
Required. Unique.

The name of the policy. Scopes, client-entries, and client-classes
 refer to policies by name.

Returns:

possible object is String

---

setName

public void setName(java.lang.String value)

Sets the value of the name property.

Parameters:

value - allowed object is String

---

getOfferTimeout

public javax.xml.bind.JAXBElement<java.lang.String> getOfferTimeout()

Gets the value of the offerTimeout property.

Network Registrar Type: AT_TIME

Default value: 2m

Instructs the server to wait a specified amount of time when it
 has offered a lease to a client, but the offer is not yet accepted.
 At the end of the specified time interval, the server makes the
 lease available again.

Returns:

possible object is JAXBElement<String>

---

setOfferTimeout

public void setOfferTimeout(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the offerTimeout property.

Parameters:

value - allowed object is JAXBElement<String>

---

getOptionList

public javax.xml.bind.JAXBElement<OptionArray> getOptionList()

Gets the value of the optionList property.

Network Registrar Type: AT_NLIST(AT_OBJ(Option))

The list of DHCP options that are part of this policy.

Returns:

possible object is JAXBElement<OptionArray>

---

setOptionList

public void setOptionList(javax.xml.bind.JAXBElement<OptionArray> value)

Sets the value of the optionList property.

Parameters:

value - allowed object is JAXBElement<OptionArray>

---

getPacketFileName

public javax.xml.bind.JAXBElement<java.lang.String> getPacketFileName()

Gets the value of the packetFileName property.

Network Registrar Type: AT_STRING

```
Identifies the boot-file to use in the boot process of a client.
 The server returns this file name in the 'file' field of its replies.
 The packet-file-name cannot be longer than 128 characters.
```

Returns:

possible object is JAXBElement<String>

---

setPacketFileName

```
public void setPacketFileName(javax.xml.bind.JAXBElement<java.lang.String> value)
```

Sets the value of the packetFileName property.

Parameters:

value - allowed object is JAXBElement<String>

---

getPacketServerName

```
public javax.xml.bind.JAXBElement<java.lang.String> getPacketServerName()
```

Gets the value of the packetServerName property.

Network Registrar Type: AT_STRING

```
Identifies the host-name of the server to use in a client's boot
 process. The server returns this file name in the 'sname' field
 of its replies. The packet-server-name field cannot be longer
 than 64 characters.
```

Returns:

possible object is JAXBElement<String>

---

setPacketServerName

```
public void setPacketServerName(javax.xml.bind.JAXBElement<java.lang.String> value)
```

Sets the value of the packetServerName property.

Parameters:

value - allowed object is JAXBElement<String>

---

getPacketSiaddr

```
public javax.xml.bind.JAXBElement<java.lang.String> getPacketSiaddr()
```

Gets the value of the packetSiaddr property.

Network Registrar Type: AT_IPADDR

Identifies the IP address of the next server in the client boot
 process. For example, this might be the address of a TFTP server
 used by BOOTP clients. The server returns this address in the
 'siaddr' field of its replies.

Returns:

possible object is JAXBElement<String>

---

setPacketSiaddr

public void setPacketSiaddr(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the packetSiaddr property.

Parameters:

value - allowed object is JAXBElement<String>

---

getPermanentLeases

public javax.xml.bind.JAXBElement<java.lang.String> getPermanentLeases()

Gets the value of the permanentLeases property.

Network Registrar Type: AT_BOOL
Default value: disabled

Indicates whether leases using this policy are permanently granted
 to requesting clients. If leases are permanently granted,
 the dhcp-lease-time will be infinite.

Returns:

possible object is JAXBElement<String>

---

setPermanentLeases

public void setPermanentLeases(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the permanentLeases property.

Parameters:

value - allowed object is JAXBElement<String>

---

getPreferredLifetime

public javax.xml.bind.JAXBElement<java.lang.String> getPreferredLifetime()

Gets the value of the preferredLifetime property.

Network Registrar Type: AT_TIME
Default value: 1w

```
Assigns the default and maximum preferred lifetime for leases to
 DHCPv6 client interfaces. Expressed in seconds and relative to
 the time the server sent the packet, this attribute sets the
 length of time that the address is preferred; that is, its use is
 unrestricted. When the preferred lifetime expires, the address
 becomes deprecated and its use is restricted.
 Note: For IA_TA's, if the (expert mode) min-preferred-lifetime is
 configured, it overrides the preferred-lifetime.
```

Returns:

possible object is JAXBElement<String>

---

setPreferredLifetime

public void setPreferredLifetime(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the preferredLifetime property.

Parameters:

value - allowed object is JAXBElement<String>

---

getReconfigure

public javax.xml.bind.JAXBElement<java.lang.String> getReconfigure()

Gets the value of the reconfigure property.

Network Registrar Type: AT_ENUMINT
Default value: allow
Valid values: allow, disallow, require

```
Controls DHCPv6 client reconfiguration support:
    1  allow       Allows clients to request reconfiguration
                   support and the server will honor the
                   request (default).
    2  disallow    Allows clients to request reconfiguration
                   support but the server will not honor
                   the clients' request.
    3  require     Requires clients to request reconfiguration
                   support and the server drops client
                   Solicit and Request messages that do not
                   include a Reconfigure-Accept option.
 This attribute has special handling during the policy hierarchy
 processing when checking the Prefix policies (embedded or named)
 for the Prefixes on a Link. The Prefixes for the Link are
 processed in alphabetic (case blind) order. For each Prefix, the
 embedded and then named policy are checked. Only Prefixes to which
 the client has access (based on selection tags, etc.) are checked
 as follows:
    - If any of the prefix policies has this attribute set to
```

disallow or require, that setting is used.
- Otherwise, if at least one has it set to allow, Reconfigure
is allowed.
- If no prefix policies have this attribute set, the remaining
policies in the hierarchy are checked.

Returns:

possible object is JAXBElement<String>

---

setReconfigure

public void setReconfigure(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the reconfigure property.

Parameters:

value - allowed object is JAXBElement<String>

---

getReconfigureViaRelay

public javax.xml.bind.JAXBElement<java.lang.String> getReconfigureViaRelay()

Gets the value of the reconfigureViaRelay property.

Network Registrar Type: AT_BOOL
Default value: false

Controls whether the server should prefer unicasting or
 relaying DHCPv6 Reconfigure messages.
 If false (the default), the server prefers to unicast
 Reconfigure messages if the client has one or more valid
 statefully assigned addresses.
 If true, the server prefers to send Reconfigure messages
 via the relay agent unless no relay agent information is
 available.
 Note: When you use this attribute, consider that:
     - In networks where the DHCPv6 server cannot communicate
        directly with its client devices, for example, where
        firewalls or VPNs are in use, set this value to true.
     - The DHCPv6 server does not use embedded and named
        policies configured on a client when it evaluates
        this attribute.
     - The relay agent cannot be used if the Relay-Forw message
        came from a link-local address.

Returns:

possible object is JAXBElement<String>

---

setReconfigureViaRelay

public void setReconfigureViaRelay(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the reconfigureViaRelay property.

Parameters:

value - allowed object is JAXBElement<String>

---

getReverseDnsupdate

```
public javax.xml.bind.JAXBElement<java.lang.String> getReverseDnsupdate()
```

Gets the value of the reverseDnsupdate property.

Network Registrar Type: AT_NAMEREF

```
Specifies the name of the update configuration that determines
 which reverse zones to include in a DNS update.
```

Returns:

possible object is JAXBElement<String>

---

setReverseDnsupdate

```
public void setReverseDnsupdate(javax.xml.bind.JAXBElement<java.lang.String> value)
```

Sets the value of the reverseDnsupdate property.

Parameters:

value - allowed object is JAXBElement<String>

---

getServerLeaseTime

```
public javax.xml.bind.JAXBElement<java.lang.String> getServerLeaseTime()
```

Gets the value of the serverLeaseTime property.

Network Registrar Type: AT_TIME

```
Tells the server how long a lease is valid.  For more frequent
 communication with a client, you might have the server consider
 leases as leased for a longer period than the client considers them.
 This also provides more lease-time stability. This value is not used
 unless it is longer than the lease time in the dhcp-lease-time option
 found through the normal traversal of policies.
```

Returns:

possible object is JAXBElement<String>

---

setServerLeaseTime

public void setServerLeaseTime(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the serverLeaseTime property.

Parameters:

value - allowed object is JAXBElement<String>

---

getShortestPrefixLength

public javax.xml.bind.JAXBElement<java.lang.String> getShortestPrefixLength()

Gets the value of the shortestPrefixLength property.

Network Registrar Type: AT_RANGEINT
Valid values: 0 - 128

```
For prefix delegation, specifies the shortest prefix length allowed
 for delegated prefixes. If the requesting router (client) requests a
 prefix length that is shorter than this, this length is used.
 The default is the value of the default-prefix-length.
 This prefix length must always be greater than or equal to the prefix
 length of the prefix range.
```

Returns:

possible object is JAXBElement<String>

---

setShortestPrefixLength

public void setShortestPrefixLength(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the shortestPrefixLength property.

Parameters:

value - allowed object is JAXBElement<String>

---

getSplitLeaseTimes

public javax.xml.bind.JAXBElement<java.lang.String> getSplitLeaseTimes()

Gets the value of the splitLeaseTimes property.

Network Registrar Type: AT_BOOL
Default value: disabled

```
Specifies a value that the DHCP server might use internally to
 affect lease times.
 If enabled, the DHCP server still offers clients lease times that
 reflect the configured lease-time option from the appropriate
 policy; but the server bases its decisions regarding expiration
 on the 'server-lease-time' value.
```

Returns:

possible object is JAXBElement<String>

setSplitLeaseTimes

public void setSplitLeaseTimes(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the splitLeaseTimes property.

Parameters:
value - allowed object is JAXBElement<String>

getTenantId

public javax.xml.bind.JAXBElement<java.lang.String> getTenantId()

Gets the value of the tenantId property.

Network Registrar Type: AT_SHORT
Immutable.
Default value: 0

Identifies the tenant owner of this object.

Returns:
possible object is JAXBElement<String>

setTenantId

public void setTenantId(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the tenantId property.

Parameters:
value - allowed object is JAXBElement<String>

getUnavailableTimeout

public javax.xml.bind.JAXBElement<java.lang.String> getUnavailableTimeout()

Gets the value of the unavailableTimeout property.

Network Registrar Type: AT_TIME
Default value: 24h

Permits the server to make a lease unavailable for the time specified
 and then to return the lease to available state. If there is no value
 configured in the system_default_policy, then the default is
  86400 seconds (or 24 hours).

Returns:

possible object is JAXBElement<String>

setUnavailableTimeout

public void setUnavailableTimeout(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the unavailableTimeout property.

Parameters:

value - allowed object is JAXBElement<String>

getUseClientIdForReservations

public javax.xml.bind.JAXBElement<java.lang.String> getUseClientIdForReservations()

Gets the value of the useClientIdForReservations property.

Network Registrar Type: AT_BOOL
Default value: off

```
Controls how the server database checks for reserved IP
 addresses.
 By default, the server uses the MAC address of the DHCP client as the
 key for its database lookup.  If this attribute is set to true
 (enabled), then the server does the check for reserved
 addresses using the DHCP client-id, which the client usually sends.
 In cases where the DHCP client does not supply the client-id, the
 server synthesizes it, and uses that value.
```

Returns:

possible object is JAXBElement<String>

setUseClientIdForReservations

public void setUseClientIdForReservations(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the useClientIdForReservations property.

Parameters:

value - allowed object is JAXBElement<String>

getV4BootpReplyOptions

public javax.xml.bind.JAXBElement<StringArray> getV4BootpReplyOptions()

Gets the value of the v4BootpReplyOptions property.

Network Registrar Type: AT_NLIST(AT_OPTIONID4)

Lists the options the server returns to all BOOTP clients.

Returns:

possible object is JAXBElement<[StringArray](#)>

---

setV4BootpReplyOptions

public void setV4BootpReplyOptions(javax.xml.bind.JAXBElement<[StringArray](#)> value)

Sets the value of the v4BootpReplyOptions property.

Parameters:

value - allowed object is JAXBElement<[StringArray](#)>

---

getV4ReplyOptions

public javax.xml.bind.JAXBElement<[StringArray](#)> getV4ReplyOptions()

Gets the value of the v4ReplyOptions property.

Network Registrar Type: AT_NLIST(AT_OPTIONID4)

Lists the options the server returns to all DHCPv4 clients, whether
 or not the client specifically asks for the option data.

Returns:

possible object is JAXBElement<[StringArray](#)>

---

setV4ReplyOptions

public void setV4ReplyOptions(javax.xml.bind.JAXBElement<[StringArray](#)> value)

Sets the value of the v4ReplyOptions property.

Parameters:

value - allowed object is JAXBElement<[StringArray](#)>

---

getV6MaxClientPreferredLifetime

public javax.xml.bind.JAXBElement<java.lang.String> getV6MaxClientPreferredLifetime()

Gets the value of the v6MaxClientPreferredLifetime property.

Network Registrar Type: AT_RANGETIME
Valid values: 60s - 2y

Specifies the maximum client preferred lifetime that the server is
 allowed to send to the client. If the calculated preferred lifetime

is greater than this value, the client is sent this value.
This attribute limits the preferred lifetime sent to the client, it
does not impact any of the time calculations made by the server.
The renewal (T1) and rebinding (T2) times given to the client will be
based on the lease time actually sent to the client and may further
be limited by the v6-max-client-renewal-time and
v6-max-client-rebinding-time attributes.

Returns:

possible object is JAXBElement<String>

setV6MaxClientPreferredLifetime

`public void setV6MaxClientPreferredLifetime(javax.xml.bind.JAXBElement<java.lang.String> value)`

Sets the value of the v6MaxClientPreferredLifetime property.

Parameters:

value - allowed object is JAXBElement<String>

getV6MaxClientRebindingTime

`public javax.xml.bind.JAXBElement<java.lang.String> getV6MaxClientRebindingTime()`

Gets the value of the v6MaxClientRebindingTime property.

Network Registrar Type: AT_RANGETIME
Valid values: 30s - 2y

Specifies the maximum client rebinding time (T2) that the server is
 allowed to send to the client. If the rebinding time is greater than
 this value, the client is sent this value.
 This attribute limits the time sent to the client, it does not impact
 any of the lease time calculations made by the server.
 The actual value sent to the client may be further limited by the
 v6-max-client-preferred-lifetime as T2 must be less than or equal to
 the preferred lifetime.

Returns:
possible object is JAXBElement<String>

setV6MaxClientRebindingTime

`public void setV6MaxClientRebindingTime(javax.xml.bind.JAXBElement<java.lang.String> value)`

Sets the value of the v6MaxClientRebindingTime property.

Parameters:
value - allowed object is JAXBElement<String>

getV6MaxClientRenewalTime

public javax.xml.bind.JAXBElement<java.lang.String> getV6MaxClientRenewalTime()

Gets the value of the v6MaxClientRenewalTime property.

Network Registrar Type: AT_RANGETIME
Valid values: 30s - 2y

```
Specifies the maximum client renewal time (T1) that the server is
 allowed to send to the client. If the renewal time is greater than
 this value, the client is sent this value.
 This attribute limits the time sent to the client, it does not impact
 any of the lease time calculations made by the server.
 The actual value sent to the client may be further limited by the
 v6-max-client-rebinding-time or v6-max-client-preferred-lifetime as
 T1 must be less than or equal to T2 (and the preferred lifetime).
```

Returns:

possible object is JAXBElement<String>

setV6MaxClientRenewalTime

public void setV6MaxClientRenewalTime(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the v6MaxClientRenewalTime property.

Parameters:

value - allowed object is JAXBElement<String>

getV6MaxClientValidLifetime

public javax.xml.bind.JAXBElement<java.lang.String> getV6MaxClientValidLifetime()

Gets the value of the v6MaxClientValidLifetime property.

Network Registrar Type: AT_RANGETIME
Valid values: 60s - 2y

```
Specifies the maximum client valid lifetime that the server is
 allowed to send to the client. If the calculated valid lifetime is
 greater than this value, the client is sent this value.
 This attribute limits the valid lifetime sent to the client, it
 does not impact any of the time calculations made by the server.
```

Returns:

possible object is JAXBElement<String>

setV6MaxClientValidLifetime

```
public void setV6MaxClientValidLifetime(javax.xml.bind.JAXBElement<java.lang.String> value)
```

Sets the value of the v6MaxClientValidLifetime property.

Parameters:

value - allowed object is JAXBElement<String>

---

getV6Options

```
public javax.xml.bind.JAXBElement<OptionArray> getV6Options()
```

Gets the value of the v6Options property.

Network Registrar Type: AT_NLIST(AT_OBJ(Option))

```
Lists the DHCPv6 options that the server returns to a client as
 part of this policy.
 This attribute receives special handling during the policy hierarchy
 processing when checking the prefix policies (embedded or named)
 for the prefixes on a link. Prefixes for the link are processed
 in alphabetic (case blind) order. For each prefix, the embedded and
 then named policy are checked. Only prefixes to which the client has
 access (based on selection tags and other attributes) are checked.
```

Returns:

possible object is JAXBElement<OptionArray>

---

setV6Options

```
public void setV6Options(javax.xml.bind.JAXBElement<OptionArray> value)
```

Sets the value of the v6Options property.

Parameters:

value - allowed object is JAXBElement<OptionArray>

---

getV6ReplyOptions

```
public javax.xml.bind.JAXBElement<StringArray> getV6ReplyOptions()
```

Gets the value of the v6ReplyOptions property.

Network Registrar Type: AT_NLIST(AT_OPTIONID6)

```
Lists the options that should be returned in any
 replies to DHCPv6 clients.
 This attribute has special handling during the policy hierarchy
 processing when checking the Prefix policies (embedded or named)
 for the Prefixes on a Link. The Prefixes for the Link are
 processed in alphabetic (case blind) order. For each Prefix, the
 embedded and then named policy are checked. Only Prefixes to which
 the client has access (based on selection tags, etc.) are checked.
```

Returns:

possible object is JAXBElement<StringArray>

---

setV6ReplyOptions

public void setV6ReplyOptions(javax.xml.bind.JAXBElement<StringArray> value)

Sets the value of the v6ReplyOptions property.

Parameters:

value - allowed object is JAXBElement<StringArray>

---

getV6RsooAllowedOptions

public javax.xml.bind.JAXBElement<StringArray> getV6RsooAllowedOptions()

Gets the value of the v6RsooAllowedOptions property.

Network Registrar Type: AT_NLIST(AT_OPTIONID6)

```
Lists the RSOO-enabled options that server will process, if
 provided by a relay and no option is otherwise available. See
 RFC 6422 for more details on RSOO (Relay Supplied Options Option).
 This attribute has special handling during the policy hierarchy
 processing when checking the Prefix policies (embedded or named)
 for the Prefixes on a Link. The Prefixes for the Link are
 processed in alphabetic (case blind) order. For each Prefix, the
 embedded and then named policy are checked. Only Prefixes to which
 the client has access (based on selection tags, etc.) are checked.
```

Returns:

possible object is JAXBElement<StringArray>

---

setV6RsooAllowedOptions

public void setV6RsooAllowedOptions(javax.xml.bind.JAXBElement<StringArray> value)

Sets the value of the v6RsooAllowedOptions property.

Parameters:

value - allowed object is JAXBElement<StringArray>

---

getV6VendorOptions

public javax.xml.bind.JAXBElement<OptionArray> getV6VendorOptions()

Gets the value of the v6VendorOptions property.

Network Registrar Type: AT_NLIST(AT_OBJ(Option))

Lists DHCPv6 vendor-specific options that are part of this
 policy.
 This attribute has special handling during the policy hierarchy
 processing when checking the Prefix policies (embedded or named)
 for the Prefixes on a Link. The Prefixes for the Link are
 processed in alphabetic (case blind) order. For each Prefix, the
 embedded and then named policy are checked. Only Prefixes to which
 the client has access (based on selection tags, etc.) are checked.

Returns:

possible object is JAXBElement<OptionArray>

---

setV6VendorOptions

public void setV6VendorOptions(javax.xml.bind.JAXBElement<OptionArray> value)

Sets the value of the v6VendorOptions property.

Parameters:

value - allowed object is JAXBElement<OptionArray>

---

getValidLifetime

public javax.xml.bind.JAXBElement<java.lang.String> getValidLifetime()

Gets the value of the validLifetime property.

Network Registrar Type: AT_TIME
Default value: 2w

Assigns the default and maximum valid lifetime for leases to
 DHCPv6 client interfaces. Expressed in seconds and relative
 to the time the server sent the packet, this attribute sets
 the length of time that an address remains valid. When this
 period of time expires, the address becomes invalid and
 unusable. The valid lifetime must be greater than or equal
 to the preferred lifetime.
 Note: For IA_TA's, if the (expert mode) min-valid-lifetime is
 configured, it overrides the valid-lifetime.

Returns:

possible object is JAXBElement<String>

---

setValidLifetime

public void setValidLifetime(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the validLifetime property.

Parameters:

value - allowed object is JAXBElement<String>

getVendorOptions

public javax.xml.bind.JAXBElement<OptionArray> getVendorOptions()

Gets the value of the vendorOptions property.

Network Registrar Type: AT_NLIST(AT_OBJ(Option))

```
The list of DHCP vendor-specific options that are part of this
 policy.
```

Returns:

possible object is JAXBElement<OptionArray>

setVendorOptions

public void setVendorOptions(javax.xml.bind.JAXBElement<OptionArray> value)

Sets the value of the vendorOptions property.

Parameters:

value - allowed object is JAXBElement<OptionArray>

getViewId

public javax.xml.bind.JAXBElement<java.lang.String> getViewId()

Gets the value of the viewId property.

Network Registrar Type: AT_INT

```
Designates the optional view associated with zones used for DNS
 update that overrides the view-id configuration in forward
 (reverse) DNS Update configuration object.
```

Returns:

possible object is JAXBElement<String>

setViewId

public void setViewId(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the viewId property.

Parameters:

value - allowed object is JAXBElement<String>

Package com.cisco.cnr.ws.xsd

Class PolicyArray

java.lang.Object
    com.cisco.cnr.ws.xsd.ClassBaseArray
        com.cisco.cnr.ws.xsd.PolicyArray

---

public class **PolicyArray**
extends ClassBaseArray

Java class for PolicyArray complex type.

The following schema fragment specifies the expected content contained within this class.

```
<complexType name="PolicyArray">

Package com.cisco.cnr.ws.xsd

Class Prefix

java.lang.Object
    com.cisco.cnr.ws.xsd.ClassBase
        com.cisco.cnr.ws.xsd.Prefix

```
public class Prefix
extends ClassBase
```

The Network Registrar Prefix class.

An IPv6 prefix. A prefix defines the DHCPv6 configuration for the given address pool.

Java class for Prefix complex type.

The following schema fragment specifies the expected content contained within this class.

```
 <complexType name="Prefix">
   <complexContent>
     <extension base="{http://ws.cnr.cisco.com/xsd}ClassBase">
       <sequence>
         <element name="address" type="{http://www.w3.org/2001/XMLSchema}string"/>
         <element name="allocationAlgorithms" type="{http://www.w3.org/2001/XMLSchema}string" minOccurs="0"/>
         <element name="allocationGroup" type="{http://www.w3.org/2001/XMLSchema}string" minOccurs="0"/>
         <element name="allocationGroupPriority" type="{http://www.w3.org/2001/XMLSchema}string" minOccurs="0"/>
         <element name="deactivated" type="{http://www.w3.org/2001/XMLSchema}string" minOccurs="0"/>
         <element name="description" type="{http://www.w3.org/2001/XMLSchema}string" minOccurs="0"/>
         <element name="dhcpType" type="{http://www.w3.org/2001/XMLSchema}string" minOccurs="0"/>

Method Summary

[All Methods] [Instance Methods] [Concrete Methods]

Modifier and Type	Method	Description
java.lang.String	**getAddress**()	Gets the value of the address property.
javax.xml.bind.JAXBElement<java.lang.String>	**getAllocationAlgorithms**()	Gets the value of the allocationAlgorithms property.
javax.xml.bind.JAXBElement<java.lang.String>	**getAllocationGroup**()	Gets the value of the allocationGroup property.
javax.xml.bind.JAXBElement<java.lang.String>	**getAllocationGroupPriority**()	Gets the value of the allocationGroupPriority property.
javax.xml.bind.JAXBElement<java.lang.String>	**getDeactivated**()	Gets the value of the deactivated property.
javax.xml.bind.JAXBElement<java.lang.String>	**getDescription**()	Gets the value of the description property.
javax.xml.bind.JAXBElement<java.lang.String>	**getDhcpType**()	Gets the value of the dhcpType property.
javax.xml.bind.JAXBElement<**Policy**>	**getEmbeddedPolicy**()	Gets the value of the embeddedPolicy property.
javax.xml.bind.JAXBElement<java.lang.String>	**getExpirationTime**()	Gets the value of the expirationTime property.
javax.xml.bind.JAXBElement<java.lang.String>	**getFreeAddressConfig**()	Gets the value of the freeAddressConfig

		property.
javax.xml.bind.JAXBElement<java.lang.String>	**getIgnoreDeclines**()	Gets the value of the ignoreDeclines property.
javax.xml.bind.JAXBElement<java.lang.String>	**getLink**()	Gets the value of the link property.
javax.xml.bind.JAXBElement<java.lang.String>	**getLocalCluster**()	Gets the value of the localCluster property.
javax.xml.bind.JAXBElement<java.lang.String>	**getMaintenance**()	Gets the value of the maintenance property.
javax.xml.bind.JAXBElement<java.lang.String>	**getMaxLeases**()	Gets the value of the maxLeases property.
javax.xml.bind.JAXBElement<java.lang.String>	**getMaxPdBalancingLength**()	Gets the value of the maxPdBalancingLength property.
java.lang.String	**getName**()	Gets the value of the name property.
javax.xml.bind.JAXBElement<java.lang.String>	**getOwner**()	Gets the value of the owner property.
javax.xml.bind.JAXBElement<java.lang.String>	**getPolicy**()	Gets the value of the policy property.
javax.xml.bind.JAXBElement<java.lang.String>	**getRange**()	Gets the value of the range property.
javax.xml.bind.JAXBElement<java.lang.String>	**getRangeEnd**()	Gets the value of the rangeEnd property.
javax.xml.bind.JAXBElement<java.lang.String>	**getRangeStart**()	Gets the value of the rangeStart property.
javax.xml.bind.JAXBElement<java.lang.String>	**getRegion**()	Gets the value of the region property.
javax.xml.bind.JAXBElement<java.lang.String>	**getRestrictToAdminAllocation**()	Gets the value of the restrictToAdminAllocation property.
javax.xml.bind.JAXBElement<java.lang.String>	**getRestrictToReservations**()	Gets the value of the restrictToReservations property.
javax.xml.bind.JAXBElement<java.lang.String>	**getReverseZonePrefixLength**()	Gets the value of the reverseZonePrefixLength property.
javax.xml.bind.JAXBElement<**StringArray**>	**getSelectionTags**()	Gets the value of the selectionTags property.
javax.xml.bind.JAXBElement<java.lang.String>	**getTenantId**()	Gets the value of the

		tenantId property.
javax.xml.bind.JAXBElement<java.lang.String>	**getVpnId**()	Gets the value of the vpnId property.
void	**setAddress**(java.lang.String value)	Sets the value of the address property.
void	**setAllocationAlgorithms**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the allocationAlgorithms property.
void	**setAllocationGroup**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the allocationGroup property.
void	**setAllocationGroupPriority**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the allocationGroupPriority property.
void	**setDeactivated**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the deactivated property.
void	**setDescription**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the description property.
void	**setDhcpType**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the dhcpType property.
void	**setEmbeddedPolicy**(javax.xml.bind.JAXBElement<**Policy**> value)	Sets the value of the embeddedPolicy property.
void	**setExpirationTime**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the expirationTime property.
void	**setFreeAddressConfig**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the freeAddressConfig property.
void	**setIgnoreDeclines**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the ignoreDeclines property.
void	**setLink**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the link property.
void	**setLocalCluster**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the localCluster property.
void	**setMaintenance**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the maintenance property.
void	**setMaxLeases**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the maxLeases property.
void	**setMaxPdBalancingLength**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the maxPdBalancingLength property.
void	**setName**(java.lang.String value)	Sets the value of the

		name property.
void	[setOwner](javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the owner property.
void	[setPolicy](javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the policy property.
void	[setRange](javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the range property.
void	[setRangeEnd](javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the rangeEnd property.
void	[setRangeStart](javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the rangeStart property.
void	[setRegion](javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the region property.
void	[setRestrictToAdminAllocation](javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the restrictToAdminAllocation property.
void	[setRestrictToReservations](javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the restrictToReservations property.
void	[setReverseZonePrefixLength](javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the reverseZonePrefixLength property.
void	[setSelectionTags](javax.xml.bind.JAXBElement<[StringArray](#)> value)	Sets the value of the selectionTags property.
void	[setTenantId](javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the tenantId property.
void	[setVpnId](javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the vpnId property.

Constructor Detail

Prefix
public Prefix()

Method Detail

getAddress

public java.lang.String getAddress()

Gets the value of the address property.

Network Registrar Type: AT_PREFIX
Required. Immutable.

```
Identifies a prefix (subnet) that an interface belongs to using the
 high-order bits of an IPv6 address.
```

Returns:
possible object is String

setAddress

public void setAddress(java.lang.String value)

Sets the value of the address property.

Parameters:
value - allowed object is String

getAllocationAlgorithms

public javax.xml.bind.JAXBElement<java.lang.String> getAllocationAlgorithms()

Gets the value of the allocationAlgorithms property.

Network Registrar Type: AT_FLAGSINT
Default value: reservation,extension,random,best-fit
Valid values: client-request, reservation, extension, interface-identifier, random, best-fit

```
Controls the algorithms used by the server to select a new address
 or prefix to lease to a client. Note however that when the prefix's
 restrict-to-reservations is enabled, only the reservation flag is
 used (the others are ignored as only lease or client reservations
 can be used).
```

```
  The available algorithms are:
    client-request
      This setting (off by default) controls whether the server
      uses a client requested lease.
    reservation
      This setting (on by default) controls whether the server
      uses an available lease reservation for the client.
    extension
      This setting (on by default) controls whether the server calls
      extensions attached at the generate-lease extension point
      to generate an address or prefix for the client.
    interface-identifier
      This setting (off by default) controls whether the server uses
      the interface-identifier from the client's (link-local)
      address to generate an address. It is ignored for temporary
      addresses and prefix delegation.
    random
      This setting (on by default) controls whether the server
      generates an address using an RFC 3041-like algorithm. It is
      is ignored for prefix delegation.
    best-fit
      This setting (on by default) controls whether the server will
      delegate the first, best-fit available prefix. It is ignored
      for addresses.
 When the server needs an address to assign to a client, it
 processes the flags in the following order: client-request,
 reservation, extension, interface-identifier, and random.
 Processing stops when a usable address is produced.
 When the server needs to delegate a prefix to a client, it
 processes the flags in the following order: client-request,
 reservation, extension, best-fit. Processing stops when a
 usable prefix is produced.
```

Returns:

possible object is JAXBElement<String>

setAllocationAlgorithms

public void setAllocationAlgorithms(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the allocationAlgorithms property.

Parameters:

value - allowed object is JAXBElement<String>

getAllocationGroup

public javax.xml.bind.JAXBElement<java.lang.String> getAllocationGroup()

Gets the value of the allocationGroup property.

Network Registrar Type: AT_STRING

Specifies the allocation group to which this prefix belongs. At
 most one lease per binding is allocated across all of the prefixes
 on a link with the same allocation group name.
 This name is only specific to the link. Different links can reuse
 the same allocation group names.

Returns:

possible object is JAXBElement<String>

setAllocationGroup

public void setAllocationGroup(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the allocationGroup property.

Parameters:

value - allowed object is JAXBElement<String>

getAllocationGroupPriority

public javax.xml.bind.JAXBElement<java.lang.String> getAllocationGroupPriority()

Gets the value of the allocationGroupPriority property.

Network Registrar Type: AT_INT
Default value: 0

Specifies the priority of this prefix over other prefixes in the
 same allocation group. This settings allows control over which
 prefixes are used before others. Lower numeric values have higher
 priorities, but a priority of 0 (the default) has the lowest
 possible priority.
 Prefixes with the same priority are dynamically ordered by active
 lease count, where the lowest count will have the highest priority.

Returns:

possible object is JAXBElement<String>

setAllocationGroupPriority

public void setAllocationGroupPriority(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the allocationGroupPriority property.

Parameters:

value - allowed object is JAXBElement<String>

getDeactivated

```
public javax.xml.bind.JAXBElement<java.lang.String> getDeactivated()
```

Gets the value of the deactivated property.

Network Registrar Type: AT_BOOL
Default value: disabled

```
Controls whether a prefix extends leases to clients. A deactivated
 prefix does not extend leases to any clients. It treats all addresses
 in its ranges as if they were individually deactivated.
 Default, false (active).
```

Returns:
possible object is JAXBElement<String>

setDeactivated

```
public void setDeactivated(javax.xml.bind.JAXBElement<java.lang.String> value)
```

Sets the value of the deactivated property.

Parameters:
value - allowed object is JAXBElement<String>

getDescription

```
public javax.xml.bind.JAXBElement<java.lang.String> getDescription()
```

Gets the value of the description property.

Network Registrar Type: AT_STRING

```
Describes the prefix.
```

Returns:
possible object is JAXBElement<String>

setDescription

```
public void setDescription(javax.xml.bind.JAXBElement<java.lang.String> value)
```

Sets the value of the description property.

Parameters:
value - allowed object is JAXBElement<String>

getDhcpType

public javax.xml.bind.JAXBElement<java.lang.String> getDhcpType()

Gets the value of the dhcpType property.

Network Registrar Type: AT_ENUMINT
Default value: dhcp
Valid values: stateless, dhcp, prefix-delegation, infrastructure, parent

```
Defines how DHCP manages address assignment within a prefix:
    stateless          Prefix is used only for stateless
                       option configuration.
    dhcp               Prefix is used for stateful address
                       assignment.
    prefix-delegation Prefix is used for prefix-delegation.
    infrastructure     Prefix is used to map a client address to
                       a link, and does not have an address pool.
    parent             Prefix is not used by DHCP. It is used as
                       a container object, to group child prefixes.
```

Returns:
possible object is JAXBElement<String>

setDhcpType

public void setDhcpType(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the dhcpType property.

Parameters:
value - allowed object is JAXBElement<String>

getEmbeddedPolicy

public javax.xml.bind.JAXBElement<Policy> getEmbeddedPolicy()

Gets the value of the embeddedPolicy property.

Network Registrar Type: AT_OBJ(Policy)

Specifies a policy embedded within an IPv6 prefix.

Returns:
possible object is JAXBElement<Policy>

setEmbeddedPolicy

public void setEmbeddedPolicy(javax.xml.bind.JAXBElement<Policy> value)

Sets the value of the embeddedPolicy property.

Parameters:

value - allowed object is JAXBElement<Policy>

getExpirationTime

public javax.xml.bind.JAXBElement<java.lang.String> getExpirationTime()

Gets the value of the expirationTime property.

Network Registrar Type: AT_DATE

```
Sets the time and date on which a prefix expires. After this date
 and time, the server neither grants new leases nor renews existing
 leases from this prefix.
 Once the expiration-time has passed, the prefix is no longer used
 (though old leases and leases with grace or affinity periods
 continue to exist until those periods elapse).
 Enter this as a date in the format "[weekday] mon day
 hh:mm[:ss] year". For example, "Dec 31 23:59 2006".
```

Returns:

possible object is JAXBElement<String>

setExpirationTime

public void setExpirationTime(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the expirationTime property.

Parameters:

value - allowed object is JAXBElement<String>

getFreeAddressConfig

public javax.xml.bind.JAXBElement<java.lang.String> getFreeAddressConfig()

Gets the value of the freeAddressConfig property.

Network Registrar Type: AT_NAMEREF

```
Identifies which trap captures unexpected free address events
 on this prefix.
 If this attribute is not configured, the server looks for
```

the free-address-config attribute on the parent Link object.
If that attribute is not configured, the server looks for
the v6-default-free-address-config on the DHCPServer object.

Returns:

possible object is JAXBElement<String>

---

setFreeAddressConfig

public void setFreeAddressConfig(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the freeAddressConfig property.

Parameters:

value - allowed object is JAXBElement<String>

---

getIgnoreDeclines

public javax.xml.bind.JAXBElement<java.lang.String> getIgnoreDeclines()

Gets the value of the ignoreDeclines property.

Network Registrar Type: AT_BOOL
Default value: false

Controls whether the DHCP server responds to a DHCPv6 DECLINE
 message that refers to an IPv6 address or a delegated prefix from
 this prefix.
 If enabled, the DHCP server ignores all declines for leases in this
 prefix.
 If disabled or not set, the DHCP server sets to UNAVAILABLE every
 address or delegated prefix requested in a DECLINE message if it
 is leased to the client.
 The default value is false, so that DECLINE messages are processed
 normally.

Returns:

possible object is JAXBElement<String>

---

setIgnoreDeclines

public void setIgnoreDeclines(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the ignoreDeclines property.

Parameters:

value - allowed object is JAXBElement<String>

getLink

```
public javax.xml.bind.JAXBElement<java.lang.String> getLink()
```

Gets the value of the link property.

Network Registrar Type: AT_NAMEREF

```
Associates an IPv6 prefix (subnet) with a link. Use this attribute
 to group prefixes that are on a single link.
```

Returns:
possible object is JAXBElement<String>

setLink

```
public void setLink(javax.xml.bind.JAXBElement<java.lang.String> value)
```

Sets the value of the link property.

Parameters:
value - allowed object is JAXBElement<String>

getLocalCluster

```
public javax.xml.bind.JAXBElement<java.lang.String> getLocalCluster()
```

Gets the value of the localCluster property.

Network Registrar Type: AT_OID

```
Identifies the local DHCP cluster or failover pair
 for this regional prefix.
```

Returns:
possible object is JAXBElement<String>

setLocalCluster

```
public void setLocalCluster(javax.xml.bind.JAXBElement<java.lang.String> value)
```

Sets the value of the localCluster property.

Parameters:
value - allowed object is JAXBElement<String>

getMaintenance

```
public javax.xml.bind.JAXBElement<java.lang.String> getMaintenance()
```

Gets the value of the maintenance property.

Network Registrar Type: AT_BOOL
Default value: disabled

```
If this attribute is enabled, this Prefix and any other Prefixes
 on the same Link will participate in the current maintenance
 window.  DHCP clients will have their renewal times adjusted to
 avoid renewals during the maintenance window.  In addition, they
 will be directed to renew during the renewal-period after the end
 of the maintenance window.
```

Returns:

possible object is JAXBElement<String>

setMaintenance

```
public void setMaintenance(javax.xml.bind.JAXBElement<java.lang.String> value)
```

Sets the value of the maintenance property.

Parameters:

value - allowed object is JAXBElement<String>

getMaxLeases

```
public javax.xml.bind.JAXBElement<java.lang.String> getMaxLeases()
```

Gets the value of the maxLeases property.

Network Registrar Type: AT_RANGEINT
Default value: 65536
Valid values: 0 - 2000000

```
Sets the maximum number of non-reserved leases that the server
 will allow to exist on this prefix. When a new lease needs to
 be created, the server will only do so if the limit has not
 been exceeded. When the limit is exceeded, no new leases can be
 created and offered to clients.
 This limit is not applied when existing leases are loaded from
 the lease state database during server start-up.
 This attribute is also used when calculating the free-address
 level for address traps.
```

Returns:

possible object is JAXBElement<String>

setMaxLeases

public void setMaxLeases(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the maxLeases property.

Parameters:

value - allowed object is JAXBElement<String>

---

getMaxPdBalancingLength

public javax.xml.bind.JAXBElement<java.lang.String> getMaxPdBalancingLength()

Gets the value of the maxPdBalancingLength property.

Network Registrar Type: AT_RANGEINT
Default value: 64
Valid values: 1 - 128

```
Specifies the maximum prefix-delegation prefix length that the
 failover pool balancing will consider in balancing a prefix-
 delegation prefix.
 If specified, this value must be equal or less than the prefix
 range's prefix length plus 24, otherwise the server will use the
 prefix's range plus 24. Thus, a /32 prefix will only perform pool
 balancing for prefixes up to a /56.
 If unspecified, the lessor of the prefix range's prefix length plus
  24 or 64 is used.
 Available prefix-delegation prefixes longer than this value will not
 be considered when balancing prefix-delegation pools.
 This value should be the same or smaller than the longest allowed
 prefix length to assure all prefix-delegation prefixes can be
 assigned to clients as balancing prefixes longer than this length
 would result in prefixes that can never be delegated to clients.
```

Returns:

possible object is JAXBElement<String>

---

setMaxPdBalancingLength

public void setMaxPdBalancingLength(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the maxPdBalancingLength property.

Parameters:

value - allowed object is JAXBElement<String>

getName

```
public java.lang.String getName()
```

Gets the value of the name property.

Network Registrar Type: AT_STRING
Required. Unique.

```
Assigns a name to an IPv6 prefix (subnet).
```

Returns:

possible object is `String`

setName

```
public void setName(java.lang.String value)
```

Sets the value of the name property.

Parameters:

`value` - allowed object is `String`

getOwner

```
public javax.xml.bind.JAXBElement<java.lang.String> getOwner()
```

Gets the value of the owner property.

Network Registrar Type: AT_NAMEREF

```
Identifies the owner of this prefix, referenced by name. Owners can
 be used to limit administrative access to prefixes by owner.
 If the prefix has an associated link, the owner of the associated
 link will apply, if it is set. If there is no associated link, or
 the link owner is unset, the owner of the parent prefix will apply,
 if the prefix owner is unset.
```

Returns:

possible object is `JAXBElement<String>`

setOwner

```
public void setOwner(javax.xml.bind.JAXBElement<java.lang.String> value)
```

Sets the value of the owner property.

Parameters:

`value` - allowed object is `JAXBElement<String>`

getPolicy

`public javax.xml.bind.JAXBElement<java.lang.String> getPolicy()`

Gets the value of the policy property.

Network Registrar Type: AT_NAMEREF

```
Refers to a shared policy to use when replying to clients.
```

Returns:
possible object is JAXBElement<String>

setPolicy

`public void setPolicy(javax.xml.bind.JAXBElement<java.lang.String> value)`

Sets the value of the policy property.

Parameters:
value - allowed object is JAXBElement<String>

getRange

`public javax.xml.bind.JAXBElement<java.lang.String> getRange()`

Gets the value of the range property.

Network Registrar Type: AT_PREFIX

```
Specifies a prefix contained by the prefix address to limit the
 range of addresses or prefixes available for assignment.
 If unspecified on a prefix of dhcp-type 'prefix-delegation',
 the ranges of other prefixes with the same prefix address will
 be excluded from this prefix. If unspecified on a prefix of
 other dhcp-type values, the prefix address is used.
```

Returns:
possible object is JAXBElement<String>

setRange

`public void setRange(javax.xml.bind.JAXBElement<java.lang.String> value)`

Sets the value of the range property.

Parameters:

value - allowed object is JAXBElement<String>

getRangeEnd

public javax.xml.bind.JAXBElement<java.lang.String> getRangeEnd()

Gets the value of the rangeEnd property.

Network Registrar Type: AT_IP6

```
Specifies the end address within the prefix address range that will
 be used to allocate leases, if this is a DHCP type prefix. If unset,
 the last available address in the prefix address range is used as the
 end address (except if range-start was specified as a prefix, in
 which case the last address of the prefix specified by range-start is
 used).
```

Returns:

possible object is JAXBElement<String>

setRangeEnd

public void setRangeEnd(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the rangeEnd property.

Parameters:

value - allowed object is JAXBElement<String>

getRangeStart

public javax.xml.bind.JAXBElement<java.lang.String> getRangeStart()

Gets the value of the rangeStart property.

Network Registrar Type: AT_IP6

```
Specifies either the start address within the prefix address range
 that will be used to allocate leases or a prefix which will be used
 as the range (range-end must not be specified in this case), if this
 is a DHCP type prefix. If unset, the first available address in the
 prefix address range is used as the start address.
```

Returns:

possible object is JAXBElement<String>

setRangeStart

```
public void setRangeStart(javax.xml.bind.JAXBElement<java.lang.String> value)
```

Sets the value of the rangeStart property.

Parameters:

value - allowed object is JAXBElement<String>

getRegion

```
public javax.xml.bind.JAXBElement<java.lang.String> getRegion()
```

Gets the value of the region property.

Network Registrar Type: AT_NAMEREF

```
Identifies the region for this prefix, referenced by name. Regions
 can be used to limit administrative access to prefixes by region.
 If the prefix has an associated link, the region for the associated
 link will apply, if it is set. If there is no associated link, or
 the link region is unset, the region for the parent prefix will
 apply, if the prefix region is unset.
```

Returns:

possible object is JAXBElement<String>

setRegion

```
public void setRegion(javax.xml.bind.JAXBElement<java.lang.String> value)
```

Sets the value of the region property.

Parameters:

value - allowed object is JAXBElement<String>

getRestrictToAdminAllocation

```
public javax.xml.bind.JAXBElement<java.lang.String> getRestrictToAdminAllocation()
```

Gets the value of the restrictToAdminAllocation property.

Network Registrar Type: AT_BOOL
Default value: disabled

```
Controls whether the prefix is restricted to administrative requests
 to allocate the next available address. If set, the server will
 only respond to a client with an address from this prefix if it
 has been pre-allocated to the client.
```

Returns:

possible object is JAXBElement<String>

setRestrictToAdminAllocation

public void setRestrictToAdminAllocation(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the restrictToAdminAllocation property.

Parameters:

value - allowed object is JAXBElement<String>

getRestrictToReservations

public javax.xml.bind.JAXBElement<java.lang.String> getRestrictToReservations()

Gets the value of the restrictToReservations property.

Network Registrar Type: AT_BOOL
Default value: disabled

```
Controls whether the prefix is restricted to client (or lease)
 reservations. If enabled, the DHCP server will not
 automatically assign addresses or delegate prefixes to clients
 but instead requires the address or prefix to be supplied by a
 reservation, either a lease reservation or a client
 reservation, which is specified via a client entry or through
 an extension and the environment dictionary.
```

Returns:

possible object is JAXBElement<String>

setRestrictToReservations

public void setRestrictToReservations(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the restrictToReservations property.

Parameters:

value - allowed object is JAXBElement<String>

getReverseZonePrefixLength

public javax.xml.bind.JAXBElement<java.lang.String> getReverseZonePrefixLength()

Gets the value of the reverseZonePrefixLength property.

Network Registrar Type: AT_RANGEINT
Valid values: 0 - 124

Specifies the prefix length of the reverse zone for ip6.arpa
 updates. You do not need to specify the full reverse zone,
 because you can synthesize it by using the ip6.arpa domain.
      Use a multiple of 4 for the value, because ip6.arpa zones
      are on 4-bit boundaries. If not a multiple of 4, the value
      is rounded up to the next multiple of 4.
      The maximum value is 124, because specifying 128 would
      create a zone name without any possible hostnames
      contained within.
      A value of 0 means none of the bits are used for the zone
      name, hence ip6.arpa is used.
      If you omit the value from the DNS update configuration,
      the server uses the value from the prefix or, as a last
      resort, the prefix length derived from the address value
      of the prefix.

Returns:

possible object is JAXBElement<String>

setReverseZonePrefixLength

public void setReverseZonePrefixLength(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the reverseZonePrefixLength property.

Parameters:

value - allowed object is JAXBElement<String>

getSelectionTags

public javax.xml.bind.JAXBElement<StringArray> getSelectionTags()

Gets the value of the selectionTags property.

Network Registrar Type: AT_NLIST(AT_STRING)

Associates selection tags with an IPv6 prefix (subnet).

Returns:

possible object is JAXBElement<StringArray>

setSelectionTags

public void setSelectionTags(javax.xml.bind.JAXBElement<StringArray> value)

Sets the value of the selectionTags property.

Parameters:

value - allowed object is JAXBElement<StringArray>

---

getTenantId

public javax.xml.bind.JAXBElement<java.lang.String> getTenantId()

Gets the value of the tenantId property.

Network Registrar Type: AT_SHORT
Immutable.
Default value: 0

Identifies the tenant owner of this object.

Returns:

possible object is JAXBElement<String>

---

setTenantId

public void setTenantId(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the tenantId property.

Parameters:

value - allowed object is JAXBElement<String>

---

getVpnId

public javax.xml.bind.JAXBElement<java.lang.String> getVpnId()

Gets the value of the vpnId property.

Network Registrar Type: AT_INT
Immutable.
Default value: 0

Identifies the VPN that contains an IPv6 prefix.

Returns:

possible object is JAXBElement<String>

---

setVpnId

public void setVpnId(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the vpnId property.

Parameters:

`value` - allowed object is `JAXBElement<String>`

Package com.cisco.cnr.ws.xsd

        com.cisco.cnr.ws.xsd.PrefixTemplate

---

public class **PrefixTemplate**
extends ClassBase

The Network Registrar PrefixTemplate class.

A template to create IPv6 prefixes. The prefix address and vpn can only be supplied as context variables. Attributes of type AT_EXPR are evaluated as expressions to generate a prefix-specific value for the corresponding prefix attribute. All other attributes, except the prefix name, are copied literally from the template to the newly created prefix.

Java class for PrefixTemplate complex type.

The following schema fragment specifies the expected content contained within this class.

```
<complexType name="PrefixTemplate">
  <complexContent>
    <extension base="{http://ws.cnr.cisco.com/xsd}ClassBase">

Constructor Detail

PrefixTemplate

public PrefixTemplate()

Method Detail

getAllocationAlgorithms

public javax.xml.bind.JAXBElement<java.lang.String> getAllocationAlgorithms()

Gets the value of the allocationAlgorithms property.

Network Registrar Type: AT_FLAGSINT
Default value: reservation,extension,random,best-fit
Valid values: client-request, reservation, extension, interface-identifier, random, best-fit

```
Controls the algorithms used by the server to select a new address
 or prefix to lease to a client. Note however that when the prefix's
 restrict-to-reservations is enabled, only the reservation flag is
 used (the others are ignored as only lease or client reservations
 can be used).
 The available algorithms are:
   client-request
     This setting (off by default) controls whether the server
     uses a client requested lease.
   reservation
     This setting (on by default) controls whether the server
     uses an available lease reservation for the client.
   extension
     This setting (on by default) controls whether the server calls
     extensions attached at the generate-lease extension point
     to generate an address or prefix for the client.
   interface-identifier
     This setting (off by default) controls whether the server uses
     the interface-identifier from the client's (link-local)
     address to generate an address. It is ignored for temporary
     addresses and prefix delegation.
   random
     This setting (on by default) controls whether the server
     generates an address using an RFC 3041-like algorithm. It is
     is ignored for prefix delegation.
   best-fit
     This setting (on by default) controls whether the server will
     delegate the first, best-fit available prefix. It is ignored
     for addresses.
 When the server needs an address to assign to a client, it
 processes the flags in the following order: client-request,
 reservation, extension, interface-identifier, and random.
 Processing stops when a usable address is produced.
 When the server needs to delegate a prefix to a client, it
 processes the flags in the following order: client-request,
 reservation, extension, best-fit. Processing stops when a
 usable prefix is produced.
```

Returns:

possible object is JAXBElement<String>

setAllocationAlgorithms

```
public void setAllocationAlgorithms(javax.xml.bind.JAXBElement<java.lang.String> value)
```

Sets the value of the allocationAlgorithms property.

Parameters:

value - allowed object is JAXBElement<String>

getAllocationGroup

```
public javax.xml.bind.JAXBElement<java.lang.String> getAllocationGroup()
```

Gets the value of the allocationGroup property.

Network Registrar Type: AT_STRING

```
Specifies the allocation group to which this prefix belongs. At
 most one lease per binding is allocated across all of the prefixes
 on a link with the same allocation group name.
 This name is only specific to the link. Different links can reuse
 the same allocation group names.
```

Returns:

possible object is JAXBElement<String>

setAllocationGroup

```
public void setAllocationGroup(javax.xml.bind.JAXBElement<java.lang.String> value)
```

Sets the value of the allocationGroup property.

Parameters:

value - allowed object is JAXBElement<String>

getAllocationGroupPriority

```
public javax.xml.bind.JAXBElement<java.lang.String> getAllocationGroupPriority()
```

Gets the value of the allocationGroupPriority property.

Network Registrar Type: AT_INT
Default value: 0

```
Specifies the priority of this prefix over other prefixes in the
 same allocation group. This settings allows control over which
 prefixes are used before others. Lower numeric values have higher
 priorities, but a priority of 0 (the default) has the lowest
 possible priority.
 Prefixes with the same priority are dynamically ordered by active
 lease count, where the lowest count will have the highest priority.
```

Returns:

possible object is JAXBElement<String>

---

setAllocationGroupPriority

public void setAllocationGroupPriority(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the allocationGroupPriority property.

Parameters:

value - allowed object is JAXBElement<String>

---

getDeactivated

public javax.xml.bind.JAXBElement<java.lang.String> getDeactivated()

Gets the value of the deactivated property.

Network Registrar Type: AT_BOOL
Default value: disabled

```
Controls whether a prefix extends leases to clients. A deactivated
 prefix does not extend leases to any clients. It treats all addresses
 in its ranges as if they were individually deactivated.
 Default, false (active).
```

Returns:

possible object is JAXBElement<String>

---

setDeactivated

public void setDeactivated(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the deactivated property.

Parameters:

value - allowed object is JAXBElement<String>

---

getDescription

public javax.xml.bind.JAXBElement<java.lang.String> getDescription()

Gets the value of the description property.

Network Registrar Type: AT_STRING

Describes the prefix template.

Returns:

possible object is JAXBElement<String>

---

setDescription

public void setDescription(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the description property.

Parameters:

value - allowed object is JAXBElement<String>

---

getDhcpType

public javax.xml.bind.JAXBElement<java.lang.String> getDhcpType()

Gets the value of the dhcpType property.

Network Registrar Type: AT_ENUMINT
Default value: dhcp
Valid values: stateless, dhcp, prefix-delegation, infrastructure, parent

```
Defines how DHCP manages address assignment within a prefix:
    stateless          Prefix is used only for stateless
                       option configuration.
    dhcp               Prefix is used for stateful address
                       assignment.
    prefix-delegation  Prefix is used for prefix-delegation.
    infrastructure     Prefix is used to map a client address to
                       a link, and does not have an address pool.
    parent             Prefix is not used by DHCP. It is used as
                       a container object, to group child prefixes.
```

Returns:

possible object is JAXBElement<String>

---

setDhcpType

public void setDhcpType(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the dhcpType property.

Parameters:

value - allowed object is JAXBElement<String>

getEmbeddedPolicy

public javax.xml.bind.JAXBElement<Policy> getEmbeddedPolicy()

Gets the value of the embeddedPolicy property.

Network Registrar Type: AT_OBJ(Policy)

```
Specifies an policy embedded.
 Note: When the template is applied, this will replace the
 entire embedded-policy in the prefix.
```

Returns:

possible object is JAXBElement<Policy>

setEmbeddedPolicy

public void setEmbeddedPolicy(javax.xml.bind.JAXBElement<Policy> value)

Sets the value of the embeddedPolicy property.

Parameters:

value - allowed object is JAXBElement<Policy>

getExpirationTime

public javax.xml.bind.JAXBElement<java.lang.String> getExpirationTime()

Gets the value of the expirationTime property.

Network Registrar Type: AT_DATE

```
Sets the time and date on which a prefix expires. After this date
 and time, the server neither grants new leases nor renews existing
 leases from this prefix.
 Once the expiration-time has passed, the prefix is no longer used
 (though old leases and leases with grace or affinity periods
 continue to exist until those periods elapse).
 Enter this as a date in the format "[weekday] mon day
 hh:mm[:ss] year". For example, "Dec 31 23:59 2006".
```

Returns:

possible object is JAXBElement<String>

setExpirationTime

public void setExpirationTime(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the expirationTime property.

Parameters:

value - allowed object is JAXBElement<String>

---

getFreeAddressConfig

public javax.xml.bind.JAXBElement<java.lang.String> getFreeAddressConfig()

Gets the value of the freeAddressConfig property.

Network Registrar Type: AT_NAMEREF

```
Identifies which trap captures unexpected free address events
 on this prefix.
 If this attribute is not configured, the server looks for
 the free-address-config attribute on the parent Link object.
 If that attribute is not configured, the server looks for
 the v6-default-free-address-config on the DHCPServer object.
```

Returns:

possible object is JAXBElement<String>

---

setFreeAddressConfig

public void setFreeAddressConfig(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the freeAddressConfig property.

Parameters:

value - allowed object is JAXBElement<String>

---

getIgnoreDeclines

public javax.xml.bind.JAXBElement<java.lang.String> getIgnoreDeclines()

Gets the value of the ignoreDeclines property.

Network Registrar Type: AT_BOOL
Default value: false

```
Controls whether the DHCP server responds to a DHCPv6 DECLINE
 message that refers to an IPv6 address or a delegated prefix
 from this prefix.
 If enabled, the DHCP server ignores all declines for leases
 in this prefix.
 If disabled or not set, the DHCP server sets to UNAVAILABLE
 every address or delegated prefix requested in a DECLINE
 message if it is leased to the client.
 The default value is false, so that DECLINE messages are
```

processed normally.

Returns:

possible object is JAXBElement<String>

setIgnoreDeclines

public void setIgnoreDeclines(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the ignoreDeclines property.

Parameters:

value - allowed object is JAXBElement<String>

getMaxLeases

public javax.xml.bind.JAXBElement<java.lang.String> getMaxLeases()

Gets the value of the maxLeases property.

Network Registrar Type: AT_RANGEINT
Default value: 65536
Valid values: 0 - 2000000

Sets the maximum number of non-reserved leases that the server
 will allow to exist on the prefix. When a new lease needs to
 be created, the server will only do so if the limit has not
 been exceeded. When the limit is exceeded, no new leases can be
 created and offered to clients.

Returns:

possible object is JAXBElement<String>

setMaxLeases

public void setMaxLeases(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the maxLeases property.

Parameters:

value - allowed object is JAXBElement<String>

getMaxPdBalancingLength

public javax.xml.bind.JAXBElement<java.lang.String> getMaxPdBalancingLength()

Gets the value of the maxPdBalancingLength property.

Network Registrar Type: AT_RANGEINT
Default value: 64
Valid values: 1 - 128

```
Specifies the maximum prefix-delegation prefix length that the
 failover pool balancing will consider in balancing a prefix-
 delegation prefix.
 If specified, this value must be equal or less than the prefix
 range's prefix length plus 24, otherwise the server will use the
 prefix's range plus 24. Thus, a /32 prefix will only perform pool
 balancing for prefixes up to a /56.
 If unspecified, the lessor of the prefix range's prefix length plus
  24 or 64 is used.
 Available prefix-delegation prefixes longer than this value will not
 be considered when balancing prefix-delegation pools.
 This value should specify be the same or smaller than the longest
 allowed prefix length to assure all prefix-delegation prefixes can
 be assigned to clients as balancing prefixes longer than this length
 would result in prefixes that can never be delegated to clients.
```

Returns:

possible object is JAXBElement<String>

setMaxPdBalancingLength

public void setMaxPdBalancingLength(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the maxPdBalancingLength property.

Parameters:

value - allowed object is JAXBElement<String>

getName

public java.lang.String getName()

Gets the value of the name property.

Network Registrar Type: AT_STRING
Required. Unique.

```
Assigns a name to this prefix template.
```

Returns:

possible object is String

setName

public void setName(java.lang.String value)

Sets the value of the name property.

Parameters:

value - allowed object is String

---

getOptionsExpr

public javax.xml.bind.JAXBElement<java.lang.String> getOptionsExpr()

Gets the value of the optionsExpr property.

Network Registrar Type: AT_EXPR

```
Defines an expression that evaluates to the list of
 embedded policy options to be created.
```

Returns:

possible object is JAXBElement<String>

---

setOptionsExpr

public void setOptionsExpr(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the optionsExpr property.

Parameters:

value - allowed object is JAXBElement<String>

---

getOwner

public javax.xml.bind.JAXBElement<java.lang.String> getOwner()

Gets the value of the owner property.

Network Registrar Type: AT_NAMEREF

```
Identifies the owner of this prefix, referenced by name. Owners can
 be used to limit administrative access to prefixes by owner.
 If the prefix has an associated link, the owner of the associated
 link will apply, if it is set. If there is no associated link, or
 the link owner is unset, the owner of the parent prefix will apply,
 if the prefix owner is unset.
```

Returns:

possible object is JAXBElement<String>

setOwner

`public void setOwner(javax.xml.bind.JAXBElement<java.lang.String> value)`

Sets the value of the owner property.

Parameters:

value - allowed object is JAXBElement<String>

getPolicy

`public javax.xml.bind.JAXBElement<java.lang.String> getPolicy()`

Gets the value of the policy property.

Network Registrar Type: AT_NAMEREF

```
Refers to a shared policy to use when replying to clients.
```

Returns:

possible object is JAXBElement<String>

setPolicy

`public void setPolicy(javax.xml.bind.JAXBElement<java.lang.String> value)`

Sets the value of the policy property.

Parameters:

value - allowed object is JAXBElement<String>

getPrefixDescriptionExpr

`public javax.xml.bind.JAXBElement<java.lang.String> getPrefixDescriptionExpr()`

Gets the value of the prefixDescriptionExpr property.

Network Registrar Type: AT_EXPR

```
Defines an AT_STRING expression to apply to the description on the
 prefix object created when using the template.
```

Returns:

possible object is JAXBElement<String>

setPrefixDescriptionExpr

public void setPrefixDescriptionExpr(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the prefixDescriptionExpr property.

Parameters:

value - allowed object is JAXBElement<String>

getPrefixNameExpr

public javax.xml.bind.JAXBElement<java.lang.String> getPrefixNameExpr()

Gets the value of the prefixNameExpr property.

Network Registrar Type: AT_EXPR

```
Defines an expression that evaluates to an AT_STRING value
 to use for the name of the prefix object created when using
 the template.
```

Returns:

possible object is JAXBElement<String>

setPrefixNameExpr

public void setPrefixNameExpr(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the prefixNameExpr property.

Parameters:

value - allowed object is JAXBElement<String>

getRangeEndExpr

public javax.xml.bind.JAXBElement<java.lang.String> getRangeEndExpr()

Gets the value of the rangeEndExpr property.

Network Registrar Type: AT_EXPR

```
Defines an expression that evaluates to the range-end for the prefix.
```

Returns:

possible object is JAXBElement<String>

setRangeEndExpr

public void setRangeEndExpr(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the rangeEndExpr property.

Parameters:

value - allowed object is JAXBElement<String>

getRangeExpr

public javax.xml.bind.JAXBElement<java.lang.String> getRangeExpr()

Gets the value of the rangeExpr property.

Network Registrar Type: AT_EXPR

Defines an expression that evaluates to an AT_PREFIX value
 for the prefix range to be created.

Returns:

possible object is JAXBElement<String>

setRangeExpr

public void setRangeExpr(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the rangeExpr property.

Parameters:

value - allowed object is JAXBElement<String>

getRangeStartExpr

public javax.xml.bind.JAXBElement<java.lang.String> getRangeStartExpr()

Gets the value of the rangeStartExpr property.

Network Registrar Type: AT_EXPR

Defines an expression that evaluates to the range-start for the
 prefix.

Returns:

possible object is JAXBElement<String>

setRangeStartExpr

public void setRangeStartExpr(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the rangeStartExpr property.

Parameters:

value - allowed object is JAXBElement<String>

getRegion

public javax.xml.bind.JAXBElement<java.lang.String> getRegion()

Gets the value of the region property.

Network Registrar Type: AT_NAMEREF

```
Identifies the region for this prefix, referenced by name. Regions
 can be used to limit administrative access to prefixes by region.
 If the prefix has an associated link, the region for the associated
 link will apply, if it is set. If there is no associated link, or
 the link region is unset, the region for the parent prefix will
 apply, if the prefix region is unset.
```

Returns:

possible object is JAXBElement<String>

setRegion

public void setRegion(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the region property.

Parameters:

value - allowed object is JAXBElement<String>

getRestrictToAdminAllocation

public javax.xml.bind.JAXBElement<java.lang.String> getRestrictToAdminAllocation()

Gets the value of the restrictToAdminAllocation property.

Network Registrar Type: AT_BOOL
Default value: disabled

```
Controls whether the prefix is restricted to administrative requests
 to allocate the next available address. If set, the server will only
 respond to a client with an address from this prefix if it has been
 pre-allocated to the client.
```

Returns:

possible object is JAXBElement<String>

setRestrictToAdminAllocation

public void setRestrictToAdminAllocation(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the restrictToAdminAllocation property.

Parameters:

value - allowed object is JAXBElement<String>

getRestrictToReservations

public javax.xml.bind.JAXBElement<java.lang.String> getRestrictToReservations()

Gets the value of the restrictToReservations property.

Network Registrar Type: AT_BOOL
Default value: disabled

```
Controls whether the prefix is restricted to client (or lease)
 reservations. If enabled, the DHCP server will not
 automatically assign addresses or delegate prefixes to clients
 but instead requires the address or prefix to be supplied by a
 reservation, either a lease reservation or a client
 reservation, which is specified via a client entry or through
 an extension and the environment dictionary.
```

Returns:

possible object is JAXBElement<String>

setRestrictToReservations

public void setRestrictToReservations(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the restrictToReservations property.

Parameters:

value - allowed object is JAXBElement<String>

getReverseZonePrefixLength

public javax.xml.bind.JAXBElement<java.lang.String> getReverseZonePrefixLength()

Gets the value of the reverseZonePrefixLength property.

Network Registrar Type: AT_RANGEINT

Valid values: 0 - 124

Identifies the prefix length of the reverse zone for ip6.arpa
 updates. The server forms the zone name using this value if
 configured; otherwise the prefix length is determined from the
 Prefix. This value must be a multiple of 4 as ip6.arpa zones are
 on 4 bit (nibble) boundaries. If not a multiple of 4, it is
 rounded up to the next higher multiple of 4.

Returns:
possible object is JAXBElement<String>

---

setReverseZonePrefixLength

public void setReverseZonePrefixLength(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the reverseZonePrefixLength property.

Parameters:
value - allowed object is JAXBElement<String>

---

getSelectionTags

public javax.xml.bind.JAXBElement<StringArray> getSelectionTags()

Gets the value of the selectionTags property.

Network Registrar Type: AT_NLIST(AT_STRING)

Associates selection tags with an IPv6 prefix.

Returns:
possible object is JAXBElement<StringArray>

---

setSelectionTags

public void setSelectionTags(javax.xml.bind.JAXBElement<StringArray> value)

Sets the value of the selectionTags property.

Parameters:
value - allowed object is JAXBElement<StringArray>

---

getTenantId

public javax.xml.bind.JAXBElement<java.lang.String> getTenantId()

Gets the value of the tenantId property.

Network Registrar Type: AT_SHORT
Immutable.
Default value: 0

Identifies the tenant owner of this object.

Returns:
possible object is JAXBElement<String>

setTenantId

public void setTenantId(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the tenantId property.

Parameters:
value - allowed object is JAXBElement<String>

Package com.cisco.cnr.ws.xsd

Class PrefixTemplateArray

java.lang.Object
    com.cisco.cnr.ws.xsd.ClassBaseArray
        com.cisco.cnr.ws.xsd.PrefixTemplateArray

---

public class **PrefixTemplateArray**
extends ClassBaseArray

Java class for PrefixTemplateArray complex type.

The following schema fragment specifies the expected content contained within this class.

