Cisco Unified Workforce Optimization

Workforce Management User Guide Version 11.0

First Published: August 27, 2015

Last Updated: August 1, 2016

Contents

Getting Started

This section describes how to log in to Unified Workforce Optimization and provides a brief description of Unified Workforce Optimization.

Unified Workforce Optimization supports the following products:

- Recording and Quality Management
- Workforce Management (WFM)

The information provided in this section is common to each of these products, except where noted.

Accessing the User Interface

Unified Workforce Optimization is a web application. Access it by entering the following URL in your browser:

> https://<base server> or
>
> http://<base server>

where <base server> is the host name or IP address of the server that hosts the Unified Workforce Optimization Container.

Validating Your PC

Before you log in to Unified Workforce Optimization for the first time, validate your PC. Validating your PC means that Unified Workforce Optimization checks it to make sure that it has all the features required to run your Unified Workforce Optimization products.

To validate your PC, access the Unified Workforce Optimization login page and click the Validate my PC configuration link. Unified Workforce Optimization performs the evaluation and then displays the Diagnostics page, which lists the required features for each product in your system. The Result column tells you if your PC is configured correctly or not for that feature.

Diagnostics				
Product	**Feature**	**Supported**	**Found**	**Result**
QM	Browser Type and Version	Microsoft Internet Explorer 9, 10, 11; Google Chrome	Microsoft Internet Explorer 11 (32-bit)	✅ Good
QM	Platform	Microsoft Windows	Microsoft Windows	✅ Good
QM	Popup blocker enabled	False	False	✅ Good
QM	Audio Playback ActiveX installed/enabled	True (Windows Media Player)	True (True)	✅ Good
QM	Screen Playback ActiveX installed/enabled	True (Proxy v6.x Remote Control Viewer)	True (True)	✅ Good
QM	Live Screen Monitoring ActiveX installed/enabled	True (ScreenViewerControl Class)	True (True)	✅ Good
WFM	Browser Type and Version	Microsoft Internet Explorer 9, 10, 11; Google Chrome	Microsoft Internet Explorer 11 (32-bit)	✅ Good
WFM	Popup blocker enabled	False	False	✅ Good
CAS	Browser Type and Version	Microsoft Internet Explorer 9, 10, 11; Google Chrome	Microsoft Internet Explorer 11 (32-bit)	✅ Good
CAS	Platform	Microsoft Windows	Microsoft Windows	✅ Good
CAS	Popup blocker enabled	False	False	✅ Good
CAS	Audio Playback ActiveX installed/enabled	True (Windows Media Player)	True (True)	✅ Good
CAS	Screen Playback ActiveX installed/enabled	True (Proxy v6.x Remote Control Viewer)	True (True)	✅ Good

Calabrio ONE Component Versions	
Component	**Version**
User Interface	5.0.113.0
Calabrio Quality Management	9.3.1.146
Workforce Management	9.3.1.203
Calabrio Analytics Services	9.3.1.117

If the Diagnostics page shows Bad for any feature, you must correct that before you can log in to Unified Workforce Optimization. In some cases you will see links at the bottom of the page that will help you correct a problem. In other cases you will have to contact your supervisor or administrator for assistance.

The Component Versions section of the page displays the current versions of Unified Workforce Optimization and each installed product.

Adding a Trusted Site to Internet Explorer

Before you log in to Unified Workforce Optimization for the first time, it is recommended that you add the Unified Workforce Optimization URL as a trusted website to Internet Explorer (if that is the browser you are using). By adding a website to the Trusted security zone, you can control the level of security used on that site.

1. Start Internet Explorer and select Tools > Internet Options from the toolbar.

2. On the Security tab, clear the Enable Protected Mode check box.

3. Select Trusted Sites, and then click Sites.

4. In the Add this website to the zone field, enter the base server URL (https://<base server>) and click Add. The URL is added to the Websites list.

> **Note:** The following message might appear:
>
> "Sites added to this zone must use the https:// prefix. This prefix assures a secure connection."
>
> If you see this message, clear the Require Server Verification (https:) for all sites in this zone check box and click Add again. Then select the Require Server Verification (https:) for all sites in this zone check box.

6. Click Close to dismiss the Trusted Sites dialog box.

7. Click Apply and then OK to dismiss Internet Options.

Enabling ActiveX Controls in Internet Explorer

1. Start Internet Explorer and select Tools > Internet Options from the toolbar.

2. On the Security tab, choose one of the following options:

   - Select Local Internet and change Security level for this zone to Medium-low.

   - Select either Internet or Trusted Sites, and then click Custom Level. Scroll down to ActiveX controls and plug-ins and change the option as follows:

Option	Setting
Automatic prompting for ActiveX controls	Enable

3. Click OK to dismiss the Security Settings dialog box.

4. Click Apply and then OK to dismiss Internet Options.

5. Restart Internet Explorer.

Logging In

The Unified Workforce Optimization login page allows you to log in to a single product or to multiple products simultaneously.

The following table describes the fields on the Login page.

Field	Description
Separate Product Logins check box	This check box is present only in systems with multiple products. By default it is clear, so that when you log in, you log in to every product simultaneously. If you select the check box, you can log in to a specific product in your system.
Product name check box	This check box is present only in systems with multiple products. If you opt for separate product login, after you select the desired product you must select this check box. If you do not select it, the Username and Password fields are not enabled.
Username	Your username. If your system uses Active Directory, this is your Active Directory username. If your system does not use Active Directory, it is the username assigned to you by your administrator. **Note**: If not using Active Directory, and your administrator wants to take advantage of multiple login, your username and password must be the same in every product.
Password	Your password. If your system uses Active Directory, this is your Active Directory password. If your system does not use Active Directory, it is the password assigned to you by your administrator.
Domain	The Active Directory domain. This field is displayed only on systems that use Active Directory. Select the domain associated with your Active Directory username and password.