```
<complexType name="PrefixTemplateArray">
  <complexContent>
    <extension base="{http://ws.cnr.cisco.com/xsd}ClassBaseArray">

Constructor Detail

Range

public Range()

Method Detail

getEnd

public javax.xml.bind.JAXBElement<java.lang.String> getEnd()

Gets the value of the end property.

Network Registrar Type: AT_IPADDR

The last address in this range.

Returns:
possible object is JAXBElement<String>

setEnd

public void setEnd(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the end property.

Parameters:
value - allowed object is JAXBElement<String>

getStart

public javax.xml.bind.JAXBElement<java.lang.String> getStart()

Gets the value of the start property.

Network Registrar Type: AT_IPADDR

The first address in this range.

Returns:
possible object is JAXBElement<String>

---

setStart

`public void setStart(javax.xml.bind.JAXBElement<java.lang.String> value)`

Sets the value of the start property.

Parameters:
value - allowed object is JAXBElement<String>

Package com.cisco.cnr.ws.xsd

---

Constructor Detail

RelayAgentState

public RelayAgentState()

Method Detail

getCommState

public javax.xml.bind.JAXBElement<java.lang.String> getCommState()

Gets the value of the commState property.

Network Registrar Type: AT_ENUMINT
Valid values: none, ok, interrupted

```
Provides the current state of the communication between the failover
 partner and the relay agent.
 'none' means that no (DHCPv4) DHCPREQUEST (selecting) or (DHCPv6)
 Request addressed to another server was received in the last
 rhc-unresponsive-time seconds.
 'ok' means that a (DHCPv4) DHCPREQUEST (selecting) or (DHCPv6) Request
```

addressed to another server was received within the last
rhc-unresponsive-time seconds.
'interrupted' means that recent data indicates that there is a problem
in communications and that this server is now responding to requests
for its failover partner from this relay agent.

Returns:

possible object is JAXBElement<String>

setCommState

public void setCommState(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the commState property.

Parameters:

value - allowed object is JAXBElement<String>

getCurrentResponsesForPartner

public javax.xml.bind.JAXBElement<java.lang.String> getCurrentResponsesForPartner()

Gets the value of the currentResponsesForPartner property.

Network Registrar Type: AT_INT

Provides the number of packets to which this server has responded to
for its partner since entering 'interrupted' state.
This will be unset if the state is not 'interrupted'.

Returns:

possible object is JAXBElement<String>

setCurrentResponsesForPartner

public void setCurrentResponsesForPartner(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the currentResponsesForPartner property.

Parameters:

value - allowed object is JAXBElement<String>

getCurrentStateDuration

public javax.xml.bind.JAXBElement<java.lang.String> getCurrentStateDuration()

Gets the value of the currentStateDuration property.

Network Registrar Type: AT_TIME

Provides the time duration dependent on the current state.
 When in the "none" or "ok" state, reports the time since the last
 (DHCPv4) DHCPREQUEST (selecting) or (DHCPv6) Request addressed to
 another server was received, failover normal state was last entered,
 or the relay agent started to be monitored.
 When in the "interrupted" state, reports the time since this state
 was entered.

Returns:

possible object is JAXBElement<String>

---

setCurrentStateDuration

public void setCurrentStateDuration(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the currentStateDuration property.

Parameters:

value - allowed object is JAXBElement<String>

---

getGiaddr

public javax.xml.bind.JAXBElement<java.lang.String> getGiaddr()

Gets the value of the giaddr property.

Network Registrar Type: AT_IPADDR

Provides the GIADDR for the relay agent being monitored.
 Either this or the ip6address attribute will be set, not both.

Returns:

possible object is JAXBElement<String>

---

setGiaddr

public void setGiaddr(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the giaddr property.

Parameters:

value - allowed object is JAXBElement<String>

---

getIp6Address

public javax.xml.bind.JAXBElement<java.lang.String> getIp6Address()

Gets the value of the ip6Address property.

Network Registrar Type: AT_IP6ADDR

Provides the IPv6 source address used by the relay agent being
 monitored.
 Either this or the giaddr attribute will be set, not both.

Returns:

possible object is JAXBElement<String>

---

setIp6Address

public void setIp6Address(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the ip6Address property.

Parameters:

value - allowed object is JAXBElement<String>

---

getLastOkTime

public javax.xml.bind.JAXBElement<java.lang.String> getLastOkTime()

Gets the value of the lastOkTime property.

Network Registrar Type: AT_DATE

Provides the time of the last (DHCPv4) DHCPREQUEST (selecting) or
 (DHCPv6) Request packet was received that selected another server
 (i.e., the failover partner).

Returns:

possible object is JAXBElement<String>

---

setLastOkTime

public void setLastOkTime(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the lastOkTime property.

Parameters:

value - allowed object is JAXBElement<String>

---

getLastRelayIp6Address

public javax.xml.bind.JAXBElement<java.lang.String> getLastRelayIp6Address()

Gets the value of the lastRelayIp6Address property.

Network Registrar Type: AT_IP6ADDR

Provides the IPv6 address of the relay agent, from where this
 server receives the DHCPv6 messages. This address will be same

as 'ip6address', if DHCPv6 traffic is monitored based on
outermost relay (from where DHCP Server receives the message).

Returns:

possible object is JAXBElement<String>

---

setLastRelayIp6Address

public void setLastRelayIp6Address(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the lastRelayIp6Address property.

Parameters:

value - allowed object is JAXBElement<String>

---

getPartnerLastDiscoverSolicitTime

public javax.xml.bind.JAXBElement<java.lang.String> getPartnerLastDiscoverSolicitTime()

Gets the value of the partnerLastDiscoverSolicitTime property.

Network Registrar Type: AT_DATE

Provides the time at which this server last received a (DHCPv4)
DHCPDISCOVER or (DHCPv6) Solicit to which its failover partner should
have responded.

Returns:

possible object is JAXBElement<String>

---

setPartnerLastDiscoverSolicitTime

public void setPartnerLastDiscoverSolicitTime(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the partnerLastDiscoverSolicitTime property.

Parameters:

value - allowed object is JAXBElement<String>

---

getPartnerRequestCount

public javax.xml.bind.JAXBElement<java.lang.String> getPartnerRequestCount()

Gets the value of the partnerRequestCount property.

Network Registrar Type: AT_INT

Provides the server's current value for monitoring the partner against
the rhc-request-count.
This value is not available when the state is 'interrupted'.

Returns:

possible object is JAXBElement<String>

---

setPartnerRequestCount

public void setPartnerRequestCount(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the partnerRequestCount property.

Parameters:

value - allowed object is JAXBElement<String>

---

getPartnerUnresponsiveDuration

public javax.xml.bind.JAXBElement<java.lang.String> getPartnerUnresponsiveDuration()

Gets the value of the partnerUnresponsiveDuration property.

Network Registrar Type: AT_TIME

```
Provides the server's current value for monitoring the partner against
 the rhc-unresponsive-time.
 This value is not available when the state is 'interrupted'.
```

Returns:

possible object is JAXBElement<String>

---

setPartnerUnresponsiveDuration

public void setPartnerUnresponsiveDuration(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the partnerUnresponsiveDuration property.

Parameters:

value - allowed object is JAXBElement<String>

---

getTotalResponsesForPartner

public javax.xml.bind.JAXBElement<java.lang.String> getTotalResponsesForPartner()

Gets the value of the totalResponsesForPartner property.

Network Registrar Type: AT_INT

```
Provides the total number of packets to which this server has
 responded to for its partner since the last server start/reload.
```

Returns:

possible object is JAXBElement<String>

setTotalResponsesForPartner

public void setTotalResponsesForPartner(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the totalResponsesForPartner property.

Parameters:

value - allowed object is JAXBElement<String>

Package com.cisco.cnr.ws.xsd

Class RelayAgentStateArray

java.lang.Object
    com.cisco.cnr.ws.xsd.ClassBaseArray
        com.cisco.cnr.ws.xsd.RelayAgentStateArray

Modifier and Type	Method	Description
javax.xml.bind.JAXBElement<java.lang.String>	**getClientClass**()	Gets the value of the clientClass property.
javax.xml.bind.JAXBElement<java.lang.String>	**getCmMacAddress**()	Gets the value of the cmMacAddress property.

javax.xml.bind.JAXBElement<java.lang.String>	**getDescription**()	Gets the value of the description property.
javax.xml.bind.JAXBElement<java.lang.String>	**getDeviceName**()	Gets the value of the deviceName property.
javax.xml.bind.JAXBElement<**StringArray**>	**getIncludeTags**()	Gets the value of the includeTags property.
java.lang.String	**getIpaddr**()	Gets the value of the ipaddr property.
java.lang.String	**getLookupKey**()	Gets the value of the lookupKey property.
java.lang.String	**getLookupKeyType**()	Gets the value of the lookupKeyType property.
javax.xml.bind.JAXBElement<java.lang.String>	**getScope**()	Gets the value of the scope property.
javax.xml.bind.JAXBElement<java.lang.String>	**getTenantId**()	Gets the value of the tenantId property.
javax.xml.bind.JAXBElement<java.lang.String>	**getVpnId**()	Gets the value of the vpnId property.
void	**setClientClass**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the clientClass property.
void	**setCmMacAddress**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the cmMacAddress property.
void	**setDescription**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the description property.
void	**setDeviceName**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the deviceName property.
void	**setIncludeTags**(javax.xml.bind.JAXBElement<**StringArray**> value)	Sets the value of the includeTags property.
void	**setIpaddr**(java.lang.String value)	Sets the value of the ipaddr property.
void	**setLookupKey**(java.lang.String value)	Sets the value of the lookupKey property.

void	[**setLookupKeyType**](java.lang.String value)	Sets the value of the lookupKeyType property.
void	[**setScope**](javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the scope property.
void	[**setTenantId**](javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the tenantId property.
void	[**setVpnId**](javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the vpnId property.

Constructor Detail

Reservation

```
public Reservation()
```

Method Detail

getClientClass

```
public javax.xml.bind.JAXBElement<java.lang.String> getClientClass()
```

Gets the value of the clientClass property.

Network Registrar Type: AT_NAMEREF

```
Identifies the client-class to use when selecting from among
 scopes that might contain a specified reservation. Used when
 creating a reservation. This attribute is ignored if the
 reservation is already assigned to a scope.
```

Returns:

possible object is JAXBElement<String>

---

setClientClass

```
public void setClientClass(javax.xml.bind.JAXBElement<java.lang.String> value)
```

Sets the value of the clientClass property.

Parameters:

value - allowed object is JAXBElement<String>

getCmMacAddress

public javax.xml.bind.JAXBElement<java.lang.String> getCmMacAddress()

Gets the value of the cmMacAddress property.

Network Registrar Type: AT_MACADDR

```
Sets the contents of DHCP option-82 (relay-agent-info) remote-id
 (sub-option 2) to be the value of the cable-modem's MAC address.
 When using the CMTS source-verify capability, a DHCPv4 leasequery
 response must contain a valid option-82 with the cable-modem's MAC
 address in the remote-id (sub-option 2).  If you configure the
 cable-modem's MAC address in this attribute, it will be used to create
 the remote-id in a relay-agent-info option whenever there isn't a
 relay-agent-info option available from the lease state database
 reflecting an actual relay-agent-info option sent in by an actual DHCP
 client. This would be the case if the lease was statically allocated.
```

Returns:

possible object is JAXBElement<String>

setCmMacAddress

public void setCmMacAddress(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the cmMacAddress property.

Parameters:

value - allowed object is JAXBElement<String>

getDescription

public javax.xml.bind.JAXBElement<java.lang.String> getDescription()

Gets the value of the description property.

Network Registrar Type: AT_STRING

```
Describes the device that this reservation object represents.
```

Returns:

possible object is JAXBElement<String>

setDescription

public void setDescription(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the description property.

Parameters:

value - allowed object is JAXBElement<String>

getDeviceName

public javax.xml.bind.JAXBElement<java.lang.String> getDeviceName()

Gets the value of the deviceName property.

Network Registrar Type: AT_STRING

```
Displays the name of the device represented by this
```

reservation object.

Returns:

possible object is JAXBElement<String>

---

setDeviceName

public void setDeviceName(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the deviceName property.

Parameters:

value - allowed object is JAXBElement<String>

---

getIncludeTags

public javax.xml.bind.JAXBElement<[StringArray](#)> getIncludeTags()

Gets the value of the includeTags property.

Network Registrar Type: AT_NLIST(AT_STRING)

```
Displays the selection criteria for this reservation.  Used when
 creating a reservation to select the scope (when no scope has been
 specified) or to validate that the correct scope has been specified.
 This attribute is ignored if the reservation is already assigned
 to a scope.
```

Returns:

possible object is JAXBElement<[StringArray](#)>

---

setIncludeTags

public void setIncludeTags(javax.xml.bind.JAXBElement<[StringArray](#)> value)

Sets the value of the includeTags property.

Parameters:

value - allowed object is JAXBElement<[StringArray](#)>

---

getIpaddr

public java.lang.String getIpaddr()

Gets the value of the ipaddr property.

Network Registrar Type: AT_IPADDR
Required. Immutable.

```
Displays an IP address within the network that the scope specifies
 and that contains the reservation.
```

Returns:

possible object is String

---

setIpaddr

public void setIpaddr(java.lang.String value)

Sets the value of the ipaddr property.

Parameters:

value - allowed object is `String`

---

getLookupKey

`public java.lang.String getLookupKey()`

Gets the value of the lookupKey property.

Network Registrar Type: AT_BLOB
Required.

```
Specifies the sequence of bytes that is the key for this reservation
 object. The type for this key is set in the lookup-key-type attribute.
 The string representation of this key is defined by its associated
 lookup-key-type parse and unparse methods. For example, a mac address
 key would be converted from a string to raw form with the
 AT_MACADDR parse() method, and converted from raw form to a string
 by the AT_MACADDR unparse() method.
```

Returns:
possible object is `String`

---

setLookupKey

`public void setLookupKey(java.lang.String value)`

Sets the value of the lookupKey property.

Parameters:
value - allowed object is `String`

---

getLookupKeyType

`public java.lang.String getLookupKeyType()`

Gets the value of the lookupKeyType property.

Network Registrar Type: AT_INT
Required.

```
Specifies the data type for the value in the lookup-key attribute. The
 type may take on the value of 7 for AT_BLOB, 9 for AT_MACADDR, or 46
 for AT_NSTRING.
```

Returns:
possible object is `String`

---

setLookupKeyType

`public void setLookupKeyType(java.lang.String value)`

Sets the value of the lookupKeyType property.

Parameters:
value - allowed object is `String`

---

getScope

`public javax.xml.bind.JAXBElement<java.lang.String> getScope()`

Gets the value of the scope property.

Network Registrar Type: AT_NAMEREF

```
Identifies the scope for this reservation. On local clusters,
 a parent scope must exist and this attribute must always be set.
 On regional clusters, this attribute may be unset, pending
 a push operation to the local cluster.
```

Returns:

possible object is JAXBElement<String>

---

setScope

public void setScope(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the scope property.

Parameters:

value - allowed object is JAXBElement<String>

---

getTenantId

public javax.xml.bind.JAXBElement<java.lang.String> getTenantId()

Gets the value of the tenantId property.

Network Registrar Type: AT_SHORT
Immutable.
Default value: 0

```
Identifies the tenant owner of this object.
```

Returns:

possible object is JAXBElement<String>

---

setTenantId

public void setTenantId(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the tenantId property.

Parameters:

value - allowed object is JAXBElement<String>

---

getVpnId

public javax.xml.bind.JAXBElement<java.lang.String> getVpnId()

Gets the value of the vpnId property.

Network Registrar Type: AT_INT
Immutable.
Default value: 0

```
Displays the identifier of the VPN that contains this reservation.
```

Returns:

possible object is JAXBElement<String>

---

setVpnId

public void setVpnId(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the vpnId property.

Parameters:

value - allowed object is JAXBElement<String>

Package com.cisco.cnr.ws.xsd

Class Reservation6

java.lang.Object
    com.cisco.cnr.ws.xsd.ClassBase
        com.cisco.cnr.ws.xsd.Reservation6

---

public class **Reservation6**
extends ClassBase

The Network Registrar Reservation6 class.

A DHCP lease6 reservation. A reservation is used to assign a given client a specific address.

Java class for Reservation6 complex type.

The following schema fragment specifies the expected content contained within this class.

```
<complexType name="Reservation6">
  <complexContent>
    <extension base="{http://ws.cnr.cisco.com/xsd}ClassBase">

Constructor Detail

Reservation6

```
public Reservation6()
```

Method Detail

getClientClass

```
public javax.xml.bind.JAXBElement<java.lang.String> getClientClass()
```

Gets the value of the clientClass property.

Network Registrar Type: AT_NAMEREF

```
Identifies the client class to use when selecting from among
 scopes that might contain a specified reservation. Used when
 creating a reservation. This attribute is not persistent in
 the database.
```

Returns:

possible object is JAXBElement<String>

---

setClientClass

```
public void setClientClass(javax.xml.bind.JAXBElement<java.lang.String> value)
```

Sets the value of the clientClass property.

Parameters:

value - allowed object is JAXBElement<String>

---

getCmMacAddress

public javax.xml.bind.JAXBElement<java.lang.String> getCmMacAddress()

Gets the value of the cmMacAddress property.

Network Registrar Type: AT_MACADDR

```
Specifies the cable-modem MAC address value to be used in
 generating the CableLabs vendor option (17) with the cm-mac-address
 option (1026) as the leasequery relay data (lq-relay-data) if no
 relay data is otherwise available for the lease (such as for clients
 that do not perform DHCP). This information is critical for clients
 that use a statically configured address when using the CMTS
 source-verify feature.
```

Returns:

possible object is JAXBElement<String>

---

setCmMacAddress

public void setCmMacAddress(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the cmMacAddress property.

Parameters:

value - allowed object is JAXBElement<String>

---

getDescription

public javax.xml.bind.JAXBElement<java.lang.String> getDescription()

Gets the value of the description property.

Network Registrar Type: AT_STRING

```
Describes the device that this reservation object represents.
```

Returns:

possible object is JAXBElement<String>

---

setDescription

public void setDescription(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the description property.

Parameters:

value - allowed object is JAXBElement<String>

---

getDeviceName

public javax.xml.bind.JAXBElement<java.lang.String> getDeviceName()

Gets the value of the deviceName property.

Network Registrar Type: AT_STRING

Displays the name of the device represented by this
 reservation object.

Returns:

possible object is JAXBElement<String>

---

setDeviceName

public void setDeviceName(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the deviceName property.

Parameters:

value - allowed object is JAXBElement<String>

---

getIncludeTags

public javax.xml.bind.JAXBElement<[StringArray](#)> getIncludeTags()

Gets the value of the includeTags property.

Network Registrar Type: AT_NLIST(AT_STRING)

Displays the selection criteria for this reservation. Used when
 creating a reservation to select the scope (when no scope has been
 specified) or to validate that the correct scope has been specified.
 This attribute is not persistent in the database.

Returns:

possible object is JAXBElement<[StringArray](#)>

---

setIncludeTags

public void setIncludeTags(javax.xml.bind.JAXBElement<[StringArray](#)> value)

Sets the value of the includeTags property.

Parameters:

value - allowed object is JAXBElement<[StringArray](#)>

---

getIp6Address

public java.lang.String getIp6Address()

Gets the value of the ip6Address property.

Network Registrar Type: AT_IP6
Required. Immutable.

Specifies the IPv6 address for the reservation.

Returns:

possible object is String

---

setIp6Address

public void setIp6Address(java.lang.String value)

Sets the value of the ip6Address property.

Parameters:

value - allowed object is `String`

---

getLookupKey

`public java.lang.String getLookupKey()`

Gets the value of the lookupKey property.

Network Registrar Type: AT_BLOB
Required.

```
Specifies the sequence of bytes that is the key for this reservation
 object. The type for this key is set in the lookup-key-type attribute.
 The string representation of this key is defined by its associated
 lookup-key-type parse and unparse methods. For example, a blob
 key would be converted from a string of colon-separated hex digits
 to raw form with the AT_BLOB parse() method, and converted from raw
 form to a string by the AT_BLOB unparse() method.
```

Returns:

possible object is `String`

---

setLookupKey

`public void setLookupKey(java.lang.String value)`

Sets the value of the lookupKey property.

Parameters:

value - allowed object is `String`

---

getLookupKeyType

`public java.lang.String getLookupKeyType()`

Gets the value of the lookupKeyType property.

Network Registrar Type: AT_INT
Required.

```
Specifies the data type for the value in the lookup-key attribute.
 The type may take on the value of 7 for AT_BLOB or 46 for AT_NSTRING.
```

Returns:

possible object is `String`

---

setLookupKeyType

`public void setLookupKeyType(java.lang.String value)`

Sets the value of the lookupKeyType property.

Parameters:

value - allowed object is `String`

---

getPrefix

`public javax.xml.bind.JAXBElement<java.lang.String> getPrefix()`

Gets the value of the prefix property.

Network Registrar Type: AT_NAMEREF

```
Identifies the prefix for this reservation.
```

Returns:

possible object is JAXBElement<String>

---

setPrefix

```
public void setPrefix(javax.xml.bind.JAXBElement<java.lang.String> value)
```

Sets the value of the prefix property.

Parameters:

value - allowed object is JAXBElement<String>

---

getTenantId

```
public javax.xml.bind.JAXBElement<java.lang.String> getTenantId()
```

Gets the value of the tenantId property.

Network Registrar Type: AT_SHORT
Immutable.
Default value: 0

```
Identifies the tenant owner of this object.
```

Returns:

possible object is JAXBElement<String>

---

setTenantId

```
public void setTenantId(javax.xml.bind.JAXBElement<java.lang.String> value)
```

Sets the value of the tenantId property.

Parameters:

value - allowed object is JAXBElement<String>

---

getVpnId

```
public javax.xml.bind.JAXBElement<java.lang.String> getVpnId()
```

Gets the value of the vpnId property.

Network Registrar Type: AT_INT
Immutable.
Default value: 0

```
Displays the identifier of the VPN that contains this reservation.
```

Returns:

possible object is JAXBElement<String>

---

setVpnId

```
public void setVpnId(javax.xml.bind.JAXBElement<java.lang.String> value)
```

Sets the value of the vpnId property.

Parameters:

`value` - allowed object is JAXBElement<String>

public ResourceStatus()

Method Detail

getCritical

public javax.xml.bind.JAXBElement<java.lang.String> getCritical()

Gets the value of the critical property.

Network Registrar Type: AT_INT

Count of critical resources.

Returns:
possible object is JAXBElement<String>

---

setCritical

public void setCritical(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the critical property.

Parameters:

value - allowed object is JAXBElement<String>

getOk

public javax.xml.bind.JAXBElement<java.lang.String> getOk()

Gets the value of the ok property.

Network Registrar Type: AT_INT

Count of normal resources.

Returns:

possible object is JAXBElement<String>

setOk

public void setOk(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the ok property.

Parameters:

value - allowed object is JAXBElement<String>

getWarning

public javax.xml.bind.JAXBElement<java.lang.String> getWarning()

Gets the value of the warning property.

Network Registrar Type: AT_INT

Count of resources with warning.

Returns:

possible object is JAXBElement<String>

setWarning

public void setWarning(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the warning property.

Parameters:

<button>All Methods</button> <button>Instance Methods</button> <button>Concrete Methods</button>

Modifier and Type	Method	Description
javax.xml.bind.JAXBElement<java.lang.String>	**getAscendingOrdered**()	Gets the value of the ascendingOrdered property.
javax.xml.bind.JAXBElement<java.lang.String>	**getEventClearMessage**()	Gets the value of the eventClearMessage property.
javax.xml.bind.JAXBElement<java.lang.String>	**getEventReportMessage**()	Gets the value of the eventReportMessage property.
javax.xml.bind.JAXBElement<java.lang.String>	**getEventState**()	Gets the value of the eventState property.
javax.xml.bind.JAXBElement<java.lang.String>	**getEventTimestamp**()	Gets the value of the eventTimestamp property.
javax.xml.bind.JAXBElement<java.lang.String>	**getIntCriticalLevel**()	Gets the value of the intCriticalLevel property.
javax.xml.bind.JAXBElement<java.lang.String>	**getIntDataType**()	Gets the value of the intDataType property.
javax.xml.bind.JAXBElement<java.lang.String>	**getIntWarningLevel**()	Gets the value of the intWarningLevel property.

javax.xml.bind.JAXBElement<java.lang.String>	**getLastEventTime**()	Gets the value of the lastEventTime property.
javax.xml.bind.JAXBElement<java.lang.String>	**getLastIntValue**()	Gets the value of the lastIntValue property.
javax.xml.bind.JAXBElement<java.lang.String>	**getLastResetTime**()	Gets the value of the lastResetTime property.
javax.xml.bind.JAXBElement<java.lang.String>	**getLastUpdatedTime**()	Gets the value of the lastUpdatedTime property.
javax.xml.bind.JAXBElement<java.lang.String>	**getLastValueMessage**()	Gets the value of the lastValueMessage property.
javax.xml.bind.JAXBElement<java.lang.String>	**getLastValueState**()	Gets the value of the lastValueState property.
javax.xml.bind.JAXBElement<java.lang.String>	**getName**()	Gets the value of the name property.
javax.xml.bind.JAXBElement<java.lang.String>	**getPeakIntValue**()	Gets the value of the peakIntValue property.
javax.xml.bind.JAXBElement<java.lang.String>	**getPeakTime**()	Gets the value of the peakTime property.
javax.xml.bind.JAXBElement<java.lang.String>	**getPeakValueMessage**()	Gets the value of the peakValueMessage property.
javax.xml.bind.JAXBElement<java.lang.String>	**getResourceType**()	Gets the value of the resourceType property.
javax.xml.bind.JAXBElement<java.lang.String>	**getServerClass**()	Gets the value of the serverClass property.
javax.xml.bind.JAXBElement<java.lang.String>	**getState**()	Gets the value of the state property.
javax.xml.bind.JAXBElement<java.lang.String>	**getTenantId**()	Gets the value of the tenantId property.
void	**setAscendingOrdered**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the

		ascendingOrdered property.
void	**setEventClearMessage**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the eventClearMessage property.
void	**setEventReportMessage**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the eventReportMessage property.
void	**setEventState**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the eventState property.
void	**setEventTimestamp**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the eventTimestamp property.
void	**setIntCriticalLevel**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the intCriticalLevel property.
void	**setIntDataType**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the intDataType property.
void	**setIntWarningLevel**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the intWarningLevel property.
void	**setLastEventTime**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the lastEventTime property.
void	**setLastIntValue**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the lastIntValue property.
void	**setLastResetTime**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the lastResetTime property.
void	**setLastUpdatedTime**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the lastUpdatedTime property.
void	**setLastValueMessage**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the lastValueMessage property.
void	**setLastValueState**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the lastValueState property.

void	[setName](javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the name property.
void	[setPeakIntValue](javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the peakIntValue property.
void	[setPeakTime](javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the peakTime property.
void	[setPeakValueMessage](javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the peakValueMessage property.
void	[setResourceType](javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the resourceType property.
void	[setServerClass](javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the serverClass property.
void	[setState](javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the state property.
void	[setTenantId](javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the tenantId property.

Constructor Detail

ResourceValue

public ResourceValue()

Method Detail

getAscendingOrdered

public javax.xml.bind.JAXBElement<java.lang.String> getAscendingOrdered()

Gets the value of the ascendingOrdered property.

Network Registrar Type: AT_BOOL
Default value: true

```
Indicates whether this resource is an ascending (true) or descending
 (false) ordered value. An ascending ordered resource is in warning or
 critical state if the last value is greater. A descending ordered
 resource is in warning or critical state if the last value is less
 than the warning or critical value.
```

Returns:

possible object is JAXBElement<String>

setAscendingOrdered

public void setAscendingOrdered(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the ascendingOrdered property.

Parameters:

value - allowed object is JAXBElement<String>

getEventClearMessage

public javax.xml.bind.JAXBElement<java.lang.String> getEventClearMessage()

Gets the value of the eventClearMessage property.

Network Registrar Type: AT_STRING

```
Reports a server event has been cleared.
```

Returns:

possible object is JAXBElement<String>

setEventClearMessage

```
public void setEventClearMessage(javax.xml.bind.JAXBElement<java.lang.String> value)
```

Sets the value of the eventClearMessage property.

Parameters:

value - allowed object is JAXBElement<String>

getEventReportMessage

```
public javax.xml.bind.JAXBElement<java.lang.String> getEventReportMessage()
```

Gets the value of the eventReportMessage property.

Network Registrar Type: AT_STRING

```
Reports a server event has occurred.
```

Returns:

possible object is JAXBElement<String>

setEventReportMessage

```
public void setEventReportMessage(javax.xml.bind.JAXBElement<java.lang.String> value)
```

Sets the value of the eventReportMessage property.

Parameters:

value - allowed object is JAXBElement<String>

getEventState

```
public javax.xml.bind.JAXBElement<java.lang.String> getEventState()
```

Gets the value of the eventState property.

Network Registrar Type: AT_ENUMINT
Default value: clear
Valid values: clear, warning, critical

```
Gives the state of the last event sent.
 Note: Because of rate limiting, this may not match the state of the
 resource.
```

Returns:

possible object is JAXBElement<String>

setEventState

public void setEventState(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the eventState property.

Parameters:
value - allowed object is JAXBElement<String>

getEventTimestamp

public javax.xml.bind.JAXBElement<java.lang.String> getEventTimestamp()

Gets the value of the eventTimestamp property.

Network Registrar Type: AT_DATE

```
Gives the time at which the event was first triggered. This is set
 when the event enters the warning or critical state, and unset when
 the event returns to the cleared state. Subsequent events that
 report only value changes or the clearing of the event will use the
 same time.
```

Returns:
possible object is JAXBElement<String>

setEventTimestamp

public void setEventTimestamp(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the eventTimestamp property.

Parameters:
value - allowed object is JAXBElement<String>

getIntCriticalLevel

public javax.xml.bind.JAXBElement<java.lang.String> getIntCriticalLevel()

Gets the value of the intCriticalLevel property.

Network Registrar Type: AT_INT64

Gives the critical level if it is an integer.

Returns:

possible object is JAXBElement<String>

---

setIntCriticalLevel

public void setIntCriticalLevel(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the intCriticalLevel property.

Parameters:

value - allowed object is JAXBElement<String>

---

getIntDataType

public javax.xml.bind.JAXBElement<java.lang.String> getIntDataType()

Gets the value of the intDataType property.

Network Registrar Type: AT_ATTRTYPE
Default value: AT_INT64

Indicates the attribute type for formatting the integer attribute
 values (last-int-value, peak-int-value, int-warning-level, and
 int-critical-level).

Returns:

possible object is JAXBElement<String>

---

setIntDataType

public void setIntDataType(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the intDataType property.

Parameters:

value - allowed object is JAXBElement<String>

---

getIntWarningLevel

public javax.xml.bind.JAXBElement<java.lang.String> getIntWarningLevel()

Gets the value of the intWarningLevel property.

Network Registrar Type: AT_INT64

```
Gives the warning level if it is an integer.
```

Returns:
possible object is JAXBElement<String>

setIntWarningLevel

public void setIntWarningLevel(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the intWarningLevel property.

Parameters:
value - allowed object is JAXBElement<String>

getLastEventTime

public javax.xml.bind.JAXBElement<java.lang.String> getLastEventTime()

Gets the value of the lastEventTime property.

Network Registrar Type: AT_DATE

```
Gives the time that an event was last generated.
 This is used to rate limit event generation.
```

Returns:
possible object is JAXBElement<String>

setLastEventTime

public void setLastEventTime(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the lastEventTime property.

Parameters:
value - allowed object is JAXBElement<String>

getLastIntValue

public javax.xml.bind.JAXBElement<java.lang.String> getLastIntValue()

Gets the value of the lastIntValue property.

Network Registrar Type: AT_INT64

Gives the most recent value for this resource.

Returns:

possible object is JAXBElement<String>

setLastIntValue

public void setLastIntValue(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the lastIntValue property.

Parameters:

value - allowed object is JAXBElement<String>

getLastResetTime

public javax.xml.bind.JAXBElement<java.lang.String> getLastResetTime()

Gets the value of the lastResetTime property.

Network Registrar Type: AT_DATE

Gives the time at which the resource peak was last reset, if reset.

Returns:

possible object is JAXBElement<String>

setLastResetTime

public void setLastResetTime(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the lastResetTime property.

Parameters:

value - allowed object is JAXBElement<String>

getLastUpdatedTime

public javax.xml.bind.JAXBElement<java.lang.String> getLastUpdatedTime()

Gets the value of the lastUpdatedTime property.

Network Registrar Type: AT_DATE

Gives the time at which the resource was last read or updated.

Returns:
possible object is JAXBElement<String>

setLastUpdatedTime

public void setLastUpdatedTime(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the lastUpdatedTime property.

Parameters:
value - allowed object is JAXBElement<String>

getLastValueMessage

public javax.xml.bind.JAXBElement<java.lang.String> getLastValueMessage()

Gets the value of the lastValueMessage property.

Network Registrar Type: AT_STRING

```
Gives the last reported value as a text string. If the
 value exceeds the critical level, that is indicated as
 the threshold-level. Otherwise the warning level is shown.
 This will be formatted as:
    above
 or:
    below
 Note that the values may not be an integer, may include commas
 every 3 decimal places, and may be followed by units.
```

Returns:
possible object is JAXBElement<String>

setLastValueMessage

```
public void setLastValueMessage(javax.xml.bind.JAXBElement<java.lang.String> value)
```

Sets the value of the lastValueMessage property.

Parameters:

value - allowed object is JAXBElement<String>

---

getLastValueState

```
public javax.xml.bind.JAXBElement<java.lang.String> getLastValueState()
```

Gets the value of the lastValueState property.

Network Registrar Type: AT_ENUMINT
Valid values: OK, Warning, Critical

```
Gives the state of the resource based on the last value:
   OK
     The resource is below (or above) the warning and critical levels.
   Warning
     The resource is above (or below) the warning level, but not above
     (or below) the critical level.
   Critical
     The resource is above (or below) the critical level.
 Note that some resources are monitored for above the configured levels
 (i.e., memory used and counts), while others are monitored for below
 the configured levels (i.e., free disk space).
```

Returns:

possible object is JAXBElement<String>

---

setLastValueState

```
public void setLastValueState(javax.xml.bind.JAXBElement<java.lang.String> value)
```

Sets the value of the lastValueState property.

Parameters:

value - allowed object is JAXBElement<String>

---

getName

```
public javax.xml.bind.JAXBElement<java.lang.String> getName()
```

Gets the value of the name property.

Network Registrar Type: AT_STRING
Unique. Immutable.

```
Gives the name of the resource being monitored. This name should
 correspond to the ResourceMonitor object's resource name (minus the
 "-warning-level" and "-critical-level" suffix).
```

Returns:
possible object is JAXBElement<String>

setName

public void setName(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the name property.

Parameters:
value - allowed object is JAXBElement<String>

getPeakIntValue

public javax.xml.bind.JAXBElement<java.lang.String> getPeakIntValue()

Gets the value of the peakIntValue property.

Network Registrar Type: AT_INT64

```
Gives the peak value for this resource.
```

Returns:
possible object is JAXBElement<String>

setPeakIntValue

public void setPeakIntValue(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the peakIntValue property.

Parameters:
value - allowed object is JAXBElement<String>

getPeakTime

public javax.xml.bind.JAXBElement<java.lang.String> getPeakTime()

Gets the value of the peakTime property.

Network Registrar Type: AT_DATE

```
Gives the time at which the resource the peak value was last updated.
```

Returns:

possible object is JAXBElement<String>

setPeakTime

public void setPeakTime(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the peakTime property.

Parameters:

value - allowed object is JAXBElement<String>

getPeakValueMessage

public javax.xml.bind.JAXBElement<java.lang.String> getPeakValueMessage()

Gets the value of the peakValueMessage property.

Network Registrar Type: AT_STRING

```
Gives the peak reported value as a text string. If the
 value exceeds the critical level, that is indicated as
 the threshold-level. Otherwise the warning level is shown.
 This will be formatted as:
    max above
 or:
    min below
 Note that the values may not be an integer, may include commas every
  3 decimal places, and may be followed by units.
```

Returns:

possible object is JAXBElement<String>

setPeakValueMessage

```
public void setPeakValueMessage(javax.xml.bind.JAXBElement<java.lang.String> value)
```

Sets the value of the peakValueMessage property.

Parameters:

value - allowed object is JAXBElement<String>

---

getResourceType

```
public javax.xml.bind.JAXBElement<java.lang.String> getResourceType()
```

Gets the value of the resourceType property.

Network Registrar Type: AT_ENUMINT
Default value: Config
Valid values: Config, Event

```
Identifies the resource type for this resource value.
    Config - Reported values are defined by the ResourceMonitor class.
    Event - Reported values are defined by server events.
```

Returns:

possible object is JAXBElement<String>

---

setResourceType

```
public void setResourceType(javax.xml.bind.JAXBElement<java.lang.String> value)
```

Sets the value of the resourceType property.

Parameters:

value - allowed object is JAXBElement<String>

---

getServerClass

```
public javax.xml.bind.JAXBElement<java.lang.String> getServerClass()
```

Gets the value of the serverClass property.

Network Registrar Type: AT_INT
Default value: 1451

```
Gives the class-id of the server for the resource. This should reflect
 the server used for licensing.
 For resources unrelated to a specific licensed server, this should be
```

the CCMServerConfig class-id (1451).

Returns:

possible object is JAXBElement<String>

---

setServerClass

public void setServerClass(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the serverClass property.

Parameters:

value - allowed object is JAXBElement<String>

---

getState

public javax.xml.bind.JAXBElement<java.lang.String> getState()

Gets the value of the state property.

Network Registrar Type: AT_ENUMINT
Valid values: OK, Warning, Critical

```
Gives the state of the resource:
   OK
     The resource has been below (or above) the warning and critical
     levels since the resource was last reset or began to be monitored.
   Warning
     The resource has been above (or below) the warning level, but not
     above (or below) the critical level, since the resource was last
     reset or began to be monitored.
   Critical
     The resource has been above (or below) the critical level since
     the resource was last reset or began to be monitored.
 Note that some resources are monitored for above the configured levels
 (i.e., memory used and counts), while others are monitored for below
 the configured levels (i.e., free disk space).
```

Returns:

possible object is JAXBElement<String>

---

setState

public void setState(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the state property.

Parameters:

value - allowed object is JAXBElement<String>

getTenantId

```
public javax.xml.bind.JAXBElement<java.lang.String> getTenantId()
```

Gets the value of the tenantId property.

Network Registrar Type: AT_SHORT
Immutable.
Default value: 0

```
Identifies the tenant owner of this object.
```

Returns:

possible object is JAXBElement<String>

setTenantId

```
public void setTenantId(javax.xml.bind.JAXBElement<java.lang.String> value)
```

Sets the value of the tenantId property.

Parameters:

value - allowed object is JAXBElement<String>

Package com.cisco.cnr.ws.xsd

Class ResourceValueArray

java.lang.Object
    com.cisco.cnr.ws.xsd.ClassBaseArray
        com.cisco.cnr.ws.xsd.ResourceValueArray

Class Scope

java.lang.Object
    com.cisco.cnr.ws.xsd.ClassBase
       com.cisco.cnr.ws.xsd.Scope

---

public class **Scope**
extends ClassBase

The Network Registrar Scope class.

A DHCP Scope object. A scope defines a set of dynamic address pools on a subnet that share its configuration attributes. A scope can also contain reserved addresses on the specified subnet that should use the configuration.

Java class for Scope complex type.

The following schema fragment specifies the expected content contained within this class.

```
<complexType name="Scope">
  <complexContent>
    <extension base="{http://ws.cnr.cisco.com/xsd}ClassBase">

Method Summary

All Methods	Instance Methods	Concrete Methods

Modifier and Type	Method	Description
javax.xml.bind.JAXBElement<java.lang.String>	**getAllocateFirstAvailable**()	Gets the value of the allocateFirstAvailable property.
javax.xml.bind.JAXBElement<java.lang.String>	**getAllocationPriority**()	Gets the value of the allocationPriority property.
javax.xml.bind.JAXBElement<java.lang.String>	**getBackupPct**()	Gets the value of the backupPct property.
javax.xml.bind.JAXBElement<java.lang.String>	**getBootp**()	Gets the value of the bootp property.
javax.xml.bind.JAXBElement<java.lang.String>	**getDeactivated**()	Gets the value of the deactivated property.
javax.xml.bind.JAXBElement<java.lang.String>	**getDescription**()	Gets the value of the description property.
javax.xml.bind.JAXBElement<java.lang.String>	**getDhcp**()	Gets the value of the dhcp property.
javax.xml.bind.JAXBElement<java.lang.String>	**getDnsHostBytes**()	Gets the value of the dnsHostBytes property.
javax.xml.bind.JAXBElement<java.lang.String>	**getDynamicBootp**()	Gets the value of the dynamicBootp property.
javax.xml.bind.JAXBElement<**Policy**>	**getEmbeddedPolicy**()	Gets the value of the embeddedPolicy property.
javax.xml.bind.JAXBElement<java.lang.String>	**getFailoverBackupAllocationBoundary**()	Gets the value of the failoverBackupAllocationBoundary property.
javax.xml.bind.JAXBElement<java.lang.String>	**getFreeAddressConfig**()	Gets the value of the freeAddressConfig property.
javax.xml.bind.JAXBElement<java.lang.String>	**getIgnoreDeclines**()	Gets the value of the ignoreDeclines property.
javax.xml.bind.JAXBElement<java.lang.String>	**getMaintenance**()	Gets the value of the maintenance property.

java.lang.String	**getName**()	Gets the value of the name property.
javax.xml.bind.JAXBElement<java.lang.String>	**getPingClients**()	Gets the value of the pingClients property.
javax.xml.bind.JAXBElement<java.lang.String>	**getPingTimeout**()	Gets the value of the pingTimeout property.
javax.xml.bind.JAXBElement<java.lang.String>	**getPolicy**()	Gets the value of the policy property.
javax.xml.bind.JAXBElement<java.lang.String>	**getPrimarySubnet**()	Gets the value of the primarySubnet property.
javax.xml.bind.JAXBElement<**RangeArray**>	**getRangeList**()	Gets the value of the rangeList property.
javax.xml.bind.JAXBElement<java.lang.String>	**getRenewOnly**()	Gets the value of the renewOnly property.
javax.xml.bind.JAXBElement<java.lang.String>	**getRestrictToAdminAllocation**()	Gets the value of the restrictToAdminAllocation property.
javax.xml.bind.JAXBElement<java.lang.String>	**getRestrictToReservations**()	Gets the value of the restrictToReservations property.
javax.xml.bind.JAXBElement<**StringArray**>	**getSelectionTagList**()	Gets the value of the selectionTagList property.
java.lang.String	**getSubnet**()	Gets the value of the subnet property.
javax.xml.bind.JAXBElement<java.lang.String>	**getTenantId**()	Gets the value of the tenantId property.
javax.xml.bind.JAXBElement<java.lang.String>	**getVpnId**()	Gets the value of the vpnId property.
void	**setAllocateFirstAvailable**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the allocateFirstAvailable property.
void	**setAllocationPriority**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the allocationPriority property.
void	**setBackupPct**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the backupPct property.
void	**setBootp**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the bootp property.
void	**setDeactivated**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the deactivated property.
void	**setDescription**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the description property.
void	**setDhcp**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the dhcp property.
void	**setDnsHostBytes**(javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the dnsHostBytes property.

void	[setDynamicBootp](javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the dynamicBootp property.
void	[setEmbeddedPolicy](javax.xml.bind.JAXBElement<[Policy]> value)	Sets the value of the embeddedPolicy property.
void	[setFailoverBackupAllocationBoundary](javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the failoverBackupAllocationBoundary property.
void	[setFreeAddressConfig](javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the freeAddressConfig property.
void	[setIgnoreDeclines](javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the ignoreDeclines property.
void	[setMaintenance](javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the maintenance property.
void	[setName](java.lang.String value)	Sets the value of the name property.
void	[setPingClients](javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the pingClients property.
void	[setPingTimeout](javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the pingTimeout property.
void	[setPolicy](javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the policy property.
void	[setPrimarySubnet](javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the primarySubnet property.
void	[setRangeList](javax.xml.bind.JAXBElement<[RangeArray]> value)	Sets the value of the rangeList property.
void	[setRenewOnly](javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the renewOnly property.
void	[setRestrictToAdminAllocation](javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the restrictToAdminAllocation property.
void	[setRestrictToReservations](javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the restrictToReservations property.
void	[setSelectionTagList](javax.xml.bind.JAXBElement<[StringArray]> value)	Sets the value of the selectionTagList property.
void	[setSubnet](java.lang.String value)	Sets the value of the subnet property.
void	[setTenantId](javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the tenantId property.
void	[setVpnId](javax.xml.bind.JAXBElement<java.lang.String> value)	Sets the value of the vpnId property.

Methods inherited from class com.cisco.cnr.ws.xsd.[ClassBase]

[getObjectOid], [setObjectOid]

Constructor Detail

Scope

public Scope()

Method Detail

getAllocateFirstAvailable

public javax.xml.bind.JAXBElement<java.lang.String> getAllocateFirstAvailable()

Gets the value of the allocateFirstAvailable property.

Network Registrar Type: AT_BOOL
Default value: false

```
Enables you to force the allocation of new IP addresses
 from this scope to be the first available IP address;
 otherwise, the default of the 'least recently used' IP address is
 used.
 If this attribute is not set, or is unset, then the DHCP server
 attribute priority-address-allocation controls whether
 to allocate the first available IP address.
 If priority-address-allocation is set, and allocate-first-available
 for the scope is unset, then the scope allocates addresses as if
 allocate-first-available was set.
 If allocate-first-available is enabled or disabled for a scope, then
 for that scope the setting of priority-address-allocation has no
 meaning.
```

Returns:
possible object is JAXBElement<String>

setAllocateFirstAvailable

public void setAllocateFirstAvailable(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the allocateFirstAvailable property.

Parameters:
value - allowed object is JAXBElement<String>

getAllocationPriority

```
public javax.xml.bind.JAXBElement<java.lang.String> getAllocationPriority()
```

Gets the value of the allocationPriority property.

Network Registrar Type: AT_INT
Default value: 0

```
Assigns an order to scopes for allocating IP addresses. Acceptable
 scopes, with the highest allocation priority, grant IP addresses
 until the addresses are exhausted.
 You can mix scopes with an allocation-priority along with those
 without a priority in the same network.  In this case, scopes with
 allocation priorities are examined for acceptability before those
 scopes with no allocation-priority. Lower numeric values have
 higher priorities, but an allocation-priority of 0 (the default) has
 no priority.
 If this attribute is not set, or is unset or 0, then the
 DHCP priority-address-allocation attribute controls the priority
 of the scope. If the DHCP priority-address-allocation attribute is
 set, and allocation-priority for the scope is unset, then the
 allocation-priority for the scope is the network number of the
 scope.
 If you explicitly set allocation-priority, then, for that scope,
 the DHCP setting of priority-address-allocation has no meaning.
```

Returns:
possible object is JAXBElement<String>

setAllocationPriority

```
public void setAllocationPriority(javax.xml.bind.JAXBElement<java.lang.String> value)
```

Sets the value of the allocationPriority property.

Parameters:
value - allowed object is JAXBElement<String>

getBackupPct

```
public javax.xml.bind.JAXBElement<java.lang.String> getBackupPct()
```

Gets the value of the backupPct property.

Network Registrar Type: AT_PERCENT

```
Determines the percentage of available addresses that the main server
 sends to the backup server. If you define this value using the
 scope command, make sure you define it on the main server. If you
 define it on a backup server, it is ignored.
 Used with the scope command, the backup-pct attribute overrides
 the defined values on the failover pair for backup-pct and
 dynamic-bootp-backup-pct. The attribute value defined with the scope
```

command becomes the value used for this scope, whether or not this
scope supports dynamic-bootp.
If you set the value to zero (0), the backup server receives no
addresses. Since 0 is a significant value, once you set this value,
you must unset it for the scope to use the failover pair's values for
backup-pct or dynamic-bootp-backup-pct.
Note: If the failover pair is configured to use load balancing, the
backup-pct is ignored and 50% is used.

Returns:

possible object is JAXBElement<String>

---

setBackupPct

public void setBackupPct(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the backupPct property.

Parameters:

value - allowed object is JAXBElement<String>

---

getBootp

public javax.xml.bind.JAXBElement<java.lang.String> getBootp()

Gets the value of the bootp property.

Network Registrar Type: AT_BOOL
Default value: disabled

Controls whether the server accepts BOOTP requests. If you want
 clients to always receive the same addresses, you must reserve
 IP addresses for all your BOOTP clients.

Returns:

possible object is JAXBElement<String>

---

setBootp

public void setBootp(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the bootp property.

Parameters:

value - allowed object is JAXBElement<String>

---

getDeactivated

public javax.xml.bind.JAXBElement<java.lang.String> getDeactivated()

Gets the value of the deactivated property.

Network Registrar Type: AT_BOOL

Controls whether a scope extends leases to any clients. A deactivated
 scope does not extend leases to any clients. It treats all addresses
 in its ranges as if they were individually deactivated.

Returns:

possible object is JAXBElement<String>

setDeactivated

public void setDeactivated(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the deactivated property.

Parameters:

value - allowed object is JAXBElement<String>

getDescription

public javax.xml.bind.JAXBElement<java.lang.String> getDescription()

Gets the value of the description property.

Network Registrar Type: AT_STRING

Describes the scope.

Returns:

possible object is JAXBElement<String>

setDescription

public void setDescription(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the description property.

Parameters:

value - allowed object is JAXBElement<String>

getDhcp

public javax.xml.bind.JAXBElement<java.lang.String> getDhcp()

Gets the value of the dhcp property.

Network Registrar Type: AT_BOOL
Default value: enabled

Controls whether the DHCP server accepts DHCP requests for this
 scope. Disable DHCP if you want a scope to use BOOTP exclusively
 or you want to deactivate the scope temporarily.

Returns:

possible object is JAXBElement<String>

---

setDhcp

public void setDhcp(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the dhcp property.

Parameters:

value - allowed object is JAXBElement<String>

---

getDnsHostBytes

public javax.xml.bind.JAXBElement<java.lang.String> getDnsHostBytes()

Gets the value of the dnsHostBytes property.

Network Registrar Type: AT_RANGEINT
Valid values: 1 - 4

Tells DHCP how many bytes in a lease IP address to use when forming
 in-addr.arpa names. The server forms names in the in-addr zone by
 prepending dns-host-bytes of IP address (in reverse order) to the
 reverse zone name. If unset, the server synthesizes an appropriate
 value based on the scope's subnet size.

Returns:

possible object is JAXBElement<String>

---

setDnsHostBytes

public void setDnsHostBytes(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the dnsHostBytes property.

Parameters:

value - allowed object is JAXBElement<String>

---

getDynamicBootp

public javax.xml.bind.JAXBElement<java.lang.String> getDynamicBootp()

Gets the value of the dynamicBootp property.

Network Registrar Type: AT_BOOL
Default value: disabled

Controls whether the server will accept dynamic BOOTP
 requests for this scope. Dynamic BOOTP requests are BOOTP requests
 that do not match a reservation, but could be satisfied from the

available lease pool. To use this feature you must also enable
bootp.

Returns:

possible object is JAXBElement<String>

setDynamicBootp

public void setDynamicBootp(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the dynamicBootp property.

Parameters:

value - allowed object is JAXBElement<String>

getEmbeddedPolicy

public javax.xml.bind.JAXBElement<Policy> getEmbeddedPolicy()

Gets the value of the embeddedPolicy property.

Network Registrar Type: AT_OBJ(Policy)

Displays the embedded policy for a scope.

Returns:

possible object is JAXBElement<Policy>

setEmbeddedPolicy

public void setEmbeddedPolicy(javax.xml.bind.JAXBElement<Policy> value)

Sets the value of the embeddedPolicy property.

Parameters:

value - allowed object is JAXBElement<Policy>

getFailoverBackupAllocationBoundary

public javax.xml.bind.JAXBElement<java.lang.String> getFailoverBackupAllocationBoundary()

Gets the value of the failoverBackupAllocationBoundary property.

Network Registrar Type: AT_IPADDR

Sets the IP address allocation boundary for a backup server in a
 failover relationship.
 If the allocate-first-available attribute is set, the backup
 server allocates IP addresses in descending order from this
 boundary.
 If the allocate-first available attribute is unset or set to 0,
 the boundary used for allocating addresses is half the

distance between the first and last IP address configured in the
ranges for this scope. If no IP addresses are available
below this boundary, the first IP address available above this
boundary is used.

Returns:

possible object is JAXBElement<String>

---

setFailoverBackupAllocationBoundary

public void setFailoverBackupAllocationBoundary(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the failoverBackupAllocationBoundary property.

Parameters:

value - allowed object is JAXBElement<String>

---

getFreeAddressConfig

public javax.xml.bind.JAXBElement<java.lang.String> getFreeAddressConfig()

Gets the value of the freeAddressConfig property.

Network Registrar Type: AT_NAMEREF

Identifies which trap captures unexpected free address events
 on this scope.

Returns:

possible object is JAXBElement<String>

---

setFreeAddressConfig

public void setFreeAddressConfig(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the freeAddressConfig property.

Parameters:

value - allowed object is JAXBElement<String>

---

getIgnoreDeclines

public javax.xml.bind.JAXBElement<java.lang.String> getIgnoreDeclines()

Gets the value of the ignoreDeclines property.

Network Registrar Type: AT_BOOL
Default value: false

Determines whether the server reacts to server DHCPDECLINE
 messages that refer to one of the scope's IP addresses.
 If enabled (true), the DHCP server ignores all declines that

refer to an IP address in this scope. If disabled, the DHCP server
sets to UNAVAILABLE every IP address referred to in this scope.
Default is false (disabled).

Returns:

possible object is JAXBElement<String>

setIgnoreDeclines

public void setIgnoreDeclines(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the ignoreDeclines property.

Parameters:

value - allowed object is JAXBElement<String>

getMaintenance

public javax.xml.bind.JAXBElement<java.lang.String> getMaintenance()

Gets the value of the maintenance property.

Network Registrar Type: AT_BOOL
Default value: disabled

If this attribute is enabled, this Scope and any other Scopes
on the same Link (Network) will participate in the current maintenance
window. DHCP clients will have their renewal times adjusted to
avoid renewals during the maintenance window. In addition, they
will be directed to renew during the renewal-period after the end
of the maintenance window.

Returns:

possible object is JAXBElement<String>

setMaintenance

public void setMaintenance(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the maintenance property.

Parameters:

value - allowed object is JAXBElement<String>

getName

public java.lang.String getName()

Gets the value of the name property.

Network Registrar Type: AT_STRING
Required. Unique.

The name of the scope object.

Returns:

possible object is String

---

setName

public void setName(java.lang.String value)

Sets the value of the name property.

Parameters:

value - allowed object is String

---

getPingClients

public javax.xml.bind.JAXBElement<java.lang.String> getPingClients()

Gets the value of the pingClients property.

Network Registrar Type: AT_BOOL

```
If this attribute is not set, or is unset, then the DHCP server
 attribute ping-clients controls whether the server should attempt
 to ping an address before offering a lease. If enabled (true),
 this attribute also indicates a ping timeout.
 if ping-clients is set and ping-clients for the scope is unset,
 then the server pings an address as if it was set in the scope.
 If ping-clients is enabled or disabled for a scope, then
 for that scope the setting of ping-clients at the server level has
 no meaning.
 If not specified for the scope, the DHCP server's 'ping-clients'
 is used as the default.
```

Returns:

possible object is JAXBElement<String>

---

setPingClients

public void setPingClients(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the pingClients property.

Parameters:

value - allowed object is JAXBElement<String>

---

getPingTimeout

public javax.xml.bind.JAXBElement<java.lang.String> getPingTimeout()

Gets the value of the pingTimeout property.

Network Registrar Type: AT_INT

```
Sets the number of milliseconds the DHCP server waits for ping
 responses. If you make this value too large, you slow down
 the lease offering processes. If you make this value too small,
 you reduce the effectiveness of pinging addresses before
 offering them. 300 milliseconds (the default value) is often the
 best choice.
 Only used if 'ping-clients' is enabled either for this scope or for
 the DHCP server.
 If not specified for the scope, the DHCP server's 'ping-timeout'
 is used as the default.
```

Returns:

possible object is JAXBElement<String>

---

setPingTimeout

```
public void setPingTimeout(javax.xml.bind.JAXBElement<java.lang.String> value)
```

Sets the value of the pingTimeout property.

Parameters:

value - allowed object is JAXBElement<String>

---

getPolicy

```
public javax.xml.bind.JAXBElement<java.lang.String> getPolicy()
```

Gets the value of the policy property.

Network Registrar Type: AT_NAMEREF
Default value: default

```
Identifies the name of the policy associated with this scope. Default
 is the default policy.  This means that the scope uses all the
 properties set in the default policy (including the lease time),
 unless you specifically reset a property.
```

Returns:

possible object is JAXBElement<String>

---

setPolicy

```
public void setPolicy(javax.xml.bind.JAXBElement<java.lang.String> value)
```

Sets the value of the policy property.

Parameters:

value - allowed object is JAXBElement<String>

getPrimarySubnet

`public javax.xml.bind.JAXBElement<java.lang.String> getPrimarySubnet()`

Gets the value of the primarySubnet property.

Network Registrar Type: AT_SUBNET

```
Determines the subnet address and mask of the primary scope.
 Use this attribute when multiple logical IP subnets are present
 on the same physical network.
```

Returns:

possible object is JAXBElement<String>

setPrimarySubnet

`public void setPrimarySubnet(javax.xml.bind.JAXBElement<java.lang.String> value)`

Sets the value of the primarySubnet property.

Parameters:

value - allowed object is JAXBElement<String>

getRangeList

`public javax.xml.bind.JAXBElement<RangeArray> getRangeList()`

Gets the value of the rangeList property.

Network Registrar Type: AT_NLIST(AT_OBJ(Range))

```
The ranges that are part of this Scope.
```

Returns:

possible object is JAXBElement<RangeArray>

setRangeList

`public void setRangeList(javax.xml.bind.JAXBElement<RangeArray> value)`

Sets the value of the rangeList property.

Parameters:

value - allowed object is JAXBElement<RangeArray>

getRenewOnly

`public javax.xml.bind.JAXBElement<java.lang.String> getRenewOnly()`

Gets the value of the renewOnly property.

Network Registrar Type: AT_BOOL

```
Controls whether to allow existing clients to reacquire their
 leases, but not offer any leases to new clients.  Note that a
 renew-only scope does not change the client associated with any
 of its leases (other than to allow a client, currently using what
 the server believes is an available IP address, to continue using
 the address).
```

Returns:

possible object is JAXBElement<String>

---

setRenewOnly

public void setRenewOnly(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the renewOnly property.

Parameters:

value - allowed object is JAXBElement<String>

---

getRestrictToAdminAllocation

public javax.xml.bind.JAXBElement<java.lang.String> getRestrictToAdminAllocation()

Gets the value of the restrictToAdminAllocation property.

Network Registrar Type: AT_BOOL
Default value: disabled

```
Controls whether the scope is restricted to administrative requests
 to allocate the next available address. If set, the server will
 only respond to a client with an address from this scope if it
 has been pre-allocated to the client.
```

Returns:

possible object is JAXBElement<String>

---

setRestrictToAdminAllocation

public void setRestrictToAdminAllocation(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the restrictToAdminAllocation property.

Parameters:

value - allowed object is JAXBElement<String>

---

getRestrictToReservations

public javax.xml.bind.JAXBElement<java.lang.String> getRestrictToReservations()

Gets the value of the restrictToReservations property.

Network Registrar Type: AT_BOOL
Default value: disabled

Controls whether the scope is restricted to client (or lease)
 reservations. If enabled, the DHCP server will not
 automatically assign addresses to clients but instead
 requires the address to be supplied by a reservation, either
 a lease reservation or a client reservation, which is
 specified via a client entry or through an extension and the
 environment dictionary.

Returns:

possible object is JAXBElement<String>

---

setRestrictToReservations

public void setRestrictToReservations(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the restrictToReservations property.

Parameters:

value - allowed object is JAXBElement<String>

---

getSelectionTagList

public javax.xml.bind.JAXBElement<StringArray> getSelectionTagList()

Gets the value of the selectionTagList property.

Network Registrar Type: AT_NLIST(AT_STRING)

Associates a comma-separated list of selection tags with a
 scope. The scope compares a client's selection criteria to this
 list in order to determine whether the client can obtain a lease
 from the scope.

Returns:

possible object is JAXBElement<StringArray>

---

setSelectionTagList

public void setSelectionTagList(javax.xml.bind.JAXBElement<StringArray> value)

Sets the value of the selectionTagList property.

Parameters:

value - allowed object is JAXBElement<StringArray>

---

getSubnet

public java.lang.String getSubnet()

Gets the value of the subnet property.

Network Registrar Type: AT_SUBNET
Required.

The network address of the IP subnet that this scope represents.

Returns:
possible object is `String`

---

setSubnet

`public void setSubnet(java.lang.String value)`

Sets the value of the subnet property.

Parameters:
value - allowed object is `String`

---

getTenantId

`public javax.xml.bind.JAXBElement<java.lang.String> getTenantId()`

Gets the value of the tenantId property.

Network Registrar Type: AT_SHORT
Immutable.
Default value: 0

Identifies the tenant owner of this object.

Returns:
possible object is `JAXBElement<String>`

---

setTenantId

`public void setTenantId(javax.xml.bind.JAXBElement<java.lang.String> value)`

Sets the value of the tenantId property.

Parameters:
value - allowed object is `JAXBElement<String>`

---

getVpnId

`public javax.xml.bind.JAXBElement<java.lang.String> getVpnId()`

Gets the value of the vpnId property.

Network Registrar Type: AT_INT
Immutable.

Default value: 0

Displays the identifier of the DHCP VPN that contains the addresses
 in this scope. Define this value with the vpn vpn-name create id
 command. Once set, you cannot change this value.

Returns:

possible object is JAXBElement<String>

---

setVpnId

public void setVpnId(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the vpnId property.

Parameters:

value - allowed object is JAXBElement<String>

Package com.cisco.cnr.ws.xsd

Class ScopeArray

java.lang.Object
    com.cisco.cnr.ws.xsd.ClassBaseArray
        com.cisco.cnr.ws.xsd.ScopeArray

---

public class **ScopeArray**
extends ClassBaseArray

Java class for ScopeArray complex type.

The following schema fragment specifies the expected content contained within this class.

```
<complexType name="ScopeArray">
  <complexContent>
    <extension base="{http://ws.cnr.cisco.com/xsd}ClassBaseArray">
    </extension>

Class ScpAndJavaConverter

java.lang.Object
    com.cisco.cnr.ws.xsd.ScpAndJavaConverter

```
public class ScpAndJavaConverter
extends java.lang.Object
```

Implements a utility class that facilitates conversion between Network Registrar generic objects in ScpObj form for use with the Network Registar Java SDK and XML-based Java classes for web services. The Network Registar SDK library must be initialized by calling ScpLib.init() before this class can be used.

Example 1: Convert an ScpObj to a Java class instance.

```
 ScpObj scpObject = getAnScpObj(...);
 Object javaWebClass = ScpAndJavaConverter.toJava(scpObject);
```

Example 2: Convert a Java class instance to an ScpObj.
```
 DNSServer javaDnsServer = getADnsServer(...);
 ScpObj scpObject = ScpAndJavaConverter.toScpObj(javaDnsServer);
```

Constructor Detail

ScpAndJavaConverter

public ScpAndJavaConverter()

Method Detail

camelName

public static java.lang.String camelName(java.lang.String inName)

deCamelName

public static java.lang.String deCamelName(java.lang.String inName)

getAttrName

public static java.lang.String getAttrName(java.lang.String className, java.lang.String attrName)

getScpAttrName

```
public static java.lang.String getScpAttrName(java.lang.String className,
java.lang.String camelName)
```

toScpList

```
public static com.cisco.cnr.sdk.ScpList toScpList(java.lang.Object inObject,
com.cisco.cnr.sdk.ScpAttrType inAttrType) throws java.lang.Exception
```

Convert an XML Java web services instance to an ScpObj.

Parameters:

inObject - java class to convert

Returns:

an ScpObj that corresponds to the input object

Throws:

java.lang.Exception

toScpObj

```
public static com.cisco.cnr.sdk.ScpObj toScpObj(java.lang.Object inObject) throws
java.lang.Exception
```

Convert an XML Java web services instance to an ScpObj.

Parameters:

inObject - java class to convert

Returns:

an ScpObj that corresponds to the input object

Throws:

java.lang.Exception

toScpObj

```
public static com.cisco.cnr.sdk.ScpObj toScpObj(java.lang.Object inObject,
com.cisco.cnr.sdk.dhcp.OptionDefinitionFactory odFactory, java.lang.String parent) throws
java.lang.Exception
```

Throws:

java.lang.Exception

toJava

```
public static java.lang.Object toJava(com.cisco.cnr.sdk.ScpList inScpList) throws
java.lang.Exception
```

Converts an ScpList to an XML Java Array object.

Parameters:

inScpList - ScpList instance to convert

Returns:

a Java class instance that corresponds to the input

Throws:

java.lang.Exception

---

scpToJava

```
public static java.lang.Object scpToJava(com.cisco.cnr.sdk.ScpList inScpList) throws
java.lang.Exception
```

Converts an ScpList to an XML Java array object without wrapping the result in a JAXBElement

Parameters:

inScpList - the original ScpList object to convert

Returns:

the base Java array object

Throws:

java.lang.Exception

---

toJava

```
public static java.lang.Object toJava(com.cisco.cnr.sdk.ScpObj inScpObj) throws
java.lang.Exception
```

Convert an ScpObj to an XML Java object.

Parameters:

inScpObj - ScpObj instance to convert

Returns:

a Java class instance that corresponds to the input

Throws:

java.lang.Exception

---

toJava

```
public static java.lang.Object toJava(com.cisco.cnr.sdk.ScpObj inScpObj,
com.cisco.cnr.sdk.dhcp.OptionDefinitionFactory odFactory) throws java.lang.Exception
```

Throws:

java.lang.Exception

scpToJava

public static java.lang.Object scpToJava(com.cisco.cnr.sdk.ScpObj inScpObj) throws
java.lang.Exception

Converts an ScpObj to an XML Java object without wrapping the result in a JAXBElement

Parameters:

inScpObj - the original ScpObj object to convert

Returns:

the base Java object

Throws:

java.lang.Exception

scpToJava

public static java.lang.Object scpToJava(com.cisco.cnr.sdk.ScpObj inScpObj,
com.cisco.cnr.sdk.dhcp.OptionDefinitionFactory odFactory, java.lang.String parent) throws
java.lang.Exception

Throws:

java.lang.Exception

getClassCreateMethod

public static java.lang.reflect.Method getClassCreateMethod(java.lang.String inClassName)
throws java.lang.Exception

Gets the ObjectFactory create method for this SCP class name

Parameters:

inClassName - name of the class to create

Returns:

Method

Throws:

java.lang.Exception

removeUnsetAttr

public static void removeUnsetAttr(com.cisco.cnr.sdk.ScpObj ioFrom,

```
com.cisco.cnr.sdk.ScpObj inThese) throws java.lang.Exception
```

Remove from an ScpObj any attribute that is unset in another ScpObj, unless it is required.

Parameters:

`ioFrom` - ScpObj to modify

`inThese` - template ScpObj with unset attributes to match

Throws:

`java.lang.Exception`

Package com.cisco.cnr.ws.xsd

Class ServerSystemStats

java.lang.Object
    com.cisco.cnr.ws.xsd.ClassBase
        com.cisco.cnr.ws.xsd.ServerSystemStats

```
public class ServerSystemStats
extends ClassBase
```

The Network Registrar ServerSystemStats class.

Provides information about the system resources used by one Network Registrar server.

Java class for ServerSystemStats complex type.

The following schema fragment specifies the expected content contained within this class.

```
 <complexType name="ServerSystemStats">
   <complexContent>
     <extension base="{http://ws.cnr.cisco.com/xsd}ClassBase">
       <sequence>
         <element name="cpuUtilization" type="{http://www.w3.org/2001/XMLSchema}string" minOccurs="0"/>
         <element name="memoryUtilization" type="{http://www.w3.org/2001/XMLSchema}string" minOccurs="0"/>
         <element name="name" type="{http://www.w3.org/2001/XMLSchema}string" minOccurs="0"/>
         <element name="pid" type="{http://www.w3.org/2001/XMLSchema}string" minOccurs="0"/>
         <element name="serverType" type="{http://www.w3.org/2001/XMLSchema}string" minOccurs="0"/>
         <element name="statisticsRequestTime" type="{http://www.w3.org/2001/XMLSchema}string" minOccurs="0"/>
         <element name="vmUtilization" type="{http://www.w3.org/2001/XMLSchema}string" minOccurs="0"/>
       </sequence>
     </extension>
   </complexContent>
 </complexType>
```

Constructor Detail

ServerSystemStats

public ServerSystemStats()

Method Detail

getCpuUtilization

public javax.xml.bind.JAXBElement<java.lang.String> getCpuUtilization()

Gets the value of the cpuUtilization property.

Network Registrar Type: AT_TIME

Describes the server CPU utilization, in seconds.

Returns:
possible object is JAXBElement<String>

setCpuUtilization

public void setCpuUtilization(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the cpuUtilization property.

Parameters:
value - allowed object is JAXBElement<String>

getMemoryUtilization

`public javax.xml.bind.JAXBElement<java.lang.String> getMemoryUtilization()`

Gets the value of the memoryUtilization property.

Network Registrar Type: AT_INT

`Describes the server resident memory size, in KBytes.`

Returns:
possible object is JAXBElement<String>

setMemoryUtilization

`public void setMemoryUtilization(javax.xml.bind.JAXBElement<java.lang.String> value)`

Sets the value of the memoryUtilization property.

Parameters:
value - allowed object is JAXBElement<String>

getName

`public javax.xml.bind.JAXBElement<java.lang.String> getName()`

Gets the value of the name property.

Network Registrar Type: AT_STRING

`Names the server.`

Returns:
possible object is JAXBElement<String>

setName

`public void setName(javax.xml.bind.JAXBElement<java.lang.String> value)`

Sets the value of the name property.

Parameters:
value - allowed object is JAXBElement<String>

getPid

public javax.xml.bind.JAXBElement<java.lang.String> getPid()

Gets the value of the pid property.

Network Registrar Type: AT_INT

```
Identifies server process id.
```

Returns:
possible object is JAXBElement<String>

setPid

public void setPid(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the pid property.

Parameters:
value - allowed object is JAXBElement<String>

getServerType

public javax.xml.bind.JAXBElement<java.lang.String> getServerType()

Gets the value of the serverType property.

Network Registrar Type: AT_INT

```
Specifies the type of server, represented as its schema
 class id.
```

Returns:
possible object is JAXBElement<String>

setServerType

public void setServerType(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the serverType property.

Parameters:
value - allowed object is JAXBElement<String>

getStatisticsRequestTime

public javax.xml.bind.JAXBElement<java.lang.String> getStatisticsRequestTime()

Gets the value of the statisticsRequestTime property.

Network Registrar Type: AT_DATE

```
Gives the time at which the statistics were collected.
```

Returns:
possible object is JAXBElement<String>

setStatisticsRequestTime

public void setStatisticsRequestTime(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the statisticsRequestTime property.

Parameters:
value - allowed object is JAXBElement<String>

getVmUtilization

public javax.xml.bind.JAXBElement<java.lang.String> getVmUtilization()

Gets the value of the vmUtilization property.

Network Registrar Type: AT_INT

```
Describes the server virtual memory utilization, in KBytes.
```

Returns:
possible object is JAXBElement<String>

setVmUtilization

public void setVmUtilization(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the vmUtilization property.

Parameters:
value - allowed object is JAXBElement<String>

Package com.cisco.cnr.ws.xsd

Class ServerSystemStatsArray

Constructor Detail

SystemStats
public SystemStats()

Method Detail

getDataFreeSpace

public javax.xml.bind.JAXBElement<java.lang.String> getDataFreeSpace()

Gets the value of the dataFreeSpace property.

Network Registrar Type: AT_INT

```
Tracks the free space on the partition that holds the
 Network Registrar data directory, in megabytes.
```

Returns:

possible object is JAXBElement<String>

setDataFreeSpace

public void setDataFreeSpace(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the dataFreeSpace property.

Parameters:

value - allowed object is JAXBElement<String>

getDataPath

public javax.xml.bind.JAXBElement<java.lang.String> getDataPath()

Gets the value of the dataPath property.

Network Registrar Type: AT_STRING

```
The path to the Network Registrar data directory.
```

Returns:

possible object is JAXBElement<String>

setDataPath

public void setDataPath(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the dataPath property.

Parameters:

value - allowed object is JAXBElement<String>

getDataTotalSpace

public javax.xml.bind.JAXBElement<java.lang.String> getDataTotalSpace()

Gets the value of the dataTotalSpace property.

Network Registrar Type: AT_INT

```
The size of the partition that holds the Network Registrar
 data directory, in megabytes.
```

Returns:

possible object is JAXBElement<String>

setDataTotalSpace

public void setDataTotalSpace(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the dataTotalSpace property.

Parameters:

value - allowed object is JAXBElement<String>

getLastBackupBytes

public javax.xml.bind.JAXBElement<java.lang.String> getLastBackupBytes()

Gets the value of the lastBackupBytes property.

Network Registrar Type: AT_FILESIZE

```
Gives how many bytes were backed up (whether successful or not).
```

Returns:

possible object is JAXBElement<String>

setLastBackupBytes

public void setLastBackupBytes(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the lastBackupBytes property.

Parameters:

value - allowed object is JAXBElement<String>

getLastBackupElapsedTime

`public javax.xml.bind.JAXBElement<java.lang.String> getLastBackupElapsedTime()`

Gets the value of the lastBackupElapsedTime property.

Network Registrar Type: AT_TIME

```
Gives how long, in seconds, the last backup took to complete (whether
 successful or not).
```

Returns:

possible object is JAXBElement<String>

setLastBackupElapsedTime

`public void setLastBackupElapsedTime(javax.xml.bind.JAXBElement<java.lang.String> value)`

Sets the value of the lastBackupElapsedTime property.

Parameters:

value - allowed object is JAXBElement<String>

getLastGoodBackup

`public javax.xml.bind.JAXBElement<java.lang.String> getLastGoodBackup()`

Gets the value of the lastGoodBackup property.

Network Registrar Type: AT_DATE

```
Gives the time at which the last successful nightly database
 backup finished.
```

Returns:

possible object is JAXBElement<String>

setLastGoodBackup

`public void setLastGoodBackup(javax.xml.bind.JAXBElement<java.lang.String> value)`

Sets the value of the lastGoodBackup property.

Parameters:

value - allowed object is JAXBElement<String>

getLogsFreeSpace

public javax.xml.bind.JAXBElement<java.lang.String> getLogsFreeSpace()

Gets the value of the logsFreeSpace property.

Network Registrar Type: AT_INT

```
Tracks the free space on the partition holding the
 Network Registrar logs directory, in megabytes.
```

Returns:
possible object is JAXBElement<String>

---

setLogsFreeSpace

public void setLogsFreeSpace(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the logsFreeSpace property.

Parameters:
value - allowed object is JAXBElement<String>

---

getLogsPath

public javax.xml.bind.JAXBElement<java.lang.String> getLogsPath()

Gets the value of the logsPath property.

Network Registrar Type: AT_STRING

```
Identifies the path to the Network Registrar logs directory.
```

Returns:
possible object is JAXBElement<String>

---

setLogsPath

public void setLogsPath(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the logsPath property.

Parameters:
value - allowed object is JAXBElement<String>

---

getLogsTotalSpace

public javax.xml.bind.JAXBElement<java.lang.String> getLogsTotalSpace()

Gets the value of the logsTotalSpace property.

Network Registrar Type: AT_INT

```
Tracks the size of the partition holding the Network Registrar
 logs directory, in megabytes.
```

Returns:

possible object is JAXBElement<String>

---

setLogsTotalSpace

public void setLogsTotalSpace(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the logsTotalSpace property.

Parameters:

value - allowed object is JAXBElement<String>

---

getServerStats

public javax.xml.bind.JAXBElement<ServerSystemStatsArray> getServerStats()

Gets the value of the serverStats property.

Network Registrar Type: AT_NLIST(AT_OBJ(ServerSystemStats))

```
Lists statistics objects, one for each Network Registrar
 server, holding information about the use of
 system resources for each server.
```

Returns:

possible object is JAXBElement<ServerSystemStatsArray>

---

setServerStats

public void setServerStats(javax.xml.bind.JAXBElement<ServerSystemStatsArray> value)

Sets the value of the serverStats property.

Parameters:

value - allowed object is JAXBElement<ServerSystemStatsArray>

---

getStatisticsRequestTime

public javax.xml.bind.JAXBElement<java.lang.String> getStatisticsRequestTime()

Gets the value of the statisticsRequestTime property.

Network Registrar Type: AT_DATE

Gives the time at which the statistics were collected.

Returns:
possible object is JAXBElement<String>

---

setStatisticsRequestTime

`public void setStatisticsRequestTime(javax.xml.bind.JAXBElement<java.lang.String> value)`

Sets the value of the statisticsRequestTime property.

Parameters:
value - allowed object is JAXBElement<String>

Package com.cisco.cnr.ws.xsd

Class SystemStatsArray

void	**setTotalBytesSent**(javax.xml.bind.JAXBElement<java.lang.String> value)		Sets the value of the totalBytesSent property.
void	**setTotalReplies**(javax.xml.bind.JAXBElement<java.lang.String> value)		Sets the value of the totalReplies property.
void	**setTotalRequests**(javax.xml.bind.JAXBElement<java.lang.String> value)		Sets the value of the totalRequests property.

Constructor Detail

TCPConnectionRelatedServer

public TCPConnectionRelatedServer()

Method Detail

getCommState

public javax.xml.bind.JAXBElement<java.lang.String> getCommState()

Gets the value of the commState property.

Network Registrar Type: AT_ENUMINT
Valid values: none, ok, interrupted

Specifies the status of communication. This will always be ok.

Returns:

possible object is JAXBElement<String>

setCommState

public void setCommState(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the commState property.

Parameters:

value - allowed object is JAXBElement<String>

getCurrentRequests

public javax.xml.bind.JAXBElement<java.lang.String> getCurrentRequests()

Gets the value of the currentRequests property.

Network Registrar Type: AT_INT

```
Specifies the number of active requests.
```

Returns:
possible object is JAXBElement<String>

setCurrentRequests

public void setCurrentRequests(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the currentRequests property.

Parameters:
value - allowed object is JAXBElement<String>

getCurrentState

public javax.xml.bind.JAXBElement<java.lang.String> getCurrentState()

Gets the value of the currentState property.

Network Registrar Type: AT_NSTRING

```
Specifies the current state of the connection. This is up to the
 connection handler to set and may reflect the outstanding request
 currently being processed, if any. Should be reported as "idle" if
 the connection is waiting for a request.
```

Returns:
possible object is JAXBElement<String>

setCurrentState

public void setCurrentState(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the currentState property.

Parameters:

value - allowed object is JAXBElement<String>

getIp6Address

public javax.xml.bind.JAXBElement<java.lang.String> getIp6Address()

Gets the value of the ip6Address property.

Network Registrar Type: AT_IP6ADDR

Specifies the IPv6 address of the remote end of the connection.

Returns:

possible object is JAXBElement<String>

setIp6Address

public void setIp6Address(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the ip6Address property.

Parameters:

value - allowed object is JAXBElement<String>

getIpaddr

public javax.xml.bind.JAXBElement<java.lang.String> getIpaddr()

Gets the value of the ipaddr property.

Network Registrar Type: AT_IPADDR

Specifies the address of the remote end of the connection.

Returns:

possible object is JAXBElement<String>

setIpaddr

public void setIpaddr(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the ipaddr property.

Parameters:

value - allowed object is JAXBElement<String>

getLastReceiveTime

public javax.xml.bind.JAXBElement<java.lang.String> getLastReceiveTime()

Gets the value of the lastReceiveTime property.

Network Registrar Type: AT_DATE

Specifies the time of the last byte received.

Returns:

possible object is JAXBElement<String>

setLastReceiveTime

public void setLastReceiveTime(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the lastReceiveTime property.

Parameters:

value - allowed object is JAXBElement<String>

getLastSendTime

public javax.xml.bind.JAXBElement<java.lang.String> getLastSendTime()

Gets the value of the lastSendTime property.

Network Registrar Type: AT_DATE

Specifies the time of the last byte sent.

Returns:

possible object is JAXBElement<String>

setLastSendTime

`public void setLastSendTime(javax.xml.bind.JAXBElement<java.lang.String> value)`

Sets the value of the lastSendTime property.

Parameters:

value - allowed object is JAXBElement<String>

getName

`public javax.xml.bind.JAXBElement<java.lang.String> getName()`

Gets the value of the name property.

Network Registrar Type: AT_NSTRING

```
Specifies the name of the service on which this connection was
 accepted.
```

Returns:

possible object is JAXBElement<String>

setName

`public void setName(javax.xml.bind.JAXBElement<java.lang.String> value)`

Sets the value of the name property.

Parameters:

value - allowed object is JAXBElement<String>

getOurIp6Address

`public javax.xml.bind.JAXBElement<java.lang.String> getOurIp6Address()`

Gets the value of the ourIp6Address property.

Network Registrar Type: AT_IP6ADDR

```
Specifies the IPv6 address of the local end of the connection.
```

Returns:

possible object is JAXBElement<String>

setOurIp6Address

public void setOurIp6Address(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the ourIp6Address property.

Parameters:
value - allowed object is JAXBElement<String>

getOurIpaddr

public javax.xml.bind.JAXBElement<java.lang.String> getOurIpaddr()

Gets the value of the ourIpaddr property.

Network Registrar Type: AT_IPADDR

Specifies the address of the local end of the connection.

Returns:
possible object is JAXBElement<String>

setOurIpaddr

public void setOurIpaddr(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the ourIpaddr property.

Parameters:
value - allowed object is JAXBElement<String>

getOurPort

public javax.xml.bind.JAXBElement<java.lang.String> getOurPort()

Gets the value of the ourPort property.

Network Registrar Type: AT_SHORT

Specifies the port number for the local end of the connection.

Returns:

possible object is JAXBElement<String>

setOurPort

public void setOurPort(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the ourPort property.

Parameters:

value - allowed object is JAXBElement<String>

getPort

public javax.xml.bind.JAXBElement<java.lang.String> getPort()

Gets the value of the port property.

Network Registrar Type: AT_SHORT

Specifies the port number for the remote end of the connection.

Returns:

possible object is JAXBElement<String>

setPort

public void setPort(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the port property.

Parameters:

value - allowed object is JAXBElement<String>

getStartTime

public javax.xml.bind.JAXBElement<java.lang.String> getStartTime()

Gets the value of the startTime property.

Network Registrar Type: AT_DATE

Specifies the time when the connection was established.

Returns:

possible object is JAXBElement<String>

setStartTime

public void setStartTime(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the startTime property.

Parameters:

value - allowed object is JAXBElement<String>

getTotalBytesReceived

public javax.xml.bind.JAXBElement<java.lang.String> getTotalBytesReceived()

Gets the value of the totalBytesReceived property.

Network Registrar Type: AT_INT64

Specifies the total number of bytes received over the connection.

Returns:

possible object is JAXBElement<String>

setTotalBytesReceived

public void setTotalBytesReceived(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the totalBytesReceived property.

Parameters:

value - allowed object is JAXBElement<String>

getTotalBytesSent

public javax.xml.bind.JAXBElement<java.lang.String> getTotalBytesSent()

Gets the value of the totalBytesSent property.

Network Registrar Type: AT_INT64

Specifies the total number of bytes sent over the connection.

Returns:

possible object is JAXBElement<String>

setTotalBytesSent

public void setTotalBytesSent(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the totalBytesSent property.

Parameters:

value - allowed object is JAXBElement<String>

getTotalReplies

public javax.xml.bind.JAXBElement<java.lang.String> getTotalReplies()

Gets the value of the totalReplies property.

Network Registrar Type: AT_INT

Specifies the total number of reply messages sent.

Returns:

possible object is JAXBElement<String>

setTotalReplies

public void setTotalReplies(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the totalReplies property.

Parameters:

value - allowed object is JAXBElement<String>

getTotalRequests

public javax.xml.bind.JAXBElement<java.lang.String> getTotalRequests()

Gets the value of the totalRequests property.

Network Registrar Type: AT_INT

Specifies the total number of request messages received.

Returns:
possible object is JAXBElement<String>

setTotalRequests

public void setTotalRequests(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the totalRequests property.

Parameters:
value - allowed object is JAXBElement<String>

Package com.cisco.cnr.ws.xsd

Class TCPConnectionRelatedServerArray

java.lang.Object
    com.cisco.cnr.ws.xsd.ClassBaseArray
        com.cisco.cnr.ws.xsd.TCPConnectionRelatedServerArray

Constructor Detail

TCPListenerRelatedServer

public TCPListenerRelatedServer()

Method Detail

getCommState

public javax.xml.bind.JAXBElement<java.lang.String> getCommState()

Gets the value of the commState property.

Network Registrar Type: AT_ENUMINT

Valid values: none, ok, interrupted

Specifies the status of communication. This will always be none.

Returns:
possible object is JAXBElement<String>

---

setCommState

public void setCommState(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the commState property.

Parameters:
value - allowed object is JAXBElement<String>

---

getCurrentConnections

public javax.xml.bind.JAXBElement<java.lang.String> getCurrentConnections()

Gets the value of the currentConnections property.

Network Registrar Type: AT_INT

Specifies the number of currently active connections.

Returns:
possible object is JAXBElement<String>

---

setCurrentConnections

public void setCurrentConnections(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the currentConnections property.

Parameters:
value - allowed object is JAXBElement<String>

---

getIp6Address

public javax.xml.bind.JAXBElement<java.lang.String> getIp6Address()

Gets the value of the ip6Address property.

Network Registrar Type: AT_IP6ADDR

Specifies the IPv6 address to which the listener is bound. May be
  0::0.

Returns:

possible object is JAXBElement<String>

---

setIp6Address

public void setIp6Address(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the ip6Address property.

Parameters:

value - allowed object is JAXBElement<String>

---

getIpaddr

public javax.xml.bind.JAXBElement<java.lang.String> getIpaddr()

Gets the value of the ipaddr property.

Network Registrar Type: AT_IPADDR

Specifies the address to which the listener is bound. May be 0.0.0.0.

Returns:

possible object is JAXBElement<String>

---

setIpaddr

public void setIpaddr(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the ipaddr property.

Parameters:

value - allowed object is JAXBElement<String>

---

getName

public javax.xml.bind.JAXBElement<java.lang.String> getName()

Gets the value of the name property.

Network Registrar Type: AT_NSTRING

```
Specifies the name of the service.
```

Returns:
possible object is JAXBElement<String>

---

setName

```
public void setName(javax.xml.bind.JAXBElement<java.lang.String> value)
```

Sets the value of the name property.

Parameters:
value - allowed object is JAXBElement<String>

---

getPort

```
public javax.xml.bind.JAXBElement<java.lang.String> getPort()
```

Gets the value of the port property.

Network Registrar Type: AT_SHORT

```
Specifies the port number to which the listener is bound. Incoming
 connections to this port will be processed.
```

Returns:
possible object is JAXBElement<String>

---

setPort

```
public void setPort(javax.xml.bind.JAXBElement<java.lang.String> value)
```

Sets the value of the port property.

Parameters:
value - allowed object is JAXBElement<String>

---

getRejectedConnections

public javax.xml.bind.JAXBElement<java.lang.String> getRejectedConnections()

Gets the value of the rejectedConnections property.

Network Registrar Type: AT_INT

```
Specifies the total number of incoming connections that were
 rejected, such as the maximum number of active connections were
 exceeded.
```

Returns:

possible object is JAXBElement<String>

setRejectedConnections

public void setRejectedConnections(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the rejectedConnections property.

Parameters:

value - allowed object is JAXBElement<String>

getTotalConnections

public javax.xml.bind.JAXBElement<java.lang.String> getTotalConnections()

Gets the value of the totalConnections property.

Network Registrar Type: AT_INT

```
Specifies the total number of incoming connections.
```

Returns:

possible object is JAXBElement<String>

setTotalConnections

public void setTotalConnections(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the totalConnections property.

Parameters:

value - allowed object is JAXBElement<String>

Package com.cisco.cnr.ws.xsd

Constructor Detail

UpdatePolicy

public UpdatePolicy()

Method Detail

getDescription

public javax.xml.bind.JAXBElement<java.lang.String> getDescription()

Gets the value of the description property.

Network Registrar Type: AT_STRING

An optional description for this DNS update policy
 configuration.

Returns:

possible object is JAXBElement<String>

setDescription

`public void setDescription(javax.xml.bind.JAXBElement<java.lang.String> value)`

Sets the value of the description property.

Parameters:

value - allowed object is JAXBElement<String>

getName

`public java.lang.String getName()`

Gets the value of the name property.

Network Registrar Type: AT_STRING
Required. Unique.

```
Specifies the name of the Update Policy.
```

Returns:

possible object is String

setName

`public void setName(java.lang.String value)`

Sets the value of the name property.

Parameters:

value - allowed object is String

getRules

`public javax.xml.bind.JAXBElement<StringArray> getRules()`

Gets the value of the rules property.

Network Registrar Type: AT_NLIST(AT_RULE)

```
Lists rules that make up the update policy. Each rule has the
 following syntax:

 action:   Can be grant or deny.
               grant - will allow an update if the rest of the rule
                     matches.
           deny  - will deny an update if the rest of the rule
                     matches.
 acl-list: A list of one or more ip addresses, network addresses,
           keys and/or named acl references. Note key names must be
           prefixed with "key " (i.e. "key key.example" ).
 keyword:  Can be name, subdomain or wildcard.
               name - used to specify a specific RR.
               subdomain - used to specify a subdomain name.
               wildcard - used to specify a name with wildcard
           characters.
 value:    The name, sudomain or wildcard value associated with the
           specified keyword. Note that all values specified are
           relative to the zone in which they are applied.
```

Therefore it is not necessary to add the zone name to
                   the end of the value.
                   The supported wildcard characters are:
                   *   Will match zero or more characters. For example,
                          the pattern dhcp-* matches all strings with the
                          dhcp- prefix including the string dhcp-.
                   ?   Will match a single character. For example, the
                          pattern zone?.com matches zone1.com, zone2.com,
                          etc but does not match zone.com
                   [...] Will match any characters listed within the
                          brackets. For example, you can provide a range
                          such as 0-9 or a-z. If the pattern also includes
                          the - character, make it the first character in
                          the list (i.e. dhcp[-a-z]*)
    rr-types: A comma delimited list of RR types for this rule. Each RR
              type can also be negated using the exclamation point
              (i.e. !A,!TXT). You can also specify all types the an
              asterisk (*).

Returns:

possible object is JAXBElement<StringArray>

---

setRules

public void setRules(javax.xml.bind.JAXBElement<StringArray> value)

Sets the value of the rules property.

Parameters:

value - allowed object is JAXBElement<StringArray>

---

getTenantId

public javax.xml.bind.JAXBElement<java.lang.String> getTenantId()

Gets the value of the tenantId property.

Network Registrar Type: AT_SHORT
Immutable.
Default value: 0

Identifies the tenant owner of this object.

Returns:

possible object is JAXBElement<String>

---

setTenantId

public void setTenantId(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the tenantId property.

Parameters:

value - allowed object is JAXBElement<String>

Package com.cisco.cnr.ws.xsd

Class UpdatePolicyArray

Constructor Detail

VPN

public VPN()

Method Detail

getAddrBlocksDefaultSelectionTags

public javax.xml.bind.JAXBElement<[StringArray](#)> getAddrBlocksDefaultSelectionTags()

Gets the value of the addrBlocksDefaultSelectionTags property.

Network Registrar Type: AT_ARRAY(AT_STRING)

Specifies the default selection tag (or list of tags) that will
 be associated with incoming subnet-allocation requests in this
 vpn that do not contain any subnet name data. No
 default.

Returns:

possible object is JAXBElement<[StringArray](#)>

---

setAddrBlocksDefaultSelectionTags

public void setAddrBlocksDefaultSelectionTags(javax.xml.bind.JAXBElement<[StringArray](#)> value)

Sets the value of the addrBlocksDefaultSelectionTags property.

Parameters:

value - allowed object is JAXBElement<[StringArray](#)>

---

getAddrBlocksUseClientAffinity

public javax.xml.bind.JAXBElement<java.lang.String> getAddrBlocksUseClientAffinity()

Gets the value of the addrBlocksUseClientAffinity property.

Network Registrar Type: AT_BOOL

```
Determines whether the DHCP server attempts to allocate
 subnets to clients using address-blocks that the clients
 have already used. Default is true (enable).
 If you disable this attribute, the server then supplies
 subnets from any block that is suitable, based on other
 selection data in the clients' messages.
```

Returns:

possible object is JAXBElement<String>

---

setAddrBlocksUseClientAffinity

public void setAddrBlocksUseClientAffinity(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the addrBlocksUseClientAffinity property.

Parameters:

value - allowed object is JAXBElement<String>

---

getAddrBlocksUseLanSegments

public javax.xml.bind.JAXBElement<java.lang.String> getAddrBlocksUseLanSegments()

Gets the value of the addrBlocksUseLanSegments property.

Network Registrar Type: AT_BOOL

```
Controls whether DHCP subnet-allocation uses the
 lan-segment attribute when configured on address-blocks.
```

Returns:

possible object is JAXBElement<String>

setAddrBlocksUseLanSegments

public void setAddrBlocksUseLanSegments(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the addrBlocksUseLanSegments property.

Parameters:

value - allowed object is JAXBElement<String>

getAddrBlocksUseSelectionTags

public javax.xml.bind.JAXBElement<java.lang.String> getAddrBlocksUseSelectionTags()

Gets the value of the addrBlocksUseSelectionTags property.

Network Registrar Type: AT_BOOL

```
Controls whether the server compares the subnet name data in
 incoming subnet-allocation requests with each address-block's
 selection tags. A block will only be considered if the
 two match. No default.
```

Returns:
possible object is JAXBElement<String>

setAddrBlocksUseSelectionTags

public void setAddrBlocksUseSelectionTags(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the addrBlocksUseSelectionTags property.

Parameters:
value - allowed object is JAXBElement<String>

getDescription

public javax.xml.bind.JAXBElement<java.lang.String> getDescription()

Gets the value of the description property.

Network Registrar Type: AT_STRING

```
Describes the VPN that this object represents.
```

Returns:
possible object is JAXBElement<String>

setDescription

public void setDescription(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the description property.

Parameters:
value - allowed object is JAXBElement<String>

getId

public java.lang.String getId()

Gets the value of the id property.

Network Registrar Type: AT_INT
Required. Unique. Immutable.

The VPN's unique id. This is a 32 bit value that is associated
 with every VPN-qualified IP address, subnet or address block.
 It is different than and unrelated to the standard 7-byte VPN-ID.

Returns:
possible object is String

setId

public void setId(java.lang.String value)

Sets the value of the id property.

Parameters:
value - allowed object is String

getName

public java.lang.String getName()

Gets the value of the name property.

Network Registrar Type: AT_STRING
Required. Unique.

The VPN's name within the CNR management system. Independent from,
 but could be the same as the vrf-name.

Returns:
possible object is String

setName

public void setName(java.lang.String value)

Sets the value of the name property.

Parameters:

value - allowed object is String

getTenantId

public javax.xml.bind.JAXBElement<java.lang.String> getTenantId()

Gets the value of the tenantId property.

Network Registrar Type: AT_SHORT
Immutable.
Default value: 0

Identifies the tenant owner of this object.

Returns:

possible object is JAXBElement<String>

setTenantId

public void setTenantId(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the tenantId property.

Parameters:

value - allowed object is JAXBElement<String>

getTenantPrivateNetwork

public javax.xml.bind.JAXBElement<java.lang.String> getTenantPrivateNetwork()

Gets the value of the tenantPrivateNetwork property.

Network Registrar Type: AT_BOOL
Default value: false

Indicates that this VPN represents the tenant non-routable (RFC1918)
 addresses on a local cluster. This attribute applies only to regional
 CCM clusters, and will be ignored if set on a local cluster.

Returns:

possible object is JAXBElement<String>

setTenantPrivateNetwork

public void setTenantPrivateNetwork(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the tenantPrivateNetwork property.

Parameters:

value - allowed object is JAXBElement<String>

getVpnId

public javax.xml.bind.JAXBElement<java.lang.String> getVpnId()

Gets the value of the vpnId property.

Network Registrar Type: AT_VPNID

```
The vpn-id in RFC 2685 format (i.e, 7 octets),
 using a syntax similar to that used by IOS to enter the
 same information.  The syntax is 3 hex octets, a colon,
 and 4 hex octets.  For example 010203:04050607 would
 be the way to enter the following hex octets:
  01:02:03:04:05:06:07 into this property.
```

Returns:

possible object is JAXBElement<String>

setVpnId

public void setVpnId(javax.xml.bind.JAXBElement<java.lang.String> value)

Sets the value of the vpnId property.

Parameters:

value - allowed object is JAXBElement<String>

getVrfName

public javax.xml.bind.JAXBElement<java.lang.String> getVrfName()

Gets the value of the vrfName property.

Network Registrar Type: AT_STRING

```
The VPN's VRF name.
```

Returns:

possible object is JAXBElement<String>

setVrfName

```
public void setVrfName(javax.xml.bind.JAXBElement<java.lang.String> value)
```

Sets the value of the vrfName property.

Parameters:
value - allowed object is JAXBElement<String>

Package com.cisco.cnr.ws.xsd

Class VPNArray

java.lang.Object
    com.cisco.cnr.ws.xsd.ClassBaseArray
        com.cisco.cnr.ws.xsd.VPNArray

---

public class **VPNArray**
extends ClassBaseArray

Java class for VPNArray complex type.

The following schema fragment specifies the expected content contained within this class.