Field	Description
Language	Choose the language used in the Unified Workforce Optimization. The language you choose is used in all products, and persists from session to session for your username.
Product icons	These icons are displayed only in multiple product systems and if you have opted for separate product logins. When you click an icon, the name of the product appears above the Username field. Use these icons to select the product you want to log in to.
Validate my PC configuration	Click this link to make sure your PC is configured correctly to use Unified Workforce Optimization. See Validating Your PC for more information.

Logging in to One Product

To log in to one product:

1. Select the Separate product logins check box.

2. Click the product icon for the product you want to log in to.

3. Select the product name check box.

4. Complete the fields on the Login page.

5. Click Login.

Note: If there is only one product in your system, the Login page is simpler, and shows only the Username, Password, Domain (if you use Active Directory), and Language fields.

There is no limit to the number of login attempts you can make. An error message appears if your credentials are not correct.

Logging in to Multiple Products

To log in to multiple products:

1. Clear the Separate product logins check box (this is clear by default).

2. Complete the fields on the Login page and click Login.

If your credentials are the same across the product suite, your login gives you access to all those products (based on your role).

However, if your credentials are not the same for one or more of the products in the product suite, you are not notified of the error. You will be able to access only the products for which your credentials were valid.

To find out which products you could not access, log out and use the separate login option. Log in to each product in turn to find out which one is rejecting your credentials.

Access Based on Role

The following table shows the features available by role for WFM.

Note: The scope of a user's role limits the number of features available within an application. For example, while all roles can access reports, agents can view only one report while administrators can view all available reports.

Application	Administrator	Scheduler	Supervisor	Agent
Agent Schedules	X	X	X	
Application Management	X	X		
Dashboard	X	X	X	X
Messaging	X	X	X	X
My Schedule	X	X	X	X
Planning	X	X		
Reporting	X	X	X	X

About the Administrator Role

WFM comes with a system administrator user ID. The password for this user ID (administrator) is initially set during installation in the WFM Configuration

Setup utility, and maintained in WFM (via the Users page for the administrator user).

You cannot assign the administrator role to any other user in WFM. "Administrator" is not an option in the list of roles available when configuring users.

However, it is possible to have multiple WFM administrators.

- In systems that use Active Directory to administer user IDs and passwords, you can configure Active Directory users to be WFM administrators by assigning them to a specific user group within Active Directory. The name of this group is entered in the WFM Configuration Setup utility (WFM Authentication step) when adding the connection information for Active Directory. WFM treats any users who are members of this group as WFM administrators.

- In systems that do not use Active Directory, the only way to have multiple administrators is to allow people to share the administrator user ID and password.

Using Multiple Browser Tabs

You can run applications in separate browser tabs or separate instances of your browser during the same session. For example, you can run the Reports application in one tab and the Application Management application in another.

Logging in or out from any browser tab or browser instance affects your login status in all browser tabs and browser instances. For example, if you log in as User 1 in one tab, you are logged in as User 1 in every other tab or browser instance you open. If you log out as User 1 and then log in as User 2 from any tab or instance, all tabs and instances will be logged in as User 2 after they are refreshed.

Note: If you are running an instance of two different browsers (for example, Internet Explorer and Chrome) you can be logged into each as a different user.

To run applications in separate browser tabs, follow these steps:

1. Log in to Unified Workforce Optimization.

2. Copy the URL.

3. Open a new browser tab or instance and paste the URL in the address field.

4. Navigate to the application you want to display in that tab or instance.

5. Repeat steps 3 and 4 as many times as desired.

Clearing Your Browsing History

If Unified Workforce Optimization does not display pages properly (for example, a page is blank), it is recommended that you log out and clear your browser's browsing history.

To clear Internet Explorer browsing history:

1. In Internet Explorer, choose Tools > Internet Options.

2. On the General tab, click Delete in the Browsing history section and then click OK.

3. Restart Internet Explorer.

To clear Chrome browsing history:

1. On the browser toolbar, click the Chrome menu.

2. Choose More Tools > Clear browsing data.

3. In the dialog that appears, choose how far back you want to clear data, and select the Browsing history check box.

4. Click Clear browsing data.

5. Restart Chrome.

Best practices: It is recommended that you configure Internet Explorer to clear the browsing history every time you exit. To do this, choose Tools > Internet Options > General tab. In the Browsing history section, select the Delete browsing history on exit check box.

Logging Out

To log out of Unified Workforce Optimization, hover your mouse over your username in the upper right corner of the page, and click Log Out. This returns you to the Login page.

> **Note**: If you are logged into multiple products, logging out from one will log you out from all.

To exit Unified Workforce Optimization completely, close your browser.

User Interface

Unified Workforce Optimization is divided into three sections.

Container Bar	This toolbar at the top of the page displays navigation buttons you can use to do the following:
	■ Access Unified Workforce Optimization's common applications.
	■ View the name of the user who is currently signed in to Unified Workforce Optimization and log out.
	■ View the number of new alerts and display a list of alerts. The Alerts button also displays the number of new messages available. When you click one of the alerts in the list, an Alert Notification dialog box displays more information.
	■ Access the online help.
Application Pane	The center section of the page that displays a selected application.
Widgets	Self-contained applications that appear on the user's dashboard and can be configured for a specific purpose.