```
<complexType name="VPNArray">
  <complexContent>
    <extension base="{http://ws.cnr.cisco.com/xsd}ClassBaseArray">
    </extension>
  </complexContent>
</complexType>
```

All Classes All Packages

A

ACL - Class in *com.cisco.cnr.ws.xsd*

    The Network Registrar ACL class.

ACL() - Constructor for class com.cisco.cnr.ws.xsd.*ACL*

ACLArray - Class in *com.cisco.cnr.ws.xsd*

    Java class for ACLArray complex type.

ACLArray() - Constructor for class com.cisco.cnr.ws.xsd.*ACLArray*

AddrSet - Class in *com.cisco.cnr.ws.xsd*

    The Network Registrar AddrSet class.

AddrSet() - Constructor for class com.cisco.cnr.ws.xsd.*AddrSet*

AddrSetArray - Class in *com.cisco.cnr.ws.xsd*

    Java class for AddrSetArray complex type.

AddrSetArray() - Constructor for class com.cisco.cnr.ws.xsd.*AddrSetArray*

AttrDesc - Class in *com.cisco.cnr.ws.xsd*

    The Network Registrar AttrDesc class.

AttrDesc() - Constructor for class com.cisco.cnr.ws.xsd.*AttrDesc*

AttrDescArray - Class in *com.cisco.cnr.ws.xsd*

    Java class for AttrDescArray complex type.

AttrDescArray() - Constructor for class com.cisco.cnr.ws.xsd.*AttrDescArray*

AuthDnsSec - Class in *com.cisco.cnr.ws.xsd*

    The Network Registrar AuthDnsSec class.

AuthDnsSec() - Constructor for class com.cisco.cnr.ws.xsd.*AuthDnsSec*

C

camelName(String) - Static method in class com.cisco.cnr.ws.xsd.*ScpAndJavaConverter*

CCMCluster - Class in *com.cisco.cnr.ws.xsd*

    The Network Registrar CCMCluster class.

CCMCluster() - Constructor for class com.cisco.cnr.ws.xsd.*CCMCluster*

CCMClusterArray - Class in com.cisco.cnr.ws.xsd

Java class for CCMClusterArray complex type.

CCMClusterArray() - Constructor for class com.cisco.cnr.ws.xsd.CCMClusterArray

CCMFailoverPair - Class in com.cisco.cnr.ws.xsd

The Network Registrar CCMFailoverPair class.

CCMFailoverPair() - Constructor for class com.cisco.cnr.ws.xsd.CCMFailoverPair

CCMFailoverPairArray - Class in com.cisco.cnr.ws.xsd

Java class for CCMFailoverPairArray complex type.

CCMFailoverPairArray() - Constructor for class com.cisco.cnr.ws.xsd.CCMFailoverPairArray

CCMHaDnsPair - Class in com.cisco.cnr.ws.xsd

The Network Registrar CCMHaDnsPair class.

CCMHaDnsPair() - Constructor for class com.cisco.cnr.ws.xsd.CCMHaDnsPair

CCMHaDnsPairArray - Class in com.cisco.cnr.ws.xsd

Java class for CCMHaDnsPairArray complex type.

CCMHaDnsPairArray() - Constructor for class com.cisco.cnr.ws.xsd.CCMHaDnsPairArray

CCMHost - Class in com.cisco.cnr.ws.xsd

The Network Registrar CCMHost class.

CCMHost() - Constructor for class com.cisco.cnr.ws.xsd.CCMHost

CCMHostArray - Class in com.cisco.cnr.ws.xsd

Java class for CCMHostArray complex type.

CCMHostArray() - Constructor for class com.cisco.cnr.ws.xsd.CCMHostArray

CCMReverseZone - Class in com.cisco.cnr.ws.xsd

The Network Registrar CCMReverseZone class.

CCMReverseZone() - Constructor for class com.cisco.cnr.ws.xsd.CCMReverseZone

CCMReverseZoneArray - Class in com.cisco.cnr.ws.xsd

Java class for CCMReverseZoneArray complex type.

CCMReverseZoneArray() - Constructor for class com.cisco.cnr.ws.xsd.CCMReverseZoneArray

CCMRR - Class in com.cisco.cnr.ws.xsd

The Network Registrar CCMRR class.

CCMRR() - Constructor for class com.cisco.cnr.ws.xsd.CCMRR

CCMRRArray - Class in com.cisco.cnr.ws.xsd

Java class for CCMRRArray complex type.

CCMRRArray() - Constructor for class com.cisco.cnr.ws.xsd.CCMRRArray

CCMRRSet - Class in com.cisco.cnr.ws.xsd

The Network Registrar CCMRRSet class.

CCMRRSet() - Constructor for class com.cisco.cnr.ws.xsd.CCMRRSet

CCMRRSetArray - Class in com.cisco.cnr.ws.xsd

Java class for CCMRRSetArray complex type.

CCMRRSetArray() - Constructor for class com.cisco.cnr.ws.xsd.CCMRRSetArray

CCMScopeTemplate - Class in com.cisco.cnr.ws.xsd

The Network Registrar CCMScopeTemplate class.

CCMScopeTemplate() - Constructor for class com.cisco.cnr.ws.xsd.CCMScopeTemplate

CCMScopeTemplateArray - Class in com.cisco.cnr.ws.xsd

Java class for CCMScopeTemplateArray complex type.

CCMScopeTemplateArray() - Constructor for class com.cisco.cnr.ws.xsd.CCMScopeTemplateArray

CCMSecondaryZone - Class in com.cisco.cnr.ws.xsd

The Network Registrar CCMSecondaryZone class.

CCMSecondaryZone() - Constructor for class com.cisco.cnr.ws.xsd.CCMSecondaryZone

CCMSecondaryZoneArray - Class in com.cisco.cnr.ws.xsd

Java class for CCMSecondaryZoneArray complex type.

CCMSecondaryZoneArray() - Constructor for class com.cisco.cnr.ws.xsd.CCMSecondaryZoneArray

CCMServer - Class in com.cisco.cnr.ws.xsd

The Network Registrar CCMServer class.

CCMServer() - Constructor for class com.cisco.cnr.ws.xsd.CCMServer

CCMServerArray - Class in com.cisco.cnr.ws.xsd

Java class for CCMServerArray complex type.

CCMServerArray() - Constructor for class com.cisco.cnr.ws.xsd.CCMServerArray

CCMServerInfo - Class in com.cisco.cnr.ws.xsd

The Network Registrar CCMServerInfo class.

CCMServerInfo() - Constructor for class com.cisco.cnr.ws.xsd.CCMServerInfo

CCMServerInfoArray - Class in com.cisco.cnr.ws.xsd

Java class for CCMServerInfoArray complex type.

CCMServerInfoArray() - Constructor for class com.cisco.cnr.ws.xsd.CCMServerInfoArray

CCMSubnet - Class in com.cisco.cnr.ws.xsd

The Network Registrar CCMSubnet class.

CCMSubnet() - Constructor for class com.cisco.cnr.ws.xsd.CCMSubnet

CCMSubnetArray - Class in com.cisco.cnr.ws.xsd

Java class for CCMSubnetArray complex type.

CCMSubnetArray() - Constructor for class com.cisco.cnr.ws.xsd.CCMSubnetArray

CCMZDCaching - Class in com.cisco.cnr.ws.xsd

The Network Registrar CCMZDCaching class.

CCMZDCaching() - Constructor for class com.cisco.cnr.ws.xsd.CCMZDCaching

CdnsRedirect - Class in com.cisco.cnr.ws.xsd

      The Network Registrar CdnsRedirect class.

CdnsRedirect() - Constructor for class com.cisco.cnr.ws.xsd.CdnsRedirect

CdnsRedirectArray - Class in com.cisco.cnr.ws.xsd

      Java class for CdnsRedirectArray complex type.

CdnsRedirectArray() - Constructor for class com.cisco.cnr.ws.xsd.CdnsRedirectArray

Certificate - Class in com.cisco.cnr.ws.xsd

      The Network Registrar Certificate class.

Certificate() - Constructor for class com.cisco.cnr.ws.xsd.Certificate

CertificateArray - Class in com.cisco.cnr.ws.xsd

      Java class for CertificateArray complex type.

CertificateArray() - Constructor for class com.cisco.cnr.ws.xsd.CertificateArray

ClassBase - Class in com.cisco.cnr.ws.xsd

      Java class for ClassBase complex type.

ClassBase() - Constructor for class com.cisco.cnr.ws.xsd.ClassBase

ClassBaseArray - Class in com.cisco.cnr.ws.xsd

      Java class for ClassBaseArray complex type.

ClassBaseArray() - Constructor for class com.cisco.cnr.ws.xsd.ClassBaseArray

ClientClass - Class in com.cisco.cnr.ws.xsd

      The Network Registrar ClientClass class.

ClientClass() - Constructor for class com.cisco.cnr.ws.xsd.ClientClass

ClientClassArray - Class in com.cisco.cnr.ws.xsd

      Java class for ClientClassArray complex type.

ClientClassArray() - Constructor for class com.cisco.cnr.ws.xsd.ClientClassArray

ClientEntry - Class in com.cisco.cnr.ws.xsd

      The Network Registrar ClientEntry class.

ClientEntry() - Constructor for class com.cisco.cnr.ws.xsd.ClientEntry

ClientEntryArray - Class in com.cisco.cnr.ws.xsd

      Java class for ClientEntryArray complex type.

ClientEntryArray() - Constructor for class com.cisco.cnr.ws.xsd.ClientEntryArray

CnrSoapAuth - Class in com.cisco.cnr.ws.xsd

      Java class for CnrSoapAuth complex type.

CnrSoapAuth() - Constructor for class com.cisco.cnr.ws.xsd.CnrSoapAuth

com.cisco.cnr.ws.xsd - package com.cisco.cnr.ws.xsd

createACL() - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

      Create an instance of ACL

createCCMClusterPollReplicaInterval(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

      Create an instance of JAXBElement<String>

createCCMClusterPollReplicaOffset(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

      Create an instance of JAXBElement<String>

createCCMClusterPollReplicaRrs(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

      Create an instance of JAXBElement<String>

createCCMClusterPollSubnetUtilInterval(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

      Create an instance of JAXBElement<String>

createCCMClusterPollSubnetUtilOffset(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

      Create an instance of JAXBElement<String>

createCCMClusterPollSubnetUtilRetry(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

      Create an instance of JAXBElement<String>

createCCMClusterProductVersion(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

      Create an instance of JAXBElement<String>

createCCMClusterRemoteId(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

      Create an instance of JAXBElement<String>

createCCMClusterReplicaPollInterval(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

      Create an instance of JAXBElement<String>

createCCMClusterReplicaPollOffset(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

      Create an instance of JAXBElement<String>

createCCMClusterReplicationInitialized(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

      Create an instance of JAXBElement<String>

createCCMClusterRestoreState(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

      Create an instance of JAXBElement<String>

createCCMClusterScpPort(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

      Create an instance of JAXBElement<String>

createCCMClusterScpReadTimeout(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

      Create an instance of JAXBElement<String>

createCCMClusterSharedSecret(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

      Create an instance of JAXBElement<String>

createCCMClusterTenantId(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

      Create an instance of JAXBElement<String>

createCCMClusterUseHttpsPort(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

      Create an instance of JAXBElement<String>

createCCMClusterUseSsl(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

      Create an instance of JAXBElement<String>

createCCMFailoverPair() - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

      Create an instance of CCMFailoverPair

createCCMFailoverPair(CCMFailoverPair) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

      Create an instance of JAXBElement<CCMFailoverPair>

createCCMFailoverPairArray() - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

      Create an instance of CCMFailoverPairArray

createCCMFailoverPairArray(CCMFailoverPairArray) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<String>

createCCMHaDnsPairHaDnsMainServer(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<String>

createCCMHaDnsPairHaDnsPort(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<String>

createCCMHaDnsPairHaDnsSoaMnameUpdate(String) - Method in class
com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<String>

createCCMHaDnsPairHaDnsSyncQuietPeriod(String) - Method in class
com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<String>

createCCMHaDnsPairItem(CCMHaDnsPair) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<CCMHaDnsPair>

createCCMHaDnsPairTenantId(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<String>

createCCMHost() - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of CCMHost

createCCMHost(CCMHost) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<CCMHost>

createCCMHostAddrs(StringArray) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<StringArray>

createCCMHostAliases(StringArray) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<StringArray>

createCCMHostArray() - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of CCMHostArray

createCCMHostArray(CCMHostArray) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<CCMHostArray>

createCCMHostCreatePtrRecords(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<String>

createCCMHostIp6AddressList(StringArray) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<StringArray>

createCCMHostItem(CCMHost) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<CCMHost>

createCCMHostName(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<String>

createCCMHostTenantId(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<String>

createCCMHostViewId(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<String>

createCCMHostZone(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<String>

createCCMHostZoneOrigin(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<String>

createCCMReverseZone() - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<String>

createCCMRRWeight(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<String>

createCCMScopeTemplate() - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of CCMScopeTemplate

createCCMScopeTemplate(CCMScopeTemplate) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<CCMScopeTemplate>

createCCMScopeTemplateAllocateFirstAvailable(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<String>

createCCMScopeTemplateAllocationPriority(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<String>

createCCMScopeTemplateArray() - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of CCMScopeTemplateArray

createCCMScopeTemplateArray(CCMScopeTemplateArray) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<CCMScopeTemplateArray>

createCCMScopeTemplateBackupPct(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<String>

createCCMScopeTemplateBootp(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<String>

createCCMScopeTemplateDeactivated(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<String>

createCCMScopeTemplateDescription(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<String>

createCCMScopeTemplateDhcp(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<String>

createCCMScopeTemplateDnsHostBytes(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<String>

createCCMScopeTemplateDynamicBootp(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<String>

createCCMScopeTemplateEmbeddedPolicy(Policy) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<Policy>

createCCMScopeTemplateFreeAddressConfig(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<String>

createCCMScopeTemplateGracePeriod(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<String>

createCCMScopeTemplateIgnoreDeclines(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<String>

createCCMScopeTemplateItem(CCMScopeTemplate) - Method in class
com.cisco.cnr.ws.xsd.ObjectFactory

> Create an instance of JAXBElement<CCMScopeTemplate>

createCCMScopeTemplateOfferTimeout(String) - Method in class
com.cisco.cnr.ws.xsd.ObjectFactory

> Create an instance of JAXBElement<String>

createCCMScopeTemplateOptionsExpr(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

> Create an instance of JAXBElement<String>

createCCMScopeTemplatePingClients(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

> Create an instance of JAXBElement<String>

createCCMScopeTemplatePingTimeout(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

> Create an instance of JAXBElement<String>

createCCMScopeTemplatePolicy(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

> Create an instance of JAXBElement<String>

createCCMScopeTemplateRangesExpr(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

> Create an instance of JAXBElement<String>

createCCMScopeTemplateRenewOnly(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

> Create an instance of JAXBElement<String>

createCCMScopeTemplateRestrictToReservations(String) - Method in class
com.cisco.cnr.ws.xsd.ObjectFactory

> Create an instance of JAXBElement<String>

createCCMScopeTemplateRouterHost(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

> Create an instance of JAXBElement<String>

createCCMScopeTemplateScopeDescriptionExpr(String) - Method in class
com.cisco.cnr.ws.xsd.ObjectFactory

createFilterElementRegexpStr(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<String>

createFilterElementStringVal(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<String>

createFilterFilterElementList(FilterElementArray) - Method in class
com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<FilterElementArray>

createFilterItem(Filter) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<Filter>

createFilterNegativeTest(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<String>

createKey() - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of Key

createKey(Key) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<Key>

createKeyAlgorithm(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<String>

createKeyArray() - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of KeyArray

createKeyArray(KeyArray) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<KeyArray>

createKeyDescription(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<String>

createKeyId(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<String>

createKeyItem(Key) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<Key>

createKeySecurityType(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<String>

createKeyTenantId(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<String>

createKeyTimeSkew(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

createLeaseRelayAgentOption(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

    Create an instance of JAXBElement<String>

createLeaseRelayAgentRadiusClass(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

    Create an instance of JAXBElement<String>

createLeaseRelayAgentRadiusOptions(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

    Create an instance of JAXBElement<String>

createLeaseRelayAgentRadiusPoolName(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

    Create an instance of JAXBElement<String>

createLeaseRelayAgentRadiusSessionTimeout(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

    Create an instance of JAXBElement<String>

createLeaseRelayAgentRadiusUser(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

    Create an instance of JAXBElement<String>

createLeaseRelayAgentRadiusV6PoolName(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

    Create an instance of JAXBElement<String>

createLeaseRelayAgentRadiusVendorSpecific(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

    Create an instance of JAXBElement<String>

createLeaseRelayAgentRemoteId(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

    Create an instance of JAXBElement<String>

createLeaseRelayAgentServerIdOverride(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

    Create an instance of JAXBElement<String>

createLeaseRelayAgentSubnetSelection(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

    Create an instance of JAXBElement<String>

createLeaseRelayAgentSubscriberId(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

    Create an instance of JAXBElement<String>

createLeaseRelayAgentVIVendorClass(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

    Create an instance of JAXBElement<String>

createLeaseRelayAgentVpnId(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

    Create an instance of JAXBElement<String>

createLeaseReservationLookupKey(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

    Create an instance of JAXBElement<String>

createLeaseReservationLookupKeyType(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

    Create an instance of JAXBElement<String>

createLeaseReservationRelayAgentOption(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

    Create an instance of JAXBElement<String>

createLeaseRevDnsUpdateConfigName(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

    Create an instance of JAXBElement<String>

createLeaseScopeName(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

    Create an instance of JAXBElement<String>

Create an instance of JAXBElement<String>

createLinkPrefixList(PrefixArray) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<PrefixArray>

createLinkRegion(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<String>

createLinkTemplate() - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of LinkTemplate

createLinkTemplate(LinkTemplate) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<LinkTemplate>

createLinkTemplateArray() - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of LinkTemplateArray

createLinkTemplateArray(LinkTemplateArray) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<LinkTemplateArray>

createLinkTemplateDescription(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<String>

createLinkTemplateEmbeddedPolicy(Policy) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<Policy>

createLinkTemplateFreeAddressConfig(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<String>

createLinkTemplateGroupName(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<String>

createLinkTemplateItem(LinkTemplate) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<LinkTemplate>

createLinkTemplateLinkDescriptionExpr(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<String>

createLinkTemplateLinkNameExpr(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<String>

createLinkTemplateLinkTemplateType(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<String>

createLinkTemplateOptionsExpr(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<String>

createLinkTemplateOwner(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<String>

createLinkTemplatePolicy(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<String>

createLinkTemplatePrefixExpr(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<String>

createLinkTemplateRegion(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<String>

createLinkTemplateRootPrefix(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<String>

createLinkTemplateTenantId(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<String>

createLinkTenantId(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<String>

createLinkVpnId(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<String>

createList(Object) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<Object>

createOption() - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of Option

createOption(Option) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<Option>

createOptionArray() - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of OptionArray

createOptionArray(OptionArray) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<OptionArray>

createOptionDefinitionSet() - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of OptionDefinitionSet

createOptionDefinitionSet(OptionDefinitionSet) - Method in class
com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<OptionDefinitionSet>

createOptionDefinitionSetArray() - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of OptionDefinitionSetArray

createOptionDefinitionSetArray(OptionDefinitionSetArray) - Method in class
com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<OptionDefinitionSetArray>

createOptionDefinitionSetChildren(AttrDescArray) - Method in class
com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<AttrDescArray>

createOptionDefinitionSetDesc(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<String>

createOptionDefinitionSetFlags(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<String>

createOptionDefinitionSetItem(OptionDefinitionSet) - Method in class
com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<OptionDefinitionSet>

createOptionDefinitionSetOptionList(AttrDescArray) - Method in class
com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<AttrDescArray>

createOptionDefinitionSetTenantId(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<String>

createOptionDefinitionSetVendorOptionEnterpriseId(String) - Method in class
com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<String>

createOptionDefinitionSetVendorOptionRegex(String) - Method in class
com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<String>

createOptionDefinitionSetVendorOptionString(String) - Method in class
com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<String>

createOptionExpression(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<String>

createOptionItem(Option) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<Option>

createOptionNumber(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<String>

createOptionOptionDefinitionSetName(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<String>

createOptionOptionDesc(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<String>

createOptionRoundRobin(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<String>

createOptionSubOptions(OptionArray) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<OptionArray>

createOptionValue(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<String>

createPolicy() - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of Policy

createPolicy(Policy) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<Policy>

createPolicyAffinityPeriod(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<String>

createPolicyAllowClientARecordUpdate(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<String>

createPolicyAllowDualZoneDnsUpdate(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<String>

createPolicyAllowLeaseTimeOverride(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<String>

createPolicyAllowNonTemporaryAddresses(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<String>

createPolicyAllowRapidCommit(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<String>

createPolicyAllowTemporaryAddresses(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<String>

createPolicyArray() - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of PolicyArray

createPolicyArray(PolicyArray) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<PolicyArray>

createPolicyDefaultPrefixLength(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<String>

createPolicyExcludedPrefix(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<String>

createPolicyForwardDnsupdate(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<String>

createPolicyForwardZoneName(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<String>

createPolicyGiaddrAsServerId(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<String>

createPolicyGracePeriod(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<String>

createPolicyInhibitAllRenews(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<String>

createPolicyInhibitRenewsAtReboot(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<String>

createPolicyItem(Policy) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<Policy>

createPolicyLeaseRetentionLimit(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<String>

createPolicyLimitationCount(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<String>

createPolicyLongestPrefixLength(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<String>

createPolicyMaxClientLeaseTime(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<String>

createPolicyMaxClientRebindingTime(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<String>

createPolicyMaxClientRenewalTime(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<String>

createPolicyMaxLeasesPerBinding(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<String>

createPolicyOfferTimeout(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<String>

createPolicyOptionList(OptionArray) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<OptionArray>

createPolicyPacketFileName(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<String>

createPolicyPacketServerName(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<String>

createPolicyPacketSiaddr(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<String>

createPolicyPermanentLeases(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<String>

createPolicyPreferredLifetime(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<String>

createPolicyReconfigure(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<String>

createPolicyReconfigureViaRelay(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<String>

Create an instance of [Prefix](#)

createPrefix(Prefix) - Method in class com.cisco.cnr.ws.xsd.[ObjectFactory](#)

Create an instance of JAXBElement<[Prefix](#)>

createPrefixAllocationAlgorithms(String) - Method in class com.cisco.cnr.ws.xsd.[ObjectFactory](#)

Create an instance of JAXBElement<String>

createPrefixAllocationGroup(String) - Method in class com.cisco.cnr.ws.xsd.[ObjectFactory](#)

Create an instance of JAXBElement<String>

createPrefixAllocationGroupPriority(String) - Method in class com.cisco.cnr.ws.xsd.[ObjectFactory](#)

Create an instance of JAXBElement<String>

createPrefixArray() - Method in class com.cisco.cnr.ws.xsd.[ObjectFactory](#)

Create an instance of [PrefixArray](#)

createPrefixArray(PrefixArray) - Method in class com.cisco.cnr.ws.xsd.[ObjectFactory](#)

Create an instance of JAXBElement<[PrefixArray](#)>

createPrefixDeactivated(String) - Method in class com.cisco.cnr.ws.xsd.[ObjectFactory](#)

Create an instance of JAXBElement<String>

createPrefixDescription(String) - Method in class com.cisco.cnr.ws.xsd.[ObjectFactory](#)

Create an instance of JAXBElement<String>

createPrefixDhcpType(String) - Method in class com.cisco.cnr.ws.xsd.[ObjectFactory](#)

Create an instance of JAXBElement<String>

createPrefixEmbeddedPolicy(Policy) - Method in class com.cisco.cnr.ws.xsd.[ObjectFactory](#)

Create an instance of JAXBElement<[Policy](#)>

createPrefixExpirationTime(String) - Method in class com.cisco.cnr.ws.xsd.[ObjectFactory](#)

Create an instance of JAXBElement<String>

createPrefixFreeAddressConfig(String) - Method in class com.cisco.cnr.ws.xsd.[ObjectFactory](#)

Create an instance of JAXBElement<String>

createPrefixIgnoreDeclines(String) - Method in class com.cisco.cnr.ws.xsd.[ObjectFactory](#)

Create an instance of JAXBElement<String>

createPrefixItem(Prefix) - Method in class com.cisco.cnr.ws.xsd.[ObjectFactory](#)

Create an instance of JAXBElement<[Prefix](#)>

createPrefixLink(String) - Method in class com.cisco.cnr.ws.xsd.[ObjectFactory](#)

Create an instance of JAXBElement<String>

createPrefixLocalCluster(String) - Method in class com.cisco.cnr.ws.xsd.[ObjectFactory](#)

Create an instance of JAXBElement<String>

createPrefixMaintenance(String) - Method in class com.cisco.cnr.ws.xsd.[ObjectFactory](#)

Create an instance of JAXBElement<String>

createPrefixMaxLeases(String) - Method in class com.cisco.cnr.ws.xsd.[ObjectFactory](#)

Create an instance of JAXBElement<String>

createPrefixMaxPdBalancingLength(String) - Method in class com.cisco.cnr.ws.xsd.[ObjectFactory](#)

Create an instance of JAXBElement<String>

createPrefixOwner(String) - Method in class com.cisco.cnr.ws.xsd.[ObjectFactory](#)

Create an instance of JAXBElement<String>

createPrefixPolicy(String) - Method in class com.cisco.cnr.ws.xsd.[ObjectFactory](#)

Create an instance of JAXBElement<String>

createPrefixRange(String) - Method in class com.cisco.cnr.ws.xsd.[ObjectFactory](#)

Create an instance of JAXBElement<String>

Create an instance of JAXBElement<String>

createPrefixTemplateItem(PrefixTemplate) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<PrefixTemplate>

createPrefixTemplateMaxLeases(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<String>

createPrefixTemplateMaxPdBalancingLength(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<String>

createPrefixTemplateOptionsExpr(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<String>

createPrefixTemplateOwner(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<String>

createPrefixTemplatePolicy(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<String>

createPrefixTemplatePrefixDescriptionExpr(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<String>

createPrefixTemplatePrefixNameExpr(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<String>

createPrefixTemplateRangeEndExpr(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<String>

createPrefixTemplateRangeExpr(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<String>

createPrefixTemplateRangeStartExpr(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<String>

createPrefixTemplateRegion(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<String>

createPrefixTemplateRestrictToAdminAllocation(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<String>

createPrefixTemplateRestrictToReservations(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<String>

createPrefixTemplateReverseZonePrefixLength(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<String>

createPrefixTemplateSelectionTags(StringArray) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<StringArray>

createPrefixTemplateTenantId(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<String>

createPrefixTenantId(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<String>

createPrefixVpnId(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<String>

createRange() - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

createStringArray() - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of StringArray

createStringArray(StringArray) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<StringArray>

createStringItem(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<String>

createSystemStats() - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of SystemStats

createSystemStats(SystemStats) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<SystemStats>

createSystemStatsArray() - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of SystemStatsArray

createSystemStatsArray(SystemStatsArray) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<SystemStatsArray>

createSystemStatsDataFreeSpace(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<String>

createSystemStatsDataPath(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<String>

createSystemStatsDataTotalSpace(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<String>

createSystemStatsItem(SystemStats) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<SystemStats>

createSystemStatsLastBackupBytes(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<String>

createSystemStatsLastBackupElapsedTime(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<String>

createSystemStatsLastGoodBackup(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<String>

createSystemStatsLogsFreeSpace(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<String>

createSystemStatsLogsPath(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<String>

createSystemStatsLogsTotalSpace(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<String>

createSystemStatsServerStats(ServerSystemStatsArray) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<ServerSystemStatsArray>

createSystemStatsStatisticsRequestTime(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of JAXBElement<String>

createTCPConnectionRelatedServer() - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

Create an instance of TCPConnectionRelatedServer

createTCPConnectionRelatedServer(TCPConnectionRelatedServer) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

createVPNVrfName(String) - Method in class com.cisco.cnr.ws.xsd.ObjectFactory

> Create an instance of JAXBElement<String>

CurrentPrefixUtilization - Class in com.cisco.cnr.ws.xsd

> The Network Registrar CurrentPrefixUtilization class.

CurrentPrefixUtilization() - Constructor for class com.cisco.cnr.ws.xsd.CurrentPrefixUtilization

CurrentPrefixUtilizationArray - Class in com.cisco.cnr.ws.xsd

> Java class for CurrentPrefixUtilizationArray complex type.

CurrentPrefixUtilizationArray() - Constructor for class com.cisco.cnr.ws.xsd.CurrentPrefixUtilizationArray

CurrentUtilization - Class in com.cisco.cnr.ws.xsd

> The Network Registrar CurrentUtilization class.

CurrentUtilization() - Constructor for class com.cisco.cnr.ws.xsd.CurrentUtilization

CurrentUtilizationArray - Class in com.cisco.cnr.ws.xsd

> Java class for CurrentUtilizationArray complex type.

CurrentUtilizationArray() - Constructor for class com.cisco.cnr.ws.xsd.CurrentUtilizationArray

D

deCamelName(String) - Static method in class com.cisco.cnr.ws.xsd.ScpAndJavaConverter

DHCP6Stats - Class in com.cisco.cnr.ws.xsd

> The Network Registrar DHCP6Stats class.

DHCP6Stats() - Constructor for class com.cisco.cnr.ws.xsd.DHCP6Stats

DHCP6StatsArray - Class in com.cisco.cnr.ws.xsd

> Java class for DHCP6StatsArray complex type.

DHCP6StatsArray() - Constructor for class com.cisco.cnr.ws.xsd.DHCP6StatsArray

DHCPFailoverStats - Class in com.cisco.cnr.ws.xsd

> The Network Registrar DHCPFailoverStats class.

DHCPFailoverStats() - Constructor for class com.cisco.cnr.ws.xsd.DHCPFailoverStats

DHCPFailoverStatsArray - Class in com.cisco.cnr.ws.xsd

> Java class for DHCPFailoverStatsArray complex type.

DHCPFailoverStatsArray() - Constructor for class com.cisco.cnr.ws.xsd.DHCPFailoverStatsArray

DHCPMaintenanceWindow - Class in com.cisco.cnr.ws.xsd

> The Network Registrar DHCPMaintenanceWindow class.

DHCPMaintenanceWindow() - Constructor for class com.cisco.cnr.ws.xsd.DHCPMaintenanceWindow

DHCPMaintenanceWindowArray - Class in com.cisco.cnr.ws.xsd

> Java class for DHCPMaintenanceWindowArray complex type.

DHCPMaintenanceWindowArray() - Constructor for class

com.cisco.cnr.ws.xsd.DHCPMaintenanceWindowArray

DHCPRenewalData - Class in com.cisco.cnr.ws.xsd
　　The Network Registrar DHCPRenewalData class.
DHCPRenewalData() - Constructor for class com.cisco.cnr.ws.xsd.DHCPRenewalData

DHCPRenewalDataArray - Class in com.cisco.cnr.ws.xsd
　　Java class for DHCPRenewalDataArray complex type.
DHCPRenewalDataArray() - Constructor for class com.cisco.cnr.ws.xsd.DHCPRenewalDataArray

DHCPScopeAggregationStats - Class in com.cisco.cnr.ws.xsd
　　The Network Registrar DHCPScopeAggregationStats class.
DHCPScopeAggregationStats() - Constructor for class
com.cisco.cnr.ws.xsd.DHCPScopeAggregationStats

DHCPScopeAggregationStatsArray - Class in com.cisco.cnr.ws.xsd
　　Java class for DHCPScopeAggregationStatsArray complex type.
DHCPScopeAggregationStatsArray() - Constructor for class
com.cisco.cnr.ws.xsd.DHCPScopeAggregationStatsArray

DHCPScopeStatus - Class in com.cisco.cnr.ws.xsd
　　The Network Registrar DHCPScopeStatus class.
DHCPScopeStatus() - Constructor for class com.cisco.cnr.ws.xsd.DHCPScopeStatus

DHCPScopeStatusArray - Class in com.cisco.cnr.ws.xsd
　　Java class for DHCPScopeStatusArray complex type.
DHCPScopeStatusArray() - Constructor for class com.cisco.cnr.ws.xsd.DHCPScopeStatusArray

DHCPServer - Class in com.cisco.cnr.ws.xsd
　　The Network Registrar DHCPServer class.
DHCPServer() - Constructor for class com.cisco.cnr.ws.xsd.DHCPServer

DHCPServerActivityStats - Class in com.cisco.cnr.ws.xsd
　　The Network Registrar DHCPServerActivityStats class.
DHCPServerActivityStats() - Constructor for class com.cisco.cnr.ws.xsd.DHCPServerActivityStats

DHCPServerActivityStatsArray - Class in com.cisco.cnr.ws.xsd
　　Java class for DHCPServerActivityStatsArray complex type.
DHCPServerActivityStatsArray() - Constructor for class
com.cisco.cnr.ws.xsd.DHCPServerActivityStatsArray

DHCPServerStats - Class in com.cisco.cnr.ws.xsd
　　The Network Registrar DHCPServerStats class.
DHCPServerStats() - Constructor for class com.cisco.cnr.ws.xsd.DHCPServerStats

DHCPServerStatsArray - Class in com.cisco.cnr.ws.xsd
　　Java class for DHCPServerStatsArray complex type.
DHCPServerStatsArray() - Constructor for class com.cisco.cnr.ws.xsd.DHCPServerStatsArray

DHCPTopUtilizedStats - Class in com.cisco.cnr.ws.xsd

The Network Registrar DHCPTopUtilizedStats class.

DHCPTopUtilizedStats() - Constructor for class com.cisco.cnr.ws.xsd.DHCPTopUtilizedStats

DHCPTopUtilizedStatsArray - Class in com.cisco.cnr.ws.xsd

Java class for DHCPTopUtilizedStatsArray complex type.

DHCPTopUtilizedStatsArray() - Constructor for class com.cisco.cnr.ws.xsd.DHCPTopUtilizedStatsArray

Dns64 - Class in com.cisco.cnr.ws.xsd

The Network Registrar Dns64 class.

Dns64() - Constructor for class com.cisco.cnr.ws.xsd.Dns64

Dns64Array - Class in com.cisco.cnr.ws.xsd

Java class for Dns64Array complex type.

Dns64Array() - Constructor for class com.cisco.cnr.ws.xsd.Dns64Array

DNSCachingServer - Class in com.cisco.cnr.ws.xsd

The Network Registrar DNSCachingServer class.

DNSCachingServer() - Constructor for class com.cisco.cnr.ws.xsd.DNSCachingServer

DNSCachingServerConfig - Class in com.cisco.cnr.ws.xsd

The Network Registrar DNSCachingServerConfig class.

DNSCachingServerConfig() - Constructor for class com.cisco.cnr.ws.xsd.DNSCachingServerConfig

DNSCachingServerRateLimitItem - Class in com.cisco.cnr.ws.xsd

The Network Registrar DNSCachingServerRateLimitItem class.

DNSCachingServerRateLimitItem() - Constructor for class
com.cisco.cnr.ws.xsd.DNSCachingServerRateLimitItem

DNSCachingServerRateLimitItemArray - Class in com.cisco.cnr.ws.xsd

Java class for DNSCachingServerRateLimitItemArray complex type.

DNSCachingServerRateLimitItemArray() - Constructor for class
com.cisco.cnr.ws.xsd.DNSCachingServerRateLimitItemArray

DNSCachingServerRateLimitStats - Class in com.cisco.cnr.ws.xsd

The Network Registrar DNSCachingServerRateLimitStats class.

DNSCachingServerRateLimitStats() - Constructor for class
com.cisco.cnr.ws.xsd.DNSCachingServerRateLimitStats

DNSCachingServerRateLimitStatsArray - Class in com.cisco.cnr.ws.xsd

Java class for DNSCachingServerRateLimitStatsArray complex type.

DNSCachingServerRateLimitStatsArray() - Constructor for class
com.cisco.cnr.ws.xsd.DNSCachingServerRateLimitStatsArray

DNSCachingServerStats - Class in com.cisco.cnr.ws.xsd

The Network Registrar DNSCachingServerStats class.

DNSCachingServerStats() - Constructor for class com.cisco.cnr.ws.xsd.DNSCachingServerStats

DNSCachingServerStatsArray - Class in com.cisco.cnr.ws.xsd

Java class for DNSCachingServerStatsArray complex type.

DNSCachingServerStatsArray() - Constructor for class
com.cisco.cnr.ws.xsd.DNSCachingServerStatsArray

DnsEnumConfig - Class in com.cisco.cnr.ws.xsd

The Network Registrar DnsEnumConfig class.

DnsEnumConfig() - Constructor for class com.cisco.cnr.ws.xsd.DnsEnumConfig

DnsEnumDomain - Class in com.cisco.cnr.ws.xsd

The Network Registrar DnsEnumDomain class.

DnsEnumDomain() - Constructor for class com.cisco.cnr.ws.xsd.DnsEnumDomain

DnsEnumDomainArray - Class in com.cisco.cnr.ws.xsd

Java class for DnsEnumDomainArray complex type.

DnsEnumDomainArray() - Constructor for class com.cisco.cnr.ws.xsd.DnsEnumDomainArray

DnsEnumEntry - Class in com.cisco.cnr.ws.xsd

The Network Registrar DnsEnumEntry class.

DnsEnumEntry() - Constructor for class com.cisco.cnr.ws.xsd.DnsEnumEntry

DnsEnumEntryArray - Class in com.cisco.cnr.ws.xsd

Java class for DnsEnumEntryArray complex type.

DnsEnumEntryArray() - Constructor for class com.cisco.cnr.ws.xsd.DnsEnumEntryArray

DnsEnumEntrySet - Class in com.cisco.cnr.ws.xsd

The Network Registrar DnsEnumEntrySet class.

DnsEnumEntrySet() - Constructor for class com.cisco.cnr.ws.xsd.DnsEnumEntrySet

DnsEnumEntrySetArray - Class in com.cisco.cnr.ws.xsd

Java class for DnsEnumEntrySetArray complex type.

DnsEnumEntrySetArray() - Constructor for class com.cisco.cnr.ws.xsd.DnsEnumEntrySetArray

DnsException - Class in com.cisco.cnr.ws.xsd

The Network Registrar DnsException class.

DnsException() - Constructor for class com.cisco.cnr.ws.xsd.DnsException

DnsExceptionArray - Class in com.cisco.cnr.ws.xsd

Java class for DnsExceptionArray complex type.

DnsExceptionArray() - Constructor for class com.cisco.cnr.ws.xsd.DnsExceptionArray

DnsForwarder - Class in com.cisco.cnr.ws.xsd

The Network Registrar DnsForwarder class.

DnsForwarder() - Constructor for class com.cisco.cnr.ws.xsd.DnsForwarder

DnsForwarderArray - Class in com.cisco.cnr.ws.xsd

Java class for DnsForwarderArray complex type.

DnsForwarderArray() - Constructor for class com.cisco.cnr.ws.xsd.DnsForwarderArray

DnsHAStatus - Class in com.cisco.cnr.ws.xsd
> The Network Registrar DnsHAStatus class.

DnsHAStatus() - Constructor for class com.cisco.cnr.ws.xsd.DnsHAStatus

DnsHAStatusArray - Class in com.cisco.cnr.ws.xsd
> Java class for DnsHAStatusArray complex type.

DnsHAStatusArray() - Constructor for class com.cisco.cnr.ws.xsd.DnsHAStatusArray

DnsIPnPort - Class in com.cisco.cnr.ws.xsd
> The Network Registrar DnsIPnPort class.

DnsIPnPort() - Constructor for class com.cisco.cnr.ws.xsd.DnsIPnPort

DnsIPnPortArray - Class in com.cisco.cnr.ws.xsd
> Java class for DnsIPnPortArray complex type.

DnsIPnPortArray() - Constructor for class com.cisco.cnr.ws.xsd.DnsIPnPortArray

DNSRelatedServer - Class in com.cisco.cnr.ws.xsd
> The Network Registrar DNSRelatedServer class.

DNSRelatedServer() - Constructor for class com.cisco.cnr.ws.xsd.DNSRelatedServer

DNSRelatedServerArray - Class in com.cisco.cnr.ws.xsd
> Java class for DNSRelatedServerArray complex type.

DNSRelatedServerArray() - Constructor for class com.cisco.cnr.ws.xsd.DNSRelatedServerArray

DnsSec - Class in com.cisco.cnr.ws.xsd
> The Network Registrar DnsSec class.

DnsSec() - Constructor for class com.cisco.cnr.ws.xsd.DnsSec

DnsSecKey - Class in com.cisco.cnr.ws.xsd
> The Network Registrar DnsSecKey class.

DnsSecKey() - Constructor for class com.cisco.cnr.ws.xsd.DnsSecKey

DnsSecKeyArray - Class in com.cisco.cnr.ws.xsd
> Java class for DnsSecKeyArray complex type.

DnsSecKeyArray() - Constructor for class com.cisco.cnr.ws.xsd.DnsSecKeyArray

DNSServer - Class in com.cisco.cnr.ws.xsd
> The Network Registrar DNSServer class.

DNSServer() - Constructor for class com.cisco.cnr.ws.xsd.DNSServer

DNSServerCacheStats - Class in com.cisco.cnr.ws.xsd
> The Network Registrar DNSServerCacheStats class.

DNSServerCacheStats() - Constructor for class com.cisco.cnr.ws.xsd.DNSServerCacheStats

DNSServerCacheStatsArray - Class in com.cisco.cnr.ws.xsd
> Java class for DNSServerCacheStatsArray complex type.

DNSServerCacheStatsArray() - Constructor for class com.cisco.cnr.ws.xsd.DNSServerCacheStatsArray

DNSServerDBStats - Class in com.cisco.cnr.ws.xsd

    The Network Registrar DNSServerDBStats class.

DNSServerDBStats() - Constructor for class com.cisco.cnr.ws.xsd.DNSServerDBStats

DNSServerDBStatsArray - Class in com.cisco.cnr.ws.xsd

    Java class for DNSServerDBStatsArray complex type.

DNSServerDBStatsArray() - Constructor for class com.cisco.cnr.ws.xsd.DNSServerDBStatsArray

DNSServerErrorsStats - Class in com.cisco.cnr.ws.xsd

    The Network Registrar DNSServerErrorsStats class.

DNSServerErrorsStats() - Constructor for class com.cisco.cnr.ws.xsd.DNSServerErrorsStats

DNSServerErrorsStatsArray - Class in com.cisco.cnr.ws.xsd

    Java class for DNSServerErrorsStatsArray complex type.

DNSServerErrorsStatsArray() - Constructor for class com.cisco.cnr.ws.xsd.DNSServerErrorsStatsArray

DNSServerHaStats - Class in com.cisco.cnr.ws.xsd

    The Network Registrar DNSServerHaStats class.

DNSServerHaStats() - Constructor for class com.cisco.cnr.ws.xsd.DNSServerHaStats

DNSServerHaStatsArray - Class in com.cisco.cnr.ws.xsd

    Java class for DNSServerHaStatsArray complex type.

DNSServerHaStatsArray() - Constructor for class com.cisco.cnr.ws.xsd.DNSServerHaStatsArray

DNSServerIPv6Stats - Class in com.cisco.cnr.ws.xsd

    The Network Registrar DNSServerIPv6Stats class.

DNSServerIPv6Stats() - Constructor for class com.cisco.cnr.ws.xsd.DNSServerIPv6Stats

DNSServerIPv6StatsArray - Class in com.cisco.cnr.ws.xsd

    Java class for DNSServerIPv6StatsArray complex type.

DNSServerIPv6StatsArray() - Constructor for class com.cisco.cnr.ws.xsd.DNSServerIPv6StatsArray

DNSServerMaxCounterStats - Class in com.cisco.cnr.ws.xsd

    The Network Registrar DNSServerMaxCounterStats class.

DNSServerMaxCounterStats() - Constructor for class com.cisco.cnr.ws.xsd.DNSServerMaxCounterStats

DNSServerMaxCounterStatsArray - Class in com.cisco.cnr.ws.xsd

    Java class for DNSServerMaxCounterStatsArray complex type.

DNSServerMaxCounterStatsArray() - Constructor for class com.cisco.cnr.ws.xsd.DNSServerMaxCounterStatsArray

DNSServerPerformanceStats - Class in com.cisco.cnr.ws.xsd

    The Network Registrar DNSServerPerformanceStats class.

DNSServerPerformanceStats() - Constructor for class com.cisco.cnr.ws.xsd.DNSServerPerformanceStats

DnsTrustAnchor - Class in com.cisco.cnr.ws.xsd

    The Network Registrar DnsTrustAnchor class.

DnsTrustAnchor() - Constructor for class com.cisco.cnr.ws.xsd.DnsTrustAnchor

DnsTrustAnchorArray - Class in com.cisco.cnr.ws.xsd

    Java class for DnsTrustAnchorArray complex type.

DnsTrustAnchorArray() - Constructor for class com.cisco.cnr.ws.xsd.DnsTrustAnchorArray

DnsUpdateConfig - Class in com.cisco.cnr.ws.xsd

    The Network Registrar DnsUpdateConfig class.

DnsUpdateConfig() - Constructor for class com.cisco.cnr.ws.xsd.DnsUpdateConfig

DnsUpdateConfigArray - Class in com.cisco.cnr.ws.xsd

    Java class for DnsUpdateConfigArray complex type.

DnsUpdateConfigArray() - Constructor for class com.cisco.cnr.ws.xsd.DnsUpdateConfigArray

DnsView - Class in com.cisco.cnr.ws.xsd

    The Network Registrar DnsView class.

DnsView() - Constructor for class com.cisco.cnr.ws.xsd.DnsView

DnsViewArray - Class in com.cisco.cnr.ws.xsd

    Java class for DnsViewArray complex type.

DnsViewArray() - Constructor for class com.cisco.cnr.ws.xsd.DnsViewArray

DnsZoneStatus - Class in com.cisco.cnr.ws.xsd

    The Network Registrar DnsZoneStatus class.

DnsZoneStatus() - Constructor for class com.cisco.cnr.ws.xsd.DnsZoneStatus

DnsZoneStatusArray - Class in com.cisco.cnr.ws.xsd

    Java class for DnsZoneStatusArray complex type.

DnsZoneStatusArray() - Constructor for class com.cisco.cnr.ws.xsd.DnsZoneStatusArray

F

FailoverRelatedServer - Class in com.cisco.cnr.ws.xsd

    The Network Registrar FailoverRelatedServer class.

FailoverRelatedServer() - Constructor for class com.cisco.cnr.ws.xsd.FailoverRelatedServer

FailoverRelatedServerArray - Class in com.cisco.cnr.ws.xsd

    Java class for FailoverRelatedServerArray complex type.

FailoverRelatedServerArray() - Constructor for class com.cisco.cnr.ws.xsd.FailoverRelatedServerArray

Filter - Class in com.cisco.cnr.ws.xsd

    The Network Registrar Filter class.

Filter() - Constructor for class com.cisco.cnr.ws.xsd.Filter

FilterArray - Class in com.cisco.cnr.ws.xsd

> Java class for FilterArray complex type.

FilterArray() - Constructor for class com.cisco.cnr.ws.xsd.FilterArray

FilterElement - Class in com.cisco.cnr.ws.xsd

> The Network Registrar FilterElement class.

FilterElement() - Constructor for class com.cisco.cnr.ws.xsd.FilterElement

FilterElementArray - Class in com.cisco.cnr.ws.xsd

> Java class for FilterElementArray complex type.

FilterElementArray() - Constructor for class com.cisco.cnr.ws.xsd.FilterElementArray

G

getAaaaResponse() - Method in class com.cisco.cnr.ws.xsd.CdnsRedirect

> Gets the value of the aaaaResponse property.

getAckLatencyCounts() - Method in class com.cisco.cnr.ws.xsd.DHCPServerActivityStats

> Gets the value of the ackLatencyCounts property.

getAcknowledgedRequests() - Method in class com.cisco.cnr.ws.xsd.DNSRelatedServer

> Gets the value of the acknowledgedRequests property.

getAcknowledgedRequests() - Method in class com.cisco.cnr.ws.xsd.LDAPRelatedServer

> Gets the value of the acknowledgedRequests property.

getAcks() - Method in class com.cisco.cnr.ws.xsd.DHCPServerActivityStats

> Gets the value of the acks property.

getAcksPerSecond() - Method in class com.cisco.cnr.ws.xsd.DHCPServerActivityStats

> Gets the value of the acksPerSecond property.

getAclBlacklist() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServer

> Gets the value of the aclBlacklist property.

getAclBlacklist() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerConfig

> Gets the value of the aclBlacklist property.

getAclBlocklist() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServer

> Gets the value of the aclBlocklist property.

getAclBlocklist() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerConfig

> Gets the value of the aclBlocklist property.

getAclBlocklist() - Method in class com.cisco.cnr.ws.xsd.DNSServer

> Gets the value of the aclBlocklist property.

getAclBlocklistDroppedRequests() - Method in class com.cisco.cnr.ws.xsd.DNSServerSecurityStats

> Gets the value of the aclBlocklistDroppedRequests property.

getAclDoNotQuery() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServer

> Gets the value of the aclDoNotQuery property.

getAclDoNotQuery() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerConfig

> Gets the value of the aclDoNotQuery property.

getAclMatchClients() - Method in class com.cisco.cnr.ws.xsd.Dns64

> Gets the value of the aclMatchClients property.

getAclMatchClients() - Method in class com.cisco.cnr.ws.xsd.DnsView

Gets the value of the aclMatchClients property.

getAclQuery() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServer

Gets the value of the aclQuery property.

getAclQuery() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerConfig

Gets the value of the aclQuery property.

getAction() - Method in class com.cisco.cnr.ws.xsd.CdnsRedirect

Gets the value of the action property.

getAction() - Method in class com.cisco.cnr.ws.xsd.ClientClass

Gets the value of the action property.

getAction() - Method in class com.cisco.cnr.ws.xsd.ClientEntry

Gets the value of the action property.

getActivationDate() - Method in class com.cisco.cnr.ws.xsd.DnsSecKey

Gets the value of the activationDate property.

getActiveBindingUpdateLatencyAverage() - Method in class com.cisco.cnr.ws.xsd.DHCPFailoverStats

Gets the value of the activeBindingUpdateLatencyAverage property.

getActiveBindingUpdateLatencyCounts() - Method in class com.cisco.cnr.ws.xsd.DHCPFailoverStats

Gets the value of the activeBindingUpdateLatencyCounts property.

getActiveBindingUpdateLatencyMaximum() - Method in class
com.cisco.cnr.ws.xsd.DHCPFailoverStats

Gets the value of the activeBindingUpdateLatencyMaximum property.

getActiveDynamic() - Method in class com.cisco.cnr.ws.xsd.CurrentPrefixUtilization

Gets the value of the activeDynamic property.

getActiveDynamic() - Method in class com.cisco.cnr.ws.xsd.CurrentUtilization

Gets the value of the activeDynamic property.

getActiveLeasequeries() - Method in class com.cisco.cnr.ws.xsd.DHCP6Stats

Gets the value of the activeLeasequeries property.

getActiveLeasequeryData() - Method in class com.cisco.cnr.ws.xsd.DHCP6Stats

Gets the value of the activeLeasequeryData property.

getActiveLeasequeryDone() - Method in class com.cisco.cnr.ws.xsd.DHCP6Stats

Gets the value of the activeLeasequeryDone property.

getActiveLeasequeryReplies() - Method in class com.cisco.cnr.ws.xsd.DHCP6Stats

Gets the value of the activeLeasequeryReplies property.

getActiveLeases() - Method in class com.cisco.cnr.ws.xsd.DHCP6Stats

Gets the value of the activeLeases property.

getActiveLeases() - Method in class com.cisco.cnr.ws.xsd.DHCPServerActivityStats

Gets the value of the activeLeases property.

getActivityCounterLogSettings() - Method in class com.cisco.cnr.ws.xsd.DNSServer

Gets the value of the activityCounterLogSettings property.

getActivitySummaryInterval() - Method in class com.cisco.cnr.ws.xsd.DHCPServer

Gets the value of the activitySummaryInterval property.

getActivitySummaryInterval() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServer

Gets the value of the activitySummaryInterval property.

getActivitySummaryInterval() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerConfig

Gets the value of the activitySummaryInterval property.

Gets the value of the answersWithFormerr property.

getAnswersWithNodata() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats

Gets the value of the answersWithNodata property.

getAnswersWithNoerror() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats

Gets the value of the answersWithNoerror property.

getAnswersWithNotauth() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats

Gets the value of the answersWithNotauth property.

getAnswersWithNotimp() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats

Gets the value of the answersWithNotimp property.

getAnswersWithNxdomain() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats

Gets the value of the answersWithNxdomain property.

getAnswersWithOtherErrors() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats

Gets the value of the answersWithOtherErrors property.

getAnswersWithRefused() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats

Gets the value of the answersWithRefused property.

getAnswersWithServfail() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats

Gets the value of the answersWithServfail property.

getAnyMatchSublist() - Method in class com.cisco.cnr.ws.xsd.FilterElement

Gets the value of the anyMatchSublist property.

getAppliesTo() - Method in class com.cisco.cnr.ws.xsd.CdnsDomainRateLimit

Gets the value of the appliesTo property.

getAResponse() - Method in class com.cisco.cnr.ws.xsd.CdnsRedirect

Gets the value of the aResponse property.

getAscendingOrdered() - Method in class com.cisco.cnr.ws.xsd.ResourceValue

Gets the value of the ascendingOrdered property.

getAttrid() - Method in class com.cisco.cnr.ws.xsd.FilterElement

Gets the value of the attrid property.

getAttrName(String, String) - Static method in class com.cisco.cnr.ws.xsd.ScpAndJavaConverter

getAuthenticateUntil() - Method in class com.cisco.cnr.ws.xsd.ClientEntry

Gets the value of the authenticateUntil property.

getAuthFails() - Method in class com.cisco.cnr.ws.xsd.DHCP6Stats

Gets the value of the authFails property.

getAutoUpdate() - Method in class com.cisco.cnr.ws.xsd.DnsTrustAnchor

Gets the value of the autoUpdate property.

getAvail() - Method in class com.cisco.cnr.ws.xsd.CurrentUtilization

Gets the value of the avail property.

getAvailable() - Method in class com.cisco.cnr.ws.xsd.CurrentPrefixUtilization

Gets the value of the available property.

getAxfrInErrors() - Method in class com.cisco.cnr.ws.xsd.DNSServerErrorsStats

Gets the value of the axfrInErrors property.

getAxfrOutErrors() - Method in class com.cisco.cnr.ws.xsd.DNSServerErrorsStats

Gets the value of the axfrOutErrors property.

getAxfrsIn() - Method in class com.cisco.cnr.ws.xsd.DNSServerPerformanceStats

Gets the value of the axfrsIn property.

getAxfrsOut() - Method in class com.cisco.cnr.ws.xsd.DNSServerPerformanceStats
Gets the value of the axfrsOut property.
getAxfrVersion() - Method in class com.cisco.cnr.ws.xsd.CCMRR
Gets the value of the axfrVersion property.
getAxfrVersion() - Method in class com.cisco.cnr.ws.xsd.CCMRRSet
Gets the value of the axfrVersion property.
getBackup() - Method in class com.cisco.cnr.ws.xsd.CCMFailoverPair
Gets the value of the backup property.
getBackup() - Method in class com.cisco.cnr.ws.xsd.CCMHaDnsPair
Gets the value of the backup property.
getBackupIp6Address() - Method in class com.cisco.cnr.ws.xsd.CCMFailoverPair
Gets the value of the backupIp6Address property.
getBackupPct() - Method in class com.cisco.cnr.ws.xsd.CCMFailoverPair
Gets the value of the backupPct property.
getBackupPct() - Method in class com.cisco.cnr.ws.xsd.CCMScopeTemplate
Gets the value of the backupPct property.
getBackupPct() - Method in class com.cisco.cnr.ws.xsd.Scope
Gets the value of the backupPct property.
getBackupServer() - Method in class com.cisco.cnr.ws.xsd.CCMFailoverPair
Gets the value of the backupServer property.
getBackupServerAddr() - Method in class com.cisco.cnr.ws.xsd.DnsUpdateConfig
Gets the value of the backupServerAddr property.
getBackupServerIp6Address() - Method in class com.cisco.cnr.ws.xsd.DnsUpdateConfig
Gets the value of the backupServerIp6Address property.
getBackupServerKey() - Method in class com.cisco.cnr.ws.xsd.DnsUpdateConfig
Gets the value of the backupServerKey property.
getBaseType() - Method in class com.cisco.cnr.ws.xsd.AttrDesc
Gets the value of the baseType property.
getBindingAcksReceived() - Method in class com.cisco.cnr.ws.xsd.DHCPFailoverStats
Gets the value of the bindingAcksReceived property.
getBindingAcksReceived() - Method in class com.cisco.cnr.ws.xsd.FailoverRelatedServer
Gets the value of the bindingAcksReceived property.
getBindingAcksReceivedTotal() - Method in class com.cisco.cnr.ws.xsd.FailoverRelatedServer
Gets the value of the bindingAcksReceivedTotal property.
getBindingAcksSent() - Method in class com.cisco.cnr.ws.xsd.DHCPFailoverStats
Gets the value of the bindingAcksSent property.
getBindingAcksSent() - Method in class com.cisco.cnr.ws.xsd.FailoverRelatedServer
Gets the value of the bindingAcksSent property.
getBindingAcksSentTotal() - Method in class com.cisco.cnr.ws.xsd.FailoverRelatedServer
Gets the value of the bindingAcksSentTotal property.
getBindingEndTime() - Method in class com.cisco.cnr.ws.xsd.Lease
Gets the value of the bindingEndTime property.
getBindingEndTime() - Method in class com.cisco.cnr.ws.xsd.Lease6
Gets the value of the bindingEndTime property.
getBindingFlags() - Method in class com.cisco.cnr.ws.xsd.Lease6

Gets the value of the bindingFlags property.

getBindingIaid() - Method in class com.cisco.cnr.ws.xsd.Lease6

Gets the value of the bindingIaid property.

getBindingNaksReceived() - Method in class com.cisco.cnr.ws.xsd.DHCPFailoverStats

Gets the value of the bindingNaksReceived property.

getBindingNaksSent() - Method in class com.cisco.cnr.ws.xsd.DHCPFailoverStats

Gets the value of the bindingNaksSent property.

getBindingRebindingTime() - Method in class com.cisco.cnr.ws.xsd.Lease6

Gets the value of the bindingRebindingTime property.

getBindingRenewalTime() - Method in class com.cisco.cnr.ws.xsd.Lease6

Gets the value of the bindingRenewalTime property.

getBindingStartTime() - Method in class com.cisco.cnr.ws.xsd.Lease

Gets the value of the bindingStartTime property.

getBindingStartTime() - Method in class com.cisco.cnr.ws.xsd.Lease6

Gets the value of the bindingStartTime property.

getBindingType() - Method in class com.cisco.cnr.ws.xsd.Lease6

Gets the value of the bindingType property.

getBindingUpdatesReceived() - Method in class com.cisco.cnr.ws.xsd.DHCPFailoverStats

Gets the value of the bindingUpdatesReceived property.

getBindingUpdatesReceived() - Method in class com.cisco.cnr.ws.xsd.FailoverRelatedServer

Gets the value of the bindingUpdatesReceived property.

getBindingUpdatesReceivedTotal() - Method in class com.cisco.cnr.ws.xsd.FailoverRelatedServer

Gets the value of the bindingUpdatesReceivedTotal property.

getBindingUpdatesSent() - Method in class com.cisco.cnr.ws.xsd.DHCPFailoverStats

Gets the value of the bindingUpdatesSent property.

getBindingUpdatesSent() - Method in class com.cisco.cnr.ws.xsd.FailoverRelatedServer

Gets the value of the bindingUpdatesSent property.

getBindingUpdatesSentTotal() - Method in class com.cisco.cnr.ws.xsd.FailoverRelatedServer

Gets the value of the bindingUpdatesSentTotal property.

getBits() - Method in class com.cisco.cnr.ws.xsd.DnsSecKey

Gets the value of the bits property.

getBlackholeAcl() - Method in class com.cisco.cnr.ws.xsd.DNSServer

Gets the value of the blackholeAcl property.

getBlackholeAclDroppedRequests() - Method in class com.cisco.cnr.ws.xsd.DNSServerSecurityStats

Gets the value of the blackholeAclDroppedRequests property.

getBlobVal() - Method in class com.cisco.cnr.ws.xsd.FilterElement

Gets the value of the blobVal property.

getBootp() - Method in class com.cisco.cnr.ws.xsd.CCMScopeTemplate

Gets the value of the bootp property.

getBootp() - Method in class com.cisco.cnr.ws.xsd.Scope

Gets the value of the bootp property.

getBootpReceived() - Method in class com.cisco.cnr.ws.xsd.DHCPServerActivityStats

Gets the value of the bootpReceived property.

getBootpSent() - Method in class com.cisco.cnr.ws.xsd.DHCPServerActivityStats

Gets the value of the bootpSent property.

getBucketInterval() - Method in class com.cisco.cnr.ws.xsd.DHCPRenewalData

    Gets the value of the bucketInterval property.

getBuckets() - Method in class com.cisco.cnr.ws.xsd.DHCPRenewalData

    Gets the value of the buckets property.

getBulkLeasequeries() - Method in class com.cisco.cnr.ws.xsd.DHCP6Stats

    Gets the value of the bulkLeasequeries property.

getBulkLeasequeryData() - Method in class com.cisco.cnr.ws.xsd.DHCP6Stats

    Gets the value of the bulkLeasequeryData property.

getBulkLeasequeryDone() - Method in class com.cisco.cnr.ws.xsd.DHCP6Stats

    Gets the value of the bulkLeasequeryDone property.

getBulkLeasequeryReplies() - Method in class com.cisco.cnr.ws.xsd.DHCP6Stats

    Gets the value of the bulkLeasequeryReplies property.

getCacheClientForRequests() - Method in class com.cisco.cnr.ws.xsd.DHCPServer

    Gets the value of the cacheClientForRequests property.

getCacheFull() - Method in class com.cisco.cnr.ws.xsd.DNSServerCacheStats

    Gets the value of the cacheFull property.

getCacheHits() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats

    Gets the value of the cacheHits property.

getCacheHits() - Method in class com.cisco.cnr.ws.xsd.DNSServerCacheStats

    Gets the value of the cacheHits property.

getCacheHits() - Method in class com.cisco.cnr.ws.xsd.DNSServerQueryStats

    Gets the value of the cacheHits property.

getCacheMaxNegativeTtl() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServer

    Gets the value of the cacheMaxNegativeTtl property.

getCacheMaxNegativeTtl() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerConfig

    Gets the value of the cacheMaxNegativeTtl property.

getCacheMaxTtl() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServer

    Gets the value of the cacheMaxTtl property.

getCacheMaxTtl() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerConfig

    Gets the value of the cacheMaxTtl property.

getCacheMinTtl() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServer

    Gets the value of the cacheMinTtl property.

getCacheMinTtl() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerConfig

    Gets the value of the cacheMinTtl property.

getCacheMisses() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats

    Gets the value of the cacheMisses property.

getCacheMisses() - Method in class com.cisco.cnr.ws.xsd.DNSServerCacheStats

    Gets the value of the cacheMisses property.

getCacheMisses() - Method in class com.cisco.cnr.ws.xsd.DNSServerQueryStats

    Gets the value of the cacheMisses property.

getCacheNxdomain() - Method in class com.cisco.cnr.ws.xsd.DNSServerCacheStats

    Gets the value of the cacheNxdomain property.

getCachePrefetches() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats

    Gets the value of the cachePrefetches property.

getCacheRecords() - Method in class com.cisco.cnr.ws.xsd.DNSServerCacheStats

Gets the value of the cacheRecords property.

getCacheRrs() - Method in class com.cisco.cnr.ws.xsd.DNSServerCacheStats

Gets the value of the cacheRrs property.

getCacheSize() - Method in class com.cisco.cnr.ws.xsd.DNSServerCacheStats

Gets the value of the cacheSize property.

getCachingServer() - Method in class com.cisco.cnr.ws.xsd.CCMZDCaching

Gets the value of the cachingServer property.

getCachingServerList() - Method in class com.cisco.cnr.ws.xsd.CCMZoneDistribution

Gets the value of the cachingServerList property.

getCCMServerType() - Method in class com.cisco.cnr.ws.xsd.CCMServer

Gets the value of the CCMServerType property.

getCCMSubnetType() - Method in class com.cisco.cnr.ws.xsd.CCMSubnet

Gets the value of the CCMSubnetType property.

getCertificateContents() - Method in class com.cisco.cnr.ws.xsd.Certificate

Gets the value of the certificateContents property.

getCertificateType() - Method in class com.cisco.cnr.ws.xsd.Certificate

Gets the value of the CertificateType property.

getChildren() - Method in class com.cisco.cnr.ws.xsd.AttrDesc

Gets the value of the children property.

getChildren() - Method in class com.cisco.cnr.ws.xsd.OptionDefinitionSet

Gets the value of the children property.

getCiscoUmbrella() - Method in class com.cisco.cnr.ws.xsd.DnsForwarder

Gets the value of the ciscoUmbrella property.

getClassCreateMethod(String) - Static method in class com.cisco.cnr.ws.xsd.ScpAndJavaConverter

Gets the ObjectFactory create method for this SCP class name

getClassid() - Method in class com.cisco.cnr.ws.xsd.CCMServerInfo

Gets the value of the classid property.

getClassid() - Method in class com.cisco.cnr.ws.xsd.Filter

Gets the value of the classid property.

getClientAcl() - Method in class com.cisco.cnr.ws.xsd.CdnsRedirect

Gets the value of the clientAcl property.

getClientActiveLeases() - Method in class com.cisco.cnr.ws.xsd.Lease6

Gets the value of the clientActiveLeases property.

getClientBinaryClientId() - Method in class com.cisco.cnr.ws.xsd.Lease

Gets the value of the clientBinaryClientId property.

getClientCacheCount() - Method in class com.cisco.cnr.ws.xsd.DHCPServer

Gets the value of the clientCacheCount property.

getClientCacheTtl() - Method in class com.cisco.cnr.ws.xsd.DHCPServer

Gets the value of the clientCacheTtl property.

getClientClass() - Method in class com.cisco.cnr.ws.xsd.DHCPServer

Gets the value of the clientClass property.

getClientClass() - Method in class com.cisco.cnr.ws.xsd.Reservation

Gets the value of the clientClass property.

getClientClass() - Method in class com.cisco.cnr.ws.xsd.Reservation6

Gets the value of the clientClass property.

getClientClassFails() - Method in class com.cisco.cnr.ws.xsd.DHCP6Stats

Gets the value of the clientClassFails property.

getClientClassFails() - Method in class com.cisco.cnr.ws.xsd.DHCPServerActivityStats

Gets the value of the clientClassFails property.

getClientClassLookupId() - Method in class com.cisco.cnr.ws.xsd.DHCPServer

Gets the value of the clientClassLookupId property.

getClientClassName() - Method in class com.cisco.cnr.ws.xsd.ClientEntry

Gets the value of the clientClassName property.

getClientClassName() - Method in class com.cisco.cnr.ws.xsd.Lease6

Gets the value of the clientClassName property.

getClientDnsName() - Method in class com.cisco.cnr.ws.xsd.Lease

Gets the value of the clientDnsName property.

getClientDomainName() - Method in class com.cisco.cnr.ws.xsd.Lease

Gets the value of the clientDomainName property.

getClientDuid() - Method in class com.cisco.cnr.ws.xsd.Lease

Gets the value of the clientDuid property.

getClientFlags() - Method in class com.cisco.cnr.ws.xsd.Lease

Gets the value of the clientFlags property.

getClientFlags() - Method in class com.cisco.cnr.ws.xsd.Lease6

Gets the value of the clientFlags property.

getClientHostName() - Method in class com.cisco.cnr.ws.xsd.Lease

Gets the value of the clientHostName property.

getClientIaid() - Method in class com.cisco.cnr.ws.xsd.Lease

Gets the value of the clientIaid property.

getClientId() - Method in class com.cisco.cnr.ws.xsd.Lease6

Gets the value of the clientId property.

getClientLastTransactionTime() - Method in class com.cisco.cnr.ws.xsd.Lease

Gets the value of the clientLastTransactionTime property.

getClientLastTransactionTime() - Method in class com.cisco.cnr.ws.xsd.Lease6

Gets the value of the clientLastTransactionTime property.

getClientLookupId() - Method in class com.cisco.cnr.ws.xsd.ClientClass

Gets the value of the clientLookupId property.

getClientLookupKey() - Method in class com.cisco.cnr.ws.xsd.Lease6

Gets the value of the clientLookupKey property.

getClientLookupKeyType() - Method in class com.cisco.cnr.ws.xsd.Lease6

Gets the value of the clientLookupKeyType property.

getClientMacAddr() - Method in class com.cisco.cnr.ws.xsd.Lease

Gets the value of the clientMacAddr property.

getClientOro() - Method in class com.cisco.cnr.ws.xsd.Lease6

Gets the value of the clientOro property.

getClientOsType() - Method in class com.cisco.cnr.ws.xsd.Lease

Gets the value of the clientOsType property.

getClientOverrideClientId() - Method in class com.cisco.cnr.ws.xsd.Lease

Gets the value of the clientOverrideClientId property.

getClientRateLimit() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats

Gets the value of the clientRateLimit property.

getClientRatelimited() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerRateLimitStats

Gets the value of the clientRatelimited property.

getClientRateLimiting() - Method in class com.cisco.cnr.ws.xsd.CdnsRateLimit

Gets the value of the clientRateLimiting property.

getClientRateLimitingFactor() - Method in class com.cisco.cnr.ws.xsd.CdnsRateLimit

Gets the value of the clientRateLimitingFactor property.

getClientRateLimitingQps() - Method in class com.cisco.cnr.ws.xsd.CdnsRateLimit

Gets the value of the clientRateLimitingQps property.

getClientReconfigureKey() - Method in class com.cisco.cnr.ws.xsd.Lease6

Gets the value of the clientReconfigureKey property.

getClientReconfigureKeyGenerationTime() - Method in class com.cisco.cnr.ws.xsd.Lease6

Gets the value of the clientReconfigureKeyGenerationTime property.

getClientRelayAddress() - Method in class com.cisco.cnr.ws.xsd.Lease6

Gets the value of the clientRelayAddress property.

getClientRelayMessage() - Method in class com.cisco.cnr.ws.xsd.Lease6

Gets the value of the clientRelayMessage property.

getClientRelayPort() - Method in class com.cisco.cnr.ws.xsd.Lease6

Gets the value of the clientRelayPort property.

getClientReportMaxCount() - Method in class com.cisco.cnr.ws.xsd.CdnsRateLimit

Gets the value of the clientReportMaxCount property.

getClientReservedActiveLeases() - Method in class com.cisco.cnr.ws.xsd.DHCP6Stats

Gets the value of the clientReservedActiveLeases property.

getClientReservedActiveLeases() - Method in class com.cisco.cnr.ws.xsd.DHCPServerActivityStats

Gets the value of the clientReservedActiveLeases property.

getClientReservedLeases() - Method in class com.cisco.cnr.ws.xsd.DHCP6Stats

Gets the value of the clientReservedLeases property.

getClientReservedLeases() - Method in class com.cisco.cnr.ws.xsd.DHCPServerActivityStats

Gets the value of the clientReservedLeases property.

getClients() - Method in class com.cisco.cnr.ws.xsd.DHCPRenewalData

Gets the value of the clients property.

getClients() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerRateLimitStats

Gets the value of the clients property.

getClientsAdjusted() - Method in class com.cisco.cnr.ws.xsd.DHCPRenewalData

Gets the value of the clientsAdjusted property.

getClientUserDefinedData() - Method in class com.cisco.cnr.ws.xsd.Lease6

Gets the value of the clientUserDefinedData property.

getClientVendorClass() - Method in class com.cisco.cnr.ws.xsd.Lease

Gets the value of the clientVendorClass property.

getClientVendorClass() - Method in class com.cisco.cnr.ws.xsd.Lease6

Gets the value of the clientVendorClass property.

getClientVendorInfo() - Method in class com.cisco.cnr.ws.xsd.Lease

Gets the value of the clientVendorInfo property.

getClientVendorInfo() - Method in class com.cisco.cnr.ws.xsd.Lease6

Gets the value of the clientVendorInfo property.

getClusterId() - Method in class com.cisco.cnr.ws.xsd.CCMCluster
Gets the value of the clusterId property.
getClusterId() - Method in class com.cisco.cnr.ws.xsd.CurrentPrefixUtilization
Gets the value of the clusterId property.
getClusterId() - Method in class com.cisco.cnr.ws.xsd.CurrentUtilization
Gets the value of the clusterId property.
getClusterName() - Method in class com.cisco.cnr.ws.xsd.DnsHAStatus
Gets the value of the clusterName property.
getCmMacAddress() - Method in class com.cisco.cnr.ws.xsd.Lease6
Gets the value of the cmMacAddress property.
getCmMacAddress() - Method in class com.cisco.cnr.ws.xsd.Reservation
Gets the value of the cmMacAddress property.
getCmMacAddress() - Method in class com.cisco.cnr.ws.xsd.Reservation6
Gets the value of the cmMacAddress property.
getCollectPerformanceStatistics() - Method in class com.cisco.cnr.ws.xsd.DHCPServer
Gets the value of the collectPerformanceStatistics property.
getCollectSampleCounters() - Method in class com.cisco.cnr.ws.xsd.DHCPServer
Gets the value of the collectSampleCounters property.
getCommState() - Method in class com.cisco.cnr.ws.xsd.DNSRelatedServer
Gets the value of the commState property.
getCommState() - Method in class com.cisco.cnr.ws.xsd.FailoverRelatedServer
Gets the value of the commState property.
getCommState() - Method in class com.cisco.cnr.ws.xsd.LDAPRelatedServer
Gets the value of the commState property.
getCommState() - Method in class com.cisco.cnr.ws.xsd.RelayAgentState
Gets the value of the commState property.
getCommState() - Method in class com.cisco.cnr.ws.xsd.TCPConnectionRelatedServer
Gets the value of the commState property.
getCommState() - Method in class com.cisco.cnr.ws.xsd.TCPListenerRelatedServer
Gets the value of the commState property.
getConcurrentXfrsIn() - Method in class com.cisco.cnr.ws.xsd.DNSServerMaxCounterStats
Gets the value of the concurrentXfrsIn property.
getConcurrentXfrsOut() - Method in class com.cisco.cnr.ws.xsd.DNSServerMaxCounterStats
Gets the value of the concurrentXfrsOut property.
getConfigRecurs() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats
Gets the value of the configRecurs property.
getConfigRecurs() - Method in class com.cisco.cnr.ws.xsd.DNSServerStats
Gets the value of the configRecurs property.
getConfigReset() - Method in class com.cisco.cnr.ws.xsd.DNSServerStats
Gets the value of the configReset property.
getConfigResetTime() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats
Gets the value of the configResetTime property.
getConfigResetTime() - Method in class com.cisco.cnr.ws.xsd.DNSServerStats
Gets the value of the configResetTime property.
getConfigUpTime() - Method in class com.cisco.cnr.ws.xsd.DNSServerStats

Gets the value of the configUpTime property.

getConfiguredBucketInterval() - Method in class com.cisco.cnr.ws.xsd.DHCPRenewalData

Gets the value of the configuredBucketInterval property.

getConfiguredBy() - Method in class com.cisco.cnr.ws.xsd.Certificate

Gets the value of the configuredBy property.

getConfiguredLeases() - Method in class com.cisco.cnr.ws.xsd.DHCPServerActivityStats

Gets the value of the configuredLeases property.

getConfiguredMaxRenewalTime() - Method in class com.cisco.cnr.ws.xsd.DHCPRenewalData

Gets the value of the configuredMaxRenewalTime property.

getConfirms() - Method in class com.cisco.cnr.ws.xsd.DHCP6Stats

Gets the value of the confirms property.

getConnectAcksReceived() - Method in class com.cisco.cnr.ws.xsd.DHCPFailoverStats

Gets the value of the connectAcksReceived property.

getConnectAcksSent() - Method in class com.cisco.cnr.ws.xsd.DHCPFailoverStats

Gets the value of the connectAcksSent property.

getConnectionEndTime() - Method in class com.cisco.cnr.ws.xsd.FailoverRelatedServer

Gets the value of the connectionEndTime property.

getConnectionStartTime() - Method in class com.cisco.cnr.ws.xsd.FailoverRelatedServer

Gets the value of the connectionStartTime property.

getConnectionsTerminatedByPartner() - Method in class com.cisco.cnr.ws.xsd.DHCPFailoverStats

Gets the value of the connectionsTerminatedByPartner property.

getConnectionsTerminatedByServer() - Method in class com.cisco.cnr.ws.xsd.DHCPFailoverStats

Gets the value of the connectionsTerminatedByServer property.

getConnectsReceived() - Method in class com.cisco.cnr.ws.xsd.DHCPFailoverStats

Gets the value of the connectsReceived property.

getConnectsSent() - Method in class com.cisco.cnr.ws.xsd.DHCPFailoverStats

Gets the value of the connectsSent property.

getConntrackUsageWarning() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServer

Gets the value of the conntrackUsageWarning property.

getConntrackUsageWarning() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerConfig

Gets the value of the conntrackUsageWarning property.

getConntrackUsageWarning() - Method in class com.cisco.cnr.ws.xsd.DNSServer

Gets the value of the conntrackUsageWarning property.

getContactsReceived() - Method in class com.cisco.cnr.ws.xsd.DHCPFailoverStats

Gets the value of the contactsReceived property.

getContactsSent() - Method in class com.cisco.cnr.ws.xsd.DHCPFailoverStats

Gets the value of the contactsSent property.

getCount() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerRateLimitItem

Gets the value of the count property.

getCounterResetTime() - Method in class com.cisco.cnr.ws.xsd.DNSServerStats

Gets the value of the counterResetTime property.

getCpuUtilization() - Method in class com.cisco.cnr.ws.xsd.ServerSystemStats

Gets the value of the cpuUtilization property.

getCreatePtrRecords() - Method in class com.cisco.cnr.ws.xsd.CCMHost

Gets the value of the createPtrRecords property.

Gets the value of the declines property.

getDeclines() - Method in class com.cisco.cnr.ws.xsd.DHCPServerActivityStats

Gets the value of the declines property.

getDefaultFreeAddressConfig() - Method in class com.cisco.cnr.ws.xsd.DHCPServer

Gets the value of the defaultFreeAddressConfig property.

getDefaultPrefixLength() - Method in class com.cisco.cnr.ws.xsd.Policy

Gets the value of the defaultPrefixLength property.

getDefaultServices() - Method in class com.cisco.cnr.ws.xsd.DnsEnumConfig

Gets the value of the defaultServices property.

getDefaultVpn() - Method in class com.cisco.cnr.ws.xsd.ClientClass

Gets the value of the defaultVpn property.

getDefaultVpn() - Method in class com.cisco.cnr.ws.xsd.ClientEntry

Gets the value of the defaultVpn property.

getDeferLeaseExtensions() - Method in class com.cisco.cnr.ws.xsd.DHCPServer

Gets the value of the deferLeaseExtensions property.

getDefttl() - Method in class com.cisco.cnr.ws.xsd.CCMReverseZone

Gets the value of the defttl property.

getDefttl() - Method in class com.cisco.cnr.ws.xsd.CCMZone

Gets the value of the defttl property.

getDefttl() - Method in class com.cisco.cnr.ws.xsd.CCMZoneTemplate

Gets the value of the defttl property.

getDeleteOrphanedLeases() - Method in class com.cisco.cnr.ws.xsd.DHCPServer

Gets the value of the deleteOrphanedLeases property.

getDeleteOrphanedSubnets() - Method in class com.cisco.cnr.ws.xsd.DHCPServer

Gets the value of the deleteOrphanedSubnets property.

getDesc() - Method in class com.cisco.cnr.ws.xsd.AttrDesc

Gets the value of the desc property.

getDesc() - Method in class com.cisco.cnr.ws.xsd.OptionDefinitionSet

Gets the value of the desc property.

getDescription() - Method in class com.cisco.cnr.ws.xsd.ACL

Gets the value of the description property.

getDescription() - Method in class com.cisco.cnr.ws.xsd.AuthDnsSec

Gets the value of the description property.

getDescription() - Method in class com.cisco.cnr.ws.xsd.CCMHaDnsPair

Gets the value of the description property.

getDescription() - Method in class com.cisco.cnr.ws.xsd.CCMReverseZone

Gets the value of the description property.

getDescription() - Method in class com.cisco.cnr.ws.xsd.CCMRRSet

Gets the value of the description property.

getDescription() - Method in class com.cisco.cnr.ws.xsd.CCMScopeTemplate

Gets the value of the description property.

getDescription() - Method in class com.cisco.cnr.ws.xsd.CCMSecondaryZone

Gets the value of the description property.

getDescription() - Method in class com.cisco.cnr.ws.xsd.CCMSubnet

Gets the value of the description property.

getDescription() - Method in class com.cisco.cnr.ws.xsd.CCMZone
Gets the value of the description property.
getDescription() - Method in class com.cisco.cnr.ws.xsd.CCMZoneDistribution
Gets the value of the description property.
getDescription() - Method in class com.cisco.cnr.ws.xsd.CCMZoneTemplate
Gets the value of the description property.
getDescription() - Method in class com.cisco.cnr.ws.xsd.CdnsRateLimit
Gets the value of the description property.
getDescription() - Method in class com.cisco.cnr.ws.xsd.CdnsRedirect
Gets the value of the description property.
getDescription() - Method in class com.cisco.cnr.ws.xsd.Certificate
Gets the value of the description property.
getDescription() - Method in class com.cisco.cnr.ws.xsd.Dns64
Gets the value of the description property.
getDescription() - Method in class com.cisco.cnr.ws.xsd.DnsEnumDomain
Gets the value of the description property.
getDescription() - Method in class com.cisco.cnr.ws.xsd.DnsEnumEntrySet
Gets the value of the description property.
getDescription() - Method in class com.cisco.cnr.ws.xsd.DnsException
Gets the value of the description property.
getDescription() - Method in class com.cisco.cnr.ws.xsd.DnsForwarder
Gets the value of the description property.
getDescription() - Method in class com.cisco.cnr.ws.xsd.DnsSecKey
Gets the value of the description property.
getDescription() - Method in class com.cisco.cnr.ws.xsd.DnsTrustAnchor
Gets the value of the description property.
getDescription() - Method in class com.cisco.cnr.ws.xsd.DnsView
Gets the value of the description property.
getDescription() - Method in class com.cisco.cnr.ws.xsd.Filter
Gets the value of the description property.
getDescription() - Method in class com.cisco.cnr.ws.xsd.Key
Gets the value of the description property.
getDescription() - Method in class com.cisco.cnr.ws.xsd.Link
Gets the value of the description property.
getDescription() - Method in class com.cisco.cnr.ws.xsd.LinkTemplate
Gets the value of the description property.
getDescription() - Method in class com.cisco.cnr.ws.xsd.Prefix
Gets the value of the description property.
getDescription() - Method in class com.cisco.cnr.ws.xsd.PrefixTemplate
Gets the value of the description property.