Toolbar

The following table describes the buttons that appear in the toolbar at the top of the screen.

Toolbar

Button	Icon	Description
Logo	–	Click the logo to navigate to the website. Click the down arrow at the right of the logo to show a drop-down menu of all available applications.
Dashboard		Provides information based on the products installed. Administrators can log in to Unified Workforce Optimization and lock down the Dashboard by role.
Schedules and Planning		This application: - Allows administrators, supervisors, and schedulers to manage schedules for selected agents by updating the production schedule. - Allows agents to display their schedules by day, week, or month with a detail, summary, or list view.
Messaging		Allows agents to make requests, and for administrators, supervisors, and schedulers to manage requests.
Application Management		Allows administrators and schedulers to manage services, people, schedulers, activities, historical data, system configuration, vacation planning, and strategic planning
Reporting		Allows you to generate statistics report.
Signed In	NA	Displays the name of the current user and allows you to log out of Unified Workforce Optimization.
Alerts	226	Displays a list of alerts. For more information, see the *Application User Guide*.
Help	?	Displays the help by product.

Application Pane

The application pane displays the application you select from the toolbar. See Toolbar for more information on available applications.

The applications available to you depend on your role and software license.

Tables

The interface often displays information in tables. These tables can be modified to your preferences.

Sorting Tables

Data that is presented in tabular form can be sorted based on the contents of a single column in the table. The sort can be ascending or descending.

When you click a column header, a small triangle at the right of the primary sort column heading displays the direction of the sort, ascending or descending.

Dashboard

The Dashboard application is a common (multi-product) application that contains product-specific widgets. It is displayed by default when you log in.
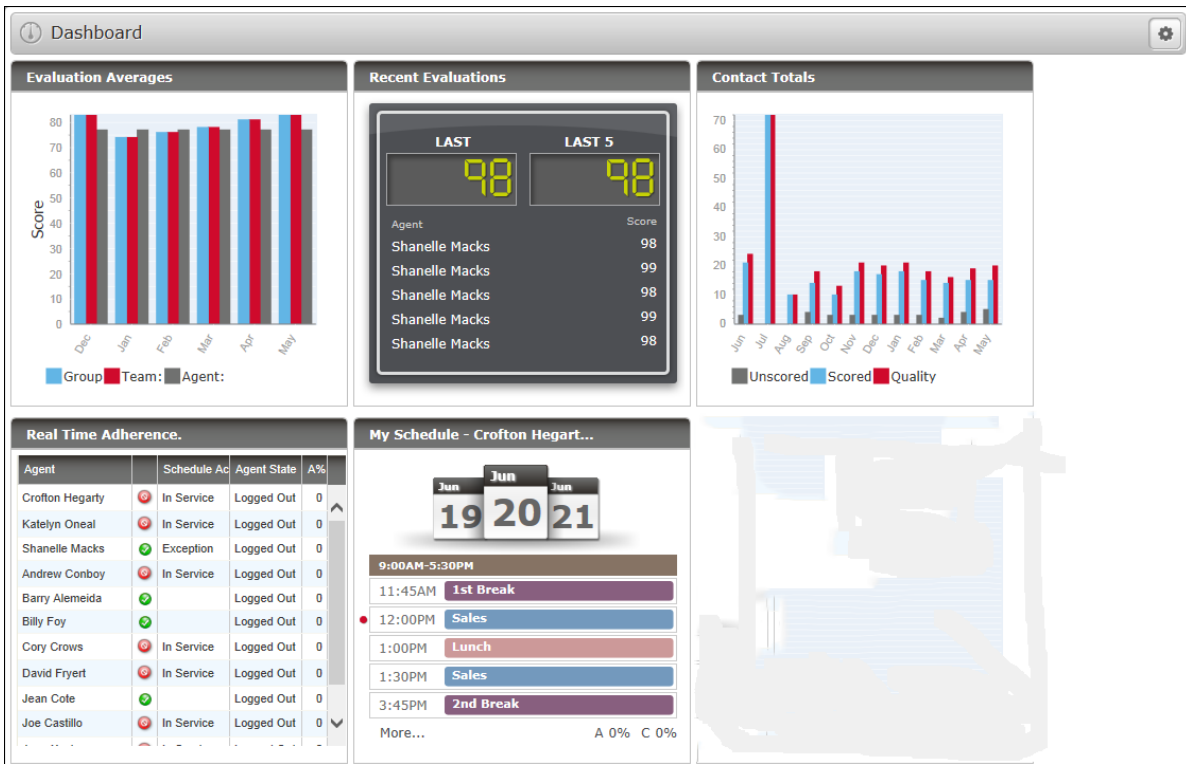

The widgets that you see depends on which products you log in to, your role, and the dashboard view assigned to you by the administrator.

> **Example**: If you log in to two products as an agent, you will see the widgets for both those products that the administrator configured for the agent dashboard. If one of the products is down, the widgets associated with that product do not appear.

The dashboard displays all widgets in a continuous sequence, left to right and top to bottom. Blank spaces between widgets are not allowed.

If enabled by your administrator, you can click Settings to customize the layout and contents of your dashboard. You can:

- Select the widgets to display

- Rename widgets

- Configure widget settings, including the type of chart to be displayed (line graph, vertical bar, and stacked bar)

- Reposition the widgets in the dashboard

Changes made to the dashboard or widget settings are saved automatically after they are applied and persist until they are changed by you or the administrator.

Besides the Settings button in the toolbar, administrators have access to a drop-down list box that contains a list of roles. The administrator selects the role whose dashboard view is to be configured.

Available Widgets by Role

The following list displays the widgets that are available to users according to their role. You might see all or a subset of these widgets in your dashboard, depending on how your administrator configured the dashboard for your role.

If you are logged into other products, you will see widgets for those products as well. Consult the user documentation for the other products for complete widget descriptions.

Available widgets per role

Widget	Agent	Supervisor	Scheduler
Agent Calls Per Hour	x	x	x
Agent Call Volumes	x	x	x
Agent Percentages	x	x	x
Agent Time Distributions	x	x	x
Agent Time Totals	x	x	x
My Schedule	x	x	x

Widget	Agent	Supervisor	Scheduler
Real Time Adherence		x	x
Service Queue Performance		x	x

Widget Toolbar

When you mouse over a widget toolbar, one or two buttons become visible. The following table describes these toolbar buttons.

Widget toolbar buttons

Button	Icon	Description
Action Link		Closes the current application and opens another application that displays information related to the widget.
Settings		Displays the configurable settings in a roll-out panel for this widget. When you apply changes to the settings, the changes persist each time you log in. Click the icon again to hide the Settings panel.

Widget Settings

The Widget Settings window allows you to customize the settings for the selected widget.

The fields that can appear in the Widget Settings dialog box are listed below. Only fields that apply to a specific widget appear in that widget's Settings dialog box.

Note: Some widgets might not display one or more of these settings because the data is unavailable or not applicable.

Field	Description
Agent	The name of the agent. The default setting for this field depends on your role: ■ If you are an agent, your name appears in this field and the field is disabled ■ If you are a supervisor, this field is enabled and you can choose an agent from the drop-down list ■ If you are a supervisor and an agent, your name appears in this field and you can choose an agent from the drop-down list If you choose an agent's name from the drop-down list that is not your own name, the agent's name appears in the widget tool bar.
Range	The date range for the historical information. The default range is one month.
Chart	The type of chart you want to appear in this widget. Your choices are: ■ Line Graph (default)—displays metrics as a line ■ Stacked Bar—displays metrics stacked on top of each other ■ Vertical Bar—displays metrics next to each other
Group By	How dates are grouped. The default setting is Day.
Series 1-8	The data elements you want to appear in this widget. Each widget contains a unique set of data elements.
Service Queue	The name of the service queue. This field only appears for supervisors.
Goal	When selected, displays the goal for the selected service queue.

Widget Descriptions

This section describes the widgets available in your dashboard.

Agent Call Volumes Widget

The Agent Call Volumes widget displays an agent's call volumes for the selected date range. Data can be grouped by day or by month, for a range of 1–12 months. Hover your mouse over a data point in the chart to display a screentip containing the exact value for the data point.

You can choose to display either handled calls (the total number of ACD calls completed by the agent) or transferred calls (the total number of ACD calls transferred by the agent), or both.

> **Note:** A zero in the graph indicates the agent logged in during the day but took no calls. No data in the graph indicates that the agent did not log in on that specific day.

Agent Calls per Hour Widget

The Agent Calls per Hour widget displays the average number of ACD calls per hour an agent handles over the selected date range. Data can be grouped by day or by month, for a range of 1–12 months. You can hover your mouse over a data point in the chart to display a screentip containing the exact value for the data point.

A call is counted in the schedule interval in which the agent answers it.

> **Example**: If an agent answers a call at 10:58 and completes the call at 11:03, that call is counted in the 10:00–10:59 schedule interval.

Agent Percentages Widget

The Agent Percentages widget displays your occupancy ratio or percentage of calls answered, or both, for the selected date range.

Data can be grouped by day or by month, for a range of 1–12 months. You can hover your mouse over a data point in the chart to display a screentip containing the exact value for the data point.

You can choose to display either or both of the following data elements in any order from the Settings panel:

- Occupancy %—The percentage of in-session time that the agent spends in active contact handling states (for example, on incoming calls, in wrapup activity, on outbound calls).

- Utilization %—The percentage of offered calls that the agent answered.

Agent Time Distributions Widget

The Agent Time Distributions widget displays the average time you spent in a specific ACD state for the selected date range.

Data can be grouped by day or by month, for a range of 1–12 months, and is expressed in seconds. You can hover your mouse over a data point in the chart to display a screentip containing the exact value for the data point.

You can choose to display up to three of the following data elements in any order.

Data Element	Description
Average Processing Time	The average amount of time an agent was in the Talking, On Hold, Work Ready, and Work Not Ready states.
Average Talk Time	The average amount of time an agent was on incoming ACD calls, beginning when the call is answered until the call is disconnected, including hold time.
Average Hold Time	The average amount of time the agent placed calls on hold, including hold time for transfers and conferences.
Average Work Time	The average amount of time an agent spent in the Work state immediately following an ACD call.
Average Ready Time	The average amount of time an agent was logged in and available to accept ACD calls.
Average Not Ready Time	The average amount of time an agent was logged in but not available to take ACD calls.

Agent Time Totals Widget

The Agent Time Totals widget displays the total time an agent spent in specific ACD states for the selected date range.

Data can be grouped by day or by month, for ranges between 1 and 12 months, and is presented in HH:MM:SS format. You can hover your mouse over a data point in the chart to display a screentip containing the exact value for the data point.

You can choose to display up to eight of the following data elements in any order.