getDescription() - Method in class com.cisco.cnr.ws.xsd.Reservation
Gets the value of the description property.
getDescription() - Method in class com.cisco.cnr.ws.xsd.Reservation6
Gets the value of the description property.
getDescription() - Method in class com.cisco.cnr.ws.xsd.Scope

Gets the value of the description property.

getDescription() - Method in class com.cisco.cnr.ws.xsd.UpdatePolicy

Gets the value of the description property.

getDescription() - Method in class com.cisco.cnr.ws.xsd.VPN

Gets the value of the description property.

getDetectedTsigBadKey() - Method in class com.cisco.cnr.ws.xsd.DNSServerSecurityStats

Gets the value of the detectedTsigBadKey property.

getDetectedTsigBadSig() - Method in class com.cisco.cnr.ws.xsd.DNSServerSecurityStats

Gets the value of the detectedTsigBadSig property.

getDetectedTsigBadTime() - Method in class com.cisco.cnr.ws.xsd.DNSServerSecurityStats

Gets the value of the detectedTsigBadTime property.

getDeviceName() - Method in class com.cisco.cnr.ws.xsd.Reservation

Gets the value of the deviceName property.

getDeviceName() - Method in class com.cisco.cnr.ws.xsd.Reservation6

Gets the value of the deviceName property.

getDhcp() - Method in class com.cisco.cnr.ws.xsd.CCMScopeTemplate

Gets the value of the dhcp property.

getDhcp() - Method in class com.cisco.cnr.ws.xsd.Scope

Gets the value of the dhcp property.

getDhcpType() - Method in class com.cisco.cnr.ws.xsd.CurrentPrefixUtilization

Gets the value of the dhcpType property.

getDhcpType() - Method in class com.cisco.cnr.ws.xsd.Prefix

Gets the value of the dhcpType property.

getDhcpType() - Method in class com.cisco.cnr.ws.xsd.PrefixTemplate

Gets the value of the dhcpType property.

getDiscardedMessages() - Method in class com.cisco.cnr.ws.xsd.DHCPFailoverStats

Gets the value of the discardedMessages property.

getDiscards() - Method in class com.cisco.cnr.ws.xsd.DHCP6Stats

Gets the value of the discards property.

getDiscards() - Method in class com.cisco.cnr.ws.xsd.DHCPServerActivityStats

Gets the value of the discards property.

getDisconnectsReceived() - Method in class com.cisco.cnr.ws.xsd.DHCPFailoverStats

Gets the value of the disconnectsReceived property.

getDisconnectsSent() - Method in class com.cisco.cnr.ws.xsd.DHCPFailoverStats

Gets the value of the disconnectsSent property.

getDiscovers() - Method in class com.cisco.cnr.ws.xsd.DHCPServerActivityStats

Gets the value of the discovers property.

getDistMap() - Method in class com.cisco.cnr.ws.xsd.CCMReverseZone

Gets the value of the distMap property.

getDistMap() - Method in class com.cisco.cnr.ws.xsd.CCMZone

Gets the value of the distMap property.

getDistMap() - Method in class com.cisco.cnr.ws.xsd.CCMZoneTemplate

Gets the value of the distMap property.

getDistributeRenewals() - Method in class com.cisco.cnr.ws.xsd.DHCPServer

Gets the value of the distributeRenewals property.

getDistributeRenewalsBucketInterval() - Method in class com.cisco.cnr.ws.xsd.DHCPServer
> Gets the value of the distributeRenewalsBucketInterval property.

getDistributeRenewalsMaxRenewalTime() - Method in class com.cisco.cnr.ws.xsd.DHCPServer
> Gets the value of the distributeRenewalsMaxRenewalTime property.

getDns64() - Method in class com.cisco.cnr.ws.xsd.Dns64
> Gets the value of the dns64 property.

getDns64A2AaaaConversions() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats
> Gets the value of the dns64A2AaaaConversions property.

getDns64PtrConversions() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats
> Gets the value of the dns64PtrConversions property.

getDnsClientIdentity() - Method in class com.cisco.cnr.ws.xsd.DHCPServer
> Gets the value of the dnsClientIdentity property.

getDnsClientIdentity() - Method in class com.cisco.cnr.ws.xsd.DnsUpdateConfig
> Gets the value of the dnsClientIdentity property.

getDnsConcurrentPackets() - Method in class com.cisco.cnr.ws.xsd.DNSServerMaxCounterStats
> Gets the value of the dnsConcurrentPackets property.

getDnsEnumEntryType() - Method in class com.cisco.cnr.ws.xsd.DnsEnumEntry
> Gets the value of the DnsEnumEntryType property.

getDnsHostBytes() - Method in class com.cisco.cnr.ws.xsd.CCMScopeTemplate
> Gets the value of the dnsHostBytes property.

getDnsHostBytes() - Method in class com.cisco.cnr.ws.xsd.CCMSubnet
> Gets the value of the dnsHostBytes property.

getDnsHostBytes() - Method in class com.cisco.cnr.ws.xsd.DnsUpdateConfig
> Gets the value of the dnsHostBytes property.

getDnsHostBytes() - Method in class com.cisco.cnr.ws.xsd.Scope
> Gets the value of the dnsHostBytes property.

getDnssec() - Method in class com.cisco.cnr.ws.xsd.CCMReverseZone
> Gets the value of the dnssec property.

getDnssec() - Method in class com.cisco.cnr.ws.xsd.CCMSecondaryZone
> Gets the value of the dnssec property.

getDnssec() - Method in class com.cisco.cnr.ws.xsd.CCMZone
> Gets the value of the dnssec property.

getDnssec() - Method in class com.cisco.cnr.ws.xsd.CCMZoneTemplate
> Gets the value of the dnssec property.

getDnssec() - Method in class com.cisco.cnr.ws.xsd.DnsSec
> Gets the value of the dnssec property.

getDnsSecKeyType() - Method in class com.cisco.cnr.ws.xsd.DnsSecKey
> Gets the value of the DnsSecKeyType property.

getDnssecQueries() - Method in class com.cisco.cnr.ws.xsd.DNSServerSecurityStats
> Gets the value of the dnssecQueries property.

getDnssecRequestsDropped() - Method in class com.cisco.cnr.ws.xsd.DNSServerSecurityStats
> Gets the value of the dnssecRequestsDropped property.

getDnssecResponses() - Method in class com.cisco.cnr.ws.xsd.DNSServerSecurityStats
> Gets the value of the dnssecResponses property.

getDnssecSignZone() - Method in class com.cisco.cnr.ws.xsd.DNSServerSecurityStats

Gets the value of the dnssecSignZone property.

getDnssecZones() - Method in class com.cisco.cnr.ws.xsd.DNSServerSecurityStats

Gets the value of the dnssecZones property.

getDnsServerFlags() - Method in class com.cisco.cnr.ws.xsd.DNSRelatedServer

Gets the value of the dnsServerFlags property.

getDnsServerState() - Method in class com.cisco.cnr.ws.xsd.DNSRelatedServer

Gets the value of the dnsServerState property.

getDnsTimeout() - Method in class com.cisco.cnr.ws.xsd.DHCPServer

Gets the value of the dnsTimeout property.

getDnsTimeout() - Method in class com.cisco.cnr.ws.xsd.DNSRelatedServer

Gets the value of the dnsTimeout property.

getDnsUpdateFlags() - Method in class com.cisco.cnr.ws.xsd.Lease6

Gets the value of the dnsUpdateFlags property.

getDocsisVersionIdMissing() - Method in class com.cisco.cnr.ws.xsd.DHCPServer

Gets the value of the docsisVersionIdMissing property.

getDomain() - Method in class com.cisco.cnr.ws.xsd.CdnsDomainRateLimit

Gets the value of the domain property.

getDomainInsecure() - Method in class com.cisco.cnr.ws.xsd.DnsSec

Gets the value of the domainInsecure property.

getDomainName() - Method in class com.cisco.cnr.ws.xsd.ClientClass

Gets the value of the domainName property.

getDomainName() - Method in class com.cisco.cnr.ws.xsd.ClientEntry

Gets the value of the domainName property.

getDomainPrefix() - Method in class com.cisco.cnr.ws.xsd.DnsEnumDomain

Gets the value of the domainPrefix property.

getDomainPrefix() - Method in class com.cisco.cnr.ws.xsd.DnsEnumEntrySet

Gets the value of the domainPrefix property.

getDomainRateLimit() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats

Gets the value of the domainRateLimit property.

getDomainRatelimited() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerRateLimitStats

Gets the value of the domainRatelimited property.

getDomainRateLimiting() - Method in class com.cisco.cnr.ws.xsd.CdnsRateLimit

Gets the value of the domainRateLimiting property.

getDomainRateLimitingFactor() - Method in class com.cisco.cnr.ws.xsd.CdnsRateLimit

Gets the value of the domainRateLimitingFactor property.

getDomainRateLimitingList() - Method in class com.cisco.cnr.ws.xsd.CdnsRateLimit

Gets the value of the domainRateLimitingList property.

getDomainRateLimitingQps() - Method in class com.cisco.cnr.ws.xsd.CdnsRateLimit

Gets the value of the domainRateLimitingQps property.

getDomainReportMaxCount() - Method in class com.cisco.cnr.ws.xsd.CdnsRateLimit

Gets the value of the domainReportMaxCount property.

getDomains() - Method in class com.cisco.cnr.ws.xsd.CdnsRedirect

Gets the value of the domains property.

getDomains() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerRateLimitStats

Gets the value of the domains property.

Gets the value of the embeddedPolicy property.

getEmbeddedPolicy() - Method in class com.cisco.cnr.ws.xsd.ClientEntry

Gets the value of the embeddedPolicy property.

getEmbeddedPolicy() - Method in class com.cisco.cnr.ws.xsd.Link

Gets the value of the embeddedPolicy property.

getEmbeddedPolicy() - Method in class com.cisco.cnr.ws.xsd.LinkTemplate

Gets the value of the embeddedPolicy property.

getEmbeddedPolicy() - Method in class com.cisco.cnr.ws.xsd.Prefix

Gets the value of the embeddedPolicy property.

getEmbeddedPolicy() - Method in class com.cisco.cnr.ws.xsd.PrefixTemplate

Gets the value of the embeddedPolicy property.

getEmbeddedPolicy() - Method in class com.cisco.cnr.ws.xsd.Scope

Gets the value of the embeddedPolicy property.

getEnableSigning() - Method in class com.cisco.cnr.ws.xsd.DnsSecKey

Gets the value of the enableSigning property.

getEnd() - Method in class com.cisco.cnr.ws.xsd.DHCPMaintenanceWindow

Gets the value of the end property.

getEnd() - Method in class com.cisco.cnr.ws.xsd.Range

Gets the value of the end property.

getEndTime() - Method in class com.cisco.cnr.ws.xsd.DHCPRenewalData

Gets the value of the endTime property.

getEndTime() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerRateLimitStats

Gets the value of the endTime property.

getEnhancedSampleCounters() - Method in class com.cisco.cnr.ws.xsd.DHCPServer

Gets the value of the enhancedSampleCounters property.

getEqualPriorityMostAvailable() - Method in class com.cisco.cnr.ws.xsd.DHCPServer

Gets the value of the equalPriorityMostAvailable property.

getEstEndRecoverTime() - Method in class com.cisco.cnr.ws.xsd.FailoverRelatedServer

Gets the value of the estEndRecoverTime property.

getEstPartnerEndRecoverTime() - Method in class com.cisco.cnr.ws.xsd.FailoverRelatedServer

Gets the value of the estPartnerEndRecoverTime property.

getEventClearMessage() - Method in class com.cisco.cnr.ws.xsd.ResourceValue

Gets the value of the eventClearMessage property.

getEventReportMessage() - Method in class com.cisco.cnr.ws.xsd.ResourceValue

Gets the value of the eventReportMessage property.

getEventState() - Method in class com.cisco.cnr.ws.xsd.ResourceValue

Gets the value of the eventState property.

getEventTimestamp() - Method in class com.cisco.cnr.ws.xsd.ResourceValue

Gets the value of the eventTimestamp property.

getExceededMaxDnsPackets() - Method in class com.cisco.cnr.ws.xsd.DNSServerErrorsStats

Gets the value of the exceededMaxDnsPackets property.

getExceededMaxTargetCount() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats

Gets the value of the exceededMaxTargetCount property.

getExcludedPrefix() - Method in class com.cisco.cnr.ws.xsd.Lease6

Gets the value of the excludedPrefix property.

getExcludedPrefix() - Method in class com.cisco.cnr.ws.xsd.Policy

    Gets the value of the excludedPrefix property.

getExpiration() - Method in class com.cisco.cnr.ws.xsd.Lease

    Gets the value of the expiration property.

getExpirationDate() - Method in class com.cisco.cnr.ws.xsd.DnsSecKey

    Gets the value of the expirationDate property.

getExpirationTime() - Method in class com.cisco.cnr.ws.xsd.Prefix

    Gets the value of the expirationTime property.

getExpirationTime() - Method in class com.cisco.cnr.ws.xsd.PrefixTemplate

    Gets the value of the expirationTime property.

getExpire() - Method in class com.cisco.cnr.ws.xsd.CCMReverseZone

    Gets the value of the expire property.

getExpire() - Method in class com.cisco.cnr.ws.xsd.CCMZone

    Gets the value of the expire property.

getExpire() - Method in class com.cisco.cnr.ws.xsd.CCMZoneTemplate

    Gets the value of the expire property.

getExpired() - Method in class com.cisco.cnr.ws.xsd.CurrentPrefixUtilization

    Gets the value of the expired property.

getExpired() - Method in class com.cisco.cnr.ws.xsd.CurrentUtilization

    Gets the value of the expired property.

getExpression() - Method in class com.cisco.cnr.ws.xsd.Option

    Gets the value of the expression property.

getExpressionConfigurationTraceLevel() - Method in class com.cisco.cnr.ws.xsd.DHCPServer

    Gets the value of the expressionConfigurationTraceLevel property.

getExpressionTraceLevel() - Method in class com.cisco.cnr.ws.xsd.DHCPServer

    Gets the value of the expressionTraceLevel property.

getExtensionDrops() - Method in class com.cisco.cnr.ws.xsd.DHCP6Stats

    Gets the value of the extensionDrops property.

getExtensionDrops() - Method in class com.cisco.cnr.ws.xsd.DHCPServerActivityStats

    Gets the value of the extensionDrops property.

getExtensionErrors() - Method in class com.cisco.cnr.ws.xsd.DHCP6Stats

    Gets the value of the extensionErrors property.

getExtensionErrors() - Method in class com.cisco.cnr.ws.xsd.DHCPServerActivityStats

    Gets the value of the extensionErrors property.

getExtensionTraceLevel() - Method in class com.cisco.cnr.ws.xsd.DHCPServer

    Gets the value of the extensionTraceLevel property.

getFailedConnections() - Method in class com.cisco.cnr.ws.xsd.DHCPFailoverStats

    Gets the value of the failedConnections property.

getFailover() - Method in class com.cisco.cnr.ws.xsd.CCMFailoverPair

    Gets the value of the failover property.

getFailoverBackupAllocationBoundary() - Method in class com.cisco.cnr.ws.xsd.Scope

    Gets the value of the failoverBackupAllocationBoundary property.

getFailoverExpirationTime() - Method in class com.cisco.cnr.ws.xsd.Lease

    Gets the value of the failoverExpirationTime property.

getFailoverExpirationTime() - Method in class com.cisco.cnr.ws.xsd.Lease6

Gets the value of the failoverExpirationTime property.

getFailoverpair() - Method in class com.cisco.cnr.ws.xsd.CCMSubnet

Gets the value of the failoverpair property.

getFailoverPairName() - Method in class com.cisco.cnr.ws.xsd.FailoverRelatedServer

Gets the value of the failoverPairName property.

getFailoverRecover() - Method in class com.cisco.cnr.ws.xsd.DHCPServer

Gets the value of the failoverRecover property.

getFailoverRole() - Method in class com.cisco.cnr.ws.xsd.CurrentUtilization

Gets the value of the failoverRole property.

getFailoverState() - Method in class com.cisco.cnr.ws.xsd.CurrentUtilization

Gets the value of the failoverState property.

getFilterElementList() - Method in class com.cisco.cnr.ws.xsd.Filter

Gets the value of the filterElementList property.

getFirewallDropped() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats

Gets the value of the firewallDropped property.

getFirewallRedirected() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats

Gets the value of the firewallRedirected property.

getFirewallRedirectNxdomain() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats

Gets the value of the firewallRedirectNxdomain property.

getFirewallRefused() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats

Gets the value of the firewallRefused property.

getFirewallRpz() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats

Gets the value of the firewallRpz property.

getFlags() - Method in class com.cisco.cnr.ws.xsd.AttrDesc

Gets the value of the flags property.

getFlags() - Method in class com.cisco.cnr.ws.xsd.Lease

Gets the value of the flags property.

getFlags() - Method in class com.cisco.cnr.ws.xsd.Lease6

Gets the value of the flags property.

getFlags() - Method in class com.cisco.cnr.ws.xsd.OptionDefinitionSet

Gets the value of the flags property.

getForceDnsUpdates() - Method in class com.cisco.cnr.ws.xsd.DHCPServer

Gets the value of the forceDnsUpdates property.

getForceDnsUpdates() - Method in class com.cisco.cnr.ws.xsd.DnsUpdateConfig

Gets the value of the forceDnsUpdates property.

getForwardDnsupdate() - Method in class com.cisco.cnr.ws.xsd.Lease6

Gets the value of the forwardDnsupdate property.

getForwardDnsupdate() - Method in class com.cisco.cnr.ws.xsd.Policy

Gets the value of the forwardDnsupdate property.

getForwardZoneName() - Method in class com.cisco.cnr.ws.xsd.CCMSubnet

Gets the value of the forwardZoneName property.

getForwardZoneName() - Method in class com.cisco.cnr.ws.xsd.DnsUpdateConfig

Gets the value of the forwardZoneName property.

getForwardZoneName() - Method in class com.cisco.cnr.ws.xsd.Policy

Gets the value of the forwardZoneName property.

getHaFailureCode() - Method in class com.cisco.cnr.ws.xsd.DnsZoneStatus

    Gets the value of the haFailureCode property.

getHaFullZoneResync() - Method in class com.cisco.cnr.ws.xsd.DNSServerHaStats

    Gets the value of the haFullZoneResync property.

getHaLastTimeStateChanged() - Method in class com.cisco.cnr.ws.xsd.DNSServerHaStats

    Gets the value of the haLastTimeStateChanged property.

getHaMsgConnectRecv() - Method in class com.cisco.cnr.ws.xsd.DNSServerHaStats

    Gets the value of the haMsgConnectRecv property.

getHaMsgConnectSent() - Method in class com.cisco.cnr.ws.xsd.DNSServerHaStats

    Gets the value of the haMsgConnectSent property.

getHaMsgHeartbeatRecv() - Method in class com.cisco.cnr.ws.xsd.DNSServerHaStats

    Gets the value of the haMsgHeartbeatRecv property.

getHaMsgHeartbeatSent() - Method in class com.cisco.cnr.ws.xsd.DNSServerHaStats

    Gets the value of the haMsgHeartbeatSent property.

getHaMsgReconcileRecv() - Method in class com.cisco.cnr.ws.xsd.DNSServerHaStats

    Gets the value of the haMsgReconcileRecv property.

getHaMsgReconcileSent() - Method in class com.cisco.cnr.ws.xsd.DNSServerHaStats

    Gets the value of the haMsgReconcileSent property.

getHaMsgReqRecv() - Method in class com.cisco.cnr.ws.xsd.DNSServerHaStats

    Gets the value of the haMsgReqRecv property.

getHaMsgReqRecvTime() - Method in class com.cisco.cnr.ws.xsd.DNSServerHaStats

    Gets the value of the haMsgReqRecvTime property.

getHaMsgReqSent() - Method in class com.cisco.cnr.ws.xsd.DNSServerHaStats

    Gets the value of the haMsgReqSent property.

getHaMsgReqSentTime() - Method in class com.cisco.cnr.ws.xsd.DNSServerHaStats

    Gets the value of the haMsgReqSentTime property.

getHaMsgRespRecv() - Method in class com.cisco.cnr.ws.xsd.DNSServerHaStats

    Gets the value of the haMsgRespRecv property.

getHaMsgRespSent() - Method in class com.cisco.cnr.ws.xsd.DNSServerHaStats

    Gets the value of the haMsgRespSent property.

getHaMsgRrsyncRecv() - Method in class com.cisco.cnr.ws.xsd.DNSServerHaStats

    Gets the value of the haMsgRrsyncRecv property.

getHaMsgRrsyncSent() - Method in class com.cisco.cnr.ws.xsd.DNSServerHaStats

    Gets the value of the haMsgRrsyncSent property.

getHaMsgRrupdateRecv() - Method in class com.cisco.cnr.ws.xsd.DNSServerHaStats

    Gets the value of the haMsgRrupdateRecv property.

getHaMsgRrupdateSent() - Method in class com.cisco.cnr.ws.xsd.DNSServerHaStats

    Gets the value of the haMsgRrupdateSent property.

getHaMsgShutdownRecv() - Method in class com.cisco.cnr.ws.xsd.DNSServerHaStats

    Gets the value of the haMsgShutdownRecv property.

getHaMsgShutdownSent() - Method in class com.cisco.cnr.ws.xsd.DNSServerHaStats

    Gets the value of the haMsgShutdownSent property.

getHaMsgZonesyncRecv() - Method in class com.cisco.cnr.ws.xsd.DNSServerHaStats

    Gets the value of the haMsgZonesyncRecv property.

getHaMsgZonesyncSent() - Method in class com.cisco.cnr.ws.xsd.DNSServerHaStats

Gets the value of the haMsgZonesyncSent property.

getHaPartnerDown() - Method in class com.cisco.cnr.ws.xsd.DNSServerHaStats

Gets the value of the haPartnerDown property.

getHaPersistedEditList() - Method in class com.cisco.cnr.ws.xsd.DNSServerMaxCounterStats

Gets the value of the haPersistedEditList property.

getHardenGlue() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServer

Gets the value of the hardenGlue property.

getHardenGlue() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerConfig

Gets the value of the hardenGlue property.

getHardwareUnicast() - Method in class com.cisco.cnr.ws.xsd.DHCPServer

Gets the value of the hardwareUnicast property.

getHaRespInconsistent() - Method in class com.cisco.cnr.ws.xsd.DNSServerHaStats

Gets the value of the haRespInconsistent property.

getHaRespServfail() - Method in class com.cisco.cnr.ws.xsd.DNSServerHaStats

Gets the value of the haRespServfail property.

getHaRespUnknown() - Method in class com.cisco.cnr.ws.xsd.DNSServerHaStats

Gets the value of the haRespUnknown property.

getHaRrActiveList() - Method in class com.cisco.cnr.ws.xsd.DNSServerMaxCounterStats

Gets the value of the haRrActiveList property.

getHaRrPendingList() - Method in class com.cisco.cnr.ws.xsd.DNSServerMaxCounterStats

Gets the value of the haRrPendingList property.

getHaStateCommInterrupted() - Method in class com.cisco.cnr.ws.xsd.DNSServerHaStats

Gets the value of the haStateCommInterrupted property.

getHaStateCurrent() - Method in class com.cisco.cnr.ws.xsd.DNSServerHaStats

Gets the value of the haStateCurrent property.

getHaStateLastChangeTime() - Method in class com.cisco.cnr.ws.xsd.DNSServerHaStats

Gets the value of the haStateLastChangeTime property.

getHaStateNegotiating() - Method in class com.cisco.cnr.ws.xsd.DNSServerHaStats

Gets the value of the haStateNegotiating property.

getHaStateNormal() - Method in class com.cisco.cnr.ws.xsd.DNSServerHaStats

Gets the value of the haStateNormal property.

getHaStatePartnerDown() - Method in class com.cisco.cnr.ws.xsd.DNSServerHaStats

Gets the value of the haStatePartnerDown property.

getHaStateStartup() - Method in class com.cisco.cnr.ws.xsd.DNSServerHaStats

Gets the value of the haStateStartup property.

getHaStatus() - Method in class com.cisco.cnr.ws.xsd.DnsZoneStatus

Gets the value of the haStatus property.

getHaSync() - Method in class com.cisco.cnr.ws.xsd.DNSServerHaStats

Gets the value of the haSync property.

getHaSyncConflict() - Method in class com.cisco.cnr.ws.xsd.DNSServerHaStats

Gets the value of the haSyncConflict property.

getHaSyncDiscardName() - Method in class com.cisco.cnr.ws.xsd.DNSServerHaStats

Gets the value of the haSyncDiscardName property.

getHaSyncMergeName() - Method in class com.cisco.cnr.ws.xsd.DNSServerHaStats

Gets the value of the haSyncMergeName property.

getHaUpdateLatencyMax() - Method in class com.cisco.cnr.ws.xsd.DNSServerMaxCounterStats

Gets the value of the haUpdateLatencyMax property.

getHaUpdateReject() - Method in class com.cisco.cnr.ws.xsd.DNSServerHaStats

Gets the value of the haUpdateReject property.

getHaZoneCount() - Method in class com.cisco.cnr.ws.xsd.DnsHAStatus

Gets the value of the haZoneCount property.

getHaZoneMismatch() - Method in class com.cisco.cnr.ws.xsd.DNSServerHaStats

Gets the value of the haZoneMismatch property.

getHealth() - Method in class com.cisco.cnr.ws.xsd.CCMServerInfo

Gets the value of the health property.

getHhcInterval() - Method in class com.cisco.cnr.ws.xsd.DNSServer

Gets the value of the hhcInterval property.

getHhcMaxInitTtl() - Method in class com.cisco.cnr.ws.xsd.DNSServer

Gets the value of the hhcMaxInitTtl property.

getHhcMaxTtl() - Method in class com.cisco.cnr.ws.xsd.DNSServer

Gets the value of the hhcMaxTtl property.

getHistoryList() - Method in class com.cisco.cnr.ws.xsd.CurrentPrefixUtilization

Gets the value of the historyList property.

getHistoryList() - Method in class com.cisco.cnr.ws.xsd.CurrentUtilization

Gets the value of the historyList property.

getHits() - Method in class com.cisco.cnr.ws.xsd.CCMRRSet

Gets the value of the hits property.

getHost() - Method in class com.cisco.cnr.ws.xsd.DnsException

Gets the value of the host property.

getHost() - Method in class com.cisco.cnr.ws.xsd.DnsForwarder

Gets the value of the host property.

getHostHealthCheck() - Method in class com.cisco.cnr.ws.xsd.CCMRRSet

Gets the value of the hostHealthCheck property.

getHostHealthCheck() - Method in class com.cisco.cnr.ws.xsd.DNSServer

Gets the value of the hostHealthCheck property.

getHostName() - Method in class com.cisco.cnr.ws.xsd.ClientClass

Gets the value of the hostName property.

getHostName() - Method in class com.cisco.cnr.ws.xsd.ClientEntry

Gets the value of the hostName property.

getHostNameGenerator() - Method in class com.cisco.cnr.ws.xsd.DnsUpdateConfig

Gets the value of the hostNameGenerator property.

getHttpPort() - Method in class com.cisco.cnr.ws.xsd.CCMCluster

Gets the value of the httpPort property.

getHttps() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServer

Gets the value of the https property.

getHttps() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerConfig

Gets the value of the https property.

getHttpsPort() - Method in class com.cisco.cnr.ws.xsd.CCMCluster

Gets the value of the httpsPort property.

getHttpsPort() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServer

Gets the value of the httpsPort property.

getHttpsPort() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerConfig

Gets the value of the httpsPort property.

getHttpsQueryBuffer() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats

Gets the value of the httpsQueryBuffer property.

getHttpsResponseBuffer() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats

Gets the value of the httpsResponseBuffer property.

getHybridAdnsAddrs() - Method in class com.cisco.cnr.ws.xsd.DNSServer

Gets the value of the hybridAdnsAddrs property.

getHybridLocalhostOnly() - Method in class com.cisco.cnr.ws.xsd.DNSServer

Gets the value of the hybridLocalhostOnly property.

getHybridMode() - Method in class com.cisco.cnr.ws.xsd.DNSServer

Gets the value of the hybridMode property.

getHybridOverride() - Method in class com.cisco.cnr.ws.xsd.DNSServer

Gets the value of the hybridOverride property.

getHybridUseAdnsAddrs() - Method in class com.cisco.cnr.ws.xsd.DNSServer

Gets the value of the hybridUseAdnsAddrs property.

getId() - Method in class com.cisco.cnr.ws.xsd.AttrDesc

Gets the value of the id property.

getId() - Method in class com.cisco.cnr.ws.xsd.DNSServerStats

Gets the value of the id property.

getId() - Method in class com.cisco.cnr.ws.xsd.Key

Gets the value of the id property.

getId() - Method in class com.cisco.cnr.ws.xsd.VPN

Gets the value of the id property.

getIdRange() - Method in class com.cisco.cnr.ws.xsd.OptionDefinitionSet

Gets the value of the idRange property.

getIgnoreCiscoOptions() - Method in class com.cisco.cnr.ws.xsd.DHCPServer

Gets the value of the ignoreCiscoOptions property.

getIgnoreDeclines() - Method in class com.cisco.cnr.ws.xsd.CCMScopeTemplate

Gets the value of the ignoreDeclines property.

getIgnoreDeclines() - Method in class com.cisco.cnr.ws.xsd.Prefix

Gets the value of the ignoreDeclines property.

getIgnoreDeclines() - Method in class com.cisco.cnr.ws.xsd.PrefixTemplate

Gets the value of the ignoreDeclines property.

getIgnoreDeclines() - Method in class com.cisco.cnr.ws.xsd.Scope

Gets the value of the ignoreDeclines property.

getIgnoreIcmpErrors() - Method in class com.cisco.cnr.ws.xsd.DHCPServer

Gets the value of the ignoreIcmpErrors property.

getIgnoreRequestsForOtherServers() - Method in class com.cisco.cnr.ws.xsd.DHCPServer

Gets the value of the ignoreRequestsForOtherServers property.

getImmediateResponseAverage() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats

Gets the value of the immediateResponseAverage property.

getImmediateResponseCount() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats

Gets the value of the immediateResponseCount property.

Gets the value of the intWarningLevel property.

getInUseAddresses() - Method in class com.cisco.cnr.ws.xsd.DHCPScopeAggregationStats

Gets the value of the inUseAddresses property.

getInvalidClients() - Method in class com.cisco.cnr.ws.xsd.DHCP6Stats

Gets the value of the invalidClients property.

getInvalidClients() - Method in class com.cisco.cnr.ws.xsd.DHCPServerActivityStats

Gets the value of the invalidClients property.

getInvalidConnections() - Method in class com.cisco.cnr.ws.xsd.DHCPFailoverStats

Gets the value of the invalidConnections property.

getInvalidMessagesReceived() - Method in class com.cisco.cnr.ws.xsd.DHCPFailoverStats

Gets the value of the invalidMessagesReceived property.

getInvalidPackets() - Method in class com.cisco.cnr.ws.xsd.DHCP6Stats

Gets the value of the invalidPackets property.

getInvalidPackets() - Method in class com.cisco.cnr.ws.xsd.DHCPServerActivityStats

Gets the value of the invalidPackets property.

getIp6Addr() - Method in class com.cisco.cnr.ws.xsd.FilterElement

Gets the value of the ip6Addr property.

getIp6Address() - Method in class com.cisco.cnr.ws.xsd.CCMCluster

Gets the value of the ip6Address property.

getIp6Address() - Method in class com.cisco.cnr.ws.xsd.DNSRelatedServer

Gets the value of the ip6Address property.

getIp6Address() - Method in class com.cisco.cnr.ws.xsd.FailoverRelatedServer

Gets the value of the ip6Address property.

getIp6Address() - Method in class com.cisco.cnr.ws.xsd.LDAPRelatedServer

Gets the value of the ip6Address property.

getIp6Address() - Method in class com.cisco.cnr.ws.xsd.Lease6

Gets the value of the ip6Address property.

getIp6Address() - Method in class com.cisco.cnr.ws.xsd.RelayAgentState

Gets the value of the ip6Address property.

getIp6Address() - Method in class com.cisco.cnr.ws.xsd.Reservation6

Gets the value of the ip6Address property.

getIp6Address() - Method in class com.cisco.cnr.ws.xsd.TCPConnectionRelatedServer

Gets the value of the ip6Address property.

getIp6Address() - Method in class com.cisco.cnr.ws.xsd.TCPListenerRelatedServer

Gets the value of the ip6Address property.

getIp6AddressList() - Method in class com.cisco.cnr.ws.xsd.CCMHost

Gets the value of the ip6AddressList property.

getIp6Prefix() - Method in class com.cisco.cnr.ws.xsd.FilterElement

Gets the value of the ip6Prefix property.

getIpaddr() - Method in class com.cisco.cnr.ws.xsd.CCMCluster

Gets the value of the ipaddr property.

getIpaddr() - Method in class com.cisco.cnr.ws.xsd.CCMServer

Gets the value of the ipaddr property.

getIpaddr() - Method in class com.cisco.cnr.ws.xsd.DNSRelatedServer

Gets the value of the ipaddr property.

Gets the value of the leaseHistPollInterval property.

getLeaseHistPollOffset() - Method in class com.cisco.cnr.ws.xsd.CCMCluster

Gets the value of the leaseHistPollOffset property.

getLeaseHistPollRetry() - Method in class com.cisco.cnr.ws.xsd.CCMCluster

Gets the value of the leaseHistPollRetry property.

getLeasequeries() - Method in class com.cisco.cnr.ws.xsd.DHCP6Stats

Gets the value of the leasequeries property.

getLeaseQueries() - Method in class com.cisco.cnr.ws.xsd.DHCPServerActivityStats

Gets the value of the leaseQueries property.

getLeaseQueriesActive() - Method in class com.cisco.cnr.ws.xsd.DHCPServerActivityStats

Gets the value of the leaseQueriesActive property.

getLeaseQueriesUnassigned() - Method in class com.cisco.cnr.ws.xsd.DHCPServerActivityStats

Gets the value of the leaseQueriesUnassigned property.

getLeaseQueriesUnknown() - Method in class com.cisco.cnr.ws.xsd.DHCPServerActivityStats

Gets the value of the leaseQueriesUnknown property.

getLeasequeryReplies() - Method in class com.cisco.cnr.ws.xsd.DHCP6Stats

Gets the value of the leasequeryReplies property.

getLeaseRebindingTime() - Method in class com.cisco.cnr.ws.xsd.Lease

Gets the value of the leaseRebindingTime property.

getLeaseRenewalTime() - Method in class com.cisco.cnr.ws.xsd.Lease

Gets the value of the leaseRenewalTime property.

getLeaseRetentionLimit() - Method in class com.cisco.cnr.ws.xsd.Policy

Gets the value of the leaseRetentionLimit property.

getLeaseRetentionMaxAge() - Method in class com.cisco.cnr.ws.xsd.DHCPServer

Gets the value of the leaseRetentionMaxAge property.

getLeaseRetentionMinAge() - Method in class com.cisco.cnr.ws.xsd.DHCPServer

Gets the value of the leaseRetentionMinAge property.

getLicensedServices() - Method in class com.cisco.cnr.ws.xsd.CCMCluster

Gets the value of the licensedServices property.

getLimit() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerRateLimitItem

Gets the value of the limit property.

getLimitationCount() - Method in class com.cisco.cnr.ws.xsd.Policy

Gets the value of the limitationCount property.

getLimitationId() - Method in class com.cisco.cnr.ws.xsd.ClientClass

Gets the value of the limitationId property.

getLimitationId() - Method in class com.cisco.cnr.ws.xsd.Lease

Gets the value of the limitationId property.

getLink() - Method in class com.cisco.cnr.ws.xsd.Prefix

Gets the value of the link property.

getLinkDescriptionExpr() - Method in class com.cisco.cnr.ws.xsd.LinkTemplate

Gets the value of the linkDescriptionExpr property.

getLinkName() - Method in class com.cisco.cnr.ws.xsd.CurrentPrefixUtilization

Gets the value of the linkName property.

getLinkNameExpr() - Method in class com.cisco.cnr.ws.xsd.LinkTemplate

Gets the value of the linkNameExpr property.

getLinkTemplateType() - Method in class com.cisco.cnr.ws.xsd.LinkTemplate

  Gets the value of the LinkTemplateType property.

getLinkType() - Method in class com.cisco.cnr.ws.xsd.Link

  Gets the value of the LinkType property.

getList() - Method in class com.cisco.cnr.ws.xsd.ClassBaseArray

  Gets the value of the list property.

getList() - Method in class com.cisco.cnr.ws.xsd.DHCPTopUtilizedStats

  Gets the value of the list property.

getListenIpVersion() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServer

  Gets the value of the listenIpVersion property.

getListenIpVersion() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerConfig

  Gets the value of the listenIpVersion property.

getListenProtocol() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServer

  Gets the value of the listenProtocol property.

getListenProtocol() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerConfig

  Gets the value of the listenProtocol property.

getLoadBalancing() - Method in class com.cisco.cnr.ws.xsd.CCMFailoverPair

  Gets the value of the loadBalancing property.

getLoadBalancingBackupPct() - Method in class com.cisco.cnr.ws.xsd.FailoverRelatedServer

  Gets the value of the loadBalancingBackupPct property.

getLoadBalancingDroppedRequests() - Method in class com.cisco.cnr.ws.xsd.FailoverRelatedServer

  Gets the value of the loadBalancingDroppedRequests property.

getLoadBalancingDroppedTotal() - Method in class com.cisco.cnr.ws.xsd.FailoverRelatedServer

  Gets the value of the loadBalancingDroppedTotal property.

getLoadBalancingLocalHba() - Method in class com.cisco.cnr.ws.xsd.FailoverRelatedServer

  Gets the value of the loadBalancingLocalHba property.

getLoadBalancingPartnerHba() - Method in class com.cisco.cnr.ws.xsd.FailoverRelatedServer

  Gets the value of the loadBalancingPartnerHba property.

getLoadBalancingProcessedRequests() - Method in class com.cisco.cnr.ws.xsd.FailoverRelatedServer

  Gets the value of the loadBalancingProcessedRequests property.

getLoadBalancingProcessedTotal() - Method in class com.cisco.cnr.ws.xsd.FailoverRelatedServer

  Gets the value of the loadBalancingProcessedTotal property.

getLocal() - Method in class com.cisco.cnr.ws.xsd.CCMServer

  Gets the value of the local property.

getLocalCluster() - Method in class com.cisco.cnr.ws.xsd.Link

  Gets the value of the localCluster property.

getLocalCluster() - Method in class com.cisco.cnr.ws.xsd.Prefix

  Gets the value of the localCluster property.

getLocalPortNum() - Method in class com.cisco.cnr.ws.xsd.DNSServer

  Gets the value of the localPortNum property.

getLocalServers() - Method in class com.cisco.cnr.ws.xsd.CCMCluster

  Gets the value of the localServers property.

getLogFormat() - Method in class com.cisco.cnr.ws.xsd.DHCPServer

  Gets the value of the logFormat property.

getLogSettings() - Method in class com.cisco.cnr.ws.xsd.DHCPServer

Gets the value of the logSettings property.

getLogSettings() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServer

Gets the value of the logSettings property.

getLogSettings() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerConfig

Gets the value of the logSettings property.

getLogsFreeSpace() - Method in class com.cisco.cnr.ws.xsd.SystemStats

Gets the value of the logsFreeSpace property.

getLogsPath() - Method in class com.cisco.cnr.ws.xsd.SystemStats

Gets the value of the logsPath property.

getLogsTotalSpace() - Method in class com.cisco.cnr.ws.xsd.SystemStats

Gets the value of the logsTotalSpace property.

getLongestPrefixLength() - Method in class com.cisco.cnr.ws.xsd.Policy

Gets the value of the longestPrefixLength property.

getLookupKey() - Method in class com.cisco.cnr.ws.xsd.Reservation

Gets the value of the lookupKey property.

getLookupKey() - Method in class com.cisco.cnr.ws.xsd.Reservation6

Gets the value of the lookupKey property.

getLookupKeyType() - Method in class com.cisco.cnr.ws.xsd.Reservation

Gets the value of the lookupKeyType property.

getLookupKeyType() - Method in class com.cisco.cnr.ws.xsd.Reservation6

Gets the value of the lookupKeyType property.

getMacAddressOnly() - Method in class com.cisco.cnr.ws.xsd.DHCPServer

Gets the value of the macAddressOnly property.

getMain() - Method in class com.cisco.cnr.ws.xsd.CCMFailoverPair

Gets the value of the main property.

getMain() - Method in class com.cisco.cnr.ws.xsd.CCMHaDnsPair

Gets the value of the main property.

getMainIp6Address() - Method in class com.cisco.cnr.ws.xsd.CCMFailoverPair

Gets the value of the mainIp6Address property.

getMainServer() - Method in class com.cisco.cnr.ws.xsd.CCMFailoverPair

Gets the value of the mainServer property.

getMaintenance() - Method in class com.cisco.cnr.ws.xsd.Link

Gets the value of the maintenance property.

getMaintenance() - Method in class com.cisco.cnr.ws.xsd.Prefix

Gets the value of the maintenance property.

getMaintenance() - Method in class com.cisco.cnr.ws.xsd.Scope

Gets the value of the maintenance property.

getMapRadiusClass() - Method in class com.cisco.cnr.ws.xsd.DHCPServer

Gets the value of the mapRadiusClass property.

getMapRadiusPoolName() - Method in class com.cisco.cnr.ws.xsd.DHCPServer

Gets the value of the mapRadiusPoolName property.

getMapUserClassId() - Method in class com.cisco.cnr.ws.xsd.DHCPServer

Gets the value of the mapUserClassId property.

getMasterServers() - Method in class com.cisco.cnr.ws.xsd.CCMSecondaryZone

Gets the value of the masterServers property.

Gets the value of the maxLeases property.

getMaxLeasesPerBinding() - Method in class com.cisco.cnr.ws.xsd.Policy

Gets the value of the maxLeasesPerBinding property.

getMaxLeaseTime() - Method in class com.cisco.cnr.ws.xsd.DHCPRenewalData

Gets the value of the maxLeaseTime property.

getMaxPdBalancingLength() - Method in class com.cisco.cnr.ws.xsd.CurrentPrefixUtilization

Gets the value of the maxPdBalancingLength property.

getMaxPdBalancingLength() - Method in class com.cisco.cnr.ws.xsd.Prefix

Gets the value of the maxPdBalancingLength property.

getMaxPdBalancingLength() - Method in class com.cisco.cnr.ws.xsd.PrefixTemplate

Gets the value of the maxPdBalancingLength property.

getMaxPingPackets() - Method in class com.cisco.cnr.ws.xsd.DHCPServer

Gets the value of the maxPingPackets property.

getMaxPreferredLifetime() - Method in class com.cisco.cnr.ws.xsd.DHCPRenewalData

Gets the value of the maxPreferredLifetime property.

getMaxRequests() - Method in class com.cisco.cnr.ws.xsd.DNSRelatedServer

Gets the value of the maxRequests property.

getMaxRequests() - Method in class com.cisco.cnr.ws.xsd.LDAPRelatedServer

Gets the value of the maxRequests property.

getMaxUdpPayloadSize() - Method in class com.cisco.cnr.ws.xsd.DNSServer

Gets the value of the maxUdpPayloadSize property.

getMaxWaitingPackets() - Method in class com.cisco.cnr.ws.xsd.DHCPServer

Gets the value of the maxWaitingPackets property.

getMclt() - Method in class com.cisco.cnr.ws.xsd.CCMFailoverPair

Gets the value of the mclt property.

getMemCache() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats

Gets the value of the memCache property.

getMemCacheExceeded() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats

Gets the value of the memCacheExceeded property.

getMemCacheHits() - Method in class com.cisco.cnr.ws.xsd.DNSServerQueryStats

Gets the value of the memCacheHits property.

getMemCacheMisses() - Method in class com.cisco.cnr.ws.xsd.DNSServerQueryStats

Gets the value of the memCacheMisses property.

getMemCacheSize() - Method in class com.cisco.cnr.ws.xsd.DNSServer

Gets the value of the memCacheSize property.

getMemIterator() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats

Gets the value of the memIterator property.

getMemoryUtilization() - Method in class com.cisco.cnr.ws.xsd.ServerSystemStats

Gets the value of the memoryUtilization property.

getMemProcess() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats

Gets the value of the memProcess property.

getMemQueryCache() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats

Gets the value of the memQueryCache property.

getMemQueryCacheExceeded() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats

Gets the value of the memQueryCacheExceeded property.

getMemValidator() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats

Gets the value of the memValidator property.

getMinDnsTtl() - Method in class com.cisco.cnr.ws.xsd.DHCPServer

Gets the value of the minDnsTtl property.

getMinDnsTtl() - Method in class com.cisco.cnr.ws.xsd.DnsUpdateConfig

Gets the value of the minDnsTtl property.

getMinimalResponses() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServer

Gets the value of the minimalResponses property.

getMinimalResponses() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerConfig

Gets the value of the minimalResponses property.

getMinimalResponses() - Method in class com.cisco.cnr.ws.xsd.DNSServer

Gets the value of the minimalResponses property.

getMinimizeTtls() - Method in class com.cisco.cnr.ws.xsd.DNSServer

Gets the value of the minimizeTtls property.

getMinttl() - Method in class com.cisco.cnr.ws.xsd.CCMReverseZone

Gets the value of the minttl property.

getMinttl() - Method in class com.cisco.cnr.ws.xsd.CCMZone

Gets the value of the minttl property.

getMinttl() - Method in class com.cisco.cnr.ws.xsd.CCMZoneTemplate

Gets the value of the minttl property.

getMode() - Method in class com.cisco.cnr.ws.xsd.DHCPScopeAggregationStats

Gets the value of the mode property.

getMsgCacheSize() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServer

Gets the value of the msgCacheSize property.

getMsgCacheSize() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerConfig

Gets the value of the msgCacheSize property.

getMulticastAddresses() - Method in class com.cisco.cnr.ws.xsd.DHCPServer

Gets the value of the multicastAddresses property.

getNaks() - Method in class com.cisco.cnr.ws.xsd.DHCPServerActivityStats

Gets the value of the naks property.

getName() - Method in class com.cisco.cnr.ws.xsd.ACL

Gets the value of the name property.

getName() - Method in class com.cisco.cnr.ws.xsd.AddrSet

Gets the value of the name property.

getName() - Method in class com.cisco.cnr.ws.xsd.AttrDesc

Gets the value of the name property.

getName() - Method in class com.cisco.cnr.ws.xsd.AuthDnsSec

Gets the value of the name property.

getName() - Method in class com.cisco.cnr.ws.xsd.CCMCluster

Gets the value of the name property.

getName() - Method in class com.cisco.cnr.ws.xsd.CCMFailoverPair

Gets the value of the name property.

getName() - Method in class com.cisco.cnr.ws.xsd.CCMHaDnsPair

Gets the value of the name property.

getName() - Method in class com.cisco.cnr.ws.xsd.CCMHost

Gets the value of the name property.

getName() - Method in class com.cisco.cnr.ws.xsd.CCMRRSet

Gets the value of the name property.

getName() - Method in class com.cisco.cnr.ws.xsd.CCMScopeTemplate

Gets the value of the name property.

getName() - Method in class com.cisco.cnr.ws.xsd.CCMServer

Gets the value of the name property.

getName() - Method in class com.cisco.cnr.ws.xsd.CCMZoneDistribution

Gets the value of the name property.

getName() - Method in class com.cisco.cnr.ws.xsd.CCMZoneTemplate

Gets the value of the name property.

getName() - Method in class com.cisco.cnr.ws.xsd.CdnsRateLimit

Gets the value of the name property.

getName() - Method in class com.cisco.cnr.ws.xsd.CdnsRedirect

Gets the value of the name property.

getName() - Method in class com.cisco.cnr.ws.xsd.Certificate

Gets the value of the name property.

getName() - Method in class com.cisco.cnr.ws.xsd.ClientClass

Gets the value of the name property.

getName() - Method in class com.cisco.cnr.ws.xsd.ClientEntry

Gets the value of the name property.

getName() - Method in class com.cisco.cnr.ws.xsd.DHCPMaintenanceWindow

Gets the value of the name property.

getName() - Method in class com.cisco.cnr.ws.xsd.DHCPScopeAggregationStats

Gets the value of the name property.

getName() - Method in class com.cisco.cnr.ws.xsd.DHCPScopeStatus

Gets the value of the name property.

getName() - Method in class com.cisco.cnr.ws.xsd.DHCPServer

Gets the value of the name property.

getName() - Method in class com.cisco.cnr.ws.xsd.Dns64

Gets the value of the name property.

getName() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServer

Gets the value of the name property.

getName() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerConfig

Gets the value of the name property.

getName() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerRateLimitItem

Gets the value of the name property.

getName() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats

Gets the value of the name property.

getName() - Method in class com.cisco.cnr.ws.xsd.DnsEnumConfig

Gets the value of the name property.

getName() - Method in class com.cisco.cnr.ws.xsd.DnsException

Gets the value of the name property.

getName() - Method in class com.cisco.cnr.ws.xsd.DnsForwarder

Gets the value of the name property.

getName() - Method in class com.cisco.cnr.ws.xsd.DnsSec
> Gets the value of the name property.

getName() - Method in class com.cisco.cnr.ws.xsd.DnsSecKey
> Gets the value of the name property.

getName() - Method in class com.cisco.cnr.ws.xsd.DNSServer
> Gets the value of the name property.

getName() - Method in class com.cisco.cnr.ws.xsd.DnsTrustAnchor
> Gets the value of the name property.

getName() - Method in class com.cisco.cnr.ws.xsd.DnsUpdateConfig
> Gets the value of the name property.

getName() - Method in class com.cisco.cnr.ws.xsd.DnsView
> Gets the value of the name property.

getName() - Method in class com.cisco.cnr.ws.xsd.Key
> Gets the value of the name property.

getName() - Method in class com.cisco.cnr.ws.xsd.Link
> Gets the value of the name property.

getName() - Method in class com.cisco.cnr.ws.xsd.LinkTemplate
> Gets the value of the name property.

getName() - Method in class com.cisco.cnr.ws.xsd.OptionDefinitionSet
> Gets the value of the name property.

getName() - Method in class com.cisco.cnr.ws.xsd.Policy
> Gets the value of the name property.

getName() - Method in class com.cisco.cnr.ws.xsd.Prefix
> Gets the value of the name property.

getName() - Method in class com.cisco.cnr.ws.xsd.PrefixTemplate
> Gets the value of the name property.

getName() - Method in class com.cisco.cnr.ws.xsd.ResourceValue
> Gets the value of the name property.

getName() - Method in class com.cisco.cnr.ws.xsd.Scope
> Gets the value of the name property.

getName() - Method in class com.cisco.cnr.ws.xsd.ServerSystemStats
> Gets the value of the name property.

getName() - Method in class com.cisco.cnr.ws.xsd.TCPConnectionRelatedServer
> Gets the value of the name property.

getName() - Method in class com.cisco.cnr.ws.xsd.TCPListenerRelatedServer
> Gets the value of the name property.

getName() - Method in class com.cisco.cnr.ws.xsd.UpdatePolicy
> Gets the value of the name property.

getName() - Method in class com.cisco.cnr.ws.xsd.VPN
> Gets the value of the name property.

getNameNumber() - Method in class com.cisco.cnr.ws.xsd.Lease6
> Gets the value of the nameNumber property.

getNameservers() - Method in class com.cisco.cnr.ws.xsd.CCMReverseZone
> Gets the value of the nameservers property.

getNameservers() - Method in class com.cisco.cnr.ws.xsd.CCMZone

Gets the value of the nameservers property.

getNameservers() - Method in class com.cisco.cnr.ws.xsd.CCMZoneTemplate

Gets the value of the nameservers property.

getNameservers() - Method in class com.cisco.cnr.ws.xsd.DnsEnumDomain

Gets the value of the nameservers property.

getNegativeTest() - Method in class com.cisco.cnr.ws.xsd.Filter

Gets the value of the negativeTest property.

getNegativeTest() - Method in class com.cisco.cnr.ws.xsd.FilterElement

Gets the value of the negativeTest property.

getNegCacheSize() - Method in class com.cisco.cnr.ws.xsd.DnsSec

Gets the value of the negCacheSize property.

getNotifiesIn() - Method in class com.cisco.cnr.ws.xsd.DNSServerPerformanceStats

Gets the value of the notifiesIn property.

getNotifiesOut() - Method in class com.cisco.cnr.ws.xsd.DNSServerPerformanceStats

Gets the value of the notifiesOut property.

getNotify() - Method in class com.cisco.cnr.ws.xsd.CCMReverseZone

Gets the value of the notify property.

getNotify() - Method in class com.cisco.cnr.ws.xsd.CCMSecondaryZone

Gets the value of the notify property.

getNotify() - Method in class com.cisco.cnr.ws.xsd.CCMZDSecondary

Gets the value of the notify property.

getNotify() - Method in class com.cisco.cnr.ws.xsd.CCMZone

Gets the value of the notify property.

getNotify() - Method in class com.cisco.cnr.ws.xsd.CCMZoneDistribution

Gets the value of the notify property.

getNotify() - Method in class com.cisco.cnr.ws.xsd.CCMZoneTemplate

Gets the value of the notify property.

getNotify() - Method in class com.cisco.cnr.ws.xsd.DNSServer

Gets the value of the notify property.

getNotifyList() - Method in class com.cisco.cnr.ws.xsd.CCMReverseZone

Gets the value of the notifyList property.

getNotifyList() - Method in class com.cisco.cnr.ws.xsd.CCMSecondaryZone

Gets the value of the notifyList property.

getNotifyList() - Method in class com.cisco.cnr.ws.xsd.CCMZDSecondary

Gets the value of the notifyList property.

getNotifyList() - Method in class com.cisco.cnr.ws.xsd.CCMZone

Gets the value of the notifyList property.

getNotifyList() - Method in class com.cisco.cnr.ws.xsd.CCMZoneDistribution

Gets the value of the notifyList property.

getNotifyList() - Method in class com.cisco.cnr.ws.xsd.CCMZoneTemplate

Gets the value of the notifyList property.

getNotifyMinInterval() - Method in class com.cisco.cnr.ws.xsd.DNSServer

Gets the value of the notifyMinInterval property.

getNotifyRcvInterval() - Method in class com.cisco.cnr.ws.xsd.DNSServer

Gets the value of the notifyRcvInterval property.

getNotifySendStagger() - Method in class com.cisco.cnr.ws.xsd.DNSServer

Gets the value of the notifySendStagger property.

getNotifySourceAddress() - Method in class com.cisco.cnr.ws.xsd.DNSServer

Gets the value of the notifySourceAddress property.

getNotifySourceIp6Address() - Method in class com.cisco.cnr.ws.xsd.DNSServer

Gets the value of the notifySourceIp6Address property.

getNotifySourcePort() - Method in class com.cisco.cnr.ws.xsd.DNSServer

Gets the value of the notifySourcePort property.

getNotifyWait() - Method in class com.cisco.cnr.ws.xsd.DNSServer

Gets the value of the notifyWait property.

getNs() - Method in class com.cisco.cnr.ws.xsd.CCMReverseZone

Gets the value of the ns property.

getNs() - Method in class com.cisco.cnr.ws.xsd.CCMZone

Gets the value of the ns property.

getNs() - Method in class com.cisco.cnr.ws.xsd.CCMZoneTemplate

Gets the value of the ns property.

getNsttl() - Method in class com.cisco.cnr.ws.xsd.CCMReverseZone

Gets the value of the nsttl property.

getNsttl() - Method in class com.cisco.cnr.ws.xsd.CCMZone

Gets the value of the nsttl property.

getNsttl() - Method in class com.cisco.cnr.ws.xsd.CCMZoneTemplate

Gets the value of the nsttl property.

getNumber() - Method in class com.cisco.cnr.ws.xsd.DnsEnumEntrySet

Gets the value of the number property.

getNumber() - Method in class com.cisco.cnr.ws.xsd.Option

Gets the value of the number property.

getNumberPrefix() - Method in class com.cisco.cnr.ws.xsd.DnsEnumConfig

Gets the value of the numberPrefix property.

getNumClientsRatelimited() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerRateLimitStats

Gets the value of the numClientsRatelimited property.

getNumDomainsRatelimited() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerRateLimitStats

Gets the value of the numDomainsRatelimited property.

getObjectOid() - Method in class com.cisco.cnr.ws.xsd.ClassBase

Gets the value of the objectOid property.

getOffered() - Method in class com.cisco.cnr.ws.xsd.CurrentPrefixUtilization

Gets the value of the offered property.

getOffered() - Method in class com.cisco.cnr.ws.xsd.CurrentUtilization

Gets the value of the offered property.

getOffers() - Method in class com.cisco.cnr.ws.xsd.DHCPServerActivityStats

Gets the value of the offers property.

getOfferTimeout() - Method in class com.cisco.cnr.ws.xsd.CCMScopeTemplate

Gets the value of the offerTimeout property.

getOfferTimeout() - Method in class com.cisco.cnr.ws.xsd.Policy

Gets the value of the offerTimeout property.

getOfferTimeouts() - Method in class com.cisco.cnr.ws.xsd.DHCP6Stats
    Gets the value of the offerTimeouts property.
getOfferTimeouts() - Method in class com.cisco.cnr.ws.xsd.DHCPServerActivityStats
    Gets the value of the offerTimeouts property.
getOk() - Method in class com.cisco.cnr.ws.xsd.ResourceStatus
    Gets the value of the ok property.
getOneLeasePerClient() - Method in class com.cisco.cnr.ws.xsd.DHCPServer
    Gets the value of the oneLeasePerClient property.
getOptionDefinitionSetName() - Method in class com.cisco.cnr.ws.xsd.Option
    Gets the value of the optionDefinitionSetName property.
getOptionDesc() - Method in class com.cisco.cnr.ws.xsd.Option
    Gets the value of the optionDesc property.
getOptionList() - Method in class com.cisco.cnr.ws.xsd.AttrDesc
    Gets the value of the optionList property.
getOptionList() - Method in class com.cisco.cnr.ws.xsd.OptionDefinitionSet
    Gets the value of the optionList property.
getOptionList() - Method in class com.cisco.cnr.ws.xsd.Policy
    Gets the value of the optionList property.
getOptionSet() - Method in class com.cisco.cnr.ws.xsd.AttrDesc
    Gets the value of the optionSet property.
getOptionsExpr() - Method in class com.cisco.cnr.ws.xsd.CCMScopeTemplate
    Gets the value of the optionsExpr property.
getOptionsExpr() - Method in class com.cisco.cnr.ws.xsd.LinkTemplate
    Gets the value of the optionsExpr property.
getOptionsExpr() - Method in class com.cisco.cnr.ws.xsd.PrefixTemplate
    Gets the value of the optionsExpr property.
getOrder() - Method in class com.cisco.cnr.ws.xsd.CCMRR
    Gets the value of the order property.
getOrder() - Method in class com.cisco.cnr.ws.xsd.DnsEnumEntry
    Gets the value of the order property.
getOrigin() - Method in class com.cisco.cnr.ws.xsd.CCMReverseZone
    Gets the value of the origin property.
getOrigin() - Method in class com.cisco.cnr.ws.xsd.CCMSecondaryZone
    Gets the value of the origin property.
getOrigin() - Method in class com.cisco.cnr.ws.xsd.CCMZone
    Gets the value of the origin property.
getOrigin() - Method in class com.cisco.cnr.ws.xsd.DnsZoneStatus
    Gets the value of the origin property.
getOtherAvail() - Method in class com.cisco.cnr.ws.xsd.CurrentUtilization
    Gets the value of the otherAvail property.
getOtherAvailable() - Method in class com.cisco.cnr.ws.xsd.CurrentPrefixUtilization
    Gets the value of the otherAvailable property.
getOtherServer() - Method in class com.cisco.cnr.ws.xsd.DHCP6Stats
    Gets the value of the otherServer property.
getOtherServerDownTime() - Method in class com.cisco.cnr.ws.xsd.FailoverRelatedServer

Gets the value of the otherServerDownTime property.

getOurIp6Address() - Method in class com.cisco.cnr.ws.xsd.FailoverRelatedServer

Gets the value of the ourIp6Address property.

getOurIp6Address() - Method in class com.cisco.cnr.ws.xsd.TCPConnectionRelatedServer

Gets the value of the ourIp6Address property.

getOurIpaddr() - Method in class com.cisco.cnr.ws.xsd.FailoverRelatedServer

Gets the value of the ourIpaddr property.

getOurIpaddr() - Method in class com.cisco.cnr.ws.xsd.TCPConnectionRelatedServer

Gets the value of the ourIpaddr property.

getOurPort() - Method in class com.cisco.cnr.ws.xsd.TCPConnectionRelatedServer

Gets the value of the ourPort property.

getOverLimitClientClassName() - Method in class com.cisco.cnr.ws.xsd.ClientClass

Gets the value of the overLimitClientClassName property.

getOverLimitClientClassName() - Method in class com.cisco.cnr.ws.xsd.ClientEntry

Gets the value of the overLimitClientClassName property.

getOverMaxWaiting() - Method in class com.cisco.cnr.ws.xsd.DHCP6Stats

Gets the value of the overMaxWaiting property.

getOverMaxWaiting() - Method in class com.cisco.cnr.ws.xsd.DHCPServerActivityStats

Gets the value of the overMaxWaiting property.

getOverrideClientId() - Method in class com.cisco.cnr.ws.xsd.ClientClass

Gets the value of the overrideClientId property.

getOverrideVpn() - Method in class com.cisco.cnr.ws.xsd.ClientClass

Gets the value of the overrideVpn property.

getOverrideVpn() - Method in class com.cisco.cnr.ws.xsd.ClientEntry

Gets the value of the overrideVpn property.

getOwner() - Method in class com.cisco.cnr.ws.xsd.CCMReverseZone

Gets the value of the owner property.

getOwner() - Method in class com.cisco.cnr.ws.xsd.CCMSubnet

Gets the value of the owner property.

getOwner() - Method in class com.cisco.cnr.ws.xsd.CCMZone

Gets the value of the owner property.

getOwner() - Method in class com.cisco.cnr.ws.xsd.CCMZoneTemplate

Gets the value of the owner property.

getOwner() - Method in class com.cisco.cnr.ws.xsd.CurrentPrefixUtilization

Gets the value of the owner property.

getOwner() - Method in class com.cisco.cnr.ws.xsd.CurrentUtilization

Gets the value of the owner property.

getOwner() - Method in class com.cisco.cnr.ws.xsd.Link

Gets the value of the owner property.

getOwner() - Method in class com.cisco.cnr.ws.xsd.LinkTemplate

Gets the value of the owner property.

getOwner() - Method in class com.cisco.cnr.ws.xsd.Prefix

Gets the value of the owner property.

getOwner() - Method in class com.cisco.cnr.ws.xsd.PrefixTemplate

Gets the value of the owner property.

Gets the value of the packetsReceivedRelay property.

getPacketsSent() - Method in class com.cisco.cnr.ws.xsd.DHCP6Stats

Gets the value of the packetsSent property.

getPacketsSent() - Method in class com.cisco.cnr.ws.xsd.DHCPFailoverStats

Gets the value of the packetsSent property.

getPacketsSent() - Method in class com.cisco.cnr.ws.xsd.DHCPServerActivityStats

Gets the value of the packetsSent property.

getPacketsSentRelay() - Method in class com.cisco.cnr.ws.xsd.DHCP6Stats

Gets the value of the packetsSentRelay property.

getParameterRequestList() - Method in class com.cisco.cnr.ws.xsd.Lease

Gets the value of the parameterRequestList property.

getParent() - Method in class com.cisco.cnr.ws.xsd.CCMSubnet

Gets the value of the parent property.

getPartnerLastDiscoverSolicitTime() - Method in class com.cisco.cnr.ws.xsd.RelayAgentState

Gets the value of the partnerLastDiscoverSolicitTime property.

getPartnerRequestCount() - Method in class com.cisco.cnr.ws.xsd.RelayAgentState

Gets the value of the partnerRequestCount property.

getPartnerRole() - Method in class com.cisco.cnr.ws.xsd.FailoverRelatedServer

Gets the value of the partnerRole property.

getPartnerState() - Method in class com.cisco.cnr.ws.xsd.FailoverRelatedServer

Gets the value of the partnerState property.

getPartnerUnresponsiveDuration() - Method in class com.cisco.cnr.ws.xsd.RelayAgentState

Gets the value of the partnerUnresponsiveDuration property.

getPartnerVendorMajorVersion() - Method in class com.cisco.cnr.ws.xsd.FailoverRelatedServer

Gets the value of the partnerVendorMajorVersion property.

getPartnerVendorMinorVersion() - Method in class com.cisco.cnr.ws.xsd.FailoverRelatedServer

Gets the value of the partnerVendorMinorVersion property.

getPassword() - Method in class com.cisco.cnr.ws.xsd.CCMCluster

Gets the value of the password property.

getPassword() - Method in class com.cisco.cnr.ws.xsd.CCMServer

Gets the value of the password property.

getPassword() - Method in class com.cisco.cnr.ws.xsd.CnrSoapAuth

Gets the value of the password property.

getPasswordSecret() - Method in class com.cisco.cnr.ws.xsd.CCMCluster

Gets the value of the passwordSecret property.

getPasswordSecret() - Method in class com.cisco.cnr.ws.xsd.CCMServer

Gets the value of the passwordSecret property.

getPeakIntValue() - Method in class com.cisco.cnr.ws.xsd.ResourceValue

Gets the value of the peakIntValue property.

getPeakTime() - Method in class com.cisco.cnr.ws.xsd.ResourceValue

Gets the value of the peakTime property.

getPeakValueMessage() - Method in class com.cisco.cnr.ws.xsd.ResourceValue

Gets the value of the peakValueMessage property.

getPendAvail() - Method in class com.cisco.cnr.ws.xsd.CurrentUtilization

Gets the value of the pendAvail property.

getPendingAvailable() - Method in class com.cisco.cnr.ws.xsd.CurrentPrefixUtilization

> Gets the value of the pendingAvailable property.

getPendingDelete() - Method in class com.cisco.cnr.ws.xsd.CurrentPrefixUtilization

> Gets the value of the pendingDelete property.

getPermanentLeases() - Method in class com.cisco.cnr.ws.xsd.Policy

> Gets the value of the permanentLeases property.

getPerson() - Method in class com.cisco.cnr.ws.xsd.CCMReverseZone

> Gets the value of the person property.

getPerson() - Method in class com.cisco.cnr.ws.xsd.CCMZone

> Gets the value of the person property.

getPerson() - Method in class com.cisco.cnr.ws.xsd.CCMZoneTemplate

> Gets the value of the person property.

getPerson() - Method in class com.cisco.cnr.ws.xsd.DnsEnumDomain

> Gets the value of the person property.

getPid() - Method in class com.cisco.cnr.ws.xsd.CCMServerInfo

> Gets the value of the pid property.

getPid() - Method in class com.cisco.cnr.ws.xsd.ServerSystemStats

> Gets the value of the pid property.

getPingClients() - Method in class com.cisco.cnr.ws.xsd.CCMScopeTemplate

> Gets the value of the pingClients property.

getPingClients() - Method in class com.cisco.cnr.ws.xsd.DHCPServer

> Gets the value of the pingClients property.

getPingClients() - Method in class com.cisco.cnr.ws.xsd.Scope

> Gets the value of the pingClients property.

getPingTimeout() - Method in class com.cisco.cnr.ws.xsd.CCMScopeTemplate

> Gets the value of the pingTimeout property.

getPingTimeout() - Method in class com.cisco.cnr.ws.xsd.DHCPServer

> Gets the value of the pingTimeout property.

getPingTimeout() - Method in class com.cisco.cnr.ws.xsd.Scope

> Gets the value of the pingTimeout property.

getPnConn() - Method in class com.cisco.cnr.ws.xsd.DNSServerPushNotificationStats

> Gets the value of the pnConn property.

getPnConnClosed() - Method in class com.cisco.cnr.ws.xsd.DNSServerPushNotificationStats

> Gets the value of the pnConnClosed property.

getPnConnCurrent() - Method in class com.cisco.cnr.ws.xsd.DNSServerPushNotificationStats

> Gets the value of the pnConnCurrent property.

getPnConnMaxConns() - Method in class com.cisco.cnr.ws.xsd.DNSServerPushNotificationStats

> Gets the value of the pnConnMaxConns property.

getPnConnRefused() - Method in class com.cisco.cnr.ws.xsd.DNSServerPushNotificationStats

> Gets the value of the pnConnRefused property.

getPnConnTerminated() - Method in class com.cisco.cnr.ws.xsd.DNSServerPushNotificationStats

> Gets the value of the pnConnTerminated property.

getPnConnTerminatedConnTtl() - Method in class com.cisco.cnr.ws.xsd.DNSServerPushNotificationStats

> Gets the value of the pnConnTerminatedConnTtl property.

getPnConnTerminatedError() - Method in class com.cisco.cnr.ws.xsd.DNSServerPushNotificationStats
    Gets the value of the pnConnTerminatedError property.
getPnKeepalive() - Method in class com.cisco.cnr.ws.xsd.DNSServerPushNotificationStats
    Gets the value of the pnKeepalive property.
getPnReconfirm() - Method in class com.cisco.cnr.ws.xsd.DNSServerPushNotificationStats
    Gets the value of the pnReconfirm property.
getPnReqMalformed() - Method in class com.cisco.cnr.ws.xsd.DNSServerPushNotificationStats
    Gets the value of the pnReqMalformed property.
getPnSubscribe() - Method in class com.cisco.cnr.ws.xsd.DNSServerPushNotificationStats
    Gets the value of the pnSubscribe property.
getPnSubscribeFormerr() - Method in class com.cisco.cnr.ws.xsd.DNSServerPushNotificationStats
    Gets the value of the pnSubscribeFormerr property.
getPnSubscribeNoerror() - Method in class com.cisco.cnr.ws.xsd.DNSServerPushNotificationStats
    Gets the value of the pnSubscribeNoerror property.
getPnSubscribeNotauth() - Method in class com.cisco.cnr.ws.xsd.DNSServerPushNotificationStats
    Gets the value of the pnSubscribeNotauth property.
getPnSubscribeRefused() - Method in class com.cisco.cnr.ws.xsd.DNSServerPushNotificationStats
    Gets the value of the pnSubscribeRefused property.
getPnSubscribeServfail() - Method in class com.cisco.cnr.ws.xsd.DNSServerPushNotificationStats
    Gets the value of the pnSubscribeServfail property.
getPnUnsubscribe() - Method in class com.cisco.cnr.ws.xsd.DNSServerPushNotificationStats
    Gets the value of the pnUnsubscribe property.
getPnUpdate() - Method in class com.cisco.cnr.ws.xsd.DNSServerPushNotificationStats
    Gets the value of the pnUpdate property.
getPolicy() - Method in class com.cisco.cnr.ws.xsd.CCMScopeTemplate
    Gets the value of the policy property.
getPolicy() - Method in class com.cisco.cnr.ws.xsd.Link
    Gets the value of the policy property.
getPolicy() - Method in class com.cisco.cnr.ws.xsd.LinkTemplate
    Gets the value of the policy property.
getPolicy() - Method in class com.cisco.cnr.ws.xsd.Prefix
    Gets the value of the policy property.
getPolicy() - Method in class com.cisco.cnr.ws.xsd.PrefixTemplate
    Gets the value of the policy property.
getPolicy() - Method in class com.cisco.cnr.ws.xsd.Scope
    Gets the value of the policy property.
getPolicyName() - Method in class com.cisco.cnr.ws.xsd.ClientClass
    Gets the value of the policyName property.
getPolicyName() - Method in class com.cisco.cnr.ws.xsd.ClientEntry
    Gets the value of the policyName property.
getPollLeaseHistInterval() - Method in class com.cisco.cnr.ws.xsd.CCMCluster
    Gets the value of the pollLeaseHistInterval property.
getPollLeaseHistOffset() - Method in class com.cisco.cnr.ws.xsd.CCMCluster
    Gets the value of the pollLeaseHistOffset property.
getPollLeaseHistRetry() - Method in class com.cisco.cnr.ws.xsd.CCMCluster

getPrefix() - Method in class com.cisco.cnr.ws.xsd.CurrentPrefixUtilization
    Gets the value of the prefix property.
getPrefix() - Method in class com.cisco.cnr.ws.xsd.Dns64
    Gets the value of the prefix property.
getPrefix() - Method in class com.cisco.cnr.ws.xsd.Reservation6
    Gets the value of the prefix property.
getPrefixCount() - Method in class com.cisco.cnr.ws.xsd.CurrentPrefixUtilization
    Gets the value of the prefixCount property.
getPrefixDeactivated() - Method in class com.cisco.cnr.ws.xsd.CurrentPrefixUtilization
    Gets the value of the prefixDeactivated property.
getPrefixDeactivatedCount() - Method in class com.cisco.cnr.ws.xsd.CurrentPrefixUtilization
    Gets the value of the prefixDeactivatedCount property.
getPrefixDelegationUpdates() - Method in class com.cisco.cnr.ws.xsd.DnsUpdateConfig
    Gets the value of the prefixDelegationUpdates property.
getPrefixDescriptionExpr() - Method in class com.cisco.cnr.ws.xsd.PrefixTemplate
    Gets the value of the prefixDescriptionExpr property.
getPrefixesAvailable() - Method in class com.cisco.cnr.ws.xsd.CurrentPrefixUtilization
    Gets the value of the prefixesAvailable property.
getPrefixesInTransition() - Method in class com.cisco.cnr.ws.xsd.CurrentPrefixUtilization
    Gets the value of the prefixesInTransition property.
getPrefixesInUse() - Method in class com.cisco.cnr.ws.xsd.CurrentPrefixUtilization
    Gets the value of the prefixesInUse property.
getPrefixesOtherAvailable() - Method in class com.cisco.cnr.ws.xsd.CurrentPrefixUtilization
    Gets the value of the prefixesOtherAvailable property.
getPrefixExpr() - Method in class com.cisco.cnr.ws.xsd.LinkTemplate
    Gets the value of the prefixExpr property.
getPrefixList() - Method in class com.cisco.cnr.ws.xsd.Link
    Gets the value of the prefixList property.
getPrefixName() - Method in class com.cisco.cnr.ws.xsd.CurrentPrefixUtilization
    Gets the value of the prefixName property.
getPrefixName() - Method in class com.cisco.cnr.ws.xsd.Lease6
    Gets the value of the prefixName property.
getPrefixNameExpr() - Method in class com.cisco.cnr.ws.xsd.PrefixTemplate
    Gets the value of the prefixNameExpr property.
getPrefixRange() - Method in class com.cisco.cnr.ws.xsd.CurrentPrefixUtilization
    Gets the value of the prefixRange property.
getPrimary() - Method in class com.cisco.cnr.ws.xsd.CCMZoneDistribution
    Gets the value of the primary property.
getPrimaryServers() - Method in class com.cisco.cnr.ws.xsd.CCMSecondaryZone
    Gets the value of the primaryServers property.
getPrimaryServers() - Method in class com.cisco.cnr.ws.xsd.CCMZDCaching
    Gets the value of the primaryServers property.
getPrimaryServers() - Method in class com.cisco.cnr.ws.xsd.CCMZDSecondary
    Gets the value of the primaryServers property.
getPrimaryServers() - Method in class com.cisco.cnr.ws.xsd.CCMZoneDistribution

Gets the value of the primaryServers property.

getPrimarySubnet() - Method in class com.cisco.cnr.ws.xsd.CCMSubnet

Gets the value of the primarySubnet property.

getPrimarySubnet() - Method in class com.cisco.cnr.ws.xsd.CurrentUtilization

Gets the value of the primarySubnet property.

getPrimarySubnet() - Method in class com.cisco.cnr.ws.xsd.Scope

Gets the value of the primarySubnet property.

getPrime() - Method in class com.cisco.cnr.ws.xsd.DnsException

Gets the value of the prime property.

getPriority() - Method in class com.cisco.cnr.ws.xsd.CdnsRedirect

Gets the value of the priority property.

getPriority() - Method in class com.cisco.cnr.ws.xsd.Dns64

Gets the value of the priority property.

getPriority() - Method in class com.cisco.cnr.ws.xsd.DnsView

Gets the value of the priority property.

getPriorityAddressAllocation() - Method in class com.cisco.cnr.ws.xsd.DHCPServer

Gets the value of the priorityAddressAllocation property.

getProbePollingEventId() - Method in class com.cisco.cnr.ws.xsd.DNSRelatedServer

Gets the value of the probePollingEventId property.

getProductVersion() - Method in class com.cisco.cnr.ws.xsd.CCMCluster

Gets the value of the productVersion property.

getProtectedState() - Method in class com.cisco.cnr.ws.xsd.CCMRRSet

Gets the value of the protectedState property.

getPublicKeyAlgorithm() - Method in class com.cisco.cnr.ws.xsd.Certificate

Gets the value of the publicKeyAlgorithm property.

getQueriesDnssec() - Method in class com.cisco.cnr.ws.xsd.DNSServerQueryStats

Gets the value of the queriesDnssec property.

getQueriesDropped() - Method in class com.cisco.cnr.ws.xsd.DNSServerQueryStats

Gets the value of the queriesDropped property.

getQueriesDroppedRecursive() - Method in class com.cisco.cnr.ws.xsd.DNSServerQueryStats

Gets the value of the queriesDroppedRecursive property.

getQueriesDroppedUnwantedClass() - Method in class com.cisco.cnr.ws.xsd.DNSServerQueryStats

Gets the value of the queriesDroppedUnwantedClass property.

getQueriesDroppedUnwantedType() - Method in class com.cisco.cnr.ws.xsd.DNSServerQueryStats

Gets the value of the queriesDroppedUnwantedType property.

getQueriesFailedAcl() - Method in class com.cisco.cnr.ws.xsd.DNSServerQueryStats

Gets the value of the queriesFailedAcl property.

getQueriesFailingAcl() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats

Gets the value of the queriesFailingAcl property.

getQueriesOverHttps() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats

Gets the value of the queriesOverHttps property.

getQueriesOverHttpsFailed() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats

Gets the value of the queriesOverHttpsFailed property.

getQueriesOverIpv4() - Method in class com.cisco.cnr.ws.xsd.DNSServerQueryStats

Gets the value of the queriesOverIpv4 property.

Gets the value of the queriesTypeDnskey property.

getQueriesTypeDnskey() - Method in class com.cisco.cnr.ws.xsd.DNSServerQueryStats

Gets the value of the queriesTypeDnskey property.

getQueriesTypeDs() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats

Gets the value of the queriesTypeDs property.

getQueriesTypeDs() - Method in class com.cisco.cnr.ws.xsd.DNSServerQueryStats

Gets the value of the queriesTypeDs property.

getQueriesTypeHttps() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats

Gets the value of the queriesTypeHttps property.

getQueriesTypeHttps() - Method in class com.cisco.cnr.ws.xsd.DNSServerQueryStats

Gets the value of the queriesTypeHttps property.

getQueriesTypeMx() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats

Gets the value of the queriesTypeMx property.

getQueriesTypeMx() - Method in class com.cisco.cnr.ws.xsd.DNSServerQueryStats

Gets the value of the queriesTypeMx property.

getQueriesTypeNaptr() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats

Gets the value of the queriesTypeNaptr property.

getQueriesTypeNaptr() - Method in class com.cisco.cnr.ws.xsd.DNSServerQueryStats

Gets the value of the queriesTypeNaptr property.

getQueriesTypeNs() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats

Gets the value of the queriesTypeNs property.

getQueriesTypeNs() - Method in class com.cisco.cnr.ws.xsd.DNSServerQueryStats

Gets the value of the queriesTypeNs property.

getQueriesTypeNsec() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats

Gets the value of the queriesTypeNsec property.

getQueriesTypeNsec() - Method in class com.cisco.cnr.ws.xsd.DNSServerQueryStats

Gets the value of the queriesTypeNsec property.

getQueriesTypeNsec3() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats

Gets the value of the queriesTypeNsec3 property.

getQueriesTypeOther() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats

Gets the value of the queriesTypeOther property.

getQueriesTypeOther() - Method in class com.cisco.cnr.ws.xsd.DNSServerQueryStats

Gets the value of the queriesTypeOther property.

getQueriesTypePtr() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats

Gets the value of the queriesTypePtr property.

getQueriesTypePtr() - Method in class com.cisco.cnr.ws.xsd.DNSServerQueryStats

Gets the value of the queriesTypePtr property.

getQueriesTypeRrsig() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats

Gets the value of the queriesTypeRrsig property.

getQueriesTypeRrsig() - Method in class com.cisco.cnr.ws.xsd.DNSServerQueryStats

Gets the value of the queriesTypeRrsig property.

getQueriesTypeSoa() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats

Gets the value of the queriesTypeSoa property.

getQueriesTypeSoa() - Method in class com.cisco.cnr.ws.xsd.DNSServerQueryStats

Gets the value of the queriesTypeSoa property.

getRange() - Method in class com.cisco.cnr.ws.xsd.Prefix

  Gets the value of the range property.

getRangeEnd() - Method in class com.cisco.cnr.ws.xsd.Prefix

  Gets the value of the rangeEnd property.

getRangeEndExpr() - Method in class com.cisco.cnr.ws.xsd.PrefixTemplate

  Gets the value of the rangeEndExpr property.

getRangeExpr() - Method in class com.cisco.cnr.ws.xsd.PrefixTemplate

  Gets the value of the rangeExpr property.

getRangeList() - Method in class com.cisco.cnr.ws.xsd.Scope

  Gets the value of the rangeList property.

getRangesExpr() - Method in class com.cisco.cnr.ws.xsd.CCMScopeTemplate

  Gets the value of the rangesExpr property.

getRangeStart() - Method in class com.cisco.cnr.ws.xsd.Prefix

  Gets the value of the rangeStart property.

getRangeStartExpr() - Method in class com.cisco.cnr.ws.xsd.PrefixTemplate

  Gets the value of the rangeStartExpr property.

getRateLimit() - Method in class com.cisco.cnr.ws.xsd.CdnsDomainRateLimit

  Gets the value of the rateLimit property.

getRcvdTsigBadKey() - Method in class com.cisco.cnr.ws.xsd.DNSServerSecurityStats

  Gets the value of the rcvdTsigBadKey property.

getRcvdTsigBadSig() - Method in class com.cisco.cnr.ws.xsd.DNSServerSecurityStats

  Gets the value of the rcvdTsigBadSig property.

getRcvdTsigBadTime() - Method in class com.cisco.cnr.ws.xsd.DNSServerSecurityStats

  Gets the value of the rcvdTsigBadTime property.

getRcvdTsigPackets() - Method in class com.cisco.cnr.ws.xsd.DNSServerSecurityStats

  Gets the value of the rcvdTsigPackets property.

getRdata() - Method in class com.cisco.cnr.ws.xsd.CCMRR

  Gets the value of the rdata property.

getRebindLimit() - Method in class com.cisco.cnr.ws.xsd.CCMFailoverPair

  Gets the value of the rebindLimit property.

getRebinds() - Method in class com.cisco.cnr.ws.xsd.DHCP6Stats

  Gets the value of the rebinds property.

getReconfigure() - Method in class com.cisco.cnr.ws.xsd.Policy

  Gets the value of the reconfigure property.

getReconfigures() - Method in class com.cisco.cnr.ws.xsd.DHCP6Stats

  Gets the value of the reconfigures property.

getReconfigureViaRelay() - Method in class com.cisco.cnr.ws.xsd.Policy

  Gets the value of the reconfigureViaRelay property.

getRecursiveRepliesTotal() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats

  Gets the value of the recursiveRepliesTotal property.

getRecursiveTimeAverage() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats

  Gets the value of the recursiveTimeAverage property.

getRecursiveTimeMedian() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats

  Gets the value of the recursiveTimeMedian property.

getRefresh() - Method in class com.cisco.cnr.ws.xsd.CCMReverseZone

Gets the value of the refresh property.

getRefresh() - Method in class com.cisco.cnr.ws.xsd.CCMZone

Gets the value of the refresh property.

getRefresh() - Method in class com.cisco.cnr.ws.xsd.CCMZoneTemplate

Gets the value of the refresh property.

getRefreshPeriod() - Method in class com.cisco.cnr.ws.xsd.DHCPMaintenanceWindow

Gets the value of the refreshPeriod property.

getRegexpStr() - Method in class com.cisco.cnr.ws.xsd.FilterElement

Gets the value of the regexpStr property.

getRegion() - Method in class com.cisco.cnr.ws.xsd.CCMReverseZone

Gets the value of the region property.

getRegion() - Method in class com.cisco.cnr.ws.xsd.CCMSubnet

Gets the value of the region property.

getRegion() - Method in class com.cisco.cnr.ws.xsd.CCMZone

Gets the value of the region property.

getRegion() - Method in class com.cisco.cnr.ws.xsd.CCMZoneTemplate

Gets the value of the region property.

getRegion() - Method in class com.cisco.cnr.ws.xsd.CurrentPrefixUtilization

Gets the value of the region property.

getRegion() - Method in class com.cisco.cnr.ws.xsd.CurrentUtilization

Gets the value of the region property.

getRegion() - Method in class com.cisco.cnr.ws.xsd.Link

Gets the value of the region property.

getRegion() - Method in class com.cisco.cnr.ws.xsd.LinkTemplate

Gets the value of the region property.

getRegion() - Method in class com.cisco.cnr.ws.xsd.Prefix

Gets the value of the region property.

getRegion() - Method in class com.cisco.cnr.ws.xsd.PrefixTemplate

Gets the value of the region property.

getRejectedConnections() - Method in class com.cisco.cnr.ws.xsd.TCPListenerRelatedServer

Gets the value of the rejectedConnections property.

getRelaxDelegationRules() - Method in class com.cisco.cnr.ws.xsd.DNSServer

Gets the value of the relaxDelegationRules property.

getRelayAgentAuth() - Method in class com.cisco.cnr.ws.xsd.Lease

Gets the value of the relayAgentAuth property.

getRelayAgentCircuitId() - Method in class com.cisco.cnr.ws.xsd.Lease

Gets the value of the relayAgentCircuitId property.

getRelayAgentDeviceClass() - Method in class com.cisco.cnr.ws.xsd.Lease

Gets the value of the relayAgentDeviceClass property.

getRelayAgentOption() - Method in class com.cisco.cnr.ws.xsd.Lease

Gets the value of the relayAgentOption property.

getRelayAgentRadiusClass() - Method in class com.cisco.cnr.ws.xsd.Lease

Gets the value of the relayAgentRadiusClass property.

getRelayAgentRadiusOptions() - Method in class com.cisco.cnr.ws.xsd.Lease

Gets the value of the relayAgentRadiusOptions property.

Gets the value of the renewOnly property.

getRenews() - Method in class com.cisco.cnr.ws.xsd.DHCP6Stats

Gets the value of the renews property.

getRepeat() - Method in class com.cisco.cnr.ws.xsd.AttrDesc

Gets the value of the repeat property.

getReplicaPollInterval() - Method in class com.cisco.cnr.ws.xsd.CCMCluster

Gets the value of the replicaPollInterval property.

getReplicaPollOffset() - Method in class com.cisco.cnr.ws.xsd.CCMCluster

Gets the value of the replicaPollOffset property.

getReplicationInitialized() - Method in class com.cisco.cnr.ws.xsd.CCMCluster

Gets the value of the replicationInitialized property.

getReplies() - Method in class com.cisco.cnr.ws.xsd.DHCP6Stats

Gets the value of the replies property.

getReplyLatencyCounts() - Method in class com.cisco.cnr.ws.xsd.DHCP6Stats

Gets the value of the replyLatencyCounts property.

getRequestBuffersAllocated() - Method in class com.cisco.cnr.ws.xsd.DHCPFailoverStats

Gets the value of the requestBuffersAllocated property.

getRequestBuffersAllocated() - Method in class com.cisco.cnr.ws.xsd.DHCPServerActivityStats

Gets the value of the requestBuffersAllocated property.

getRequestBuffersAllocated() - Method in class com.cisco.cnr.ws.xsd.FailoverRelatedServer

Gets the value of the requestBuffersAllocated property.

getRequestBuffersInUse() - Method in class com.cisco.cnr.ws.xsd.DHCPFailoverStats

Gets the value of the requestBuffersInUse property.

getRequestBuffersInUse() - Method in class com.cisco.cnr.ws.xsd.DHCPServerActivityStats

Gets the value of the requestBuffersInUse property.

getRequestBuffersInUse() - Method in class com.cisco.cnr.ws.xsd.FailoverRelatedServer

Gets the value of the requestBuffersInUse property.

getRequestDroppedOld() - Method in class com.cisco.cnr.ws.xsd.DHCP6Stats

Gets the value of the requestDroppedOld property.

getRequestDroppedOld() - Method in class com.cisco.cnr.ws.xsd.DHCPServerActivityStats

Gets the value of the requestDroppedOld property.

getRequestDroppedOthers() - Method in class com.cisco.cnr.ws.xsd.DHCP6Stats

Gets the value of the requestDroppedOthers property.

getRequestDroppedOthers() - Method in class com.cisco.cnr.ws.xsd.DHCPServerActivityStats

Gets the value of the requestDroppedOthers property.

getRequestedFqdn() - Method in class com.cisco.cnr.ws.xsd.Lease6

Gets the value of the requestedFqdn property.

getRequestedPrefixLength() - Method in class com.cisco.cnr.ws.xsd.Lease6

Gets the value of the requestedPrefixLength property.

getRequestlistTotal() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats

Gets the value of the requestlistTotal property.

getRequestlistTotalAverage() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats

Gets the value of the requestlistTotalAverage property.

getRequestlistTotalExceeded() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats

Gets the value of the requestlistTotalExceeded property.

getRequestlistTotalMax() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats

Gets the value of the requestlistTotalMax property.

getRequestlistTotalOverwritten() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats

Gets the value of the requestlistTotalOverwritten property.

getRequestlistTotalSystem() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats

Gets the value of the requestlistTotalSystem property.

getRequestlistTotalUser() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats

Gets the value of the requestlistTotalUser property.

getRequests() - Method in class com.cisco.cnr.ws.xsd.DHCP6Stats

Gets the value of the requests property.

getRequests() - Method in class com.cisco.cnr.ws.xsd.DHCPServerActivityStats

Gets the value of the requests property.

getRequests() - Method in class com.cisco.cnr.ws.xsd.DNSRelatedServer

Gets the value of the requests property.

getRequests() - Method in class com.cisco.cnr.ws.xsd.LDAPRelatedServer

Gets the value of the requests property.

getReservationCmMacAddress() - Method in class com.cisco.cnr.ws.xsd.Lease6

Gets the value of the reservationCmMacAddress property.

getReservationLookupKey() - Method in class com.cisco.cnr.ws.xsd.Lease

Gets the value of the reservationLookupKey property.

getReservationLookupKey() - Method in class com.cisco.cnr.ws.xsd.Lease6

Gets the value of the reservationLookupKey property.