Data Element	Description
Total Processing Time	The total amount of time an agentwas in the Talking, On Hold, Work Ready, and Work Not Ready states.
Total Talk Time	The total amount of time an agent was on incoming ACD calls, beginning when the call is answered until the call is disconnected, including hold time.
Total Hold Time	The total amount of time the agent placed calls on hold, including hold time for transfers and conferences.
Total Work Time	The total amount of time an agent spent in the Work state immediately following an ACD call.
Total Ready Time	The total amount of time an agent was logged in and available to accept ACD calls.
Total Not Ready Time	The total amount of time an agent was logged in but not available to take ACD calls.
Total In Service Time	The total amount of time an agent was either in a Ready state or was handling a call (total talk time plus total after contact work time). Default option for Series 1 in the Settings panel.
Total Login Time	The total time during the period the agent was logged into the ACD. Default option for Series 2 in the Settings panel.

My Schedule Widget

The My Schedule widget displays a summary of an agent's schedule for one day, with the default being today. The widget shows the agent's earliest scheduled activity and up to four more (if they exist). If the schedule has more activities than that, the word "More" appears at the bottom of the widget.

The widget also shows the agent's current adherence (A) and conformance (C) percentages for the day. For information on how the adherence and conformance percentages are calculated, see Real Time Adherence Widget.

If the agent is not scheduled for any activities, My Schedule displays the message, "Nothing Scheduled On This Day".

You can view previous and future schedules one day at a time by clicking backward and forward through the calendar pages.

You can click the Link button in the widget toolbar to open the My Schedule application and view the currently selected day's schedule in full.

The activity start and end times shown are based on the Display Time Zone configured for the agent by the administrator, while the date is based on the WFM server's time zone. If the schedule crosses midnight, the start times for activities before midnight are highlighted. See Time Zone Considerations for more information on time zones.

Agents cannot modify the My Schedule widget. Supervisors can modify the widget by selecting the agent whose schedule is displayed in the widget and renaming the widget as desired.

Real Time Adherence Widget

The Real Time Adherence widget is available to supervisors, schedulers, and administrators only. It displays real time adherence data for selected agents. The data is updated every 30 seconds.

Columns in the widget can be resized by dragging the column header dividers to the left or right. The table rows can be sorted in ascending or descending order by clicking the column header.

You can click the Link button in the widget toolbar to open the Agent Schedules application and view today's schedule in full.

You can choose to display selected agents and up to five of the following data elements in any order.

Data Element	Description
Adherence State	Displays a red dot if the agent is not in adherence, and a green dot if the agent is in adherence.
Schedule Activity	The agent's current scheduled activity. If the agent is not available, the field is blank.
Agent State	The agent's current ACD state.
Adherence %	The percentage of time that agents follow their schedules. When calculating adherence, WFM considers scheduled arrival and departure times, breaks, lunches, and time spent on scheduled activities, and compares the actual activity to the scheduled activity each millisecond through the work shift. Adherence is calculated according to the following formula: [(configured schedule adherence minutes - minutes not in adherence) ÷ configured schedule adherence minutes] × 100 Where "configured schedule adherence minutes" is the sum of time scheduled for activities the administrator has configured in the Application Management application's Calculate Adherence column as "Yes". **Note:** If the formula produces a negative value, the field displays a zero (0).

Data Element	Description
Conformance %	The percentage of time an agent works the right amount of time regardless of the time of day when the agent works. Schedule conformance does not take arrival and departure times into account.
	Schedule conformance is calculated according to the following formula:
	(Total time an agent is in a ready, talk, hold, or work state) ÷ (total scheduled in-service time) × 100
	In service time does not include lunch, breaks, projects, or exceptions.
Reason Code	The reason code associated with the Logged Out and Not Ready state in the Scheduled Activity column.

Service Queue Performance Widget

The Service Queue Performance widget is available to supervisors, schedulers, and administrators only. It displays the real time service level performance (% Service Level) for the selected service queue and optionally the goal (forecasted) service level performance as well. The data is updated every 30 minutes at 15 minutes past the hour and 45 minutes past the hour.

Data can be grouped by day or by interval, for ranges between 8 and 180 days.

The service level percentage is the percentage of actual calls answered for each interval within the service threshold time.

To compare the actual service level performance (%SVL-A) with the forecasted (goal) service level performance (%SVL-G), select Interval from the Group By drop-down list and then select the Goal check box in the Settings panel.

Administrator Tasks

By default, a user's dashboard contains every widget available for their role. Administrators can customize dashboards by role by configuring which widgets appear, how they are named, what information they contain, and how that information is presented.

If users are already logged in when the administrator customizes their dashboard, those users will not see any changes in their dashboard. They will continue to see the default dashboard for their role, or the dashboard they have customized for themselves.

If the administrator customizes a dashboard for a role and then locks it down, users with that role will see the customized dashboard the next time they log in. The locked-down dashboard overrides default and user-defined dashboards, and individual users will no longer be able to change anything in their dashboard.

Configuring the Dashboard by Role

Prerequisite: You must log in using the username and password for the administrator ID.

1. Select a role from the Role drop-down list in the Dashboard toolbar and then click Settings to display the Configure Dashboard Widgets dialog box.

    a. Drag the widgets you want to appear on the dashboard from the Available Widgets list to the Selected Widgets list. To remove widgets from the Selected Widgets list, select them and then click Delete Selected Widgets.

    b. If you want to rename a widget, double-click the widget in the Selected Widgets list and customize its name as desired.

    c. If you want to lock down the dashboard so that users cannot change it, select the Lock Down check box.

2. Click Apply to save your changes and close the Configure Dashboard Widgets dialog box.

3. If desired, rearrange the order in which the widgets appear in the dashboard by dragging them into place. A down arrow appears when you drag the widget to a legitimate position.

    You can also arrange widgets in the Configure Dashboard Widgets dialog box, but it is recommended you arrange them in the dashboard to show you what the users will actually see.

You cannot drag a widget to an empty space.

4. Configure the settings for each individual widget as desired.

Agent, Supervisor, and Scheduler Tasks

The content of your dashboard depends on if the dashboard is unlocked, or if the administrator has configured the dashboard for your highest role and then locked it down.

Managing Your Unlocked Dashboard

If the administrator has not locked your dashboard, you are free to customize it as you desire. The changes you make override the default dashboard or the customized dashboard your administrator has configured for your role. Your customized dashboard will persist in future login sessions unless your administrator configures and then locks a dashboard for your role.

With an unlocked dashboard, you can do the following:

- Rearrange the widgets on your dashboard. Click and hold the widget toolbar and drag the widget to a new location. A downward-pointing arrow appears when the widget is dragged to a legitimate location.

- Add or delete widgets from your dashboard. Click Settings on the dash-board toolbar to open the Configure Dashboard Widgets dialog box, To add widgets, drag them from the Available Widgets list to the Selected Widgets list. To delete widgets, select them in the Selected Widgets list and click Delete Selected Widgets.

- Rename widgets. In the Configure Dashboard Widgets dialog box, double-click the widget you want to rename, type the new name in the Rename Widget dialog box, and click Apply.

- Configure the content and appearance of widgets. Click Widget Con-figuration in the widget toolbar and set up the data and type of chart you want to see displayed in the widget. See Widget Settings for more inform-ation on what you can configure for individual widgets.

Managing Your Locked Dashboard

If the administrator has locked your dashboard, you can no longer change most features. The dashboard Settings icon is disabled.

When the dashboard is locked, you cannot do the following:

- Add or remove widgets from the dashboard

- Reposition widgets in the dashboard

- Rename widgets

- Configure individual widgets to change the data and type of chart displayed

Some users, depending on their role, are still able to select agents and services in certain widgets. In these widgets the Widget Configuration icon is present in the toolbar.

> **Example**: A supervisor can select an agent in the Agent Call Volumes widget. However, all other elements of the widget are locked down and cannot be changed.

If the widget does not include selections for agent or service, the Widget Configuration icon is disabled in the widget toolbar.

Application Management

The Application Management application is used by administrators to configure product features. If users have access to more than one product, all configurable features for the products are available through this application. Products must be running for the associated configurable features to be available.

Alerts

WFM generates alerts to let you know the status of requests you run. The Alerts bubble at the upper right corner of the window contains a number that shows how many unread alerts are available for viewing.
When you hover your mouse over the Alerts bubble, the Alerts List is displayed.
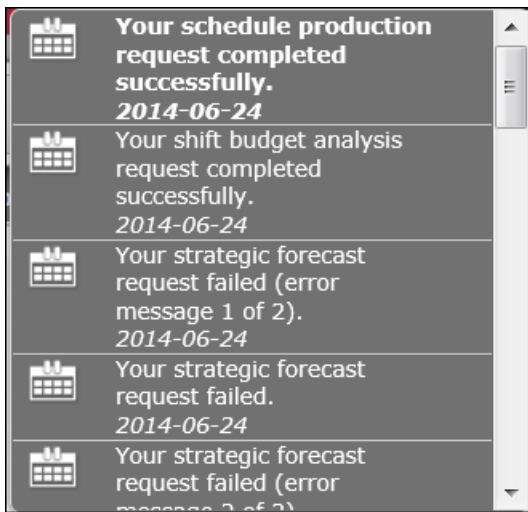

Click any of the listed alerts to display a popup containing a more detailed explanation of the alert.
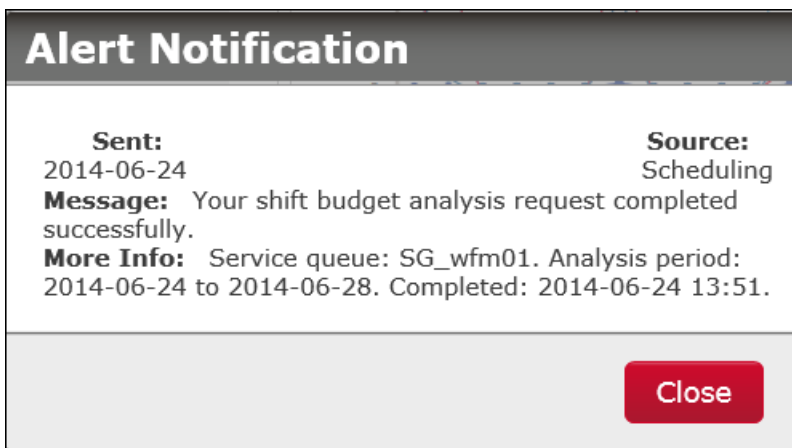

When you click Close, the popup closes and the number displayed in the Alerts bubble is reduced by one. The only way to remove items from the Alerts List is to hover over an alert and then click the X in the upper right hand corner, one by one. The Alerts List will otherwise keep accumulating alerts.