getReservationLookupKeyType() - Method in class com.cisco.cnr.ws.xsd.Lease

Gets the value of the reservationLookupKeyType property.

getReservationLookupKeyType() - Method in class com.cisco.cnr.ws.xsd.Lease6

Gets the value of the reservationLookupKeyType property.

getReservationRelayAgentOption() - Method in class com.cisco.cnr.ws.xsd.Lease

Gets the value of the reservationRelayAgentOption property.

getReservedActive() - Method in class com.cisco.cnr.ws.xsd.CurrentPrefixUtilization

Gets the value of the reservedActive property.

getReservedActive() - Method in class com.cisco.cnr.ws.xsd.CurrentUtilization

Gets the value of the reservedActive property.

getReservedActiveLeases() - Method in class com.cisco.cnr.ws.xsd.DHCP6Stats

Gets the value of the reservedActiveLeases property.

getReservedActiveLeases() - Method in class com.cisco.cnr.ws.xsd.DHCPServerActivityStats

Gets the value of the reservedActiveLeases property.

getReservedAddresses() - Method in class com.cisco.cnr.ws.xsd.ClientEntry

Gets the value of the reservedAddresses property.

getReservedInactive() - Method in class com.cisco.cnr.ws.xsd.CurrentPrefixUtilization

Gets the value of the reservedInactive property.

getReservedInactive() - Method in class com.cisco.cnr.ws.xsd.CurrentUtilization

Gets the value of the reservedInactive property.

getReservedIp6Addresses() - Method in class com.cisco.cnr.ws.xsd.ClientEntry

Gets the value of the reservedIp6Addresses property.

getReservedLeasedDeactivated() - Method in class com.cisco.cnr.ws.xsd.CurrentPrefixUtilization

Gets the value of the reservedLeasedDeactivated property.

getReservedLeasedDeactivated() - Method in class com.cisco.cnr.ws.xsd.CurrentUtilization

Gets the value of the reservedLeasedDeactivated property.

getReservedLeases() - Method in class com.cisco.cnr.ws.xsd.DHCP6Stats

Gets the value of the reservedLeases property.

getReservedLeases() - Method in class com.cisco.cnr.ws.xsd.DHCPServerActivityStats

Gets the value of the reservedLeases property.

getReservedPrefixes() - Method in class com.cisco.cnr.ws.xsd.ClientEntry

Gets the value of the reservedPrefixes property.

getReservedUnavail() - Method in class com.cisco.cnr.ws.xsd.CurrentPrefixUtilization

Gets the value of the reservedUnavail property.

getReservedUnavail() - Method in class com.cisco.cnr.ws.xsd.CurrentUtilization

Gets the value of the reservedUnavail property.

getResetTime() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats

Gets the value of the resetTime property.

getResourceType() - Method in class com.cisco.cnr.ws.xsd.ResourceValue

Gets the value of the resourceType property.

getResponseBuffersAllocated() - Method in class com.cisco.cnr.ws.xsd.DHCPServerActivityStats

Gets the value of the responseBuffersAllocated property.

getResponseBuffersInUse() - Method in class com.cisco.cnr.ws.xsd.DHCPServerActivityStats

Gets the value of the responseBuffersInUse property.

getResponseDroppedOld() - Method in class com.cisco.cnr.ws.xsd.DHCP6Stats

Gets the value of the responseDroppedOld property.

getResponseDroppedOld() - Method in class com.cisco.cnr.ws.xsd.DHCPServerActivityStats

Gets the value of the responseDroppedOld property.

getResponseDroppedOthers() - Method in class com.cisco.cnr.ws.xsd.DHCP6Stats

Gets the value of the responseDroppedOthers property.

getResponseDroppedOthers() - Method in class com.cisco.cnr.ws.xsd.DHCPServerActivityStats

Gets the value of the responseDroppedOthers property.

getResponsesDropped() - Method in class com.cisco.cnr.ws.xsd.DHCPServerActivityStats

Gets the value of the responsesDropped property.

getResponsesWithNotimp() - Method in class com.cisco.cnr.ws.xsd.DNSServerPerformanceStats

Gets the value of the responsesWithNotimp property.

getRestartTime() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats

Gets the value of the restartTime property.

getRestoreState() - Method in class com.cisco.cnr.ws.xsd.CCMCluster

Gets the value of the restoreState property.

getRestrictQuery() - Method in class com.cisco.cnr.ws.xsd.CCMZDSecondary

Gets the value of the restrictQuery property.

getRestrictQuery() - Method in class com.cisco.cnr.ws.xsd.CCMZoneDistribution

Gets the value of the restrictQuery property.

getRestrictQueryAcl() - Method in class com.cisco.cnr.ws.xsd.CCMReverseZone

Gets the value of the restrictQueryAcl property.

getRestrictQueryAcl() - Method in class com.cisco.cnr.ws.xsd.CCMSecondaryZone

Gets the value of the restrictQueryAcl property.

getRestrictQueryAcl() - Method in class com.cisco.cnr.ws.xsd.CCMZDSecondary
    Gets the value of the restrictQueryAcl property.
getRestrictQueryAcl() - Method in class com.cisco.cnr.ws.xsd.CCMZone
    Gets the value of the restrictQueryAcl property.
getRestrictQueryAcl() - Method in class com.cisco.cnr.ws.xsd.CCMZoneDistribution
    Gets the value of the restrictQueryAcl property.
getRestrictQueryAcl() - Method in class com.cisco.cnr.ws.xsd.CCMZoneTemplate
    Gets the value of the restrictQueryAcl property.
getRestrictQueryAcl() - Method in class com.cisco.cnr.ws.xsd.DNSServer
    Gets the value of the restrictQueryAcl property.
getRestrictQueryAcl() - Method in class com.cisco.cnr.ws.xsd.DNSServerSecurityStats
    Gets the value of the restrictQueryAcl property.
getRestrictToAdminAllocation() - Method in class com.cisco.cnr.ws.xsd.Prefix
    Gets the value of the restrictToAdminAllocation property.
getRestrictToAdminAllocation() - Method in class com.cisco.cnr.ws.xsd.PrefixTemplate
    Gets the value of the restrictToAdminAllocation property.
getRestrictToAdminAllocation() - Method in class com.cisco.cnr.ws.xsd.Scope
    Gets the value of the restrictToAdminAllocation property.
getRestrictToReservations() - Method in class com.cisco.cnr.ws.xsd.CCMScopeTemplate
    Gets the value of the restrictToReservations property.
getRestrictToReservations() - Method in class com.cisco.cnr.ws.xsd.Prefix
    Gets the value of the restrictToReservations property.
getRestrictToReservations() - Method in class com.cisco.cnr.ws.xsd.PrefixTemplate
    Gets the value of the restrictToReservations property.
getRestrictToReservations() - Method in class com.cisco.cnr.ws.xsd.Scope
    Gets the value of the restrictToReservations property.
getRestrictXfer() - Method in class com.cisco.cnr.ws.xsd.CCMReverseZone
    Gets the value of the restrictXfer property.
getRestrictXfer() - Method in class com.cisco.cnr.ws.xsd.CCMSecondaryZone
    Gets the value of the restrictXfer property.
getRestrictXfer() - Method in class com.cisco.cnr.ws.xsd.CCMZDSecondary
    Gets the value of the restrictXfer property.
getRestrictXfer() - Method in class com.cisco.cnr.ws.xsd.CCMZone
    Gets the value of the restrictXfer property.
getRestrictXfer() - Method in class com.cisco.cnr.ws.xsd.CCMZoneDistribution
    Gets the value of the restrictXfer property.
getRestrictXfer() - Method in class com.cisco.cnr.ws.xsd.CCMZoneTemplate
    Gets the value of the restrictXfer property.
getRestrictXfer() - Method in class com.cisco.cnr.ws.xsd.DNSServer
    Gets the value of the restrictXfer property.
getRestrictXferAcl() - Method in class com.cisco.cnr.ws.xsd.CCMReverseZone
    Gets the value of the restrictXferAcl property.
getRestrictXferAcl() - Method in class com.cisco.cnr.ws.xsd.CCMSecondaryZone
    Gets the value of the restrictXferAcl property.
getRestrictXferAcl() - Method in class com.cisco.cnr.ws.xsd.CCMZDSecondary

Gets the value of the restrictXferAcl property.

getRestrictXferAcl() - Method in class com.cisco.cnr.ws.xsd.CCMZone

Gets the value of the restrictXferAcl property.

getRestrictXferAcl() - Method in class com.cisco.cnr.ws.xsd.CCMZoneDistribution

Gets the value of the restrictXferAcl property.

getRestrictXferAcl() - Method in class com.cisco.cnr.ws.xsd.CCMZoneTemplate

Gets the value of the restrictXferAcl property.

getRestrictXferAcl() - Method in class com.cisco.cnr.ws.xsd.DNSServer

Gets the value of the restrictXferAcl property.

getRetry() - Method in class com.cisco.cnr.ws.xsd.CCMReverseZone

Gets the value of the retry property.

getRetry() - Method in class com.cisco.cnr.ws.xsd.CCMZone

Gets the value of the retry property.

getRetry() - Method in class com.cisco.cnr.ws.xsd.CCMZoneTemplate

Gets the value of the retry property.

getReturnClientFqdnIfAsked() - Method in class com.cisco.cnr.ws.xsd.DHCPServer

Gets the value of the returnClientFqdnIfAsked property.

getRevDnsUpdateConfigName() - Method in class com.cisco.cnr.ws.xsd.Lease

Gets the value of the revDnsUpdateConfigName property.

getReverseDnsupdate() - Method in class com.cisco.cnr.ws.xsd.Lease6

Gets the value of the reverseDnsupdate property.

getReverseDnsupdate() - Method in class com.cisco.cnr.ws.xsd.Policy

Gets the value of the reverseDnsupdate property.

getReverseZoneName() - Method in class com.cisco.cnr.ws.xsd.CCMSubnet

Gets the value of the reverseZoneName property.

getReverseZoneName() - Method in class com.cisco.cnr.ws.xsd.DnsUpdateConfig

Gets the value of the reverseZoneName property.

getReverseZonePrefixLength() - Method in class com.cisco.cnr.ws.xsd.DnsUpdateConfig

Gets the value of the reverseZonePrefixLength property.

getReverseZonePrefixLength() - Method in class com.cisco.cnr.ws.xsd.Prefix

Gets the value of the reverseZonePrefixLength property.

getReverseZonePrefixLength() - Method in class com.cisco.cnr.ws.xsd.PrefixTemplate

Gets the value of the reverseZonePrefixLength property.

getRevoked() - Method in class com.cisco.cnr.ws.xsd.CurrentPrefixUtilization

Gets the value of the revoked property.

getRhcElapsedTime() - Method in class com.cisco.cnr.ws.xsd.CCMFailoverPair

Gets the value of the rhcElapsedTime property.

getRhcMonitorFirstRelay() - Method in class com.cisco.cnr.ws.xsd.CCMFailoverPair

Gets the value of the rhcMonitorFirstRelay property.

getRhcRequestCount() - Method in class com.cisco.cnr.ws.xsd.CCMFailoverPair

Gets the value of the rhcRequestCount property.

getRhcResponseTime() - Method in class com.cisco.cnr.ws.xsd.CCMFailoverPair

Gets the value of the rhcResponseTime property.

getRhcRestartTime() - Method in class com.cisco.cnr.ws.xsd.CCMFailoverPair

Gets the value of the rhcRestartTime property.

getRhcServerPreference() - Method in class com.cisco.cnr.ws.xsd.CCMFailoverPair

> Gets the value of the rhcServerPreference property.

getRhcUnresponsiveTime() - Method in class com.cisco.cnr.ws.xsd.CCMFailoverPair

> Gets the value of the rhcUnresponsiveTime property.

getRhcWarningInterval() - Method in class com.cisco.cnr.ws.xsd.CCMFailoverPair

> Gets the value of the rhcWarningInterval property.

getRole() - Method in class com.cisco.cnr.ws.xsd.DnsHAStatus

> Gets the value of the role property.

getRole() - Method in class com.cisco.cnr.ws.xsd.FailoverRelatedServer

> Gets the value of the role property.

getRolloverDueDate() - Method in class com.cisco.cnr.ws.xsd.DnsSecKey

> Gets the value of the rolloverDueDate property.

getRootHints() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServer

> Gets the value of the rootHints property.

getRootHints() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerConfig

> Gets the value of the rootHints property.

getRoundRobin() - Method in class com.cisco.cnr.ws.xsd.CCMReverseZone

> Gets the value of the roundRobin property.

getRoundRobin() - Method in class com.cisco.cnr.ws.xsd.CCMSecondaryZone

> Gets the value of the roundRobin property.

getRoundRobin() - Method in class com.cisco.cnr.ws.xsd.CCMZDSecondary

> Gets the value of the roundRobin property.

getRoundRobin() - Method in class com.cisco.cnr.ws.xsd.CCMZone

> Gets the value of the roundRobin property.

getRoundRobin() - Method in class com.cisco.cnr.ws.xsd.CCMZoneDistribution

> Gets the value of the roundRobin property.

getRoundRobin() - Method in class com.cisco.cnr.ws.xsd.CCMZoneTemplate

> Gets the value of the roundRobin property.

getRoundRobin() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServer

> Gets the value of the roundRobin property.

getRoundRobin() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerConfig

> Gets the value of the roundRobin property.

getRoundRobin() - Method in class com.cisco.cnr.ws.xsd.DNSServer

> Gets the value of the roundRobin property.

getRoundRobin() - Method in class com.cisco.cnr.ws.xsd.Option

> Gets the value of the roundRobin property.

getRouterHost() - Method in class com.cisco.cnr.ws.xsd.CCMScopeTemplate

> Gets the value of the routerHost property.

getRpz() - Method in class com.cisco.cnr.ws.xsd.CCMReverseZone

> Gets the value of the rpz property.

getRpz() - Method in class com.cisco.cnr.ws.xsd.CCMSecondaryZone

> Gets the value of the rpz property.

getRpz() - Method in class com.cisco.cnr.ws.xsd.CCMZone

> Gets the value of the rpz property.

getRpzAxfrs() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats

Gets the value of the rpzAxfrs property.

getRpzCname() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats
Gets the value of the rpzCname property.

getRpzDisabled() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats
Gets the value of the rpzDisabled property.

getRpzDrop() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats
Gets the value of the rpzDrop property.

getRpzInvalid() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats
Gets the value of the rpzInvalid property.

getRpzIxfrs() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats
Gets the value of the rpzIxfrs property.

getRpzLocal() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats
Gets the value of the rpzLocal property.

getRpzNodata() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats
Gets the value of the rpzNodata property.

getRpzNoOverride() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats
Gets the value of the rpzNoOverride property.

getRpzNotifys() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats
Gets the value of the rpzNotifys property.

getRpzNotifysInvalid() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats
Gets the value of the rpzNotifysInvalid property.

getRpzNxdomain() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats
Gets the value of the rpzNxdomain property.

getRpzOverride() - Method in class com.cisco.cnr.ws.xsd.CdnsRedirect
Gets the value of the rpzOverride property.

getRpzOverrideRedirect() - Method in class com.cisco.cnr.ws.xsd.CdnsRedirect
Gets the value of the rpzOverrideRedirect property.

getRpzPassthru() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats
Gets the value of the rpzPassthru property.

getRpzRrsAdded() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats
Gets the value of the rpzRrsAdded property.

getRpzRrsetCount() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats
Gets the value of the rpzRrsetCount property.

getRpzRrsRemoved() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats
Gets the value of the rpzRrsRemoved property.

getRpzServerAddrs() - Method in class com.cisco.cnr.ws.xsd.CdnsRedirect
Gets the value of the rpzServerAddrs property.

getRpzTcp() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats
Gets the value of the rpzTcp property.

getRpzTls() - Method in class com.cisco.cnr.ws.xsd.CdnsRedirect
Gets the value of the rpzTls property.

getRpzTlsAuthName() - Method in class com.cisco.cnr.ws.xsd.CdnsRedirect
Gets the value of the rpzTlsAuthName property.

getRpzZoneName() - Method in class com.cisco.cnr.ws.xsd.CdnsRedirect
Gets the value of the rpzZoneName property.

Gets the value of the sampleTime property.

getSampleTime() - Method in class com.cisco.cnr.ws.xsd.DNSServerStats

Gets the value of the sampleTime property.

getSaveNegativeCacheEntries() - Method in class com.cisco.cnr.ws.xsd.DNSServer

Gets the value of the saveNegativeCacheEntries property.

getSaveVendorClassId() - Method in class com.cisco.cnr.ws.xsd.DHCPServer

Gets the value of the saveVendorClassId property.

getScope() - Method in class com.cisco.cnr.ws.xsd.Reservation

Gets the value of the scope property.

getScopeDeactivated() - Method in class com.cisco.cnr.ws.xsd.CurrentUtilization

Gets the value of the scopeDeactivated property.

getScopeDescriptionExpr() - Method in class com.cisco.cnr.ws.xsd.CCMScopeTemplate

Gets the value of the scopeDescriptionExpr property.

getScopeList() - Method in class com.cisco.cnr.ws.xsd.CCMSubnet

Gets the value of the scopeList property.

getScopeName() - Method in class com.cisco.cnr.ws.xsd.CCMScopeTemplate

Gets the value of the scopeName property.

getScopeName() - Method in class com.cisco.cnr.ws.xsd.CurrentUtilization

Gets the value of the scopeName property.

getScopeName() - Method in class com.cisco.cnr.ws.xsd.Lease

Gets the value of the scopeName property.

getScopeStatus() - Method in class com.cisco.cnr.ws.xsd.DHCPScopeStatus

Gets the value of the scopeStatus property.

getScopetemplate() - Method in class com.cisco.cnr.ws.xsd.CCMFailoverPair

Gets the value of the scopetemplate property.

getScpAttrName(String, String) - Static method in class com.cisco.cnr.ws.xsd.ScpAndJavaConverter

getScpPort() - Method in class com.cisco.cnr.ws.xsd.CCMCluster

Gets the value of the scpPort property.

getScpPort() - Method in class com.cisco.cnr.ws.xsd.CCMServer

Gets the value of the scpPort property.

getScpReadTimeout() - Method in class com.cisco.cnr.ws.xsd.CCMCluster

Gets the value of the scpReadTimeout property.

getScpReadTimeout() - Method in class com.cisco.cnr.ws.xsd.CCMServer

Gets the value of the scpReadTimeout property.

getScvgEnabled() - Method in class com.cisco.cnr.ws.xsd.CCMReverseZone

Gets the value of the scvgEnabled property.

getScvgEnabled() - Method in class com.cisco.cnr.ws.xsd.CCMZone

Gets the value of the scvgEnabled property.

getScvgEnabled() - Method in class com.cisco.cnr.ws.xsd.CCMZoneTemplate

Gets the value of the scvgEnabled property.

getScvgIgnoreRestartInterval() - Method in class com.cisco.cnr.ws.xsd.DNSServer

Gets the value of the scvgIgnoreRestartInterval property.

getScvgInterval() - Method in class com.cisco.cnr.ws.xsd.CCMReverseZone

Gets the value of the scvgInterval property.

getScvgInterval() - Method in class com.cisco.cnr.ws.xsd.CCMZone
Gets the value of the scvgInterval property.
getScvgInterval() - Method in class com.cisco.cnr.ws.xsd.CCMZoneTemplate
Gets the value of the scvgInterval property.
getScvgInterval() - Method in class com.cisco.cnr.ws.xsd.DNSServer
Gets the value of the scvgInterval property.
getScvgMaxRecords() - Method in class com.cisco.cnr.ws.xsd.CCMReverseZone
Gets the value of the scvgMaxRecords property.
getScvgMaxRecords() - Method in class com.cisco.cnr.ws.xsd.CCMZone
Gets the value of the scvgMaxRecords property.
getScvgMaxRecords() - Method in class com.cisco.cnr.ws.xsd.CCMZoneTemplate
Gets the value of the scvgMaxRecords property.
getScvgRefreshInterval() - Method in class com.cisco.cnr.ws.xsd.CCMReverseZone
Gets the value of the scvgRefreshInterval property.
getScvgRefreshInterval() - Method in class com.cisco.cnr.ws.xsd.CCMZone
Gets the value of the scvgRefreshInterval property.
getScvgRefreshInterval() - Method in class com.cisco.cnr.ws.xsd.CCMZoneTemplate
Gets the value of the scvgRefreshInterval property.
getScvgRefreshInterval() - Method in class com.cisco.cnr.ws.xsd.DNSServer
Gets the value of the scvgRefreshInterval property.
getSecondariesList() - Method in class com.cisco.cnr.ws.xsd.CCMZoneDistribution
Gets the value of the secondariesList property.
getSecondary() - Method in class com.cisco.cnr.ws.xsd.CCMZDSecondary
Gets the value of the secondary property.
getSecret() - Method in class com.cisco.cnr.ws.xsd.Key
Gets the value of the secret property.
getSecurityEventAlarmSettings() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServer
Gets the value of the securityEventAlarmSettings property.
getSecurityEventAlarmSettings() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerConfig
Gets the value of the securityEventAlarmSettings property.
getSecurityEventAlarmSettings() - Method in class com.cisco.cnr.ws.xsd.DNSServer
Gets the value of the securityEventAlarmSettings property.
getSecurityEventLogging() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServer
Gets the value of the securityEventLogging property.
getSecurityEventLogging() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerConfig
Gets the value of the securityEventLogging property.
getSecurityEventLogging() - Method in class com.cisco.cnr.ws.xsd.DNSServer
Gets the value of the securityEventLogging property.
getSecurityEventLogSettings() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServer
Gets the value of the securityEventLogSettings property.
getSecurityEventLogSettings() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerConfig
Gets the value of the securityEventLogSettings property.
getSecurityEventLogSettings() - Method in class com.cisco.cnr.ws.xsd.DNSServer
Gets the value of the securityEventLogSettings property.
getSecurityEventMaxQnameSize() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServer

Gets the value of the securityEventMaxQnameSize property.

getSecurityEventMaxQnameSize() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerConfig

Gets the value of the securityEventMaxQnameSize property.

getSecurityEventMaxQnameSize() - Method in class com.cisco.cnr.ws.xsd.DNSServer

Gets the value of the securityEventMaxQnameSize property.

getSecurityEventMaxQps() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServer

Gets the value of the securityEventMaxQps property.

getSecurityEventMaxQps() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerConfig

Gets the value of the securityEventMaxQps property.

getSecurityEventMaxQps() - Method in class com.cisco.cnr.ws.xsd.DNSServer

Gets the value of the securityEventMaxQps property.

getSecurityEvents() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats

Gets the value of the securityEvents property.

getSecurityEvents() - Method in class com.cisco.cnr.ws.xsd.DNSServerSecurityStats

Gets the value of the securityEvents property.

getSecurityEventsAlarm() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats

Gets the value of the securityEventsAlarm property.

getSecurityEventsAlarm() - Method in class com.cisco.cnr.ws.xsd.DNSServerSecurityStats

Gets the value of the securityEventsAlarm property.

getSecurityEventsAmplificationAttack() - Method in class
com.cisco.cnr.ws.xsd.DNSCachingServerStats

Gets the value of the securityEventsAmplificationAttack property.

getSecurityEventsAmplificationAttack() - Method in class
com.cisco.cnr.ws.xsd.DNSServerSecurityStats

Gets the value of the securityEventsAmplificationAttack property.

getSecurityEventsDnsTunneling() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats

Gets the value of the securityEventsDnsTunneling property.

getSecurityEventsDnsTunneling() - Method in class com.cisco.cnr.ws.xsd.DNSServerSecurityStats

Gets the value of the securityEventsDnsTunneling property.

getSecurityEventsDos() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats

Gets the value of the securityEventsDos property.

getSecurityEventsDos() - Method in class com.cisco.cnr.ws.xsd.DNSServerSecurityStats

Gets the value of the securityEventsDos property.

getSecurityEventsFirewall() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats

Gets the value of the securityEventsFirewall property.

getSecurityEventsMalware() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats

Gets the value of the securityEventsMalware property.

getSecurityEventsPeriodic() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats

Gets the value of the securityEventsPeriodic property.

getSecurityEventsPeriodic() - Method in class com.cisco.cnr.ws.xsd.DNSServerSecurityStats

Gets the value of the securityEventsPeriodic property.

getSecurityEventsPhishing() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats

Gets the value of the securityEventsPhishing property.

getSecurityEventsPoisoning() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats

Gets the value of the securityEventsPoisoning property.

Gets the value of the serverClass property.

getServerDeactivatedCount() - Method in class com.cisco.cnr.ws.xsd.DNSRelatedServer

Gets the value of the serverDeactivatedCount property.

getServerDeactivatedCount() - Method in class com.cisco.cnr.ws.xsd.LDAPRelatedServer

Gets the value of the serverDeactivatedCount property.

getServerDuid() - Method in class com.cisco.cnr.ws.xsd.DHCP6Stats

Gets the value of the serverDuid property.

getServerFlags() - Method in class com.cisco.cnr.ws.xsd.DHCPServer

Gets the value of the serverFlags property.

getServerIp6Address() - Method in class com.cisco.cnr.ws.xsd.DnsUpdateConfig

Gets the value of the serverIp6Address property.

getServerKey() - Method in class com.cisco.cnr.ws.xsd.DnsUpdateConfig

Gets the value of the serverKey property.

getServerLeaseTime() - Method in class com.cisco.cnr.ws.xsd.Policy

Gets the value of the serverLeaseTime property.

getServerLogSettings() - Method in class com.cisco.cnr.ws.xsd.DNSServer

Gets the value of the serverLogSettings property.

getServerReloadTime() - Method in class com.cisco.cnr.ws.xsd.DHCPServerStats

Gets the value of the serverReloadTime property.

getServerStartTime() - Method in class com.cisco.cnr.ws.xsd.DHCPServerStats

Gets the value of the serverStartTime property.

getServerStats() - Method in class com.cisco.cnr.ws.xsd.SystemStats

Gets the value of the serverStats property.

getServerType() - Method in class com.cisco.cnr.ws.xsd.ServerSystemStats

Gets the value of the serverType property.

getServerUpTime() - Method in class com.cisco.cnr.ws.xsd.DHCPServerStats

Gets the value of the serverUpTime property.

getServices() - Method in class com.cisco.cnr.ws.xsd.DnsEnumEntrySet

Gets the value of the services property.

getSharedSecret() - Method in class com.cisco.cnr.ws.xsd.CCMCluster

Gets the value of the sharedSecret property.

getShortestPrefixLength() - Method in class com.cisco.cnr.ws.xsd.Policy

Gets the value of the shortestPrefixLength property.

getSignatureAlgorithm() - Method in class com.cisco.cnr.ws.xsd.Certificate

Gets the value of the signatureAlgorithm property.

getSimulateZoneTopDynupdate() - Method in class com.cisco.cnr.ws.xsd.DNSServer

Gets the value of the simulateZoneTopDynupdate property.

getSkipClientLookup() - Method in class com.cisco.cnr.ws.xsd.DHCPServer

Gets the value of the skipClientLookup property.

getSmartCache() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServer

Gets the value of the smartCache property.

getSmartCache() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerConfig

Gets the value of the smartCache property.

getSmartCache() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats

Gets the value of the smartCache property.

Gets the value of the startTime property.

getStartTime() - Method in class com.cisco.cnr.ws.xsd.TCPConnectionRelatedServer

Gets the value of the startTime property.

getStartTimeOfPartnerState() - Method in class com.cisco.cnr.ws.xsd.FailoverRelatedServer

Gets the value of the startTimeOfPartnerState property.

getStartTimeOfState() - Method in class com.cisco.cnr.ws.xsd.FailoverRelatedServer

Gets the value of the startTimeOfState property.

getStartTimeOfState() - Method in class com.cisco.cnr.ws.xsd.Lease

Gets the value of the startTimeOfState property.

getStartTimeOfState() - Method in class com.cisco.cnr.ws.xsd.Lease6

Gets the value of the startTimeOfState property.

getStartTimeStr() - Method in class com.cisco.cnr.ws.xsd.DHCPServerStats

Gets the value of the startTimeStr property.

getState() - Method in class com.cisco.cnr.ws.xsd.CCMServerInfo

Gets the value of the state property.

getState() - Method in class com.cisco.cnr.ws.xsd.DnsHAStatus

Gets the value of the state property.

getState() - Method in class com.cisco.cnr.ws.xsd.FailoverRelatedServer

Gets the value of the state property.

getState() - Method in class com.cisco.cnr.ws.xsd.Lease

Gets the value of the state property.

getState() - Method in class com.cisco.cnr.ws.xsd.Lease6

Gets the value of the state property.

getState() - Method in class com.cisco.cnr.ws.xsd.ResourceValue

Gets the value of the state property.

getStateExpirationTime() - Method in class com.cisco.cnr.ws.xsd.Lease

Gets the value of the stateExpirationTime property.

getStateExpirationTime() - Method in class com.cisco.cnr.ws.xsd.Lease6

Gets the value of the stateExpirationTime property.

getStateReceived() - Method in class com.cisco.cnr.ws.xsd.DHCPFailoverStats

Gets the value of the stateReceived property.

getStateSent() - Method in class com.cisco.cnr.ws.xsd.DHCPFailoverStats

Gets the value of the stateSent property.

getStatisticsRequestTime() - Method in class com.cisco.cnr.ws.xsd.DHCPServerStats

Gets the value of the statisticsRequestTime property.

getStatisticsRequestTime() - Method in class com.cisco.cnr.ws.xsd.DNSServerStats

Gets the value of the statisticsRequestTime property.

getStatisticsRequestTime() - Method in class com.cisco.cnr.ws.xsd.ServerSystemStats

Gets the value of the statisticsRequestTime property.

getStatisticsRequestTime() - Method in class com.cisco.cnr.ws.xsd.SystemStats

Gets the value of the statisticsRequestTime property.

getStatisticsResetTime() - Method in class com.cisco.cnr.ws.xsd.DHCPServerStats

Gets the value of the statisticsResetTime property.

getStatus() - Method in class com.cisco.cnr.ws.xsd.DnsSecKey

Gets the value of the status property.

getStringVal() - Method in class com.cisco.cnr.ws.xsd.FilterElement

Gets the value of the stringVal property.

getSubject() - Method in class com.cisco.cnr.ws.xsd.Certificate

Gets the value of the subject property.

getSubnet() - Method in class com.cisco.cnr.ws.xsd.CurrentUtilization

Gets the value of the subnet property.

getSubnet() - Method in class com.cisco.cnr.ws.xsd.Scope

Gets the value of the subnet property.

getSubnetState() - Method in class com.cisco.cnr.ws.xsd.CCMSubnet

Gets the value of the subnetState property.

getSubOptions() - Method in class com.cisco.cnr.ws.xsd.Option

Gets the value of the subOptions property.

getSubtype() - Method in class com.cisco.cnr.ws.xsd.DnsEnumEntry

Gets the value of the subtype property.

getSuccessfulConnections() - Method in class com.cisco.cnr.ws.xsd.DHCPFailoverStats

Gets the value of the successfulConnections property.

getSyncFailureTrap() - Method in class com.cisco.cnr.ws.xsd.CCMFailoverPair

Gets the value of the syncFailureTrap property.

getSynthesizeName() - Method in class com.cisco.cnr.ws.xsd.DnsUpdateConfig

Gets the value of the synthesizeName property.

getSynthesizeReverseZone() - Method in class com.cisco.cnr.ws.xsd.DHCPServer

Gets the value of the synthesizeReverseZone property.

getSyntheticNameStem() - Method in class com.cisco.cnr.ws.xsd.DnsUpdateConfig

Gets the value of the syntheticNameStem property.

getTcpActiveLeaseQueries() - Method in class com.cisco.cnr.ws.xsd.DHCPServerActivityStats

Gets the value of the tcpActiveLeaseQueries property.

getTcpBulkLeaseQueries() - Method in class com.cisco.cnr.ws.xsd.DHCPServerActivityStats

Gets the value of the tcpBulkLeaseQueries property.

getTcpConnectionsDropped() - Method in class com.cisco.cnr.ws.xsd.DHCP6Stats

Gets the value of the tcpConnectionsDropped property.

getTcpConnectionsDropped() - Method in class com.cisco.cnr.ws.xsd.DHCPServerActivityStats

Gets the value of the tcpConnectionsDropped property.

getTcpCurrentConnections() - Method in class com.cisco.cnr.ws.xsd.DHCP6Stats

Gets the value of the tcpCurrentConnections property.

getTcpCurrentConnections() - Method in class com.cisco.cnr.ws.xsd.DHCPServerActivityStats

Gets the value of the tcpCurrentConnections property.

getTcpLqActive() - Method in class com.cisco.cnr.ws.xsd.DHCPServerActivityStats

Gets the value of the tcpLqActive property.

getTcpLqDone() - Method in class com.cisco.cnr.ws.xsd.DHCPServerActivityStats

Gets the value of the tcpLqDone property.

getTcpLqStatus() - Method in class com.cisco.cnr.ws.xsd.DHCPServerActivityStats

Gets the value of the tcpLqStatus property.

getTcpLqStatusCatchupComplete() - Method in class com.cisco.cnr.ws.xsd.DHCPServerActivityStats

Gets the value of the tcpLqStatusCatchupComplete property.

getTcpLqStatusCatchUpComplete() - Method in class com.cisco.cnr.ws.xsd.DHCP6Stats

Gets the value of the tcpLqStatusCatchUpComplete property.

getTcpLqStatusConnectionActive() - Method in class com.cisco.cnr.ws.xsd.DHCPServerActivityStats

Gets the value of the tcpLqStatusConnectionActive property.

getTcpLqStatusDataMissing() - Method in class com.cisco.cnr.ws.xsd.DHCP6Stats

Gets the value of the tcpLqStatusDataMissing property.

getTcpLqStatusDataMissing() - Method in class com.cisco.cnr.ws.xsd.DHCPServerActivityStats

Gets the value of the tcpLqStatusDataMissing property.

getTcpLqStatusMalformedQuery() - Method in class com.cisco.cnr.ws.xsd.DHCP6Stats

Gets the value of the tcpLqStatusMalformedQuery property.

getTcpLqStatusMalformedQuery() - Method in class com.cisco.cnr.ws.xsd.DHCPServerActivityStats

Gets the value of the tcpLqStatusMalformedQuery property.

getTcpLqStatusNotAllowed() - Method in class com.cisco.cnr.ws.xsd.DHCP6Stats

Gets the value of the tcpLqStatusNotAllowed property.

getTcpLqStatusNotAllowed() - Method in class com.cisco.cnr.ws.xsd.DHCPServerActivityStats

Gets the value of the tcpLqStatusNotAllowed property.

getTcpLqStatusNotConfigured() - Method in class com.cisco.cnr.ws.xsd.DHCP6Stats

Gets the value of the tcpLqStatusNotConfigured property.

getTcpLqStatusQueryTerminated() - Method in class com.cisco.cnr.ws.xsd.DHCP6Stats

Gets the value of the tcpLqStatusQueryTerminated property.

getTcpLqStatusQueryTerminated() - Method in class com.cisco.cnr.ws.xsd.DHCPServerActivityStats

Gets the value of the tcpLqStatusQueryTerminated property.

getTcpLqStatusUnknownQuery() - Method in class com.cisco.cnr.ws.xsd.DHCP6Stats

Gets the value of the tcpLqStatusUnknownQuery property.

getTcpLqStatusUnspecFail() - Method in class com.cisco.cnr.ws.xsd.DHCP6Stats

Gets the value of the tcpLqStatusUnspecFail property.

getTcpLqStatusUnspecFail() - Method in class com.cisco.cnr.ws.xsd.DHCPServerActivityStats

Gets the value of the tcpLqStatusUnspecFail property.

getTcpLqUnassigned() - Method in class com.cisco.cnr.ws.xsd.DHCPServerActivityStats

Gets the value of the tcpLqUnassigned property.

getTcpTotalConnections() - Method in class com.cisco.cnr.ws.xsd.DHCP6Stats

Gets the value of the tcpTotalConnections property.

getTcpTotalConnections() - Method in class com.cisco.cnr.ws.xsd.DHCPServerActivityStats

Gets the value of the tcpTotalConnections property.

getTemplateRootPrefix() - Method in class com.cisco.cnr.ws.xsd.Link

Gets the value of the templateRootPrefix property.

getTenantId() - Method in class com.cisco.cnr.ws.xsd.ACL

Gets the value of the tenantId property.

getTenantId() - Method in class com.cisco.cnr.ws.xsd.CCMCluster

Gets the value of the tenantId property.

getTenantId() - Method in class com.cisco.cnr.ws.xsd.CCMFailoverPair

Gets the value of the tenantId property.

getTenantId() - Method in class com.cisco.cnr.ws.xsd.CCMHaDnsPair

Gets the value of the tenantId property.

getTenantId() - Method in class com.cisco.cnr.ws.xsd.CCMHost

Gets the value of the tenantId property.

Gets the value of the topLevelDomain property.

getTopNames() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServer

Gets the value of the topNames property.

getTopNames() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerConfig

Gets the value of the topNames property.

getTopNames() - Method in class com.cisco.cnr.ws.xsd.DNSServer

Gets the value of the topNames property.

getTopNames() - Method in class com.cisco.cnr.ws.xsd.DNSTopNameStats

Gets the value of the topNames property.

getTopNamesMaxAge() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServer

Gets the value of the topNamesMaxAge property.

getTopNamesMaxAge() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerConfig

Gets the value of the topNamesMaxAge property.

getTopNamesMaxAge() - Method in class com.cisco.cnr.ws.xsd.DNSServer

Gets the value of the topNamesMaxAge property.

getTopNamesMaxCount() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServer

Gets the value of the topNamesMaxCount property.

getTopNamesMaxCount() - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerConfig

Gets the value of the topNamesMaxCount property.

getTopNamesMaxCount() - Method in class com.cisco.cnr.ws.xsd.DNSServer

Gets the value of the topNamesMaxCount property.

getTotalAcks() - Method in class com.cisco.cnr.ws.xsd.DHCPServerStats

Gets the value of the totalAcks property.

getTotalAddresses() - Method in class com.cisco.cnr.ws.xsd.DHCPScopeAggregationStats

Gets the value of the totalAddresses property.

getTotalBytesReceived() - Method in class com.cisco.cnr.ws.xsd.TCPConnectionRelatedServer

Gets the value of the totalBytesReceived property.

getTotalBytesSent() - Method in class com.cisco.cnr.ws.xsd.TCPConnectionRelatedServer

Gets the value of the totalBytesSent property.

getTotalConnections() - Method in class com.cisco.cnr.ws.xsd.TCPListenerRelatedServer

Gets the value of the totalConnections property.

getTotalCounted() - Method in class com.cisco.cnr.ws.xsd.DNSTopNameStats

Gets the value of the totalCounted property.

getTotalDeclines() - Method in class com.cisco.cnr.ws.xsd.DHCPServerStats

Gets the value of the totalDeclines property.

getTotalDiscovers() - Method in class com.cisco.cnr.ws.xsd.DHCPServerStats

Gets the value of the totalDiscovers property.

getTotalDynamic() - Method in class com.cisco.cnr.ws.xsd.CurrentUtilization

Gets the value of the totalDynamic property.

getTotalNaks() - Method in class com.cisco.cnr.ws.xsd.DHCPServerStats

Gets the value of the totalNaks property.

getTotalOffers() - Method in class com.cisco.cnr.ws.xsd.DHCPServerStats

Gets the value of the totalOffers property.

getTotalPrefixes() - Method in class com.cisco.cnr.ws.xsd.DHCP6Stats

Gets the value of the totalPrefixes property.

Gets the value of the ttl property.

getTtl() - Method in class com.cisco.cnr.ws.xsd.DnsEnumDomain

Gets the value of the ttl property.

getUnauthenticatedClientClassName() - Method in class com.cisco.cnr.ws.xsd.ClientClass

Gets the value of the unauthenticatedClientClassName property.

getUnauthenticatedClientClassName() - Method in class com.cisco.cnr.ws.xsd.ClientEntry

Gets the value of the unauthenticatedClientClassName property.

getUnauthUpdateReqs() - Method in class com.cisco.cnr.ws.xsd.DNSServerSecurityStats

Gets the value of the unauthUpdateReqs property.

getUnauthXferReqs() - Method in class com.cisco.cnr.ws.xsd.DNSServerSecurityStats

Gets the value of the unauthXferReqs property.

getUnavail() - Method in class com.cisco.cnr.ws.xsd.CurrentPrefixUtilization

Gets the value of the unavail property.

getUnavail() - Method in class com.cisco.cnr.ws.xsd.CurrentUtilization

Gets the value of the unavail property.

getUnavailableRequests() - Method in class com.cisco.cnr.ws.xsd.DHCPFailoverStats

Gets the value of the unavailableRequests property.

getUnavailableTimeout() - Method in class com.cisco.cnr.ws.xsd.Policy

Gets the value of the unavailableTimeout property.

getUnknownLinks() - Method in class com.cisco.cnr.ws.xsd.DHCP6Stats

Gets the value of the unknownLinks property.

getUnknownScopes() - Method in class com.cisco.cnr.ws.xsd.DHCPServerActivityStats

Gets the value of the unknownScopes property.

getUpdateAcl() - Method in class com.cisco.cnr.ws.xsd.CCMReverseZone

Gets the value of the updateAcl property.

getUpdateAcl() - Method in class com.cisco.cnr.ws.xsd.CCMZone

Gets the value of the updateAcl property.

getUpdateAcl() - Method in class com.cisco.cnr.ws.xsd.CCMZoneTemplate

Gets the value of the updateAcl property.

getUpdateAcl() - Method in class com.cisco.cnr.ws.xsd.DNSServer

Gets the value of the updateAcl property.

getUpdateDnsForBootp() - Method in class com.cisco.cnr.ws.xsd.CCMScopeTemplate

Gets the value of the updateDnsForBootp property.

getUpdateDnsForBootp() - Method in class com.cisco.cnr.ws.xsd.DHCPServer

Gets the value of the updateDnsForBootp property.

getUpdateDnsForBootp() - Method in class com.cisco.cnr.ws.xsd.DnsUpdateConfig

Gets the value of the updateDnsForBootp property.

getUpdateDoneReceived() - Method in class com.cisco.cnr.ws.xsd.DHCPFailoverStats

Gets the value of the updateDoneReceived property.

getUpdateDoneSent() - Method in class com.cisco.cnr.ws.xsd.DHCPFailoverStats

Gets the value of the updateDoneSent property.

getUpdatedRrs() - Method in class com.cisco.cnr.ws.xsd.DNSServerPerformanceStats

Gets the value of the updatedRrs property.

getUpdateErrors() - Method in class com.cisco.cnr.ws.xsd.DNSServerErrorsStats

Gets the value of the updateErrors property.

Gets the value of the useClientFqdnFirst property.

getUseClientIdForReservations() - Method in class com.cisco.cnr.ws.xsd.Policy

Gets the value of the useClientIdForReservations property.

getUseDnsUpdatePrereqs() - Method in class com.cisco.cnr.ws.xsd.DHCPServer

Gets the value of the useDnsUpdatePrereqs property.

getUseDnsUpdatePrereqs() - Method in class com.cisco.cnr.ws.xsd.DnsUpdateConfig

Gets the value of the useDnsUpdatePrereqs property.

getUseGssTsig() - Method in class com.cisco.cnr.ws.xsd.CCMSecondaryZone

Gets the value of the useGssTsig property.

getUseGssTsig() - Method in class com.cisco.cnr.ws.xsd.CCMZDSecondary

Gets the value of the useGssTsig property.

getUseGssTsig() - Method in class com.cisco.cnr.ws.xsd.CCMZoneDistribution

Gets the value of the useGssTsig property.

getUseGssTsig() - Method in class com.cisco.cnr.ws.xsd.DnsUpdateConfig

Gets the value of the useGssTsig property.

getUseHostName() - Method in class com.cisco.cnr.ws.xsd.DHCPServer

Gets the value of the useHostName property.

getUseHttpsPort() - Method in class com.cisco.cnr.ws.xsd.CCMCluster

Gets the value of the useHttpsPort property.

getUseLdapClientData() - Method in class com.cisco.cnr.ws.xsd.DHCPServer

Gets the value of the useLdapClientData property.

getUseOtherAvailable() - Method in class com.cisco.cnr.ws.xsd.FailoverRelatedServer

Gets the value of the useOtherAvailable property.

getUseOtherAvailableTime() - Method in class com.cisco.cnr.ws.xsd.FailoverRelatedServer

Gets the value of the useOtherAvailableTime property.

getUserDefined() - Method in class com.cisco.cnr.ws.xsd.ClientClass

Gets the value of the userDefined property.

getUserDefined() - Method in class com.cisco.cnr.ws.xsd.ClientEntry

Gets the value of the userDefined property.

getUserDefinedData() - Method in class com.cisco.cnr.ws.xsd.Lease

Gets the value of the userDefinedData property.

getUserid() - Method in class com.cisco.cnr.ws.xsd.ClientEntry

Gets the value of the userid property.

getUsername() - Method in class com.cisco.cnr.ws.xsd.CnrSoapAuth

Gets the value of the username property.

getUseSafePeriod() - Method in class com.cisco.cnr.ws.xsd.CCMFailoverPair

Gets the value of the useSafePeriod property.

getUseSsl() - Method in class com.cisco.cnr.ws.xsd.CCMCluster

Gets the value of the useSsl property.

getUseSsl() - Method in class com.cisco.cnr.ws.xsd.CCMServer

Gets the value of the useSsl property.

getUsesViews() - Method in class com.cisco.cnr.ws.xsd.DnsException

Gets the value of the usesViews property.

getUtilizedPct() - Method in class com.cisco.cnr.ws.xsd.DHCPScopeAggregationStats

Gets the value of the utilizedPct property.

Gets the value of the v6UpdateResponseStartTime property.

getV6VendorOptions() - Method in class com.cisco.cnr.ws.xsd.Policy

Gets the value of the v6VendorOptions property.

getValidateClientNameAsMac() - Method in class com.cisco.cnr.ws.xsd.DHCPServer

Gets the value of the validateClientNameAsMac property.

getValidityNotAfter() - Method in class com.cisco.cnr.ws.xsd.Certificate

Gets the value of the validityNotAfter property.

getValidityNotBefore() - Method in class com.cisco.cnr.ws.xsd.Certificate

Gets the value of the validityNotBefore property.

getValidityPeriod() - Method in class com.cisco.cnr.ws.xsd.Certificate

Gets the value of the validityPeriod property.

getValidLifetime() - Method in class com.cisco.cnr.ws.xsd.Lease6

Gets the value of the validLifetime property.

getValidLifetime() - Method in class com.cisco.cnr.ws.xsd.Policy

Gets the value of the validLifetime property.

getValue() - Method in class com.cisco.cnr.ws.xsd.Option

Gets the value of the value property.

getVendorClassId() - Method in class com.cisco.cnr.ws.xsd.Lease

Gets the value of the vendorClassId property.

getVendorOptionEnterpriseId() - Method in class com.cisco.cnr.ws.xsd.OptionDefinitionSet

Gets the value of the vendorOptionEnterpriseId property.

getVendorOptionRegex() - Method in class com.cisco.cnr.ws.xsd.OptionDefinitionSet

Gets the value of the vendorOptionRegex property.

getVendorOptions() - Method in class com.cisco.cnr.ws.xsd.Policy

Gets the value of the vendorOptions property.

getVendorOptionString() - Method in class com.cisco.cnr.ws.xsd.OptionDefinitionSet

Gets the value of the vendorOptionString property.

getVendorSpecificInformation() - Method in class com.cisco.cnr.ws.xsd.Lease

Gets the value of the vendorSpecificInformation property.

getVersion() - Method in class com.cisco.cnr.ws.xsd.Certificate

Gets the value of the version property.

getViewId() - Method in class com.cisco.cnr.ws.xsd.CCMHost

Gets the value of the viewId property.

getViewId() - Method in class com.cisco.cnr.ws.xsd.CCMReverseZone

Gets the value of the viewId property.

getViewId() - Method in class com.cisco.cnr.ws.xsd.CCMRRSet

Gets the value of the viewId property.

getViewId() - Method in class com.cisco.cnr.ws.xsd.CCMSecondaryZone

Gets the value of the viewId property.

getViewId() - Method in class com.cisco.cnr.ws.xsd.CCMZone

Gets the value of the viewId property.

getViewId() - Method in class com.cisco.cnr.ws.xsd.CCMZoneTemplate

Gets the value of the viewId property.

getViewId() - Method in class com.cisco.cnr.ws.xsd.DnsEnumDomain

Gets the value of the viewId property.

getViewId() - Method in class com.cisco.cnr.ws.xsd.DnsEnumEntrySet

Gets the value of the viewId property.

getViewId() - Method in class com.cisco.cnr.ws.xsd.DnsUpdateConfig

Gets the value of the viewId property.

getViewId() - Method in class com.cisco.cnr.ws.xsd.DnsView

Gets the value of the viewId property.

getViewId() - Method in class com.cisco.cnr.ws.xsd.Policy

Gets the value of the viewId property.

getViewQualifiedFqdn() - Method in class com.cisco.cnr.ws.xsd.CCMRRSet

Gets the value of the viewQualifiedFqdn property.

getViewQualifiedName() - Method in class com.cisco.cnr.ws.xsd.DnsZoneStatus

Gets the value of the viewQualifiedName property.

getVmUtilization() - Method in class com.cisco.cnr.ws.xsd.ServerSystemStats

Gets the value of the vmUtilization property.

getVpnCommunication() - Method in class com.cisco.cnr.ws.xsd.DHCPServer

Gets the value of the vpnCommunication property.

getVpnId() - Method in class com.cisco.cnr.ws.xsd.CCMSubnet

Gets the value of the vpnId property.

getVpnId() - Method in class com.cisco.cnr.ws.xsd.CurrentPrefixUtilization

Gets the value of the vpnId property.

getVpnId() - Method in class com.cisco.cnr.ws.xsd.CurrentUtilization

Gets the value of the vpnId property.

getVpnId() - Method in class com.cisco.cnr.ws.xsd.Lease

Gets the value of the vpnId property.

getVpnId() - Method in class com.cisco.cnr.ws.xsd.Lease6

Gets the value of the vpnId property.

getVpnId() - Method in class com.cisco.cnr.ws.xsd.Link

Gets the value of the vpnId property.

getVpnId() - Method in class com.cisco.cnr.ws.xsd.Prefix

Gets the value of the vpnId property.

getVpnId() - Method in class com.cisco.cnr.ws.xsd.Reservation

Gets the value of the vpnId property.

getVpnId() - Method in class com.cisco.cnr.ws.xsd.Reservation6

Gets the value of the vpnId property.

getVpnId() - Method in class com.cisco.cnr.ws.xsd.Scope

Gets the value of the vpnId property.

getVpnId() - Method in class com.cisco.cnr.ws.xsd.VPN

Gets the value of the vpnId property.

getVrfName() - Method in class com.cisco.cnr.ws.xsd.VPN

Gets the value of the vrfName property.

getWarning() - Method in class com.cisco.cnr.ws.xsd.ResourceStatus

Gets the value of the warning property.

getWeight() - Method in class com.cisco.cnr.ws.xsd.CCMRR

Gets the value of the weight property.

getXferFailedAttempts() - Method in class com.cisco.cnr.ws.xsd.DNSServerErrorsStats

Gets the value of the xferFailedAttempts property.

getXferIgnoreSerialDecrease() - Method in class com.cisco.cnr.ws.xsd.DNSServer

Gets the value of the xferIgnoreSerialDecrease property.

getXferInAuthErrors() - Method in class com.cisco.cnr.ws.xsd.DNSServerErrorsStats

Gets the value of the xferInAuthErrors property.

getXferRrMetaData() - Method in class com.cisco.cnr.ws.xsd.DNSServer

Gets the value of the xferRrMetaData property.

getXfrsInAtLimit() - Method in class com.cisco.cnr.ws.xsd.DNSServerPerformanceStats

Gets the value of the xfrsInAtLimit property.

getXfrsOutAtLimit() - Method in class com.cisco.cnr.ws.xsd.DNSServerPerformanceStats

Gets the value of the xfrsOutAtLimit property.

getZone() - Method in class com.cisco.cnr.ws.xsd.CCMHost

Gets the value of the zone property.

getZone() - Method in class com.cisco.cnr.ws.xsd.CCMRRSet

Gets the value of the zone property.

getZoneOrigin() - Method in class com.cisco.cnr.ws.xsd.CCMHost

Gets the value of the zoneOrigin property.

getZoneOrigin() - Method in class com.cisco.cnr.ws.xsd.CCMRRSet

Gets the value of the zoneOrigin property.

getZoneStatus() - Method in class com.cisco.cnr.ws.xsd.DnsZoneStatus

Gets the value of the zoneStatus property.

getZoneSyncCompleteCount() - Method in class com.cisco.cnr.ws.xsd.DnsHAStatus

Gets the value of the zoneSyncCompleteCount property.

getZoneSyncCompleteList() - Method in class com.cisco.cnr.ws.xsd.DnsHAStatus

Gets the value of the zoneSyncCompleteList property.

getZoneSyncFailedCount() - Method in class com.cisco.cnr.ws.xsd.DnsHAStatus

Gets the value of the zoneSyncFailedCount property.

getZoneSyncFailedList() - Method in class com.cisco.cnr.ws.xsd.DnsHAStatus

Gets the value of the zoneSyncFailedList property.

getZoneSyncPendingCount() - Method in class com.cisco.cnr.ws.xsd.DnsHAStatus

Gets the value of the zoneSyncPendingCount property.

getZoneSyncPendingList() - Method in class com.cisco.cnr.ws.xsd.DnsHAStatus

Gets the value of the zoneSyncPendingList property.

getZoneTemplate() - Method in class com.cisco.cnr.ws.xsd.DnsEnumConfig

Gets the value of the zoneTemplate property.

getZoneTemplate() - Method in class com.cisco.cnr.ws.xsd.DnsEnumDomain

Gets the value of the zoneTemplate property.

getZoneTemplate() - Method in class com.cisco.cnr.ws.xsd.DnsEnumEntrySet

Gets the value of the zoneTemplate property.

getZskAlgorithm() - Method in class com.cisco.cnr.ws.xsd.AuthDnsSec

Gets the value of the zskAlgorithm property.

getZskBits() - Method in class com.cisco.cnr.ws.xsd.AuthDnsSec

Gets the value of the zskBits property.

getZskLifetime() - Method in class com.cisco.cnr.ws.xsd.AuthDnsSec

Gets the value of the zskLifetime property.

getZskRolloverInterval() - Method in class com.cisco.cnr.ws.xsd.AuthDnsSec

      Gets the value of the zskRolloverInterval property.

K

Key - Class in com.cisco.cnr.ws.xsd

      The Network Registrar Key class.

Key() - Constructor for class com.cisco.cnr.ws.xsd.Key

KeyArray - Class in com.cisco.cnr.ws.xsd

      Java class for KeyArray complex type.

KeyArray() - Constructor for class com.cisco.cnr.ws.xsd.KeyArray

L

LDAPRelatedServer - Class in com.cisco.cnr.ws.xsd

      The Network Registrar LDAPRelatedServer class.

LDAPRelatedServer() - Constructor for class com.cisco.cnr.ws.xsd.LDAPRelatedServer

LDAPRelatedServerArray - Class in com.cisco.cnr.ws.xsd

      Java class for LDAPRelatedServerArray complex type.

LDAPRelatedServerArray() - Constructor for class com.cisco.cnr.ws.xsd.LDAPRelatedServerArray

Lease - Class in com.cisco.cnr.ws.xsd

      The Network Registrar Lease class.

Lease() - Constructor for class com.cisco.cnr.ws.xsd.Lease

Lease6 - Class in com.cisco.cnr.ws.xsd

      The Network Registrar Lease6 class.

Lease6() - Constructor for class com.cisco.cnr.ws.xsd.Lease6

Lease6Array - Class in com.cisco.cnr.ws.xsd

      Java class for Lease6Array complex type.

Lease6Array() - Constructor for class com.cisco.cnr.ws.xsd.Lease6Array

LeaseArray - Class in com.cisco.cnr.ws.xsd

      Java class for LeaseArray complex type.

LeaseArray() - Constructor for class com.cisco.cnr.ws.xsd.LeaseArray

Link - Class in com.cisco.cnr.ws.xsd

      The Network Registrar Link class.

Link() - Constructor for class com.cisco.cnr.ws.xsd.Link

LinkArray - Class in com.cisco.cnr.ws.xsd

      Java class for LinkArray complex type.

LinkArray() - Constructor for class com.cisco.cnr.ws.xsd.LinkArray

LinkTemplate - Class in com.cisco.cnr.ws.xsd
>   The Network Registrar LinkTemplate class.

LinkTemplate() - Constructor for class com.cisco.cnr.ws.xsd.LinkTemplate

LinkTemplateArray - Class in com.cisco.cnr.ws.xsd
>   Java class for LinkTemplateArray complex type.

LinkTemplateArray() - Constructor for class com.cisco.cnr.ws.xsd.LinkTemplateArray

O

ObjectFactory - Class in com.cisco.cnr.ws.xsd
>   This object contains factory methods for each Java content interface and Java element interface generated in the com.cisco.cnr.ws.xsd package.

ObjectFactory() - Constructor for class com.cisco.cnr.ws.xsd.ObjectFactory
>   Create a new ObjectFactory that can be used to create new instances of schema derived classes for package: com.cisco.cnr.ws.xsd

Option - Class in com.cisco.cnr.ws.xsd
>   The Network Registrar Option class.

Option() - Constructor for class com.cisco.cnr.ws.xsd.Option

OptionArray - Class in com.cisco.cnr.ws.xsd
>   Java class for OptionArray complex type.

OptionArray() - Constructor for class com.cisco.cnr.ws.xsd.OptionArray

OptionDefinitionSet - Class in com.cisco.cnr.ws.xsd
>   The Network Registrar OptionDefinitionSet class.

OptionDefinitionSet() - Constructor for class com.cisco.cnr.ws.xsd.OptionDefinitionSet

OptionDefinitionSetArray - Class in com.cisco.cnr.ws.xsd
>   Java class for OptionDefinitionSetArray complex type.

OptionDefinitionSetArray() - Constructor for class com.cisco.cnr.ws.xsd.OptionDefinitionSetArray

P

Policy - Class in com.cisco.cnr.ws.xsd
>   The Network Registrar Policy class.

Policy() - Constructor for class com.cisco.cnr.ws.xsd.Policy

PolicyArray - Class in com.cisco.cnr.ws.xsd
>   Java class for PolicyArray complex type.

PolicyArray() - Constructor for class com.cisco.cnr.ws.xsd.PolicyArray

Prefix - Class in com.cisco.cnr.ws.xsd

> The Network Registrar Prefix class.

Prefix() - Constructor for class com.cisco.cnr.ws.xsd.Prefix

PrefixArray - Class in com.cisco.cnr.ws.xsd

> Java class for PrefixArray complex type.

PrefixArray() - Constructor for class com.cisco.cnr.ws.xsd.PrefixArray

PrefixTemplate - Class in com.cisco.cnr.ws.xsd

> The Network Registrar PrefixTemplate class.

PrefixTemplate() - Constructor for class com.cisco.cnr.ws.xsd.PrefixTemplate

PrefixTemplateArray - Class in com.cisco.cnr.ws.xsd

> Java class for PrefixTemplateArray complex type.

PrefixTemplateArray() - Constructor for class com.cisco.cnr.ws.xsd.PrefixTemplateArray

R

Range - Class in com.cisco.cnr.ws.xsd

> The Network Registrar Range class.

Range() - Constructor for class com.cisco.cnr.ws.xsd.Range

RangeArray - Class in com.cisco.cnr.ws.xsd

> Java class for RangeArray complex type.

RangeArray() - Constructor for class com.cisco.cnr.ws.xsd.RangeArray

RelayAgentState - Class in com.cisco.cnr.ws.xsd

> The Network Registrar RelayAgentState class.

RelayAgentState() - Constructor for class com.cisco.cnr.ws.xsd.RelayAgentState

RelayAgentStateArray - Class in com.cisco.cnr.ws.xsd

> Java class for RelayAgentStateArray complex type.

RelayAgentStateArray() - Constructor for class com.cisco.cnr.ws.xsd.RelayAgentStateArray

removeUnsetAttr(ScpObj, ScpObj) - Static method in class com.cisco.cnr.ws.xsd.ScpAndJavaConverter

> Remove from an ScpObj any attribute that is unset in another ScpObj, unless it is required.

Reservation - Class in com.cisco.cnr.ws.xsd

> The Network Registrar Reservation class.

Reservation() - Constructor for class com.cisco.cnr.ws.xsd.Reservation

Reservation6 - Class in com.cisco.cnr.ws.xsd

> The Network Registrar Reservation6 class.

Reservation6() - Constructor for class com.cisco.cnr.ws.xsd.Reservation6

Reservation6Array - Class in com.cisco.cnr.ws.xsd

Java class for Reservation6Array complex type.

Reservation6Array() - Constructor for class com.cisco.cnr.ws.xsd.Reservation6Array

ReservationArray - Class in com.cisco.cnr.ws.xsd

Java class for ReservationArray complex type.

ReservationArray() - Constructor for class com.cisco.cnr.ws.xsd.ReservationArray

ResourceStatus - Class in com.cisco.cnr.ws.xsd

The Network Registrar ResourceStatus class.

ResourceStatus() - Constructor for class com.cisco.cnr.ws.xsd.ResourceStatus

ResourceStatusArray - Class in com.cisco.cnr.ws.xsd

Java class for ResourceStatusArray complex type.

ResourceStatusArray() - Constructor for class com.cisco.cnr.ws.xsd.ResourceStatusArray

ResourceValue - Class in com.cisco.cnr.ws.xsd

The Network Registrar ResourceValue class.

ResourceValue() - Constructor for class com.cisco.cnr.ws.xsd.ResourceValue

ResourceValueArray - Class in com.cisco.cnr.ws.xsd

Java class for ResourceValueArray complex type.

ResourceValueArray() - Constructor for class com.cisco.cnr.ws.xsd.ResourceValueArray

S

Scope - Class in com.cisco.cnr.ws.xsd

The Network Registrar Scope class.

Scope() - Constructor for class com.cisco.cnr.ws.xsd.Scope

ScopeArray - Class in com.cisco.cnr.ws.xsd

Java class for ScopeArray complex type.

ScopeArray() - Constructor for class com.cisco.cnr.ws.xsd.ScopeArray

ScpAndJavaConverter - Class in com.cisco.cnr.ws.xsd

Implements a utility class that facilitates conversion between Network Registrar generic objects in ScpObj form for use with the Network Registar Java SDK and XML-based Java classes for web services.

ScpAndJavaConverter() - Constructor for class com.cisco.cnr.ws.xsd.ScpAndJavaConverter

scpToJava(ScpList) - Static method in class com.cisco.cnr.ws.xsd.ScpAndJavaConverter

Converts an ScpList to an XML Java array object without wrapping the result in a JAXBElement

scpToJava(ScpObj) - Static method in class com.cisco.cnr.ws.xsd.ScpAndJavaConverter

Converts an ScpObj to an XML Java object without wrapping the result in a JAXBElement

scpToJava(ScpObj, OptionDefinitionFactory, String) - Static method in class com.cisco.cnr.ws.xsd.ScpAndJavaConverter

ServerSystemStats - Class in com.cisco.cnr.ws.xsd

    The Network Registrar ServerSystemStats class.

ServerSystemStats() - Constructor for class com.cisco.cnr.ws.xsd.ServerSystemStats

ServerSystemStatsArray - Class in com.cisco.cnr.ws.xsd

    Java class for ServerSystemStatsArray complex type.

ServerSystemStatsArray() - Constructor for class com.cisco.cnr.ws.xsd.ServerSystemStatsArray

setAaaaResponse(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CdnsRedirect

    Sets the value of the aaaaResponse property.

setAckLatencyCounts(JAXBElement<StringArray>) - Method in class com.cisco.cnr.ws.xsd.DHCPServerActivityStats

    Sets the value of the ackLatencyCounts property.

setAcknowledgedRequests(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSRelatedServer

    Sets the value of the acknowledgedRequests property.

setAcknowledgedRequests(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.LDAPRelatedServer

    Sets the value of the acknowledgedRequests property.

setAcks(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCPServerActivityStats

    Sets the value of the acks property.

setAcksPerSecond(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCPServerActivityStats

    Sets the value of the acksPerSecond property.

setAclBlacklist(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSCachingServer

    Sets the value of the aclBlacklist property.

setAclBlacklist(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerConfig

    Sets the value of the aclBlacklist property.

setAclBlocklist(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSCachingServer

    Sets the value of the aclBlocklist property.

setAclBlocklist(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerConfig

    Sets the value of the aclBlocklist property.

setAclBlocklist(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServer

    Sets the value of the aclBlocklist property.

setAclBlocklistDroppedRequests(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServerSecurityStats

    Sets the value of the aclBlocklistDroppedRequests property.

setAclDoNotQuery(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSCachingServer

    Sets the value of the aclDoNotQuery property.

setAclDoNotQuery(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerConfig

    Sets the value of the aclDoNotQuery property.

setAclMatchClients(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Dns64

    Sets the value of the aclMatchClients property.

Sets the value of the activityCounterLogSettings property.

setActivitySummaryInterval(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCPServer

Sets the value of the activitySummaryInterval property.

setActivitySummaryInterval(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSCachingServer

Sets the value of the activitySummaryInterval property.

setActivitySummaryInterval(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerConfig

Sets the value of the activitySummaryInterval property.

setActivitySummaryInterval(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServer

Sets the value of the activitySummaryInterval property.

setActivitySummarySettings(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSCachingServer

Sets the value of the activitySummarySettings property.

setActivitySummarySettings(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerConfig

Sets the value of the activitySummarySettings property.

setActivitySummaryType(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSCachingServer

Sets the value of the activitySummaryType property.

setActivitySummaryType(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerConfig

Sets the value of the activitySummaryType property.

setActivitySummaryType(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServer

Sets the value of the activitySummaryType property.

setAddr(String) - Method in class com.cisco.cnr.ws.xsd.DnsIPnPort

Sets the value of the addr property.

setAddr(JAXBElement<DnsIPnPortArray>) - Method in class com.cisco.cnr.ws.xsd.DnsException

Sets the value of the addr property.

setAddr(JAXBElement<DnsIPnPortArray>) - Method in class com.cisco.cnr.ws.xsd.DnsForwarder

Sets the value of the addr property.

setAddrBlocksDefaultSelectionTags(JAXBElement<StringArray>) - Method in class com.cisco.cnr.ws.xsd.DHCPServer

Sets the value of the addrBlocksDefaultSelectionTags property.

setAddrBlocksDefaultSelectionTags(JAXBElement<StringArray>) - Method in class com.cisco.cnr.ws.xsd.VPN

Sets the value of the addrBlocksDefaultSelectionTags property.

setAddrBlocksUseClientAffinity(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCPServer

Sets the value of the addrBlocksUseClientAffinity property.

setAddrBlocksUseClientAffinity(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.VPN

Sets the value of the addrBlocksUseClientAffinity property.

setAddrBlocksUseLanSegments(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCPServer

Sets the value of the addrBlocksUseLanSegments property.

setAddrBlocksUseLanSegments(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.VPN

Sets the value of the addrBlocksUseLanSegments property.

setAddrBlocksUseSelectionTags(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCPServer

Sets the value of the addrBlocksUseSelectionTags property.

setAddrBlocksUseSelectionTags(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.VPN

Sets the value of the addrBlocksUseSelectionTags property.

setAddress(String) - Method in class com.cisco.cnr.ws.xsd.CCMSubnet

Sets the value of the address property.

setAddress(String) - Method in class com.cisco.cnr.ws.xsd.Prefix

Sets the value of the address property.

setAddress(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Lease

Sets the value of the address property.

setAddrs(JAXBElement<StringArray>) - Method in class com.cisco.cnr.ws.xsd.CCMHost

Sets the value of the addrs property.

setAddrutilPollInterval(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMCluster

Sets the value of the addrutilPollInterval property.

setAddrutilPollOffset(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMCluster

Sets the value of the addrutilPollOffset property.

setAddrutilPollRetry(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMCluster

Sets the value of the addrutilPollRetry property.

setAddToEnvironmentDictionary(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.ClientClass

Sets the value of the addToEnvironmentDictionary property.

setAddToEnvironmentDictionary(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.ClientEntry

Sets the value of the addToEnvironmentDictionary property.

setAdmin(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMCluster

Sets the value of the admin property.

setAdmin(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMServer

Sets the value of the admin property.

setAdvertises(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCP6Stats

Sets the value of the advertises property.

setAffinityPeriod(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Policy

Sets the value of the affinityPeriod property.

setAggregationLevel(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CurrentPrefixUtilization

Sets the value of the aggregationLevel property.

setAggregationLevel(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CurrentUtilization

Sets the value of the aggregationLevel property.

setAggressiveNsec(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DnsSec

Sets the value of the aggressiveNsec property.

setAlgorithm(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DnsSecKey

Sets the value of the algorithm property.

Sets the value of the allowNonTemporaryAddresses property.

setAllowRapidCommit(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Policy

Sets the value of the allowRapidCommit property.

setAllowTemporaryAddresses(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Policy

Sets the value of the allowTemporaryAddresses property.

setAllPrefixesLinks(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DHCPMaintenanceWindow

Sets the value of the allPrefixesLinks property.

setAllScopes(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DHCPMaintenanceWindow

Sets the value of the allScopes property.

setAlternateViewIds(JAXBElement<StringArray>) - Method in class
com.cisco.cnr.ws.xsd.CCMReverseZone

Sets the value of the alternateViewIds property.

setAlternateViewIds(JAXBElement<StringArray>) - Method in class
com.cisco.cnr.ws.xsd.CCMSecondaryZone

Sets the value of the alternateViewIds property.

setAlternateViewIds(JAXBElement<StringArray>) - Method in class com.cisco.cnr.ws.xsd.CCMZone

Sets the value of the alternateViewIds property.

setAlternateViewIds(JAXBElement<StringArray>) - Method in class
com.cisco.cnr.ws.xsd.CCMZoneTemplate

Sets the value of the alternateViewIds property.

setAnswersRrsetUnsecure(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSCachingServerStats

Sets the value of the answersRrsetUnsecure property.

setAnswersSecure(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSCachingServerStats

Sets the value of the answersSecure property.

setAnswersTotal(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSCachingServerStats

Sets the value of the answersTotal property.

setAnswersUnsecure(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSCachingServerStats

Sets the value of the answersUnsecure property.

setAnswersUnwanted(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSCachingServerStats

Sets the value of the answersUnwanted property.

setAnswersWithFormerr(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSCachingServerStats

Sets the value of the answersWithFormerr property.

setAnswersWithNodata(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSCachingServerStats

Sets the value of the answersWithNodata property.

setAnswersWithNoerror(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSCachingServerStats

Sets the value of the answersWithNoerror property.

setAnswersWithNotauth(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSCachingServerStats

Sets the value of the answersWithNotauth property.

setAnswersWithNotimp(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSCachingServerStats

Sets the value of the answersWithNotimp property.

setAnswersWithNxdomain(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSCachingServerStats

Sets the value of the answersWithNxdomain property.

setAnswersWithOtherErrors(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSCachingServerStats

Sets the value of the answersWithOtherErrors property.

setAnswersWithRefused(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSCachingServerStats

Sets the value of the answersWithRefused property.

setAnswersWithServfail(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSCachingServerStats

Sets the value of the answersWithServfail property.

setAnyMatchSublist(JAXBElement<FilterElementArray>) - Method in class
com.cisco.cnr.ws.xsd.FilterElement

Sets the value of the anyMatchSublist property.

setAppliesTo(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CdnsDomainRateLimit

Sets the value of the appliesTo property.

setAResponse(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CdnsRedirect

Sets the value of the aResponse property.

setAscendingOrdered(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.ResourceValue

Sets the value of the ascendingOrdered property.

setAttrid(String) - Method in class com.cisco.cnr.ws.xsd.FilterElement

Sets the value of the attrid property.

setAuthenticateUntil(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.ClientEntry

Sets the value of the authenticateUntil property.

setAuthFails(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCP6Stats

Sets the value of the authFails property.

setAutoUpdate(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DnsTrustAnchor

Sets the value of the autoUpdate property.

setAvail(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CurrentUtilization

Sets the value of the avail property.

setAvailable(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CurrentPrefixUtilization

Sets the value of the available property.

setAxfrInErrors(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServerErrorsStats

Sets the value of the axfrInErrors property.

setAxfrOutErrors(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSServerErrorsStats

Sets the value of the axfrOutErrors property.

setAxfrsIn(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSServerPerformanceStats

Sets the value of the axfrsIn property.

setAxfrsOut(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSServerPerformanceStats

Sets the value of the axfrsOut property.

setAxfrVersion(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMRR

Sets the value of the axfrVersion property.

setAxfrVersion(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMRRSet

Sets the value of the axfrVersion property.

setBackup(String) - Method in class com.cisco.cnr.ws.xsd.CCMFailoverPair

Sets the value of the backup property.

setBackup(String) - Method in class com.cisco.cnr.ws.xsd.CCMHaDnsPair

Sets the value of the backup property.

setBackupIp6Address(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.CCMFailoverPair

Sets the value of the backupIp6Address property.

setBackupPct(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMFailoverPair

Sets the value of the backupPct property.

setBackupPct(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMScopeTemplate

Sets the value of the backupPct property.

setBackupPct(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Scope

Sets the value of the backupPct property.

setBackupServer(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMFailoverPair

Sets the value of the backupServer property.

setBackupServerAddr(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DnsUpdateConfig

Sets the value of the backupServerAddr property.

setBackupServerIp6Address(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DnsUpdateConfig

Sets the value of the backupServerIp6Address property.

setBackupServerKey(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DnsUpdateConfig

Sets the value of the backupServerKey property.

setBaseType(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.AttrDesc

Sets the value of the baseType property.

setBindingAcksReceived(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DHCPFailoverStats

Sets the value of the bindingAcksReceived property.

setBindingAcksReceived(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.FailoverRelatedServer

Sets the value of the bindingAcksReceived property.

setBindingAcksReceivedTotal(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.FailoverRelatedServer

Sets the value of the bindingAcksReceivedTotal property.

setBindingAcksSent(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DHCPFailoverStats

Sets the value of the bindingAcksSent property.

setBindingAcksSent(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.FailoverRelatedServer

      Sets the value of the bindingAcksSent property.

setBindingAcksSentTotal(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.FailoverRelatedServer

      Sets the value of the bindingAcksSentTotal property.

setBindingEndTime(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Lease

      Sets the value of the bindingEndTime property.

setBindingEndTime(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Lease6

      Sets the value of the bindingEndTime property.

setBindingFlags(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Lease6

      Sets the value of the bindingFlags property.

setBindingIaid(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Lease6

      Sets the value of the bindingIaid property.

setBindingNaksReceived(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DHCPFailoverStats

      Sets the value of the bindingNaksReceived property.

setBindingNaksSent(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DHCPFailoverStats

      Sets the value of the bindingNaksSent property.

setBindingRebindingTime(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Lease6

      Sets the value of the bindingRebindingTime property.

setBindingRenewalTime(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Lease6

      Sets the value of the bindingRenewalTime property.

setBindingStartTime(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Lease

      Sets the value of the bindingStartTime property.

setBindingStartTime(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Lease6

      Sets the value of the bindingStartTime property.

setBindingType(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Lease6

      Sets the value of the bindingType property.

setBindingUpdatesReceived(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DHCPFailoverStats

      Sets the value of the bindingUpdatesReceived property.

setBindingUpdatesReceived(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.FailoverRelatedServer

      Sets the value of the bindingUpdatesReceived property.

setBindingUpdatesReceivedTotal(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.FailoverRelatedServer

      Sets the value of the bindingUpdatesReceivedTotal property.

setBindingUpdatesSent(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DHCPFailoverStats

      Sets the value of the bindingUpdatesSent property.

setBindingUpdatesSent(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.FailoverRelatedServer

      Sets the value of the bindingUpdatesSent property.

setBindingUpdatesSentTotal(JAXBElement<String>) - Method in class

com.cisco.cnr.ws.xsd.FailoverRelatedServer
>   Sets the value of the bindingUpdatesSentTotal property.

setBits(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DnsSecKey
>   Sets the value of the bits property.

setBlackholeAcl(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServer
>   Sets the value of the blackholeAcl property.

setBlackholeAclDroppedRequests(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSServerSecurityStats
>   Sets the value of the blackholeAclDroppedRequests property.

setBlobVal(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.FilterElement
>   Sets the value of the blobVal property.

setBootp(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMScopeTemplate
>   Sets the value of the bootp property.

setBootp(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Scope
>   Sets the value of the bootp property.

setBootpReceived(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DHCPServerActivityStats
>   Sets the value of the bootpReceived property.

setBootpSent(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCPServerActivityStats
>   Sets the value of the bootpSent property.

setBucketInterval(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCPRenewalData
>   Sets the value of the bucketInterval property.

setBuckets(JAXBElement<StringArray>) - Method in class com.cisco.cnr.ws.xsd.DHCPRenewalData
>   Sets the value of the buckets property.

setBulkLeasequeries(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCP6Stats
>   Sets the value of the bulkLeasequeries property.

setBulkLeasequeryData(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCP6Stats
>   Sets the value of the bulkLeasequeryData property.

setBulkLeasequeryDone(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCP6Stats
>   Sets the value of the bulkLeasequeryDone property.

setBulkLeasequeryReplies(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DHCP6Stats
>   Sets the value of the bulkLeasequeryReplies property.

setCacheClientForRequests(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DHCPServer
>   Sets the value of the cacheClientForRequests property.

setCacheFull(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServerCacheStats
>   Sets the value of the cacheFull property.

setCacheHits(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats
>   Sets the value of the cacheHits property.

setCacheHits(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServerCacheStats
>   Sets the value of the cacheHits property.

setCacheHits(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServerQueryStats
>   Sets the value of the cacheHits property.

setCacheMaxNegativeTtl(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSCachingServer

Sets the value of the cacheMaxNegativeTtl property.

setCacheMaxNegativeTtl(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSCachingServerConfig

Sets the value of the cacheMaxNegativeTtl property.

setCacheMaxTtl(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSCachingServer

Sets the value of the cacheMaxTtl property.

setCacheMaxTtl(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSCachingServerConfig

Sets the value of the cacheMaxTtl property.

setCacheMinTtl(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSCachingServer

Sets the value of the cacheMinTtl property.

setCacheMinTtl(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSCachingServerConfig

Sets the value of the cacheMinTtl property.

setCacheMisses(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSCachingServerStats

Sets the value of the cacheMisses property.

setCacheMisses(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServerCacheStats

Sets the value of the cacheMisses property.

setCacheMisses(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServerQueryStats

Sets the value of the cacheMisses property.

setCacheNxdomain(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSServerCacheStats

Sets the value of the cacheNxdomain property.

setCachePrefetches(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSCachingServerStats

Sets the value of the cachePrefetches property.

setCacheRecords(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSServerCacheStats

Sets the value of the cacheRecords property.

setCacheRrs(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServerCacheStats

Sets the value of the cacheRrs property.

setCacheSize(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServerCacheStats

Sets the value of the cacheSize property.

setCachingServer(String) - Method in class com.cisco.cnr.ws.xsd.CCMZDCaching

Sets the value of the cachingServer property.

setCachingServerList(JAXBElement<CCMZDCachingArray>) - Method in class
com.cisco.cnr.ws.xsd.CCMZoneDistribution

Sets the value of the cachingServerList property.

setCCMServerType(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMServer

Sets the value of the ccmServerType property.

setCCMSubnetType(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMSubnet

Sets the value of the ccmSubnetType property.

setCertificateContents(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Certificate

Sets the value of the certificateContents property.

setCertificateType(String) - Method in class com.cisco.cnr.ws.xsd.Certificate

setClusterName(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DnsHAStatus

> Sets the value of the clusterName property.

setCmMacAddress(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Lease6

> Sets the value of the cmMacAddress property.

setCmMacAddress(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Reservation

> Sets the value of the cmMacAddress property.

setCmMacAddress(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Reservation6

> Sets the value of the cmMacAddress property.

setCollectPerformanceStatistics(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCPServer

> Sets the value of the collectPerformanceStatistics property.

setCollectSampleCounters(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCPServer

> Sets the value of the collectSampleCounters property.

setCommState(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSRelatedServer

> Sets the value of the commState property.

setCommState(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.FailoverRelatedServer

> Sets the value of the commState property.

setCommState(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.LDAPRelatedServer

> Sets the value of the commState property.

setCommState(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.RelayAgentState

> Sets the value of the commState property.

setCommState(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.TCPConnectionRelatedServer

> Sets the value of the commState property.

setCommState(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.TCPListenerRelatedServer

> Sets the value of the commState property.

setConcurrentXfrsIn(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServerMaxCounterStats

> Sets the value of the concurrentXfrsIn property.

setConcurrentXfrsOut(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServerMaxCounterStats

> Sets the value of the concurrentXfrsOut property.

setConfigRecurs(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats

> Sets the value of the configRecurs property.

setConfigRecurs(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServerStats

> Sets the value of the configRecurs property.

setConfigReset(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServerStats

> Sets the value of the configReset property.

setConfigResetTime(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats

> Sets the value of the configResetTime property.

setConfigResetTime(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServerStats

> Sets the value of the configResetTime property.

setConfigUpTime(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServerStats
> Sets the value of the configUpTime property.

setConfiguredBucketInterval(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DHCPRenewalData
> Sets the value of the configuredBucketInterval property.

setConfiguredBy(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Certificate
> Sets the value of the configuredBy property.

setConfiguredLeases(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DHCPServerActivityStats
> Sets the value of the configuredLeases property.

setConfiguredMaxRenewalTime(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DHCPRenewalData
> Sets the value of the configuredMaxRenewalTime property.

setConfirms(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCP6Stats
> Sets the value of the confirms property.

setConnectAcksReceived(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DHCPFailoverStats
> Sets the value of the connectAcksReceived property.

setConnectAcksSent(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DHCPFailoverStats
> Sets the value of the connectAcksSent property.

setConnectionEndTime(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.FailoverRelatedServer
> Sets the value of the connectionEndTime property.

setConnectionStartTime(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.FailoverRelatedServer