Long View Navigation

The navigation pane at the left of any Application Management page is called the "long view".
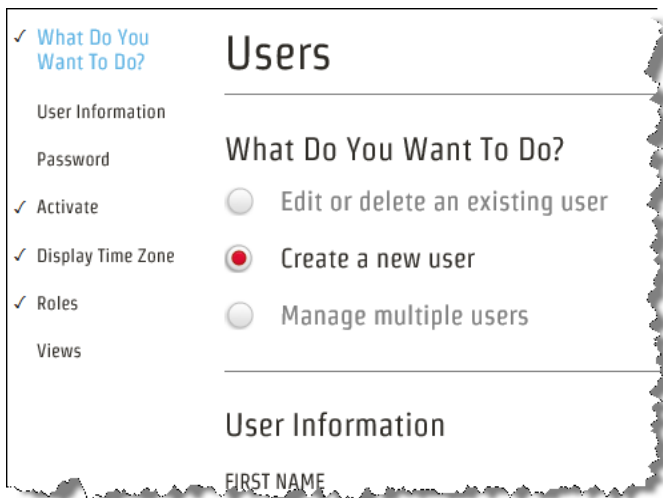

Use the long view to help you move up and down on the page. A navigation link in the long view will turn bold blue when you select it, and that section of the page will jump to the top of the window.

Check marks next to each navigation link tell you if a section of the page has been completed or not. When all links are checked, you have provided all the information necessary to configure that record.

Synchronizing with the ACD

WFM can synchronize data with some ACDs (for example, Cisco Unified Contact Center Enterprise and Cisco Unified Contact Center Express). The Sync Service automatically extracts the following information from the ACD and loads it into WFM:

- Agents
- Main teams

- Relationships between agents and main teams
- Service queues

Once this information is extracted to WFM, you can then configure WFM to generate forecasts and schedules for service queues.

Note: Any teams, agents, relationships, or service queues you create in WFM are not synced back to the ACD. They are maintained only in WFM.

Synchronizing Agent Data

WFM assumes that every user imported from the ACD to WFM is an agent. As a result, it creates a user record and an agent record for each synced user and then links the two together.

Before you activate an agent in WFM, ensure that the user actually is an agent and not a supervisor or scheduler.

If the user is not an agent, you must create a new non-agent user manually in WFM and assign the appropriate role and view to that user.

When user data is changed in the ACD, the Sync service detects it and makes changes in WFM. The following table summarizes these changes.

Change in the ACD	Resulting Change in WFM
New agent is added	New agent is added. Specifically: • Applies the ACD agent first and last name to the WFM agent first and last name. • Applies the ACD login ID to the WFM Employee ID and ACD ID. You can change the Employee ID but not the ACD ID. Changing the Employee ID has no effect on the ACD login ID. • Sets the WFM start dates for the company and department to the current date. • Assigns the corresponding team to the agent as the agent's main team. • Assigns the agent to the NewAgents team and the default team, if there is one. New user is added. Specifically: • Applies the ACD agent first and last name to the WFM user first and last name. • Creates a link between the user and the agent. • Sets the status of the user to inactive.
Agent first or last name is changed	Agent first or last name is changed.
Agent is deleted	Agent and user status remain set to active.

Synchronizing Team Data

When team data is changed in the ACD, the Sync service detects it and makes changes in WFM. The following table summarizes these changes.

Change in the ACD	Resulting Change in WFM
New team is added	New team is added with the same name Makes any agent who is a member of the team in the ACD a member of the team in WFM, and designates the team as the agent's main team
Team name is changed	Team name is changed
New agent is added to the team	New agent is added to the team, and the team is designated as that agent's main team
Team is changed	No change
Agent is removed from a team	No change

You can create teams in WFM and assign agents to these teams, but these new teams are not synchronized with the ACD.

In the ACD, an agent can belong to only one team. In WFM, an agent can belong to multiple teams. Assigning an agent to a team in WFM has no effect on the agent's team assignment in the ACD.

Synchronizing Service Queue Data

When service queue data is changed in the ACD, the Sync service detects it and makes changes in WFM. The following table summarizes these changes.

Change in the ACD	Resulting Change in WFM
New service queue is added	New service queue is added. Specifically: • Applies the ACD service queue name to the WFM service queue description • Applies the ACD service queue ID to the WFM service queue ID • The new service queue has a service queue type of Interactive/Voice New skill mapping is added. Specifically: • Applies the ACD service queue name to the WFM skill mapping name • Applies the ACD service queue ID to the WFM skill mapping number Creates a one-to-one mapping between the ACD skill mapping and the WFM skill mapping
Service queue name is changed	• Applies the new ACD service queue name to the WFM service queue description (name) • Applies the new ACD service queue name to the WFM skill mapping name
Service queue is deleted	No change

Activities

The pages in this section of Application Management enable you to set up and manage exceptions and projects.

The pages are:

- [Exceptions](#)
- [Exception Types](#)
- [Projects](#)

Exceptions

Exceptions are activities that take agents away from being in service. Examples of exceptions are meetings, training, and time off.

Exceptions are assigned in any of three ways:

- Requested by agents via an Exception Request for either past and future dates. This type of exception must be approved by the agent's supervisor before it is applied to the schedule.

- Assigned to agents before a schedule is run by a supervisor or scheduler. When generating a schedule, WFM applies the exception to the agent's schedule and moves breaks to accommodate it. WFM also attempts to schedule another agent to work on that date to ensure that requirements are covered for the service queue.

- Assigned to agents after a schedule is run by a supervisor or scheduler using the Agent Schedules page. Assigning exceptions post-production ensures that the schedule accurately reflects current conditions, and that a history of exceptions is saved.

A list of agents assigned a specific exception can be generated by the Reports application (Assigned Exceptions report).

When an exception is applied to a schedule, WFM applies the exception to conform to these rules:

- An exception must appear within the agent's work shift available hours. The excess time will not appear in the agent's schedule.

- The maximum length of the exception is adjusted to the maximum availability of the agent if the duration of the exception is greater than the agent's availability.

- An exception is applied on the dates and times specified unless it occurs on a day the agent has no work shift.