> Sets the value of the connectionStartTime property.

setConnectionsTerminatedByPartner(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DHCPFailoverStats
> Sets the value of the connectionsTerminatedByPartner property.

setConnectionsTerminatedByServer(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DHCPFailoverStats
> Sets the value of the connectionsTerminatedByServer property.

setConnectsReceived(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DHCPFailoverStats
> Sets the value of the connectsReceived property.

setConnectsSent(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCPFailoverStats
> Sets the value of the connectsSent property.

setConntrackUsageWarning(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSCachingServer
> Sets the value of the conntrackUsageWarning property.

setConntrackUsageWarning(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSCachingServerConfig
> Sets the value of the conntrackUsageWarning property.

setConntrackUsageWarning(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSServer

Sets the value of the conntrackUsageWarning property.

setContactsReceived(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DHCPFailoverStats

Sets the value of the contactsReceived property.

setContactsSent(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCPFailoverStats

Sets the value of the contactsSent property.

setCount(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSCachingServerRateLimitItem

Sets the value of the count property.

setCounterResetTime(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSServerStats

Sets the value of the counterResetTime property.

setCpuUtilization(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.ServerSystemStats

Sets the value of the cpuUtilization property.

setCreatePtrRecords(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMHost

Sets the value of the createPtrRecords property.

setCreationTime(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Lease6

Sets the value of the creationTime property.

setCritical(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.ResourceStatus

Sets the value of the critical property.

setCsetdbCheckPts(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSServerDBStats

Sets the value of the csetdbCheckPts property.

setCsetdbCsetsTrimmed(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSServerDBStats

Sets the value of the csetdbCsetsTrimmed property.

setCsetdbDeletes(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServerDBStats

Sets the value of the csetdbDeletes property.

setCsetdbLogPurges(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSServerDBStats

Sets the value of the csetdbLogPurges property.

setCsetdbLogPurgesCount(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSServerDBStats

Sets the value of the csetdbLogPurgesCount property.

setCsetdbReads(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServerDBStats

Sets the value of the csetdbReads property.

setCsetdbTxn(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServerDBStats

Sets the value of the csetdbTxn property.

setCsetdbTxnAborts(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSServerDBStats

Sets the value of the csetdbTxnAborts property.

setCsetdbTxnCommits(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSServerDBStats

Sets the value of the csetdbTxnCommits property.

setCsetdbWrites(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServerDBStats

Sets the value of the csetdbWrites property.

setCsetqCount(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServerDBStats

Sets the value of the csetqCount property.

setCurrentBindingUpdatesInFlight(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.FailoverRelatedServer

Sets the value of the currentBindingUpdatesInFlight property.

setCurrentBindingUpdatesQueued(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.FailoverRelatedServer

Sets the value of the currentBindingUpdatesQueued property.

setCurrentConnections(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.TCPListenerRelatedServer

Sets the value of the currentConnections property.

setCurrentRequests(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.TCPConnectionRelatedServer

Sets the value of the currentRequests property.

setCurrentResponsesForPartner(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.RelayAgentState

Sets the value of the currentResponsesForPartner property.

setCurrentState(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.TCPConnectionRelatedServer

Sets the value of the currentState property.

setCurrentStateDuration(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.RelayAgentState

Sets the value of the currentStateDuration property.

setCurrentTime(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSRelatedServer

Sets the value of the currentTime property.

setCurrentTime(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.FailoverRelatedServer

Sets the value of the currentTime property.

setDataFreeSpace(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.SystemStats

Sets the value of the dataFreeSpace property.

setDataPath(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.SystemStats

Sets the value of the dataPath property.

setDataSource(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Lease

Sets the value of the dataSource property.

setDataSource(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Lease6

Sets the value of the dataSource property.

setDataTotalSpace(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.SystemStats

Sets the value of the dataTotalSpace property.

setDateEnd(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.FilterElement

Sets the value of the dateEnd property.

setDateStart(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.FilterElement

Sets the value of the dateStart property.

setDbtxnGeneration(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Lease

Sets the value of the dbtxnGeneration property.

setDbtxnGeneration(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Lease6

Sets the value of the dbtxnGeneration property.

setDbtxnSeq(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Lease

setDeferLeaseExtensions(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DHCPServer
> Sets the value of the deferLeaseExtensions property.

setDefttl(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMReverseZone
> Sets the value of the defttl property.

setDefttl(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMZone
> Sets the value of the defttl property.

setDefttl(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMZoneTemplate
> Sets the value of the defttl property.

setDeleteOrphanedLeases(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DHCPServer
> Sets the value of the deleteOrphanedLeases property.

setDeleteOrphanedSubnets(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DHCPServer
> Sets the value of the deleteOrphanedSubnets property.

setDesc(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.AttrDesc
> Sets the value of the desc property.

setDesc(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.OptionDefinitionSet
> Sets the value of the desc property.

setDescription(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.ACL
> Sets the value of the description property.

setDescription(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.AuthDnsSec
> Sets the value of the description property.

setDescription(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMHaDnsPair
> Sets the value of the description property.

setDescription(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMReverseZone
> Sets the value of the description property.

setDescription(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMRRSet
> Sets the value of the description property.

setDescription(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMScopeTemplate
> Sets the value of the description property.

setDescription(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMSecondaryZone
> Sets the value of the description property.

setDescription(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMSubnet
> Sets the value of the description property.

setDescription(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMZone
> Sets the value of the description property.

setDescription(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMZoneDistribution
> Sets the value of the description property.

setDescription(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMZoneTemplate
> Sets the value of the description property.

setDescription(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CdnsRateLimit
> Sets the value of the description property.

setDescription(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CdnsRedirect
> Sets the value of the description property.

Sets the value of the detectedTsigBadSig property.

setDetectedTsigBadTime(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServerSecurityStats

Sets the value of the detectedTsigBadTime property.

setDeviceName(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Reservation

Sets the value of the deviceName property.

setDeviceName(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Reservation6

Sets the value of the deviceName property.

setDhcp(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMScopeTemplate

Sets the value of the dhcp property.

setDhcp(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Scope

Sets the value of the dhcp property.

setDhcpType(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CurrentPrefixUtilization

Sets the value of the dhcpType property.

setDhcpType(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Prefix

Sets the value of the dhcpType property.

setDhcpType(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.PrefixTemplate

Sets the value of the dhcpType property.

setDiscardedMessages(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCPFailoverStats

Sets the value of the discardedMessages property.

setDiscards(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCP6Stats

Sets the value of the discards property.

setDiscards(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCPServerActivityStats

Sets the value of the discards property.

setDisconnectsReceived(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCPFailoverStats

Sets the value of the disconnectsReceived property.

setDisconnectsSent(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCPFailoverStats

Sets the value of the disconnectsSent property.

setDiscovers(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCPServerActivityStats

Sets the value of the discovers property.

setDistMap(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMReverseZone

Sets the value of the distMap property.

setDistMap(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMZone

Sets the value of the distMap property.

setDistMap(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMZoneTemplate

Sets the value of the distMap property.

setDistributeRenewals(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCPServer

Sets the value of the distributeRenewals property.

setDistributeRenewalsBucketInterval(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCPServer

Sets the value of the distributeRenewalsBucketInterval property.

setDistributeRenewalsMaxRenewalTime(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCPServer

setDnssecResponses(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSServerSecurityStats
>   Sets the value of the dnssecResponses property.

setDnssecSignZone(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSServerSecurityStats
>   Sets the value of the dnssecSignZone property.

setDnssecZones(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSServerSecurityStats
>   Sets the value of the dnssecZones property.

setDnsServerFlags(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSRelatedServer
>   Sets the value of the dnsServerFlags property.

setDnsServerState(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSRelatedServer
>   Sets the value of the dnsServerState property.

setDnsTimeout(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCPServer
>   Sets the value of the dnsTimeout property.

setDnsTimeout(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSRelatedServer
>   Sets the value of the dnsTimeout property.

setDnsUpdateFlags(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Lease6
>   Sets the value of the dnsUpdateFlags property.

setDocsisVersionIdMissing(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DHCPServer
>   Sets the value of the docsisVersionIdMissing property.

setDomain(String) - Method in class com.cisco.cnr.ws.xsd.CdnsDomainRateLimit
>   Sets the value of the domain property.

setDomainInsecure(JAXBElement<StringArray>) - Method in class com.cisco.cnr.ws.xsd.DnsSec
>   Sets the value of the domainInsecure property.

setDomainName(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.ClientClass
>   Sets the value of the domainName property.

setDomainName(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.ClientEntry
>   Sets the value of the domainName property.

setDomainPrefix(String) - Method in class com.cisco.cnr.ws.xsd.DnsEnumDomain
>   Sets the value of the domainPrefix property.

setDomainPrefix(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DnsEnumEntrySet
>   Sets the value of the domainPrefix property.

setDomainRateLimit(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSCachingServerStats
>   Sets the value of the domainRateLimit property.

setDomainRatelimited(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSCachingServerRateLimitStats
>   Sets the value of the domainRatelimited property.

setDomainRateLimiting(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.CdnsRateLimit
>   Sets the value of the domainRateLimiting property.

setDomainRateLimitingFactor(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.CdnsRateLimit
>   Sets the value of the domainRateLimitingFactor property.

setDomainRateLimitingList(JAXBElement<CdnsDomainRateLimitArray>) - Method in class com.cisco.cnr.ws.xsd.CdnsRateLimit

> Sets the value of the domainRateLimitingList property.

setDomainRateLimitingQps(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CdnsRateLimit

> Sets the value of the domainRateLimitingQps property.

setDomainReportMaxCount(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CdnsRateLimit

> Sets the value of the domainReportMaxCount property.

setDomains(JAXBElement<DNSCachingServerRateLimitItemArray>) - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerRateLimitStats

> Sets the value of the domains property.

setDomains(JAXBElement<StringArray>) - Method in class com.cisco.cnr.ws.xsd.CdnsRedirect

> Sets the value of the domains property.

setDosPotential(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServerSecurityStats

> Sets the value of the dosPotential property.

setDropOldPackets(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCPServer

> Sets the value of the dropOldPackets property.

setDropPacketOnExtensionFailure(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCPServer

> Sets the value of the dropPacketOnExtensionFailure property.

setDroppedTotal(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCP6Stats

> Sets the value of the droppedTotal property.

setDroppedTotal(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCPServerActivityStats

> Sets the value of the droppedTotal property.

setDropRecursiveQueries(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServer

> Sets the value of the dropRecursiveQueries property.

setDsRr(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMReverseZone

> Sets the value of the dsRr property.

setDsRr(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMZone

> Sets the value of the dsRr property.

setDuplicates(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCP6Stats

> Sets the value of the duplicates property.

setDuplicates(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCPServerActivityStats

> Sets the value of the duplicates property.

setDynamicBootp(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMScopeTemplate

> Sets the value of the dynamicBootp property.

setDynamicBootp(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Scope

> Sets the value of the dynamicBootp property.

setDynamicBootpBackupPct(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMFailoverPair

> Sets the value of the dynamicBootpBackupPct property.

setDynamicDns(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DnsUpdateConfig

> Sets the value of the dynamicDns property.

setEcsAlwaysForward(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSCachingServer
> Sets the value of the ecsAlwaysForward property.

setEcsAlwaysForward(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSCachingServerConfig
> Sets the value of the ecsAlwaysForward property.

setEcsDestination(JAXBElement<StringArray>) - Method in class
com.cisco.cnr.ws.xsd.DNSCachingServer
> Sets the value of the ecsDestination property.

setEcsDestination(JAXBElement<StringArray>) - Method in class
com.cisco.cnr.ws.xsd.DNSCachingServerConfig
> Sets the value of the ecsDestination property.

setEcsEnable(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSCachingServer
> Sets the value of the ecsEnable property.

setEcsEnable(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerConfig
> Sets the value of the ecsEnable property.

setEdnsMaxPayload(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServer
> Sets the value of the ednsMaxPayload property.

setEmbeddedPolicy(JAXBElement<Policy>) - Method in class
com.cisco.cnr.ws.xsd.CCMScopeTemplate
> Sets the value of the embeddedPolicy property.

setEmbeddedPolicy(JAXBElement<Policy>) - Method in class com.cisco.cnr.ws.xsd.ClientClass
> Sets the value of the embeddedPolicy property.

setEmbeddedPolicy(JAXBElement<Policy>) - Method in class com.cisco.cnr.ws.xsd.ClientEntry
> Sets the value of the embeddedPolicy property.

setEmbeddedPolicy(JAXBElement<Policy>) - Method in class com.cisco.cnr.ws.xsd.Link
> Sets the value of the embeddedPolicy property.

setEmbeddedPolicy(JAXBElement<Policy>) - Method in class com.cisco.cnr.ws.xsd.LinkTemplate
> Sets the value of the embeddedPolicy property.

setEmbeddedPolicy(JAXBElement<Policy>) - Method in class com.cisco.cnr.ws.xsd.Prefix
> Sets the value of the embeddedPolicy property.

setEmbeddedPolicy(JAXBElement<Policy>) - Method in class com.cisco.cnr.ws.xsd.PrefixTemplate
> Sets the value of the embeddedPolicy property.

setEmbeddedPolicy(JAXBElement<Policy>) - Method in class com.cisco.cnr.ws.xsd.Scope
> Sets the value of the embeddedPolicy property.

setEnableSigning(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DnsSecKey
> Sets the value of the enableSigning property.

setEnd(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCPMaintenanceWindow
> Sets the value of the end property.

setEnd(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Range
> Sets the value of the end property.

setEndTime(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCPRenewalData
> Sets the value of the endTime property.

setEndTime(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSCachingServerRateLimitStats
> Sets the value of the endTime property.

setEnhancedSampleCounters(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DHCPServer
>   Sets the value of the enhancedSampleCounters property.
setEqualPriorityMostAvailable(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DHCPServer
>   Sets the value of the equalPriorityMostAvailable property.
setEstEndRecoverTime(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.FailoverRelatedServer
>   Sets the value of the estEndRecoverTime property.
setEstPartnerEndRecoverTime(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.FailoverRelatedServer
>   Sets the value of the estPartnerEndRecoverTime property.
setEventClearMessage(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.ResourceValue
>   Sets the value of the eventClearMessage property.
setEventReportMessage(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.ResourceValue
>   Sets the value of the eventReportMessage property.
setEventState(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.ResourceValue
>   Sets the value of the eventState property.
setEventTimestamp(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.ResourceValue
>   Sets the value of the eventTimestamp property.
setExceededMaxDnsPackets(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSServerErrorsStats
>   Sets the value of the exceededMaxDnsPackets property.
setExceededMaxTargetCount(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSCachingServerStats
>   Sets the value of the exceededMaxTargetCount property.
setExcludedPrefix(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Lease6
>   Sets the value of the excludedPrefix property.
setExcludedPrefix(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Policy
>   Sets the value of the excludedPrefix property.
setExpiration(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Lease
>   Sets the value of the expiration property.
setExpirationDate(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DnsSecKey
>   Sets the value of the expirationDate property.
setExpirationTime(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Prefix
>   Sets the value of the expirationTime property.
setExpirationTime(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.PrefixTemplate
>   Sets the value of the expirationTime property.
setExpire(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMReverseZone
>   Sets the value of the expire property.
setExpire(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMZone
>   Sets the value of the expire property.
setExpire(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMZoneTemplate
>   Sets the value of the expire property.

setExpired(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CurrentPrefixUtilization

    Sets the value of the expired property.

setExpired(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CurrentUtilization

    Sets the value of the expired property.

setExpression(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Option

    Sets the value of the expression property.

setExpressionConfigurationTraceLevel(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCPServer

    Sets the value of the expressionConfigurationTraceLevel property.

setExpressionTraceLevel(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCPServer

    Sets the value of the expressionTraceLevel property.

setExtensionDrops(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCP6Stats

    Sets the value of the extensionDrops property.

setExtensionDrops(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCPServerActivityStats

    Sets the value of the extensionDrops property.

setExtensionErrors(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCP6Stats

    Sets the value of the extensionErrors property.

setExtensionErrors(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCPServerActivityStats

    Sets the value of the extensionErrors property.

setExtensionTraceLevel(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCPServer

    Sets the value of the extensionTraceLevel property.

setFailedConnections(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCPFailoverStats

    Sets the value of the failedConnections property.

setFailover(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMFailoverPair

    Sets the value of the failover property.

setFailoverBackupAllocationBoundary(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Scope

    Sets the value of the failoverBackupAllocationBoundary property.

setFailoverExpirationTime(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Lease

    Sets the value of the failoverExpirationTime property.

setFailoverExpirationTime(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Lease6

    Sets the value of the failoverExpirationTime property.

setFailoverpair(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMSubnet

    Sets the value of the failoverpair property.

setFailoverPairName(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.FailoverRelatedServer

    Sets the value of the failoverPairName property.

setFailoverRecover(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCPServer

    Sets the value of the failoverRecover property.

setFailoverRole(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CurrentUtilization

    Sets the value of the failoverRole property.

setFailoverState(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CurrentUtilization

    Sets the value of the failoverState property.

setFilterElementList(JAXBElement<FilterElementArray>) - Method in class com.cisco.cnr.ws.xsd.Filter

      Sets the value of the filterElementList property.

setFirewallDropped(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats

      Sets the value of the firewallDropped property.

setFirewallRedirected(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats

      Sets the value of the firewallRedirected property.

setFirewallRedirectNxdomain(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats

      Sets the value of the firewallRedirectNxdomain property.

setFirewallRefused(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats

      Sets the value of the firewallRefused property.

setFirewallRpz(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats

      Sets the value of the firewallRpz property.

setFlags(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.AttrDesc

      Sets the value of the flags property.

setFlags(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Lease

      Sets the value of the flags property.

setFlags(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Lease6

      Sets the value of the flags property.

setFlags(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.OptionDefinitionSet

      Sets the value of the flags property.

setForceDnsUpdates(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCPServer

      Sets the value of the forceDnsUpdates property.

setForceDnsUpdates(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DnsUpdateConfig

      Sets the value of the forceDnsUpdates property.

setForwardDnsupdate(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Lease6

      Sets the value of the forwardDnsupdate property.

setForwardDnsupdate(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Policy

      Sets the value of the forwardDnsupdate property.

setForwardZoneName(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMSubnet

      Sets the value of the forwardZoneName property.

setForwardZoneName(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DnsUpdateConfig

      Sets the value of the forwardZoneName property.

setForwardZoneName(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Policy

      Sets the value of the forwardZoneName property.

setFqdn(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMCluster

      Sets the value of the fqdn property.

setFqdn(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMServer

      Sets the value of the fqdn property.

Sets the value of the haMsgReqSentTime property.

setHaMsgRespRecv(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSServerHaStats

Sets the value of the haMsgRespRecv property.

setHaMsgRespSent(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSServerHaStats

Sets the value of the haMsgRespSent property.

setHaMsgRrsyncRecv(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSServerHaStats

Sets the value of the haMsgRrsyncRecv property.

setHaMsgRrsyncSent(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSServerHaStats

Sets the value of the haMsgRrsyncSent property.

setHaMsgRrupdateRecv(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSServerHaStats

Sets the value of the haMsgRrupdateRecv property.

setHaMsgRrupdateSent(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSServerHaStats

Sets the value of the haMsgRrupdateSent property.

setHaMsgShutdownRecv(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSServerHaStats

Sets the value of the haMsgShutdownRecv property.

setHaMsgShutdownSent(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSServerHaStats

Sets the value of the haMsgShutdownSent property.

setHaMsgZonesyncRecv(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSServerHaStats

Sets the value of the haMsgZonesyncRecv property.

setHaMsgZonesyncSent(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSServerHaStats

Sets the value of the haMsgZonesyncSent property.

setHaPartnerDown(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServerHaStats

Sets the value of the haPartnerDown property.

setHaPersistedEditList(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSServerMaxCounterStats

Sets the value of the haPersistedEditList property.

setHardenGlue(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSCachingServer

Sets the value of the hardenGlue property.

setHardenGlue(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSCachingServerConfig

Sets the value of the hardenGlue property.

setHardwareUnicast(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCPServer

Sets the value of the hardwareUnicast property.

setHaRespInconsistent(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSServerHaStats

Sets the value of the haRespInconsistent property.

setHaRespServfail(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServerHaStats
> Sets the value of the haRespServfail property.

setHaRespUnknown(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServerHaStats
> Sets the value of the haRespUnknown property.

setHaRrActiveList(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServerMaxCounterStats
> Sets the value of the haRrActiveList property.

setHaRrPendingList(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServerMaxCounterStats
> Sets the value of the haRrPendingList property.

setHaStateCommInterrupted(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServerHaStats
> Sets the value of the haStateCommInterrupted property.

setHaStateCurrent(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServerHaStats
> Sets the value of the haStateCurrent property.

setHaStateLastChangeTime(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServerHaStats
> Sets the value of the haStateLastChangeTime property.

setHaStateNegotiating(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServerHaStats
> Sets the value of the haStateNegotiating property.

setHaStateNormal(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServerHaStats
> Sets the value of the haStateNormal property.

setHaStatePartnerDown(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServerHaStats
> Sets the value of the haStatePartnerDown property.

setHaStateStartup(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServerHaStats
> Sets the value of the haStateStartup property.

setHaStatus(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DnsZoneStatus
> Sets the value of the haStatus property.

setHaSync(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServerHaStats
> Sets the value of the haSync property.

setHaSyncConflict(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServerHaStats
> Sets the value of the haSyncConflict property.

setHaSyncDiscardName(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServerHaStats
> Sets the value of the haSyncDiscardName property.

setHaSyncMergeName(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServerHaStats
> Sets the value of the haSyncMergeName property.

setHaUpdateLatencyMax(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServerMaxCounterStats
> Sets the value of the haUpdateLatencyMax property.

setHaUpdateReject(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServerHaStats

Sets the value of the haUpdateReject property.

setHaZoneCount(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DnsHAStatus

Sets the value of the haZoneCount property.

setHaZoneMismatch(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServerHaStats

Sets the value of the haZoneMismatch property.

setHealth(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMServerInfo

Sets the value of the health property.

setHhcInterval(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServer

Sets the value of the hhcInterval property.

setHhcMaxInitTtl(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServer

Sets the value of the hhcMaxInitTtl property.

setHhcMaxTtl(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServer

Sets the value of the hhcMaxTtl property.

setHistoryList(JAXBElement<CurrentPrefixUtilizationArray>) - Method in class com.cisco.cnr.ws.xsd.CurrentPrefixUtilization

Sets the value of the historyList property.

setHistoryList(JAXBElement<CurrentUtilizationArray>) - Method in class com.cisco.cnr.ws.xsd.CurrentUtilization

Sets the value of the historyList property.

setHits(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMRRSet

Sets the value of the hits property.

setHost(JAXBElement<StringArray>) - Method in class com.cisco.cnr.ws.xsd.DnsException

Sets the value of the host property.

setHost(JAXBElement<StringArray>) - Method in class com.cisco.cnr.ws.xsd.DnsForwarder

Sets the value of the host property.

setHostHealthCheck(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMRRSet

Sets the value of the hostHealthCheck property.

setHostHealthCheck(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServer

Sets the value of the hostHealthCheck property.

setHostName(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.ClientClass

Sets the value of the hostName property.

setHostName(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.ClientEntry

Sets the value of the hostName property.

setHostNameGenerator(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DnsUpdateConfig

Sets the value of the hostNameGenerator property.

setHttpPort(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMCluster

Sets the value of the httpPort property.

setHttps(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSCachingServer

Sets the value of the https property.

setHttps(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerConfig

Sets the value of the https property.

setHttpsPort(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMCluster

Sets the value of the httpsPort property.

setHttpsPort(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSCachingServer
> Sets the value of the httpsPort property.

setHttpsPort(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerConfig
> Sets the value of the httpsPort property.

setHttpsQueryBuffer(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats
> Sets the value of the httpsQueryBuffer property.

setHttpsResponseBuffer(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats
> Sets the value of the httpsResponseBuffer property.

setHybridAdnsAddrs(JAXBElement<StringArray>) - Method in class com.cisco.cnr.ws.xsd.DNSServer
> Sets the value of the hybridAdnsAddrs property.

setHybridLocalhostOnly(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServer
> Sets the value of the hybridLocalhostOnly property.

setHybridMode(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServer
> Sets the value of the hybridMode property.

setHybridOverride(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServer
> Sets the value of the hybridOverride property.

setHybridUseAdnsAddrs(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServer
> Sets the value of the hybridUseAdnsAddrs property.

setId(String) - Method in class com.cisco.cnr.ws.xsd.VPN
> Sets the value of the id property.

setId(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.AttrDesc
> Sets the value of the id property.

setId(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServerStats
> Sets the value of the id property.

setId(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Key
> Sets the value of the id property.

setIdRange(String) - Method in class com.cisco.cnr.ws.xsd.OptionDefinitionSet
> Sets the value of the idRange property.

setIgnoreCiscoOptions(JAXBElement<StringArray>) - Method in class com.cisco.cnr.ws.xsd.DHCPServer
> Sets the value of the ignoreCiscoOptions property.

setIgnoreDeclines(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMScopeTemplate
> Sets the value of the ignoreDeclines property.

setIgnoreDeclines(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Prefix
> Sets the value of the ignoreDeclines property.

setIgnoreDeclines(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.PrefixTemplate
> Sets the value of the ignoreDeclines property.

setIgnoreDeclines(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Scope
> Sets the value of the ignoreDeclines property.

setIgnoreIcmpErrors(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCPServer
> Sets the value of the ignoreIcmpErrors property.

setIgnoreRequestsForOtherServers(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCPServer

setIntEnd(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.FilterElement
>Sets the value of the intEnd property.

setInterface(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMSubnet
>Sets the value of the interface property.

setInterface(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Link
>Sets the value of the interface property.

setInterval(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCPRenewalData
>Sets the value of the interval property.

setIntStart(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.FilterElement
>Sets the value of the intStart property.

setIntVal(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.FilterElement
>Sets the value of the intVal property.

setIntWarningLevel(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.ResourceValue
>Sets the value of the intWarningLevel property.

setInUseAddresses(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DHCPScopeAggregationStats
>Sets the value of the inUseAddresses property.

setInvalidClients(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCP6Stats
>Sets the value of the invalidClients property.

setInvalidClients(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DHCPServerActivityStats
>Sets the value of the invalidClients property.

setInvalidConnections(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DHCPFailoverStats
>Sets the value of the invalidConnections property.

setInvalidMessagesReceived(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DHCPFailoverStats
>Sets the value of the invalidMessagesReceived property.

setInvalidPackets(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCP6Stats
>Sets the value of the invalidPackets property.

setInvalidPackets(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DHCPServerActivityStats
>Sets the value of the invalidPackets property.

setIp6Addr(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.FilterElement
>Sets the value of the ip6Addr property.

setIp6Address(String) - Method in class com.cisco.cnr.ws.xsd.Reservation6
>Sets the value of the ip6Address property.

setIp6Address(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMCluster
>Sets the value of the ip6Address property.

setIp6Address(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSRelatedServer
>Sets the value of the ip6Address property.

setIp6Address(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.FailoverRelatedServer
>Sets the value of the ip6Address property.

setIp6Address(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.LDAPRelatedServer
>Sets the value of the ip6Address property.

setIp6Address(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Lease6

Sets the value of the ip6Address property.

setIp6Address(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.RelayAgentState

Sets the value of the ip6Address property.

setIp6Address(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.TCPConnectionRelatedServer

Sets the value of the ip6Address property.

setIp6Address(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.TCPListenerRelatedServer

Sets the value of the ip6Address property.

setIp6AddressList(JAXBElement<StringArray>) - Method in class com.cisco.cnr.ws.xsd.CCMHost

Sets the value of the ip6AddressList property.

setIp6Prefix(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.FilterElement

Sets the value of the ip6Prefix property.

setIpaddr(String) - Method in class com.cisco.cnr.ws.xsd.Reservation

Sets the value of the ipaddr property.

setIpaddr(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMCluster

Sets the value of the ipaddr property.

setIpaddr(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMServer

Sets the value of the ipaddr property.

setIpaddr(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSRelatedServer

Sets the value of the ipaddr property.

setIpaddr(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.FailoverRelatedServer

Sets the value of the ipaddr property.

setIpaddr(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.LDAPRelatedServer

Sets the value of the ipaddr property.

setIpaddr(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.TCPConnectionRelatedServer

Sets the value of the ipaddr property.

setIpaddr(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.TCPListenerRelatedServer

Sets the value of the ipaddr property.

setIpAddr(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.FilterElement

Sets the value of the ipAddr property.

setIpaddrs(JAXBElement<StringArray>) - Method in class com.cisco.cnr.ws.xsd.AddrSet

Sets the value of the ipaddrs property.

setIpHistory(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCPServer

Sets the value of the ipHistory property.

setIpHistoryMaxAge(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCPServer

Sets the value of the ipHistoryMaxAge property.

setIpRange(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.FilterElement

Sets the value of the ipRange property.

setIpSubnet(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.FilterElement

Sets the value of the ipSubnet property.

setIpv4PacketsIn(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServerPerformanceStats

Sets the value of the ipv4PacketsIn property.

setIpv4PacketsOut(JAXBElement<String>) - Method in class

com.cisco.cnr.ws.xsd.DNSServerPerformanceStats

      Sets the value of the ipv4PacketsOut property.

setIpv6PacketsIn(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServerIPv6Stats

      Sets the value of the ipv6PacketsIn property.

setIpv6PacketsIn(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSServerPerformanceStats

      Sets the value of the ipv6PacketsIn property.

setIpv6PacketsOut(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSServerIPv6Stats

      Sets the value of the ipv6PacketsOut property.

setIpv6PacketsOut(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSServerPerformanceStats

      Sets the value of the ipv6PacketsOut property.

setIssuer(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Certificate

      Sets the value of the issuer property.

setIxfrInErrors(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServerErrorsStats

      Sets the value of the ixfrInErrors property.

setIxfrOutErrors(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSServerErrorsStats

      Sets the value of the ixfrOutErrors property.

setIxfrsFullResp(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSServerPerformanceStats

      Sets the value of the ixfrsFullResp property.

setIxfrsIn(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServerPerformanceStats

      Sets the value of the ixfrsIn property.

setIxfrsOut(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSServerPerformanceStats

      Sets the value of the ixfrsOut property.

setKeyCacheExceeded(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSCachingServerStats

      Sets the value of the keyCacheExceeded property.

setKeyCacheSize(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DnsSec

      Sets the value of the keyCacheSize property.

setKeyContents(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Certificate

      Sets the value of the keyContents property.

setKeyGroup(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMReverseZone

      Sets the value of the keyGroup property.

setKeyGroup(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMZone

      Sets the value of the keyGroup property.

setKeyGroup(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMZoneTemplate

      Sets the value of the keyGroup property.

setKeyGroup(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DnsSecKey

      Sets the value of the keyGroup property.

setKeyRollover(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.AuthDnsSec

      Sets the value of the keyRollover property.

setKskAlgorithm(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.AuthDnsSec

Sets the value of the lastProbeSentTime property.

setLastReceiveTime(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.TCPConnectionRelatedServer

Sets the value of the lastReceiveTime property.

setLastRelayIp6Address(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.RelayAgentState

Sets the value of the lastRelayIp6Address property.

setLastReplyReceivedTime(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSRelatedServer

Sets the value of the lastReplyReceivedTime property.

setLastResetTime(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMRRSet

Sets the value of the lastResetTime property.

setLastResetTime(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSTopNameStats

Sets the value of the lastResetTime property.

setLastResetTime(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.ResourceValue

Sets the value of the lastResetTime property.

setLastSendTime(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.TCPConnectionRelatedServer

Sets the value of the lastSendTime property.

setLastTransactionTimeGranularity(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCPServer

Sets the value of the lastTransactionTimeGranularity property.

setLastUpdatedTime(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.ResourceValue

Sets the value of the lastUpdatedTime property.

setLastValueMessage(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.ResourceValue

Sets the value of the lastValueMessage property.

setLastValueState(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.ResourceValue

Sets the value of the lastValueState property.

setLateRenewals(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCPRenewalData

Sets the value of the lateRenewals property.

setLdapMode(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCPServer

Sets the value of the ldapMode property.

setLeased(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CurrentPrefixUtilization

Sets the value of the leased property.

setLeased(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CurrentUtilization

Sets the value of the leased property.

setLeasedDeactivated(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CurrentPrefixUtilization

Sets the value of the leasedDeactivated property.

setLeasedDeactivated(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CurrentUtilization

Sets the value of the leasedDeactivated property.

setLeaseHistPollInterval(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMCluster

Sets the value of the leaseHistPollInterval property.

setLeaseHistPollOffset(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMCluster

Sets the value of the leaseHistPollOffset property.

setLeaseHistPollRetry(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMCluster
> Sets the value of the leaseHistPollRetry property.

setLeasequeries(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCP6Stats
> Sets the value of the leasequeries property.

setLeaseQueries(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCPServerActivityStats
> Sets the value of the leaseQueries property.

setLeaseQueriesActive(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCPServerActivityStats
> Sets the value of the leaseQueriesActive property.

setLeaseQueriesUnassigned(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCPServerActivityStats
> Sets the value of the leaseQueriesUnassigned property.

setLeaseQueriesUnknown(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCPServerActivityStats
> Sets the value of the leaseQueriesUnknown property.

setLeasequeryReplies(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCP6Stats
> Sets the value of the leasequeryReplies property.

setLeaseRebindingTime(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Lease
> Sets the value of the leaseRebindingTime property.

setLeaseRenewalTime(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Lease
> Sets the value of the leaseRenewalTime property.

setLeaseRetentionLimit(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Policy
> Sets the value of the leaseRetentionLimit property.

setLeaseRetentionMaxAge(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCPServer
> Sets the value of the leaseRetentionMaxAge property.

setLeaseRetentionMinAge(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCPServer
> Sets the value of the leaseRetentionMinAge property.

setLicensedServices(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMCluster
> Sets the value of the licensedServices property.

setLimit(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerRateLimitItem
> Sets the value of the limit property.

setLimitationCount(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Policy
> Sets the value of the limitationCount property.

setLimitationId(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.ClientClass
> Sets the value of the limitationId property.

setLimitationId(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Lease
> Sets the value of the limitationId property.

setLink(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Prefix
> Sets the value of the link property.

setLinkDescriptionExpr(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.LinkTemplate
> Sets the value of the linkDescriptionExpr property.

setLinkName(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CurrentPrefixUtilization

Sets the value of the linkName property.

setLinkNameExpr(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.LinkTemplate

Sets the value of the linkNameExpr property.

setLinkTemplateType(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.LinkTemplate

Sets the value of the linkTemplateType property.

setLinkType(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Link

Sets the value of the linkType property.

setList(JAXBElement<DHCPScopeAggregationStatsArray>) - Method in class com.cisco.cnr.ws.xsd.DHCPTopUtilizedStats

Sets the value of the list property.

setListenIpVersion(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSCachingServer

Sets the value of the listenIpVersion property.

setListenIpVersion(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerConfig

Sets the value of the listenIpVersion property.

setListenProtocol(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSCachingServer

Sets the value of the listenProtocol property.

setListenProtocol(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerConfig

Sets the value of the listenProtocol property.

setLoadBalancing(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMFailoverPair

Sets the value of the loadBalancing property.

setLoadBalancingBackupPct(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.FailoverRelatedServer

Sets the value of the loadBalancingBackupPct property.

setLoadBalancingDroppedRequests(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.FailoverRelatedServer

Sets the value of the loadBalancingDroppedRequests property.

setLoadBalancingDroppedTotal(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.FailoverRelatedServer

Sets the value of the loadBalancingDroppedTotal property.

setLoadBalancingLocalHba(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.FailoverRelatedServer

Sets the value of the loadBalancingLocalHba property.

setLoadBalancingPartnerHba(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.FailoverRelatedServer

Sets the value of the loadBalancingPartnerHba property.

setLoadBalancingProcessedRequests(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.FailoverRelatedServer

Sets the value of the loadBalancingProcessedRequests property.

setLoadBalancingProcessedTotal(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.FailoverRelatedServer

Sets the value of the loadBalancingProcessedTotal property.

setLocal(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMServer

Sets the value of the local property.

setLocalCluster(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Link

Sets the value of the localCluster property.

setLocalCluster(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Prefix

Sets the value of the localCluster property.

setLocalPortNum(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServer

Sets the value of the localPortNum property.

setLocalServers(JAXBElement<CCMServerArray>) - Method in class com.cisco.cnr.ws.xsd.CCMCluster

Sets the value of the localServers property.

setLogFormat(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCPServer

Sets the value of the logFormat property.

setLogSettings(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCPServer

Sets the value of the logSettings property.

setLogSettings(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSCachingServer

Sets the value of the logSettings property.

setLogSettings(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerConfig

Sets the value of the logSettings property.

setLogsFreeSpace(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.SystemStats

Sets the value of the logsFreeSpace property.

setLogsPath(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.SystemStats

Sets the value of the logsPath property.

setLogsTotalSpace(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.SystemStats

Sets the value of the logsTotalSpace property.

setLongestPrefixLength(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Policy

Sets the value of the longestPrefixLength property.

setLookupKey(String) - Method in class com.cisco.cnr.ws.xsd.Reservation

Sets the value of the lookupKey property.

setLookupKey(String) - Method in class com.cisco.cnr.ws.xsd.Reservation6

Sets the value of the lookupKey property.

setLookupKeyType(String) - Method in class com.cisco.cnr.ws.xsd.Reservation

Sets the value of the lookupKeyType property.

setLookupKeyType(String) - Method in class com.cisco.cnr.ws.xsd.Reservation6

Sets the value of the lookupKeyType property.

setMacAddressOnly(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCPServer

Sets the value of the macAddressOnly property.

setMain(String) - Method in class com.cisco.cnr.ws.xsd.CCMFailoverPair

Sets the value of the main property.

setMain(String) - Method in class com.cisco.cnr.ws.xsd.CCMHaDnsPair

Sets the value of the main property.

setMainIp6Address(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMFailoverPair

Sets the value of the mainIp6Address property.

setMainServer(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMFailoverPair

Sets the value of the mainServer property.

setMaintenance(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Link

Sets the value of the maintenance property.

Sets the value of the maxDnsRetries property.

setMaxDnsRetries(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSRelatedServer

Sets the value of the maxDnsRetries property.

setMaxDnsTtl(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCPServer

Sets the value of the maxDnsTtl property.

setMaxDnsTtl(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DnsUpdateConfig

Sets the value of the maxDnsTtl property.

setMaximumBindingUpdatesInFlight(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.FailoverRelatedServer

Sets the value of the maximumBindingUpdatesInFlight property.

setMaximumBindingUpdatesQueued(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.FailoverRelatedServer

Sets the value of the maximumBindingUpdatesQueued property.

setMaximumClientLeadTime(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.FailoverRelatedServer

Sets the value of the maximumClientLeadTime property.

setMaxLeases(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Prefix

Sets the value of the maxLeases property.

setMaxLeases(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.PrefixTemplate

Sets the value of the maxLeases property.

setMaxLeasesPerBinding(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Policy

Sets the value of the maxLeasesPerBinding property.

setMaxLeaseTime(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCPRenewalData

Sets the value of the maxLeaseTime property.

setMaxPdBalancingLength(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CurrentPrefixUtilization

Sets the value of the maxPdBalancingLength property.

setMaxPdBalancingLength(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Prefix

Sets the value of the maxPdBalancingLength property.

setMaxPdBalancingLength(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.PrefixTemplate

Sets the value of the maxPdBalancingLength property.

setMaxPingPackets(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCPServer

Sets the value of the maxPingPackets property.

setMaxPreferredLifetime(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCPRenewalData

Sets the value of the maxPreferredLifetime property.

setMaxRequests(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSRelatedServer

Sets the value of the maxRequests property.

setMaxRequests(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.LDAPRelatedServer

Sets the value of the maxRequests property.

setMaxUdpPayloadSize(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServer

Sets the value of the maxUdpPayloadSize property.

setMaxWaitingPackets(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCPServer

Sets the value of the maxWaitingPackets property.

setMclt(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMFailoverPair

Sets the value of the mclt property.

setMemCache(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats

Sets the value of the memCache property.

setMemCacheExceeded(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSCachingServerStats

Sets the value of the memCacheExceeded property.

setMemCacheHits(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSServerQueryStats

Sets the value of the memCacheHits property.

setMemCacheMisses(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSServerQueryStats

Sets the value of the memCacheMisses property.

setMemCacheSize(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServer

Sets the value of the memCacheSize property.

setMemIterator(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSCachingServerStats

Sets the value of the memIterator property.

setMemoryUtilization(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.ServerSystemStats

Sets the value of the memoryUtilization property.

setMemProcess(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSCachingServerStats

Sets the value of the memProcess property.

setMemQueryCache(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSCachingServerStats

Sets the value of the memQueryCache property.

setMemQueryCacheExceeded(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSCachingServerStats

Sets the value of the memQueryCacheExceeded property.

setMemValidator(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSCachingServerStats

Sets the value of the memValidator property.

setMinDnsTtl(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCPServer

Sets the value of the minDnsTtl property.

setMinDnsTtl(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DnsUpdateConfig

Sets the value of the minDnsTtl property.

setMinimalResponses(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSCachingServer

Sets the value of the minimalResponses property.

setMinimalResponses(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSCachingServerConfig

Sets the value of the minimalResponses property.

setMinimalResponses(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServer

Sets the value of the minimalResponses property.

setMinimizeTtls(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServer

Sets the value of the minimizeTtls property.

setMinttl(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMReverseZone
    Sets the value of the minttl property.
setMinttl(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMZone
    Sets the value of the minttl property.
setMinttl(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMZoneTemplate
    Sets the value of the minttl property.
setMode(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCPScopeAggregationStats
    Sets the value of the mode property.
setMsgCacheSize(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSCachingServer
    Sets the value of the msgCacheSize property.
setMsgCacheSize(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSCachingServerConfig
    Sets the value of the msgCacheSize property.
setMulticastAddresses(JAXBElement<StringArray>) - Method in class
com.cisco.cnr.ws.xsd.DHCPServer
    Sets the value of the multicastAddresses property.
setNaks(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCPServerActivityStats
    Sets the value of the naks property.
setName(String) - Method in class com.cisco.cnr.ws.xsd.ACL
    Sets the value of the name property.
setName(String) - Method in class com.cisco.cnr.ws.xsd.CCMCluster
    Sets the value of the name property.
setName(String) - Method in class com.cisco.cnr.ws.xsd.CCMFailoverPair
    Sets the value of the name property.
setName(String) - Method in class com.cisco.cnr.ws.xsd.CCMHaDnsPair
    Sets the value of the name property.
setName(String) - Method in class com.cisco.cnr.ws.xsd.CCMRRSet
    Sets the value of the name property.
setName(String) - Method in class com.cisco.cnr.ws.xsd.CCMScopeTemplate
    Sets the value of the name property.
setName(String) - Method in class com.cisco.cnr.ws.xsd.CCMServer
    Sets the value of the name property.
setName(String) - Method in class com.cisco.cnr.ws.xsd.CCMZoneDistribution
    Sets the value of the name property.
setName(String) - Method in class com.cisco.cnr.ws.xsd.CCMZoneTemplate
    Sets the value of the name property.
setName(String) - Method in class com.cisco.cnr.ws.xsd.CdnsRedirect
    Sets the value of the name property.
setName(String) - Method in class com.cisco.cnr.ws.xsd.Certificate
    Sets the value of the name property.
setName(String) - Method in class com.cisco.cnr.ws.xsd.ClientClass
    Sets the value of the name property.
setName(String) - Method in class com.cisco.cnr.ws.xsd.ClientEntry
    Sets the value of the name property.
setName(String) - Method in class com.cisco.cnr.ws.xsd.DHCPMaintenanceWindow

Sets the value of the name property.

setName(String) - Method in class com.cisco.cnr.ws.xsd.Dns64

Sets the value of the name property.

setName(String) - Method in class com.cisco.cnr.ws.xsd.DnsException

Sets the value of the name property.

setName(String) - Method in class com.cisco.cnr.ws.xsd.DnsForwarder

Sets the value of the name property.

setName(String) - Method in class com.cisco.cnr.ws.xsd.DnsSec

Sets the value of the name property.

setName(String) - Method in class com.cisco.cnr.ws.xsd.DnsSecKey

Sets the value of the name property.

setName(String) - Method in class com.cisco.cnr.ws.xsd.DnsTrustAnchor

Sets the value of the name property.

setName(String) - Method in class com.cisco.cnr.ws.xsd.DnsUpdateConfig

Sets the value of the name property.

setName(String) - Method in class com.cisco.cnr.ws.xsd.DnsView

Sets the value of the name property.

setName(String) - Method in class com.cisco.cnr.ws.xsd.Key

Sets the value of the name property.

setName(String) - Method in class com.cisco.cnr.ws.xsd.Link

Sets the value of the name property.

setName(String) - Method in class com.cisco.cnr.ws.xsd.LinkTemplate

Sets the value of the name property.

setName(String) - Method in class com.cisco.cnr.ws.xsd.OptionDefinitionSet

Sets the value of the name property.

setName(String) - Method in class com.cisco.cnr.ws.xsd.Policy

Sets the value of the name property.

setName(String) - Method in class com.cisco.cnr.ws.xsd.Prefix

Sets the value of the name property.

setName(String) - Method in class com.cisco.cnr.ws.xsd.PrefixTemplate

Sets the value of the name property.

setName(String) - Method in class com.cisco.cnr.ws.xsd.Scope

Sets the value of the name property.

setName(String) - Method in class com.cisco.cnr.ws.xsd.UpdatePolicy

Sets the value of the name property.

setName(String) - Method in class com.cisco.cnr.ws.xsd.VPN

Sets the value of the name property.

setName(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.AddrSet

Sets the value of the name property.

setName(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.AttrDesc

Sets the value of the name property.

setName(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.AuthDnsSec

Sets the value of the name property.

setName(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMHost

Sets the value of the name property.

setName(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CdnsRateLimit
  Sets the value of the name property.
setName(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCPScopeAggregationStats
  Sets the value of the name property.
setName(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCPScopeStatus
  Sets the value of the name property.
setName(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCPServer
  Sets the value of the name property.
setName(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSCachingServer
  Sets the value of the name property.
setName(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerConfig
  Sets the value of the name property.
setName(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerRateLimitItem
  Sets the value of the name property.
setName(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats
  Sets the value of the name property.
setName(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DnsEnumConfig
  Sets the value of the name property.
setName(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServer
  Sets the value of the name property.
setName(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.ResourceValue
  Sets the value of the name property.
setName(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.ServerSystemStats
  Sets the value of the name property.
setName(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.TCPConnectionRelatedServer
  Sets the value of the name property.
setName(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.TCPListenerRelatedServer
  Sets the value of the name property.
setNameNumber(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Lease6
  Sets the value of the nameNumber property.
setNameservers(StringArray) - Method in class com.cisco.cnr.ws.xsd.CCMReverseZone
  Sets the value of the nameservers property.
setNameservers(StringArray) - Method in class com.cisco.cnr.ws.xsd.CCMZone
  Sets the value of the nameservers property.
setNameservers(JAXBElement<StringArray>) - Method in class com.cisco.cnr.ws.xsd.CCMZoneTemplate
  Sets the value of the nameservers property.
setNameservers(JAXBElement<StringArray>) - Method in class com.cisco.cnr.ws.xsd.DnsEnumDomain
  Sets the value of the nameservers property.
setNegativeTest(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Filter
  Sets the value of the negativeTest property.
setNegativeTest(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.FilterElement
  Sets the value of the negativeTest property.

Sets the value of the notifySourceIp6Address property.

setNotifySourcePort(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServer

Sets the value of the notifySourcePort property.

setNotifyWait(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServer

Sets the value of the notifyWait property.

setNs(String) - Method in class com.cisco.cnr.ws.xsd.CCMReverseZone

Sets the value of the ns property.

setNs(String) - Method in class com.cisco.cnr.ws.xsd.CCMZone

Sets the value of the ns property.

setNs(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMZoneTemplate

Sets the value of the ns property.

setNsttl(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMReverseZone

Sets the value of the nsttl property.

setNsttl(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMZone

Sets the value of the nsttl property.

setNsttl(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMZoneTemplate

Sets the value of the nsttl property.

setNumber(String) - Method in class com.cisco.cnr.ws.xsd.DnsEnumEntrySet

Sets the value of the number property.

setNumber(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Option

Sets the value of the number property.

setNumberPrefix(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DnsEnumConfig

Sets the value of the numberPrefix property.

setNumClientsRatelimited(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerRateLimitStats

Sets the value of the numClientsRatelimited property.

setNumDomainsRatelimited(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerRateLimitStats

Sets the value of the numDomainsRatelimited property.

setObjectOid(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.ClassBase

Sets the value of the objectOid property.

setOffered(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CurrentPrefixUtilization

Sets the value of the offered property.

setOffered(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CurrentUtilization

Sets the value of the offered property.

setOffers(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCPServerActivityStats

Sets the value of the offers property.

setOfferTimeout(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMScopeTemplate

Sets the value of the offerTimeout property.

setOfferTimeout(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Policy

Sets the value of the offerTimeout property.

setOfferTimeouts(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCP6Stats

Sets the value of the offerTimeouts property.

setOfferTimeouts(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCPServerActivityStats

Sets the value of the offerTimeouts property.

setOk(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.ResourceStatus

Sets the value of the ok property.

setOneLeasePerClient(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCPServer

Sets the value of the oneLeasePerClient property.

setOptionDefinitionSetName(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Option

Sets the value of the optionDefinitionSetName property.

setOptionDesc(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Option

Sets the value of the optionDesc property.

setOptionList(JAXBElement<AttrDescArray>) - Method in class com.cisco.cnr.ws.xsd.AttrDesc

Sets the value of the optionList property.

setOptionList(JAXBElement<AttrDescArray>) - Method in class com.cisco.cnr.ws.xsd.OptionDefinitionSet

Sets the value of the optionList property.

setOptionList(JAXBElement<OptionArray>) - Method in class com.cisco.cnr.ws.xsd.Policy

Sets the value of the optionList property.

setOptionSet(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.AttrDesc

Sets the value of the optionSet property.

setOptionsExpr(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMScopeTemplate

Sets the value of the optionsExpr property.

setOptionsExpr(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.LinkTemplate

Sets the value of the optionsExpr property.

setOptionsExpr(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.PrefixTemplate

Sets the value of the optionsExpr property.

setOrder(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMRR

Sets the value of the order property.

setOrder(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DnsEnumEntry

Sets the value of the order property.

setOrigin(String) - Method in class com.cisco.cnr.ws.xsd.CCMReverseZone

Sets the value of the origin property.

setOrigin(String) - Method in class com.cisco.cnr.ws.xsd.CCMSecondaryZone

Sets the value of the origin property.

setOrigin(String) - Method in class com.cisco.cnr.ws.xsd.CCMZone

Sets the value of the origin property.

setOrigin(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DnsZoneStatus

Sets the value of the origin property.

setOtherAvail(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CurrentUtilization

Sets the value of the otherAvail property.

setOtherAvailable(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CurrentPrefixUtilization

Sets the value of the otherAvailable property.

setOtherServer(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCP6Stats

Sets the value of the otherServer property.

setOtherServerDownTime(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.FailoverRelatedServer

Sets the value of the otherServerDownTime property.

setOurIp6Address(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.FailoverRelatedServer

Sets the value of the ourIp6Address property.

setOurIp6Address(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.TCPConnectionRelatedServer

Sets the value of the ourIp6Address property.

setOurIpaddr(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.FailoverRelatedServer

Sets the value of the ourIpaddr property.

setOurIpaddr(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.TCPConnectionRelatedServer

Sets the value of the ourIpaddr property.

setOurPort(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.TCPConnectionRelatedServer

Sets the value of the ourPort property.

setOverLimitClientClassName(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.ClientClass

Sets the value of the overLimitClientClassName property.

setOverLimitClientClassName(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.ClientEntry

Sets the value of the overLimitClientClassName property.

setOverMaxWaiting(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCP6Stats

Sets the value of the overMaxWaiting property.

setOverMaxWaiting(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DHCPServerActivityStats

Sets the value of the overMaxWaiting property.

setOverrideClientId(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.ClientClass

Sets the value of the overrideClientId property.

setOverrideVpn(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.ClientClass

Sets the value of the overrideVpn property.

setOverrideVpn(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.ClientEntry

Sets the value of the overrideVpn property.

setOwner(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMReverseZone

Sets the value of the owner property.

setOwner(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMSubnet

Sets the value of the owner property.

setOwner(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMZone

Sets the value of the owner property.

setOwner(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMZoneTemplate

Sets the value of the owner property.

setOwner(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CurrentPrefixUtilization

Sets the value of the owner property.

setOwner(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CurrentUtilization

Sets the value of the owner property.

setOwner(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Link

Sets the value of the owner property.

setOwner(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.LinkTemplate

    Sets the value of the owner property.

setOwner(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Prefix

    Sets the value of the owner property.

setOwner(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.PrefixTemplate

    Sets the value of the owner property.

setPacketFileName(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Policy

    Sets the value of the packetFileName property.

setPacketLogging(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSCachingServer

    Sets the value of the packetLogging property.

setPacketLogging(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerConfig

    Sets the value of the packetLogging property.

setPacketLogging(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServer

    Sets the value of the packetLogging property.

setPacketLoggingFile(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSCachingServer

    Sets the value of the packetLoggingFile property.

setPacketLoggingFile(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerConfig

    Sets the value of the packetLoggingFile property.

setPacketLoggingFile(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServer

    Sets the value of the packetLoggingFile property.

setPacketLogSettings(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSCachingServer

    Sets the value of the packetLogSettings property.

setPacketLogSettings(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerConfig

    Sets the value of the packetLogSettings property.

setPacketLogSettings(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServer

    Sets the value of the packetLogSettings property.

setPacketsDropped(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCPServerActivityStats

    Sets the value of the packetsDropped property.

setPacketServerName(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Policy

    Sets the value of the packetServerName property.

setPacketSiaddr(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Policy

    Sets the value of the packetSiaddr property.

setPacketsIn(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServerPerformanceStats

    Sets the value of the packetsIn property.

setPacketsInTcp(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServerPerformanceStats

    Sets the value of the packetsInTcp property.

setPacketsInUdp(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServerPerformanceStats

Sets the value of the packetsInUdp property.

setPacketsOut(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSServerPerformanceStats

Sets the value of the packetsOut property.

setPacketsOutTcp(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSServerPerformanceStats

Sets the value of the packetsOutTcp property.

setPacketsOutUdp(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSServerPerformanceStats

Sets the value of the packetsOutUdp property.

setPacketsReceived(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCP6Stats

Sets the value of the packetsReceived property.

setPacketsReceived(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DHCPFailoverStats

Sets the value of the packetsReceived property.

setPacketsReceived(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DHCPServerActivityStats

Sets the value of the packetsReceived property.

setPacketsReceivedRelay(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DHCP6Stats

Sets the value of the packetsReceivedRelay property.

setPacketsSent(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCP6Stats

Sets the value of the packetsSent property.

setPacketsSent(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCPFailoverStats

Sets the value of the packetsSent property.

setPacketsSent(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DHCPServerActivityStats

Sets the value of the packetsSent property.

setPacketsSentRelay(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCP6Stats

Sets the value of the packetsSentRelay property.

setParameterRequestList(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Lease

Sets the value of the parameterRequestList property.

setParent(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMSubnet

Sets the value of the parent property.

setPartnerLastDiscoverSolicitTime(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.RelayAgentState

Sets the value of the partnerLastDiscoverSolicitTime property.

setPartnerRequestCount(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.RelayAgentState

Sets the value of the partnerRequestCount property.

setPartnerRole(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.FailoverRelatedServer

Sets the value of the partnerRole property.

setPartnerState(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.FailoverRelatedServer

Sets the value of the partnerState property.

setPartnerUnresponsiveDuration(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.RelayAgentState

Sets the value of the partnerUnresponsiveDuration property.

setPartnerVendorMajorVersion(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.FailoverRelatedServer

Sets the value of the partnerVendorMajorVersion property.

setPartnerVendorMinorVersion(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.FailoverRelatedServer

Sets the value of the partnerVendorMinorVersion property.

setPassword(String) - Method in class com.cisco.cnr.ws.xsd.CnrSoapAuth

Sets the value of the password property.

setPassword(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMCluster

Sets the value of the password property.

setPassword(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMServer

Sets the value of the password property.

setPasswordSecret(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMCluster

Sets the value of the passwordSecret property.

setPasswordSecret(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMServer

Sets the value of the passwordSecret property.

setPeakIntValue(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.ResourceValue

Sets the value of the peakIntValue property.

setPeakTime(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.ResourceValue

Sets the value of the peakTime property.

setPeakValueMessage(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.ResourceValue

Sets the value of the peakValueMessage property.

setPendAvail(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CurrentUtilization

Sets the value of the pendAvail property.

setPendingAvailable(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.CurrentPrefixUtilization

Sets the value of the pendingAvailable property.

setPendingDelete(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.CurrentPrefixUtilization

Sets the value of the pendingDelete property.

setPermanentLeases(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Policy

Sets the value of the permanentLeases property.

setPerson(String) - Method in class com.cisco.cnr.ws.xsd.CCMReverseZone

Sets the value of the person property.

setPerson(String) - Method in class com.cisco.cnr.ws.xsd.CCMZone

Sets the value of the person property.

setPerson(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMZoneTemplate

Sets the value of the person property.

setPerson(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DnsEnumDomain

Sets the value of the person property.

setPid(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMServerInfo

Sets the value of the pid property.

setPid(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.ServerSystemStats

Sets the value of the pid property.

setPingClients(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMScopeTemplate

> Sets the value of the pingClients property.

setPingClients(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCPServer

> Sets the value of the pingClients property.

setPingClients(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Scope

> Sets the value of the pingClients property.

setPingTimeout(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMScopeTemplate

> Sets the value of the pingTimeout property.

setPingTimeout(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCPServer

> Sets the value of the pingTimeout property.

setPingTimeout(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Scope

> Sets the value of the pingTimeout property.

setPnConn(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServerPushNotificationStats

> Sets the value of the pnConn property.

setPnConnClosed(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServerPushNotificationStats

> Sets the value of the pnConnClosed property.

setPnConnCurrent(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServerPushNotificationStats

> Sets the value of the pnConnCurrent property.

setPnConnMaxConns(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServerPushNotificationStats

> Sets the value of the pnConnMaxConns property.

setPnConnRefused(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServerPushNotificationStats

> Sets the value of the pnConnRefused property.

setPnConnTerminated(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServerPushNotificationStats

> Sets the value of the pnConnTerminated property.

setPnConnTerminatedConnTtl(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServerPushNotificationStats

> Sets the value of the pnConnTerminatedConnTtl property.

setPnConnTerminatedError(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServerPushNotificationStats

> Sets the value of the pnConnTerminatedError property.

setPnKeepalive(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServerPushNotificationStats

> Sets the value of the pnKeepalive property.

setPnReconfirm(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServerPushNotificationStats

> Sets the value of the pnReconfirm property.

setPnReqMalformed(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServerPushNotificationStats

> Sets the value of the pnReqMalformed property.

setPnSubscribe(JAXBElement<String>) - Method in class

com.cisco.cnr.ws.xsd.DNSServerPushNotificationStats

  Sets the value of the pnSubscribe property.

setPnSubscribeFormerr(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSServerPushNotificationStats

  Sets the value of the pnSubscribeFormerr property.

setPnSubscribeNoerror(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSServerPushNotificationStats

  Sets the value of the pnSubscribeNoerror property.

setPnSubscribeNotauth(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSServerPushNotificationStats

  Sets the value of the pnSubscribeNotauth property.

setPnSubscribeRefused(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSServerPushNotificationStats

  Sets the value of the pnSubscribeRefused property.

setPnSubscribeServfail(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSServerPushNotificationStats

  Sets the value of the pnSubscribeServfail property.

setPnUnsubscribe(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSServerPushNotificationStats

  Sets the value of the pnUnsubscribe property.

setPnUpdate(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSServerPushNotificationStats

  Sets the value of the pnUpdate property.

setPolicy(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMScopeTemplate

  Sets the value of the policy property.

setPolicy(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Link

  Sets the value of the policy property.

setPolicy(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.LinkTemplate

  Sets the value of the policy property.

setPolicy(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Prefix

  Sets the value of the policy property.

setPolicy(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.PrefixTemplate

  Sets the value of the policy property.

setPolicy(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Scope

  Sets the value of the policy property.

setPolicyName(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.ClientClass

  Sets the value of the policyName property.

setPolicyName(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.ClientEntry

  Sets the value of the policyName property.

setPollLeaseHistInterval(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMCluster

  Sets the value of the pollLeaseHistInterval property.

setPollLeaseHistOffset(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMCluster

  Sets the value of the pollLeaseHistOffset property.

setPollLeaseHistRetry(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMCluster

  Sets the value of the pollLeaseHistRetry property.

setPollReplicaInterval(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMCluster

Sets the value of the pollReplicaInterval property.

setPollReplicaOffset(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMCluster

    Sets the value of the pollReplicaOffset property.

setPollReplicaRrs(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMCluster

    Sets the value of the pollReplicaRrs property.

setPollSubnetUtilInterval(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMCluster

    Sets the value of the pollSubnetUtilInterval property.

setPollSubnetUtilOffset(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMCluster

    Sets the value of the pollSubnetUtilOffset property.

setPollSubnetUtilRetry(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMCluster

    Sets the value of the pollSubnetUtilRetry property.

setPoolRequestsReceived(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCPFailoverStats

    Sets the value of the poolRequestsReceived property.

setPoolResponsesSent(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCPFailoverStats

    Sets the value of the poolResponsesSent property.

setPort(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSCachingServer

    Sets the value of the port property.

setPort(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerConfig

    Sets the value of the port property.

setPort(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DnsIPnPort

    Sets the value of the port property.

setPort(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServer

    Sets the value of the port property.

setPort(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.TCPConnectionRelatedServer

    Sets the value of the port property.

setPort(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.TCPListenerRelatedServer

    Sets the value of the port property.

setPortedNameserver(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DnsEnumEntrySet

    Sets the value of the portedNameserver property.

setPortedNumber(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DnsEnumEntrySet

    Sets the value of the portedNumber property.

setPreference(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DnsEnumEntry

    Sets the value of the preference property.

setPreferredLifetime(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Lease6

    Sets the value of the preferredLifetime property.

setPreferredLifetime(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Policy

    Sets the value of the preferredLifetime property.

setPrefetch(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSCachingServer

    Sets the value of the prefetch property.

setPrefetch(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerConfig

    Sets the value of the prefetch property.

setPrefetchKey(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DnsSec

Sets the value of the prefetchKey property.

setPrefix(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CurrentPrefixUtilization

Sets the value of the prefix property.

setPrefix(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Dns64

Sets the value of the prefix property.

setPrefix(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Reservation6

Sets the value of the prefix property.

setPrefixCount(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CurrentPrefixUtilization

Sets the value of the prefixCount property.

setPrefixDeactivated(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CurrentPrefixUtilization

Sets the value of the prefixDeactivated property.

setPrefixDeactivatedCount(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CurrentPrefixUtilization

Sets the value of the prefixDeactivatedCount property.

setPrefixDelegationUpdates(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DnsUpdateConfig

Sets the value of the prefixDelegationUpdates property.

setPrefixDescriptionExpr(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.PrefixTemplate

Sets the value of the prefixDescriptionExpr property.

setPrefixesAvailable(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CurrentPrefixUtilization

Sets the value of the prefixesAvailable property.

setPrefixesInTransition(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CurrentPrefixUtilization

Sets the value of the prefixesInTransition property.

setPrefixesInUse(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CurrentPrefixUtilization

Sets the value of the prefixesInUse property.

setPrefixesOtherAvailable(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CurrentPrefixUtilization

Sets the value of the prefixesOtherAvailable property.

setPrefixExpr(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.LinkTemplate

Sets the value of the prefixExpr property.

setPrefixList(JAXBElement<PrefixArray>) - Method in class com.cisco.cnr.ws.xsd.Link

Sets the value of the prefixList property.

setPrefixName(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CurrentPrefixUtilization

Sets the value of the prefixName property.

setPrefixName(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Lease6

Sets the value of the prefixName property.

setPrefixNameExpr(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.PrefixTemplate

Sets the value of the prefixNameExpr property.

setPrefixRange(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CurrentPrefixUtilization

Sets the value of the prefixRange property.

com.cisco.cnr.ws.xsd.DNSServerQueryStats

Sets the value of the queriesDroppedRecursive property.

setQueriesDroppedUnwantedClass(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSServerQueryStats

Sets the value of the queriesDroppedUnwantedClass property.

setQueriesDroppedUnwantedType(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSServerQueryStats

Sets the value of the queriesDroppedUnwantedType property.

setQueriesFailedAcl(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSServerQueryStats

Sets the value of the queriesFailedAcl property.

setQueriesFailingAcl(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSCachingServerStats

Sets the value of the queriesFailingAcl property.

setQueriesOverHttps(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSCachingServerStats

Sets the value of the queriesOverHttps property.

setQueriesOverHttpsFailed(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSCachingServerStats

Sets the value of the queriesOverHttpsFailed property.

setQueriesOverIpv4(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSServerQueryStats

Sets the value of the queriesOverIpv4 property.

setQueriesOverIpv6(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSCachingServerStats

Sets the value of the queriesOverIpv6 property.

setQueriesOverIpv6(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSServerQueryStats

Sets the value of the queriesOverIpv6 property.

setQueriesOverTcp(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSCachingServerStats

Sets the value of the queriesOverTcp property.

setQueriesOverTcp(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSServerQueryStats

Sets the value of the queriesOverTcp property.

setQueriesOverTls(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSCachingServerStats

Sets the value of the queriesOverTls property.

setQueriesOverTls(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSServerQueryStats

Sets the value of the queriesOverTls property.

setQueriesOverTlsFailed(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSServerQueryStats

Sets the value of the queriesOverTlsFailed property.

setQueriesOverUdp(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSServerQueryStats

Sets the value of the queriesOverUdp property.

setQueriesPerSecond(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSCachingServerStats

    Sets the value of the queriesPerSecond property.

setQueriesPerSecond(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSServerQueryStats

    Sets the value of the queriesPerSecond property.

setQueriesRpz(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServerQueryStats

    Sets the value of the queriesRpz property.

setQueriesTotal(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSCachingServerStats

    Sets the value of the queriesTotal property.

setQueriesTotal(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServerQueryStats

    Sets the value of the queriesTotal property.

setQueriesTypeA(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSCachingServerStats

    Sets the value of the queriesTypeA property.

setQueriesTypeA(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSServerQueryStats

    Sets the value of the queriesTypeA property.

setQueriesTypeAaaa(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSCachingServerStats

    Sets the value of the queriesTypeAaaa property.

setQueriesTypeAaaa(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSServerQueryStats

    Sets the value of the queriesTypeAaaa property.

setQueriesTypeAny(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSCachingServerStats

    Sets the value of the queriesTypeAny property.

setQueriesTypeAny(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSServerQueryStats

    Sets the value of the queriesTypeAny property.

setQueriesTypeCaa(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSServerQueryStats

    Sets the value of the queriesTypeCaa property.

setQueriesTypeCname(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSCachingServerStats

    Sets the value of the queriesTypeCname property.

setQueriesTypeCname(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSServerQueryStats

    Sets the value of the queriesTypeCname property.

setQueriesTypeDnskey(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSCachingServerStats

    Sets the value of the queriesTypeDnskey property.

setQueriesTypeDnskey(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSServerQueryStats

    Sets the value of the queriesTypeDnskey property.

setQueriesTypeDs(JAXBElement<String>) - Method in class

com.cisco.cnr.ws.xsd.DNSCachingServerStats

Sets the value of the queriesTypeDs property.

setQueriesTypeDs(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSServerQueryStats

Sets the value of the queriesTypeDs property.

setQueriesTypeHttps(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSCachingServerStats

Sets the value of the queriesTypeHttps property.

setQueriesTypeHttps(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSServerQueryStats

Sets the value of the queriesTypeHttps property.

setQueriesTypeMx(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSCachingServerStats

Sets the value of the queriesTypeMx property.

setQueriesTypeMx(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSServerQueryStats

Sets the value of the queriesTypeMx property.

setQueriesTypeNaptr(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSCachingServerStats

Sets the value of the queriesTypeNaptr property.

setQueriesTypeNaptr(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSServerQueryStats

Sets the value of the queriesTypeNaptr property.

setQueriesTypeNs(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSCachingServerStats

Sets the value of the queriesTypeNs property.

setQueriesTypeNs(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSServerQueryStats

Sets the value of the queriesTypeNs property.

setQueriesTypeNsec(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSCachingServerStats

Sets the value of the queriesTypeNsec property.

setQueriesTypeNsec(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSServerQueryStats

Sets the value of the queriesTypeNsec property.

setQueriesTypeNsec3(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSCachingServerStats

Sets the value of the queriesTypeNsec3 property.

setQueriesTypeOther(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSCachingServerStats

Sets the value of the queriesTypeOther property.

setQueriesTypeOther(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSServerQueryStats

Sets the value of the queriesTypeOther property.

setQueriesTypePtr(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSCachingServerStats

Sets the value of the queriesTypePtr property.

setQueriesTypePtr(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSServerQueryStats

> Sets the value of the queriesTypePtr property.

setQueriesTypeRrsig(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSCachingServerStats

> Sets the value of the queriesTypeRrsig property.

setQueriesTypeRrsig(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSServerQueryStats

> Sets the value of the queriesTypeRrsig property.

setQueriesTypeSoa(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSCachingServerStats

> Sets the value of the queriesTypeSoa property.

setQueriesTypeSoa(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSServerQueryStats

> Sets the value of the queriesTypeSoa property.

setQueriesTypeSrv(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSCachingServerStats

> Sets the value of the queriesTypeSrv property.

setQueriesTypeSrv(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSServerQueryStats

> Sets the value of the queriesTypeSrv property.

setQueriesTypeSvcb(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSCachingServerStats

> Sets the value of the queriesTypeSvcb property.

setQueriesTypeSvcb(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSServerQueryStats

> Sets the value of the queriesTypeSvcb property.

setQueriesTypeTxt(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSCachingServerStats

> Sets the value of the queriesTypeTxt property.

setQueriesTypeTxt(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSServerQueryStats

> Sets the value of the queriesTypeTxt property.

setQueriesTypeUri(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSServerQueryStats

> Sets the value of the queriesTypeUri property.

setQueriesUnwantedClass(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSCachingServerStats

> Sets the value of the queriesUnwantedClass property.

setQueriesWithEdns(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSCachingServerStats

> Sets the value of the queriesWithEdns property.

setQueriesWithEdns(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSServerQueryStats

> Sets the value of the queriesWithEdns property.

setQueriesWithEdnsDo(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSCachingServerStats

Sets the value of the queriesWithEdnsDo property.

setQueriesWithFlagAa(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats

Sets the value of the queriesWithFlagAa property.

setQueriesWithFlagAd(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats

Sets the value of the queriesWithFlagAd property.

setQueriesWithFlagCd(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats

Sets the value of the queriesWithFlagCd property.

setQueriesWithFlagQr(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats

Sets the value of the queriesWithFlagQr property.

setQueriesWithFlagRa(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats

Sets the value of the queriesWithFlagRa property.

setQueriesWithFlagRd(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats

Sets the value of the queriesWithFlagRd property.

setQueriesWithFlagTc(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats

Sets the value of the queriesWithFlagTc property.

setQueriesWithFlagZ(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats

Sets the value of the queriesWithFlagZ property.

setQueryAnswersRpzHits(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServerQueryStats

Sets the value of the queryAnswersRpzHits property.

setQueryAnswersRpzMisses(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServerQueryStats

Sets the value of the queryAnswersRpzMisses property.

setQueryAnswersTotal(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServerQueryStats

Sets the value of the queryAnswersTotal property.

setQueryAnswersWithFormerr(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServerQueryStats

Sets the value of the queryAnswersWithFormerr property.

setQueryAnswersWithNodata(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServerQueryStats

Sets the value of the queryAnswersWithNodata property.

setQueryAnswersWithNoerror(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServerQueryStats

Sets the value of the queryAnswersWithNoerror property.

setQueryAnswersWithNotauth(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServerQueryStats

Sets the value of the queryAnswersWithNotauth property.

setQueryAnswersWithNxdomain(JAXBElement<String>) - Method in class

setRandomizeQueryCaseExclusion(JAXBElement<StringArray>) - Method in class com.cisco.cnr.ws.xsd.DNSCachingServer

Sets the value of the randomizeQueryCaseExclusion property.

setRandomizeQueryCaseExclusion(JAXBElement<StringArray>) - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerConfig

Sets the value of the randomizeQueryCaseExclusion property.

setRange(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Prefix

Sets the value of the range property.

setRangeEnd(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Prefix

Sets the value of the rangeEnd property.

setRangeEndExpr(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.PrefixTemplate

Sets the value of the rangeEndExpr property.

setRangeExpr(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.PrefixTemplate

Sets the value of the rangeExpr property.

setRangeList(JAXBElement<RangeArray>) - Method in class com.cisco.cnr.ws.xsd.Scope

Sets the value of the rangeList property.

setRangesExpr(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMScopeTemplate

Sets the value of the rangesExpr property.

setRangeStart(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Prefix

Sets the value of the rangeStart property.

setRangeStartExpr(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.PrefixTemplate

Sets the value of the rangeStartExpr property.

setRateLimit(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CdnsDomainRateLimit

Sets the value of the rateLimit property.

setRcvdTsigBadKey(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServerSecurityStats

Sets the value of the rcvdTsigBadKey property.

setRcvdTsigBadSig(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServerSecurityStats

Sets the value of the rcvdTsigBadSig property.

setRcvdTsigBadTime(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServerSecurityStats

Sets the value of the rcvdTsigBadTime property.

setRcvdTsigPackets(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServerSecurityStats

Sets the value of the rcvdTsigPackets property.

setRdata(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMRR

Sets the value of the rdata property.

setRebindLimit(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMFailoverPair

Sets the value of the rebindLimit property.

setRebinds(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCP6Stats

Sets the value of the rebinds property.

setReconfigure(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Policy

Sets the value of the reconfigure property.

setReconfigures(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCP6Stats

Sets the value of the reconfigures property.

setReconfigureViaRelay(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Policy
> Sets the value of the reconfigureViaRelay property.

setRecursiveRepliesTotal(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats
> Sets the value of the recursiveRepliesTotal property.

setRecursiveTimeAverage(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats
> Sets the value of the recursiveTimeAverage property.

setRecursiveTimeMedian(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats
> Sets the value of the recursiveTimeMedian property.

setRefresh(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMReverseZone
> Sets the value of the refresh property.

setRefresh(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMZone
> Sets the value of the refresh property.

setRefresh(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMZoneTemplate
> Sets the value of the refresh property.

setRefreshPeriod(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCPMaintenanceWindow
> Sets the value of the refreshPeriod property.

setRegexpStr(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.FilterElement
> Sets the value of the regexpStr property.

setRegion(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMReverseZone
> Sets the value of the region property.

setRegion(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMSubnet
> Sets the value of the region property.

setRegion(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMZone
> Sets the value of the region property.

setRegion(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMZoneTemplate
> Sets the value of the region property.

setRegion(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CurrentPrefixUtilization
> Sets the value of the region property.

setRegion(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CurrentUtilization
> Sets the value of the region property.

setRegion(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Link
> Sets the value of the region property.

setRegion(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.LinkTemplate
> Sets the value of the region property.

setRegion(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Prefix
> Sets the value of the region property.

setRegion(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.PrefixTemplate
> Sets the value of the region property.

setRejectedConnections(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.TCPListenerRelatedServer
> Sets the value of the rejectedConnections property.

setRelaxDelegationRules(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServer

Sets the value of the relaxDelegationRules property.

setRelayAgentAuth(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Lease
> Sets the value of the relayAgentAuth property.

setRelayAgentCircuitId(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Lease
> Sets the value of the relayAgentCircuitId property.

setRelayAgentDeviceClass(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Lease
> Sets the value of the relayAgentDeviceClass property.

setRelayAgentOption(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Lease
> Sets the value of the relayAgentOption property.

setRelayAgentRadiusClass(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Lease
> Sets the value of the relayAgentRadiusClass property.

setRelayAgentRadiusOptions(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Lease
> Sets the value of the relayAgentRadiusOptions property.

setRelayAgentRadiusPoolName(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Lease
> Sets the value of the relayAgentRadiusPoolName property.

setRelayAgentRadiusSessionTimeout(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Lease
> Sets the value of the relayAgentRadiusSessionTimeout property.

setRelayAgentRadiusUser(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Lease
> Sets the value of the relayAgentRadiusUser property.

setRelayAgentRadiusV6PoolName(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Lease
> Sets the value of the relayAgentRadiusV6PoolName property.

setRelayAgentRadiusVendorSpecific(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Lease
> Sets the value of the relayAgentRadiusVendorSpecific property.

setRelayAgentRemoteId(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Lease
> Sets the value of the relayAgentRemoteId property.

setRelayAgentServerIdOverride(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Lease
> Sets the value of the relayAgentServerIdOverride property.

setRelayAgentSubnetSelection(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Lease
> Sets the value of the relayAgentSubnetSelection property.

setRelayAgentSubscriberId(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Lease
> Sets the value of the relayAgentSubscriberId property.

setRelayAgentVIVendorClass(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Lease
> Sets the value of the relayAgentVIVendorClass property.

setRelayAgentVpnId(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Lease
> Sets the value of the relayAgentVpnId property.

setRelayHealthCheck(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMFailoverPair
> Sets the value of the relayHealthCheck property.

setReleases(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCP6Stats
> Sets the value of the releases property.

setReleases(JAXBElement\<String>) - Method in class com.cisco.cnr.ws.xsd.DHCPServerActivityStats

Sets the value of the releases property.

setRemoteId(JAXBElement\<String>) - Method in class com.cisco.cnr.ws.xsd.CCMCluster

Sets the value of the remoteId property.

setRemoteNsCacheExceeded(JAXBElement\<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSCachingServerStats

Sets the value of the remoteNsCacheExceeded property.

setRemoteNsCacheNumhosts(JAXBElement\<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSCachingServer

Sets the value of the remoteNsCacheNumhosts property.

setRemoteNsCacheNumhosts(JAXBElement\<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSCachingServerConfig

Sets the value of the remoteNsCacheNumhosts property.

setRemoteNsHostTtl(JAXBElement\<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSCachingServer

Sets the value of the remoteNsHostTtl property.

setRemoteNsHostTtl(JAXBElement\<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSCachingServerConfig

Sets the value of the remoteNsHostTtl property.

setRemotePortNum(JAXBElement\<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServer

Sets the value of the remotePortNum property.

setRenewOnly(JAXBElement\<String>) - Method in class com.cisco.cnr.ws.xsd.CCMScopeTemplate

Sets the value of the renewOnly property.

setRenewOnly(JAXBElement\<String>) - Method in class com.cisco.cnr.ws.xsd.Scope

Sets the value of the renewOnly property.

setRenews(JAXBElement\<String>) - Method in class com.cisco.cnr.ws.xsd.DHCP6Stats

Sets the value of the renews property.

setRepeat(JAXBElement\<String>) - Method in class com.cisco.cnr.ws.xsd.AttrDesc

Sets the value of the repeat property.

setReplicaPollInterval(JAXBElement\<String>) - Method in class com.cisco.cnr.ws.xsd.CCMCluster

Sets the value of the replicaPollInterval property.

setReplicaPollOffset(JAXBElement\<String>) - Method in class com.cisco.cnr.ws.xsd.CCMCluster

Sets the value of the replicaPollOffset property.

setReplicationInitialized(JAXBElement\<String>) - Method in class com.cisco.cnr.ws.xsd.CCMCluster

Sets the value of the replicationInitialized property.

setReplies(JAXBElement\<String>) - Method in class com.cisco.cnr.ws.xsd.DHCP6Stats

Sets the value of the replies property.

setReplyLatencyCounts(JAXBElement\<StringArray>) - Method in class
com.cisco.cnr.ws.xsd.DHCP6Stats

Sets the value of the replyLatencyCounts property.

setRequestBuffersAllocated(JAXBElement\<String>) - Method in class
com.cisco.cnr.ws.xsd.DHCPFailoverStats

Sets the value of the requestBuffersAllocated property.

setRequestBuffersAllocated(JAXBElement\<String>) - Method in class
com.cisco.cnr.ws.xsd.DHCPServerActivityStats

Sets the value of the requestBuffersAllocated property.

setRequestBuffersAllocated(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.FailoverRelatedServer

      Sets the value of the requestBuffersAllocated property.

setRequestBuffersInUse(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DHCPFailoverStats

      Sets the value of the requestBuffersInUse property.

setRequestBuffersInUse(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DHCPServerActivityStats

      Sets the value of the requestBuffersInUse property.

setRequestBuffersInUse(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.FailoverRelatedServer

      Sets the value of the requestBuffersInUse property.

setRequestDroppedOld(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCP6Stats

      Sets the value of the requestDroppedOld property.

setRequestDroppedOld(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DHCPServerActivityStats

      Sets the value of the requestDroppedOld property.

setRequestDroppedOthers(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DHCP6Stats

      Sets the value of the requestDroppedOthers property.

setRequestDroppedOthers(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DHCPServerActivityStats

      Sets the value of the requestDroppedOthers property.

setRequestedFqdn(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Lease6

      Sets the value of the requestedFqdn property.

setRequestedPrefixLength(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Lease6

      Sets the value of the requestedPrefixLength property.

setRequestlistTotal(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSCachingServerStats

      Sets the value of the requestlistTotal property.

setRequestlistTotalAverage(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSCachingServerStats

      Sets the value of the requestlistTotalAverage property.

setRequestlistTotalExceeded(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSCachingServerStats

      Sets the value of the requestlistTotalExceeded property.

setRequestlistTotalMax(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSCachingServerStats

      Sets the value of the requestlistTotalMax property.

setRequestlistTotalOverwritten(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSCachingServerStats

      Sets the value of the requestlistTotalOverwritten property.

setRequestlistTotalSystem(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSCachingServerStats

      Sets the value of the requestlistTotalSystem property.

setRequestlistTotalUser(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSCachingServerStats

Sets the value of the requestlistTotalUser property.

setRequests(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCP6Stats

Sets the value of the requests property.

setRequests(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCPServerActivityStats

Sets the value of the requests property.

setRequests(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSRelatedServer

Sets the value of the requests property.

setRequests(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.LDAPRelatedServer

Sets the value of the requests property.

setReservationCmMacAddress(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Lease6

Sets the value of the reservationCmMacAddress property.

setReservationLookupKey(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Lease

Sets the value of the reservationLookupKey property.

setReservationLookupKey(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Lease6

Sets the value of the reservationLookupKey property.

setReservationLookupKeyType(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Lease

Sets the value of the reservationLookupKeyType property.

setReservationLookupKeyType(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Lease6

Sets the value of the reservationLookupKeyType property.

setReservationRelayAgentOption(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Lease

Sets the value of the reservationRelayAgentOption property.

setReservedActive(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CurrentPrefixUtilization

Sets the value of the reservedActive property.

setReservedActive(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CurrentUtilization

Sets the value of the reservedActive property.

setReservedActiveLeases(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCP6Stats

Sets the value of the reservedActiveLeases property.

setReservedActiveLeases(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCPServerActivityStats

Sets the value of the reservedActiveLeases property.

setReservedAddresses(JAXBElement<StringArray>) - Method in class com.cisco.cnr.ws.xsd.ClientEntry

Sets the value of the reservedAddresses property.

setReservedInactive(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CurrentPrefixUtilization

Sets the value of the reservedInactive property.

setReservedInactive(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CurrentUtilization

Sets the value of the reservedInactive property.

setReservedIp6Addresses(JAXBElement<StringArray>) - Method in class

setRestrictToReservations(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.PrefixTemplate
> Sets the value of the restrictToReservations property.

setRestrictToReservations(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Scope
> Sets the value of the restrictToReservations property.

setRestrictXfer(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMReverseZone
> Sets the value of the restrictXfer property.

setRestrictXfer(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMSecondaryZone
> Sets the value of the restrictXfer property.

setRestrictXfer(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMZDSecondary
> Sets the value of the restrictXfer property.

setRestrictXfer(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMZone
> Sets the value of the restrictXfer property.

setRestrictXfer(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMZoneDistribution
> Sets the value of the restrictXfer property.

setRestrictXfer(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMZoneTemplate
> Sets the value of the restrictXfer property.

setRestrictXfer(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServer
> Sets the value of the restrictXfer property.

setRestrictXferAcl(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMReverseZone
> Sets the value of the restrictXferAcl property.

setRestrictXferAcl(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.CCMSecondaryZone
> Sets the value of the restrictXferAcl property.

setRestrictXferAcl(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMZDSecondary
> Sets the value of the restrictXferAcl property.

setRestrictXferAcl(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMZone
> Sets the value of the restrictXferAcl property.

setRestrictXferAcl(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.CCMZoneDistribution
> Sets the value of the restrictXferAcl property.

setRestrictXferAcl(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMZoneTemplate
> Sets the value of the restrictXferAcl property.

setRestrictXferAcl(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServer
> Sets the value of the restrictXferAcl property.

setRetry(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMReverseZone
> Sets the value of the retry property.

setRetry(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMZone
> Sets the value of the retry property.

setRetry(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMZoneTemplate
> Sets the value of the retry property.

setReturnClientFqdnIfAsked(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DHCPServer
> Sets the value of the returnClientFqdnIfAsked property.

setRevDnsUpdateConfigName(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Lease

Sets the value of the revDnsUpdateConfigName property.

setReverseDnsupdate(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Lease6

Sets the value of the reverseDnsupdate property.

setReverseDnsupdate(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Policy

Sets the value of the reverseDnsupdate property.

setReverseZoneName(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMSubnet

Sets the value of the reverseZoneName property.

setReverseZoneName(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DnsUpdateConfig

Sets the value of the reverseZoneName property.

setReverseZonePrefixLength(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DnsUpdateConfig

Sets the value of the reverseZonePrefixLength property.

setReverseZonePrefixLength(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Prefix

Sets the value of the reverseZonePrefixLength property.

setReverseZonePrefixLength(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.PrefixTemplate

Sets the value of the reverseZonePrefixLength property.

setRevoked(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CurrentPrefixUtilization

Sets the value of the revoked property.

setRhcElapsedTime(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMFailoverPair

Sets the value of the rhcElapsedTime property.

setRhcMonitorFirstRelay(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.CCMFailoverPair

Sets the value of the rhcMonitorFirstRelay property.

setRhcRequestCount(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMFailoverPair

Sets the value of the rhcRequestCount property.

setRhcResponseTime(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMFailoverPair

Sets the value of the rhcResponseTime property.

setRhcRestartTime(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMFailoverPair

Sets the value of the rhcRestartTime property.

setRhcServerPreference(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.CCMFailoverPair

Sets the value of the rhcServerPreference property.

setRhcUnresponsiveTime(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.CCMFailoverPair

Sets the value of the rhcUnresponsiveTime property.

setRhcWarningInterval(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.CCMFailoverPair

Sets the value of the rhcWarningInterval property.

setRole(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DnsHAStatus

Sets the value of the role property.

setRole(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.FailoverRelatedServer

Sets the value of the role property.

setRolloverDueDate(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DnsSecKey

Sets the value of the rolloverDueDate property.

setRootHints(JAXBElement<AddrSetArray>) - Method in class
com.cisco.cnr.ws.xsd.DNSCachingServer

Sets the value of the rootHints property.

setRootHints(JAXBElement<AddrSetArray>) - Method in class
com.cisco.cnr.ws.xsd.DNSCachingServerConfig

Sets the value of the rootHints property.

setRoundRobin(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMReverseZone

Sets the value of the roundRobin property.

setRoundRobin(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMSecondaryZone

Sets the value of the roundRobin property.

setRoundRobin(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMZDSecondary

Sets the value of the roundRobin property.

setRoundRobin(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMZone

Sets the value of the roundRobin property.

setRoundRobin(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMZoneDistribution

Sets the value of the roundRobin property.

setRoundRobin(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMZoneTemplate

Sets the value of the roundRobin property.

setRoundRobin(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSCachingServer

Sets the value of the roundRobin property.

setRoundRobin(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSCachingServerConfig

Sets the value of the roundRobin property.

setRoundRobin(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServer

Sets the value of the roundRobin property.

setRoundRobin(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Option

Sets the value of the roundRobin property.

setRouterHost(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMScopeTemplate

Sets the value of the routerHost property.

setRpz(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMReverseZone

Sets the value of the rpz property.

setRpz(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMSecondaryZone

Sets the value of the rpz property.

setRpz(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMZone

Sets the value of the rpz property.

setRpzAxfrs(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats

Sets the value of the rpzAxfrs property.

setRpzCname(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats

Sets the value of the rpzCname property.

setRpzDisabled(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSCachingServerStats

Sets the value of the rpzDisabled property.

setRpzDrop(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats

Sets the value of the rpzDrop property.

setRpzInvalid(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats

Sets the value of the rpzInvalid property.

setRpzIxfrs(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats

Sets the value of the rpzIxfrs property.

setRpzLocal(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats

Sets the value of the rpzLocal property.

setRpzNodata(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats

Sets the value of the rpzNodata property.

setRpzNoOverride(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats

Sets the value of the rpzNoOverride property.

setRpzNotifys(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats

Sets the value of the rpzNotifys property.

setRpzNotifysInvalid(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats

Sets the value of the rpzNotifysInvalid property.

setRpzNxdomain(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats

Sets the value of the rpzNxdomain property.

setRpzOverride(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CdnsRedirect

Sets the value of the rpzOverride property.

setRpzOverrideRedirect(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CdnsRedirect

Sets the value of the rpzOverrideRedirect property.

setRpzPassthru(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats

Sets the value of the rpzPassthru property.

setRpzRrsAdded(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats

Sets the value of the rpzRrsAdded property.

setRpzRrsetCount(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats

Sets the value of the rpzRrsetCount property.

setRpzRrsRemoved(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats

Sets the value of the rpzRrsRemoved property.

setRpzServerAddrs(JAXBElement<DnsIPnPortArray>) - Method in class com.cisco.cnr.ws.xsd.CdnsRedirect

Sets the value of the rpzServerAddrs property.

setRpzTcp(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats

Sets the value of the rpzTcp property.

setRpzTls(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CdnsRedirect

Sets the value of the rpzTls property.

setRpzTlsAuthName(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CdnsRedirect

Sets the value of the rpzTlsAuthName property.

setRpzZoneName(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CdnsRedirect

Sets the value of the rpzZoneName property.

Sets the value of the scvgEnabled property.

setScvgEnabled(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMZoneTemplate

Sets the value of the scvgEnabled property.

setScvgIgnoreRestartInterval(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServer

Sets the value of the scvgIgnoreRestartInterval property.

setScvgInterval(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMReverseZone

Sets the value of the scvgInterval property.

setScvgInterval(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMZone

Sets the value of the scvgInterval property.

setScvgInterval(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMZoneTemplate

Sets the value of the scvgInterval property.

setScvgInterval(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServer

Sets the value of the scvgInterval property.

setScvgMaxRecords(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMReverseZone

Sets the value of the scvgMaxRecords property.

setScvgMaxRecords(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMZone

Sets the value of the scvgMaxRecords property.

setScvgMaxRecords(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMZoneTemplate

Sets the value of the scvgMaxRecords property.

setScvgRefreshInterval(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMReverseZone

Sets the value of the scvgRefreshInterval property.

setScvgRefreshInterval(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMZone

Sets the value of the scvgRefreshInterval property.

setScvgRefreshInterval(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMZoneTemplate

Sets the value of the scvgRefreshInterval property.

setScvgRefreshInterval(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServer

Sets the value of the scvgRefreshInterval property.

setSecondariesList(JAXBElement<CCMZDSecondaryArray>) - Method in class com.cisco.cnr.ws.xsd.CCMZoneDistribution

Sets the value of the secondariesList property.

setSecondary(String) - Method in class com.cisco.cnr.ws.xsd.CCMZDSecondary

Sets the value of the secondary property.

setSecret(String) - Method in class com.cisco.cnr.ws.xsd.Key

Sets the value of the secret property.

setSecurityEventAlarmSettings(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSCachingServer

Sets the value of the securityEventAlarmSettings property.

setSecurityEventAlarmSettings(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerConfig

Sets the value of the securityEventAlarmSettings property.

setSecurityEventAlarmSettings(JAXBElement<String>) - Method in class

com.cisco.cnr.ws.xsd.DNSServer

> Sets the value of the securityEventAlarmSettings property.

setSecurityEventLogging(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSCachingServer

> Sets the value of the securityEventLogging property.

setSecurityEventLogging(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSCachingServerConfig

> Sets the value of the securityEventLogging property.

setSecurityEventLogging(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServer

> Sets the value of the securityEventLogging property.

setSecurityEventLogSettings(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSCachingServer

> Sets the value of the securityEventLogSettings property.

setSecurityEventLogSettings(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSCachingServerConfig

> Sets the value of the securityEventLogSettings property.

setSecurityEventLogSettings(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSServer

> Sets the value of the securityEventLogSettings property.

setSecurityEventMaxQnameSize(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSCachingServer

> Sets the value of the securityEventMaxQnameSize property.

setSecurityEventMaxQnameSize(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSCachingServerConfig

> Sets the value of the securityEventMaxQnameSize property.

setSecurityEventMaxQnameSize(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSServer

> Sets the value of the securityEventMaxQnameSize property.

setSecurityEventMaxQps(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSCachingServer

> Sets the value of the securityEventMaxQps property.

setSecurityEventMaxQps(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSCachingServerConfig

> Sets the value of the securityEventMaxQps property.

setSecurityEventMaxQps(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServer

> Sets the value of the securityEventMaxQps property.

setSecurityEvents(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSCachingServerStats

> Sets the value of the securityEvents property.

setSecurityEvents(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSServerSecurityStats

> Sets the value of the securityEvents property.

setSecurityEventsAlarm(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSCachingServerStats

> Sets the value of the securityEventsAlarm property.

setSecurityEventsAlarm(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSServerSecurityStats

Sets the value of the securityEventsAlarm property.

setSecurityEventsAmplificationAttack(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats

Sets the value of the securityEventsAmplificationAttack property.

setSecurityEventsAmplificationAttack(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServerSecurityStats

Sets the value of the securityEventsAmplificationAttack property.

setSecurityEventsDnsTunneling(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats

Sets the value of the securityEventsDnsTunneling property.

setSecurityEventsDnsTunneling(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServerSecurityStats

Sets the value of the securityEventsDnsTunneling property.

setSecurityEventsDos(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats

Sets the value of the securityEventsDos property.

setSecurityEventsDos(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServerSecurityStats

Sets the value of the securityEventsDos property.

setSecurityEventsFirewall(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats

Sets the value of the securityEventsFirewall property.

setSecurityEventsMalware(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats

Sets the value of the securityEventsMalware property.

setSecurityEventsPeriodic(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats

Sets the value of the securityEventsPeriodic property.

setSecurityEventsPeriodic(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServerSecurityStats

Sets the value of the securityEventsPeriodic property.

setSecurityEventsPhishing(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats

Sets the value of the securityEventsPhishing property.

setSecurityEventsPoisoning(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats

Sets the value of the securityEventsPoisoning property.

setSecurityEventsPoisoning(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServerSecurityStats

Sets the value of the securityEventsPoisoning property.

setSecurityEventsSnooping(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats

Sets the value of the securityEventsSnooping property.

setSecurityEventsSnooping(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServerSecurityStats

Sets the value of the securityEventsSnooping property.

setSecurityType(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Key

setServerDeactivatedCount(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSRelatedServer
> Sets the value of the serverDeactivatedCount property.

setServerDeactivatedCount(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.LDAPRelatedServer
> Sets the value of the serverDeactivatedCount property.

setServerDuid(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCP6Stats
> Sets the value of the serverDuid property.

setServerFlags(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCPServer
> Sets the value of the serverFlags property.

setServerIp6Address(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DnsUpdateConfig
> Sets the value of the serverIp6Address property.

setServerKey(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DnsUpdateConfig
> Sets the value of the serverKey property.

setServerLeaseTime(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Policy
> Sets the value of the serverLeaseTime property.

setServerLogSettings(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServer
> Sets the value of the serverLogSettings property.

setServerReloadTime(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DHCPServerStats
> Sets the value of the serverReloadTime property.

setServerStartTime(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCPServerStats
> Sets the value of the serverStartTime property.

setServerStats(JAXBElement<ServerSystemStatsArray>) - Method in class
com.cisco.cnr.ws.xsd.SystemStats
> Sets the value of the serverStats property.

setServerType(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.ServerSystemStats
> Sets the value of the serverType property.

setServerUpTime(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCPServerStats
> Sets the value of the serverUpTime property.

setServices(DnsEnumEntryArray) - Method in class com.cisco.cnr.ws.xsd.DnsEnumEntrySet
> Sets the value of the services property.

setSharedSecret(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMCluster
> Sets the value of the sharedSecret property.

setShortestPrefixLength(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Policy
> Sets the value of the shortestPrefixLength property.

setSignatureAlgorithm(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Certificate
> Sets the value of the signatureAlgorithm property.

setSimulateZoneTopDynupdate(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSServer
> Sets the value of the simulateZoneTopDynupdate property.

setSkipClientLookup(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCPServer
> Sets the value of the skipClientLookup property.

setSmartCache(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSCachingServer
> Sets the value of the smartCache property.

setSplitLeaseTimes(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Policy
> Sets the value of the splitLeaseTimes property.

setStart(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCPMaintenanceWindow
> Sets the value of the start property.

setStart(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Range
> Sets the value of the start property.

setStartOfCommInterrupted(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.FailoverRelatedServer
> Sets the value of the startOfCommInterrupted property.

setStartTime(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCPRenewalData
> Sets the value of the startTime property.

setStartTime(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCPServerStats
> Sets the value of the startTime property.

setStartTime(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSCachingServerRateLimitStats
> Sets the value of the startTime property.

setStartTime(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.TCPConnectionRelatedServer
> Sets the value of the startTime property.

setStartTimeOfPartnerState(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.FailoverRelatedServer
> Sets the value of the startTimeOfPartnerState property.

setStartTimeOfState(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.FailoverRelatedServer
> Sets the value of the startTimeOfState property.

setStartTimeOfState(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Lease
> Sets the value of the startTimeOfState property.

setStartTimeOfState(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Lease6
> Sets the value of the startTimeOfState property.

setStartTimeStr(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCPServerStats
> Sets the value of the startTimeStr property.

setState(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMServerInfo
> Sets the value of the state property.

setState(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DnsHAStatus
> Sets the value of the state property.

setState(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.FailoverRelatedServer
> Sets the value of the state property.

setState(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Lease
> Sets the value of the state property.

setState(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Lease6
> Sets the value of the state property.

setState(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.ResourceValue
> Sets the value of the state property.

setStateExpirationTime(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Lease
> Sets the value of the stateExpirationTime property.

setStateExpirationTime(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Lease6

Sets the value of the stateExpirationTime property.

setStateReceived(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCPFailoverStats

Sets the value of the stateReceived property.

setStateSent(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCPFailoverStats

Sets the value of the stateSent property.

setStatisticsRequestTime(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCPServerStats

Sets the value of the statisticsRequestTime property.

setStatisticsRequestTime(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServerStats

Sets the value of the statisticsRequestTime property.

setStatisticsRequestTime(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.ServerSystemStats

Sets the value of the statisticsRequestTime property.

setStatisticsRequestTime(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.SystemStats

Sets the value of the statisticsRequestTime property.

setStatisticsResetTime(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCPServerStats

Sets the value of the statisticsResetTime property.

setStatus(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DnsSecKey

Sets the value of the status property.

setStringVal(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.FilterElement

Sets the value of the stringVal property.

setSubject(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Certificate

Sets the value of the subject property.

setSubnet(String) - Method in class com.cisco.cnr.ws.xsd.Scope

Sets the value of the subnet property.

setSubnet(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CurrentUtilization

Sets the value of the subnet property.

setSubnetState(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMSubnet

Sets the value of the subnetState property.

setSubOptions(JAXBElement<OptionArray>) - Method in class com.cisco.cnr.ws.xsd.Option

Sets the value of the subOptions property.

setSubtype(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DnsEnumEntry

Sets the value of the subtype property.

setSuccessfulConnections(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCPFailoverStats

Sets the value of the successfulConnections property.

setSyncFailureTrap(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMFailoverPair

Sets the value of the syncFailureTrap property.

setSynthesizeName(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DnsUpdateConfig

Sets the value of the synthesizeName property.

setSynthesizeReverseZone(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCPServer

Sets the value of the synthesizeReverseZone property.

setSyntheticNameStem(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DnsUpdateConfig

> Sets the value of the syntheticNameStem property.

setTcpActiveLeaseQueries(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DHCPServerActivityStats

> Sets the value of the tcpActiveLeaseQueries property.

setTcpBulkLeaseQueries(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DHCPServerActivityStats

> Sets the value of the tcpBulkLeaseQueries property.

setTcpConnectionsDropped(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DHCP6Stats

> Sets the value of the tcpConnectionsDropped property.

setTcpConnectionsDropped(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DHCPServerActivityStats

> Sets the value of the tcpConnectionsDropped property.

setTcpCurrentConnections(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DHCP6Stats

> Sets the value of the tcpCurrentConnections property.

setTcpCurrentConnections(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DHCPServerActivityStats

> Sets the value of the tcpCurrentConnections property.

setTcpLqActive(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DHCPServerActivityStats

> Sets the value of the tcpLqActive property.

setTcpLqDone(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DHCPServerActivityStats

> Sets the value of the tcpLqDone property.

setTcpLqStatus(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DHCPServerActivityStats

> Sets the value of the tcpLqStatus property.

setTcpLqStatusCatchupComplete(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DHCPServerActivityStats

> Sets the value of the tcpLqStatusCatchupComplete property.

setTcpLqStatusCatchUpComplete(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DHCP6Stats

> Sets the value of the tcpLqStatusCatchUpComplete property.

setTcpLqStatusConnectionActive(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DHCPServerActivityStats

> Sets the value of the tcpLqStatusConnectionActive property.

setTcpLqStatusDataMissing(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DHCP6Stats

> Sets the value of the tcpLqStatusDataMissing property.

setTcpLqStatusDataMissing(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DHCPServerActivityStats

> Sets the value of the tcpLqStatusDataMissing property.

setTcpLqStatusMalformedQuery(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DHCP6Stats

Sets the value of the tcpLqStatusMalformedQuery property.

setTcpLqStatusMalformedQuery(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCPServerActivityStats

Sets the value of the tcpLqStatusMalformedQuery property.

setTcpLqStatusNotAllowed(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCP6Stats

Sets the value of the tcpLqStatusNotAllowed property.

setTcpLqStatusNotAllowed(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCPServerActivityStats

Sets the value of the tcpLqStatusNotAllowed property.

setTcpLqStatusNotConfigured(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCP6Stats

Sets the value of the tcpLqStatusNotConfigured property.

setTcpLqStatusQueryTerminated(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCP6Stats

Sets the value of the tcpLqStatusQueryTerminated property.

setTcpLqStatusQueryTerminated(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCPServerActivityStats

Sets the value of the tcpLqStatusQueryTerminated property.

setTcpLqStatusUnknownQuery(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCP6Stats

Sets the value of the tcpLqStatusUnknownQuery property.

setTcpLqStatusUnspecFail(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCP6Stats

Sets the value of the tcpLqStatusUnspecFail property.

setTcpLqStatusUnspecFail(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCPServerActivityStats

Sets the value of the tcpLqStatusUnspecFail property.

setTcpLqUnassigned(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCPServerActivityStats

Sets the value of the tcpLqUnassigned property.

setTcpTotalConnections(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCP6Stats

Sets the value of the tcpTotalConnections property.

setTcpTotalConnections(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCPServerActivityStats

Sets the value of the tcpTotalConnections property.

setTemplateRootPrefix(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Link

Sets the value of the templateRootPrefix property.

setTenantId(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.ACL

Sets the value of the tenantId property.

setTenantId(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMCluster

Sets the value of the tenantId property.

setTenantId(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMFailoverPair

Sets the value of the tenantId property.

setTenantId(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMHaDnsPair

Sets the value of the tenantId property.

setTenantId(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMHost
> Sets the value of the tenantId property.

setTenantId(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMReverseZone
> Sets the value of the tenantId property.

setTenantId(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMRRSet
> Sets the value of the tenantId property.

setTenantId(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMScopeTemplate
> Sets the value of the tenantId property.

setTenantId(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMSecondaryZone
> Sets the value of the tenantId property.

setTenantId(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMSubnet
> Sets the value of the tenantId property.

setTenantId(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMZone
> Sets the value of the tenantId property.

setTenantId(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMZoneDistribution
> Sets the value of the tenantId property.

setTenantId(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMZoneTemplate
> Sets the value of the tenantId property.

setTenantId(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.ClientClass
> Sets the value of the tenantId property.

setTenantId(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.ClientEntry
> Sets the value of the tenantId property.

setTenantId(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CurrentPrefixUtilization
> Sets the value of the tenantId property.

setTenantId(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CurrentUtilization
> Sets the value of the tenantId property.

setTenantId(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DnsEnumDomain
> Sets the value of the tenantId property.

setTenantId(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DnsEnumEntrySet
> Sets the value of the tenantId property.

setTenantId(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DnsSecKey
> Sets the value of the tenantId property.

setTenantId(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DnsUpdateConfig
> Sets the value of the tenantId property.

setTenantId(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DnsView
> Sets the value of the tenantId property.

setTenantId(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Key
> Sets the value of the tenantId property.

setTenantId(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Lease
> Sets the value of the tenantId property.

setTenantId(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Lease6
> Sets the value of the tenantId property.

setTenantId(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Link
> Sets the value of the tenantId property.

setTenantId(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.LinkTemplate

setTimestamp(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSCachingServerRateLimitStats
> Sets the value of the timestamp property.

setTimestamp(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSTopNameStats
> Sets the value of the timestamp property.

setTimestamp(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DnsTrustAnchor
> Sets the value of the timestamp property.

setTimeUp(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats
> Sets the value of the timeUp property.

setTls(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSCachingServer
> Sets the value of the tls property.

setTls(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerConfig
> Sets the value of the tls property.

setTls(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DnsException
> Sets the value of the tls property.

setTls(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DnsForwarder
> Sets the value of the tls property.

setTls(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServer
> Sets the value of the tls property.

setTlsAuthName(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DnsException
> Sets the value of the tlsAuthName property.

setTlsAuthName(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DnsForwarder
> Sets the value of the tlsAuthName property.

setTlsCertificate(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSCachingServer
> Sets the value of the tlsCertificate property.

setTlsCertificate(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSCachingServerConfig
> Sets the value of the tlsCertificate property.

setTlsCertificate(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServer
> Sets the value of the tlsCertificate property.

setTlsErrorsIn(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerStats
> Sets the value of the tlsErrorsIn property.

setTlsErrorsOut(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSCachingServerStats
> Sets the value of the tlsErrorsOut property.

setTlsPort(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSCachingServer
> Sets the value of the tlsPort property.

setTlsPort(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerConfig
> Sets the value of the tlsPort property.

setTlsPort(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServer
> Sets the value of the tlsPort property.

setTlsQueries(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServerSecurityStats
> Sets the value of the tlsQueries property.

setTlsQueriesFailed(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSServerSecurityStats

Sets the value of the tlsQueriesFailed property.

setTlsSystemCertBundle(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSCachingServer

Sets the value of the tlsSystemCertBundle property.

setTlsSystemCertBundle(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSCachingServerConfig

Sets the value of the tlsSystemCertBundle property.

setTlsUpstreamCertBundle(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSCachingServer

Sets the value of the tlsUpstreamCertBundle property.

setTlsUpstreamCertBundle(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSCachingServerConfig

Sets the value of the tlsUpstreamCertBundle property.

setTopLevelDomain(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DnsEnumConfig

Sets the value of the topLevelDomain property.

setTopNames(JAXBElement<CCMRRSetArray>) - Method in class
com.cisco.cnr.ws.xsd.DNSTopNameStats

Sets the value of the topNames property.

setTopNames(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSCachingServer

Sets the value of the topNames property.

setTopNames(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSCachingServerConfig

Sets the value of the topNames property.

setTopNames(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServer

Sets the value of the topNames property.

setTopNamesMaxAge(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSCachingServer

Sets the value of the topNamesMaxAge property.

setTopNamesMaxAge(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSCachingServerConfig

Sets the value of the topNamesMaxAge property.

setTopNamesMaxAge(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServer

Sets the value of the topNamesMaxAge property.

setTopNamesMaxCount(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSCachingServer

Sets the value of the topNamesMaxCount property.

setTopNamesMaxCount(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DNSCachingServerConfig

Sets the value of the topNamesMaxCount property.

setTopNamesMaxCount(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServer

Sets the value of the topNamesMaxCount property.

setTotalAcks(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCPServerStats

Sets the value of the totalAcks property.

setTotalAddresses(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DHCPScopeAggregationStats

Sets the value of the totalAddresses property.

setTotalBytesReceived(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.TCPConnectionRelatedServer
      Sets the value of the totalBytesReceived property.
setTotalBytesSent(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.TCPConnectionRelatedServer
      Sets the value of the totalBytesSent property.
setTotalConnections(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.TCPListenerRelatedServer
      Sets the value of the totalConnections property.
setTotalCounted(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSTopNameStats
      Sets the value of the totalCounted property.
setTotalDeclines(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCPServerStats
      Sets the value of the totalDeclines property.
setTotalDiscovers(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCPServerStats
      Sets the value of the totalDiscovers property.
setTotalDynamic(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CurrentUtilization
      Sets the value of the totalDynamic property.
setTotalNaks(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCPServerStats
      Sets the value of the totalNaks property.
setTotalOffers(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCPServerStats
      Sets the value of the totalOffers property.
setTotalPrefixes(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCP6Stats
      Sets the value of the totalPrefixes property.
setTotalReleases(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCPServerStats
      Sets the value of the totalReleases property.
setTotalReplies(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.TCPConnectionRelatedServer
      Sets the value of the totalReplies property.
setTotalRequests(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCPServerStats
      Sets the value of the totalRequests property.
setTotalRequests(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.TCPConnectionRelatedServer
      Sets the value of the totalRequests property.
setTotalReserved(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.CurrentPrefixUtilization
      Sets the value of the totalReserved property.
setTotalReserved(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CurrentUtilization
      Sets the value of the totalReserved property.
setTotalResponsesForPartner(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.RelayAgentState
      Sets the value of the totalResponsesForPartner property.
setTotalRrs(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServerStats
      Sets the value of the totalRrs property.
setTotalScopes(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DHCPServerActivityStats
      Sets the value of the totalScopes property.

setTotalZones(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServerStats
Sets the value of the totalZones property.
setTrackedRenewalPeriod(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCPRenewalData
Sets the value of the trackedRenewalPeriod property.
setTransferSourceAddress(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServer
Sets the value of the transferSourceAddress property.
setTransferSourceIp6Address(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServer
Sets the value of the transferSourceIp6Address property.
setTransferSourcePort(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServer
Sets the value of the transferSourcePort property.
setTrapsEnabled(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCPServer
Sets the value of the trapsEnabled property.
setTrapsEnabled(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSCachingServer
Sets the value of the trapsEnabled property.
setTrapsEnabled(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSCachingServerConfig
Sets the value of the trapsEnabled property.
setTrapsEnabled(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServer
Sets the value of the trapsEnabled property.
setTrimHostName(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCPServer
Sets the value of the trimHostName property.
setTrustAnchorList(JAXBElement<StringArray>) - Method in class com.cisco.cnr.ws.xsd.DnsSec
Sets the value of the trustAnchorList property.
setTrustedKeyRrs(String) - Method in class com.cisco.cnr.ws.xsd.DnsTrustAnchor
Sets the value of the trustedKeyRrs property.
setTsigProcessing(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServer
Sets the value of the tsigProcessing property.
setTtl(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMRR
Sets the value of the ttl property.
setTtl(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DnsEnumDomain
Sets the value of the ttl property.
setUnauthenticatedClientClassName(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.ClientClass
Sets the value of the unauthenticatedClientClassName property.
setUnauthenticatedClientClassName(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.ClientEntry
Sets the value of the unauthenticatedClientClassName property.
setUnauthUpdateReqs(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServerSecurityStats
Sets the value of the unauthUpdateReqs property.
setUnauthXferReqs(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DNSServerSecurityStats
Sets the value of the unauthXferReqs property.

setV6PoolRequestsReceived(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DHCPFailoverStats
>   Sets the value of the v6PoolRequestsReceived property.

setV6PoolRequestsSent(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DHCPFailoverStats
>   Sets the value of the v6PoolRequestsSent property.

setV6PoolResponsesReceived(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DHCPFailoverStats
>   Sets the value of the v6PoolResponsesReceived property.

setV6PoolResponsesSent(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DHCPFailoverStats
>   Sets the value of the v6PoolResponsesSent property.

setV6ReplyOptions(JAXBElement<StringArray>) - Method in class com.cisco.cnr.ws.xsd.Policy
>   Sets the value of the v6ReplyOptions property.

setV6RsooAllowedOptions(JAXBElement<StringArray>) - Method in class
com.cisco.cnr.ws.xsd.Policy
>   Sets the value of the v6RsooAllowedOptions property.

setV6SyntheticNameGenerator(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DnsUpdateConfig
>   Sets the value of the v6SyntheticNameGenerator property.

setV6UpdateDoneReceived(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DHCPFailoverStats
>   Sets the value of the v6UpdateDoneReceived property.

setV6UpdateDoneSent(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DHCPFailoverStats
>   Sets the value of the v6UpdateDoneSent property.

setV6UpdateRequestDoneTime(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.FailoverRelatedServer
>   Sets the value of the v6UpdateRequestDoneTime property.

setV6UpdateRequestOutstanding(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.FailoverRelatedServer
>   Sets the value of the v6UpdateRequestOutstanding property.

setV6UpdateRequestsReceived(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DHCPFailoverStats
>   Sets the value of the v6UpdateRequestsReceived property.

setV6UpdateRequestsSent(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DHCPFailoverStats
>   Sets the value of the v6UpdateRequestsSent property.

setV6UpdateRequestStartTime(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.FailoverRelatedServer
>   Sets the value of the v6UpdateRequestStartTime property.

setV6UpdateResponseDoneTime(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.FailoverRelatedServer
>   Sets the value of the v6UpdateResponseDoneTime property.

setV6UpdateResponseInProgress(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.FailoverRelatedServer
>   Sets the value of the v6UpdateResponseInProgress property.

setViewId(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMSecondaryZone
    Sets the value of the viewId property.
setViewId(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMZone
    Sets the value of the viewId property.
setViewId(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMZoneTemplate
    Sets the value of the viewId property.
setViewId(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DnsEnumDomain
    Sets the value of the viewId property.
setViewId(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DnsEnumEntrySet
    Sets the value of the viewId property.
setViewId(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DnsUpdateConfig
    Sets the value of the viewId property.
setViewId(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DnsView
    Sets the value of the viewId property.
setViewId(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Policy
    Sets the value of the viewId property.
setViewQualifiedFqdn(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMRRSet
    Sets the value of the viewQualifiedFqdn property.
setViewQualifiedName(JAXBElement<String>) - Method in class
com.cisco.cnr.ws.xsd.DnsZoneStatus
    Sets the value of the viewQualifiedName property.
setVmUtilization(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.ServerSystemStats
    Sets the value of the vmUtilization property.
setVpnCommunication(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.DHCPServer
    Sets the value of the vpnCommunication property.
setVpnId(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CCMSubnet
    Sets the value of the vpnId property.
setVpnId(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CurrentPrefixUtilization
    Sets the value of the vpnId property.
setVpnId(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.CurrentUtilization
    Sets the value of the vpnId property.
setVpnId(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Lease
    Sets the value of the vpnId property.
setVpnId(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Lease6
    Sets the value of the vpnId property.
setVpnId(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Link
    Sets the value of the vpnId property.
setVpnId(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Prefix
    Sets the value of the vpnId property.
setVpnId(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Reservation
    Sets the value of the vpnId property.
setVpnId(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Reservation6
    Sets the value of the vpnId property.
setVpnId(JAXBElement<String>) - Method in class com.cisco.cnr.ws.xsd.Scope
    Sets the value of the vpnId property.

T

TCPListenerRelatedServer - Class in com.cisco.cnr.ws.xsd

The Network Registrar TCPListenerRelatedServer class.

TCPListenerRelatedServer() - Constructor for class com.cisco.cnr.ws.xsd.TCPListenerRelatedServer

TCPListenerRelatedServerArray - Class in com.cisco.cnr.ws.xsd

Java class for TCPListenerRelatedServerArray complex type.

TCPListenerRelatedServerArray() - Constructor for class com.cisco.cnr.ws.xsd.TCPListenerRelatedServerArray

toJava(ScpList) - Static method in class com.cisco.cnr.ws.xsd.ScpAndJavaConverter

Converts an ScpList to an XML Java Array object.

toJava(ScpObj) - Static method in class com.cisco.cnr.ws.xsd.ScpAndJavaConverter

Convert an ScpObj to an XML Java object.

toJava(ScpObj, OptionDefinitionFactory) - Static method in class com.cisco.cnr.ws.xsd.ScpAndJavaConverter

toScpList(Object, ScpAttrType) - Static method in class com.cisco.cnr.ws.xsd.ScpAndJavaConverter

Convert an XML Java web services instance to an ScpObj.

toScpObj(Object) - Static method in class com.cisco.cnr.ws.xsd.ScpAndJavaConverter

Convert an XML Java web services instance to an ScpObj.

toScpObj(Object, OptionDefinitionFactory, String) - Static method in class com.cisco.cnr.ws.xsd.ScpAndJavaConverter

U

UpdatePolicy - Class in com.cisco.cnr.ws.xsd

The Network Registrar UpdatePolicy class.

UpdatePolicy() - Constructor for class com.cisco.cnr.ws.xsd.UpdatePolicy

UpdatePolicyArray - Class in com.cisco.cnr.ws.xsd

Java class for UpdatePolicyArray complex type.

UpdatePolicyArray() - Constructor for class com.cisco.cnr.ws.xsd.UpdatePolicyArray

V

VPN - Class in com.cisco.cnr.ws.xsd

The Network Registrar VPN class.

VPN() - Constructor for class com.cisco.cnr.ws.xsd.VPN

VPNArray - Class in com.cisco.cnr.ws.xsd

Java class for VPNArray complex type.

VPNArray() - Constructor for class com.cisco.cnr.ws.xsd.VPNArray