- The length of an exception that is shorter than the maximum number of work hours is deducted from the maximum number of work hours for the work shift. For example, if the work shift is a maximum of 8 hours and the exception for that day is 4 hours, the agent is scheduled for a maximum of 4 hours.

Managing Exceptions

The Exceptions page (Application Management > Exceptions) allows you to create, edit, delete, and assign exceptions.

Best Practices: It is recommended that you do not delete exceptions that are no longer used if they were previously assigned to agents. If they are deleted, the historical data associated with them will be lost. Deactivate the exceptions instead.

The fields on the page when you create, edit, or delete an exception are described below.

Field	Description
Exception Information	Enter a unique name for the exception. Maximum length is 50 characters.
Activate	Select the check box to activate the exception and make it available for use. If you clear the check box, the exception will no longer be available for use.
Paid	Select the check box if the activity is a paid activity. This setting can be overridden when the exception is assigned to an agent.
Hyperlink URL	If the agent should visit a web page to perform the exception activity, enter the URL of that web page here. You must use the full URL (including http, https, and www as needed). The URL appears in the exception in My Schedule.
Text to Display	Enter optional text that will appear as a hyperlink in the exception instead of the URL.
Color	Select a color to represent this exception in the schedule.
Agents Assigned to This Exception	To view a list of agents who have been assigned this exception, run the Assigned Exception report from the Reporting application.

The fields on the page when you assign an exception to agents are described below.

Field	Description
Exception	Select the exception you want to assign from the drop-down list.
This exception is a paid activity	By default this check box shows the paid status assigned to the exception. You can select or clear the check box to override that setting when assigning the exception.
Agents	Select the agents you want to assign the exception to. By default the available pane shows all agents; you can filter the agents by clicking the Show All button and selecting a team.
Dates	Enter the start date and end date of the exception activity. You can also enter a start date and then specify a number of occurrences for a recurring activity. If you enter a number of occurrences, the End Date field is disabled.
Duration	Enter a start and end time for the activity, or choose Entire Day. WFM automatically calculates the length of time and shows it in the Hours field.
Frequency	Choose the frequency of the activity—day, week, month, or year.
Occurrence	Depending on your choice of frequency, this displays the options you can choose to set the daily, weekly, monthly, or yearly occurrence.

The following examples demonstrate how you can set the frequency and occurrence of daily, weekly, monthly, and yearly exceptions.

Example 1: To assign an exception that occurs only once, use these settings: Start Date and End Date— the same date; Frequency—Day; Daily Occurrence—Every 1 days.

Example 2: To assign an exception that occurs once a week on Monday for 10 weeks, use these settings: Start Date—date of the first Monday in the series; Number of Occurrences—10; Frequency—Week; Weekly Occurrence—Every 1 weeks, and then select Monday from On These Days. Selected days are blue, non-selected days are white.

Example 3: To assign an exception that occurs once a month on the second Monday for 12 months, use these settings: Start Date—date of the first Monday in the series; Number of Occurrences—12; Frequency—Month; Monthly Occurrence—select the second option and complete the statement "The second Monday of every 1 months."

Example 4: To assign an exception that occurs once a year on January 15 for 5 years, use these settings: Start Date—the first January 15 in the series; Number of Occurrences—5; Frequency—Year; Yearly Occurrence—select the first option and complete the statement "Every January on this date: 15".

Exception Types

An exception type is a generic or high-level exception that agents select when requesting an exception.

If you think your agents will select an appropriate exception type when requesting time off, you can create exception types that are less generic. If you think your agents will not select an appropriate exception type, you can create a small number of very broad exception types and ask agents to include a descriptive comment when they request time off.

Example: An agent has a doctor's appointment, so when requesting time off, she selects the exception type "Sick Leave" and then types a comment indicating that the request is for a doctor's appointment. This exception type serves as a placeholder until the agent's supervisor approves the request. When approving the request, the supervisor enters the specific exception "Doctor's Appointment".

Managing Exception Types

Use the Exception Types page (Application Management > Exception Types) to create, edit, and delete exception types.

The fields on the page are described below.

Field	Description
Exception Type Name	Enter a unique exception type name. Maximum length is 50 characters.

Projects

A project is an activity that prevents agents from responding to contacts. Projects are generally assigned to optimize the use of agent idle time when contact volume is low. These activities occur each work shift and can be assigned for one or more days per week.

WFM examines the coverage for every interval and schedules a project for a time when it has the least impact on coverage. If an agent is assigned multiple projects, WFM also looks at the priority assigned to each project and schedules the project with the highest priority first.

Example: You designate some of your agents to work on two projects and assign a priority to each project. If WFM generates the schedules for the two projects and discovers there are not enough agents to support all forecast requirements across both projects, it compares the priority value for the two projects. WFM then schedules agents for the project with the highest priority first.

Managing Projects

Use the Projects page (Application Management > Projects) to create, edit, and delete projects.

Best Practices: It is recommended that you do not delete projects. If you delete a project, all the historical data associated with it is lost.

Note: You cannot delete a project if it is currently scheduled.

The fields on the page are described below.

Field	Description
Project Name	Enter a unique project name.
Priority	Enter a number from 0 to 9 to describe the project priority, with 0 being the highest priority.
Hyperlink URL	If the agent should visit a web page to perform the project, enter the URL of that web page here. You must use the full URL (including **http**, **https**, and **www** as needed). The URL appears in the project activity in My Schedule.
Text to Display	Enter optional text that will appear as a hyperlink in the project activity instead of the URL.
Paid	Select the check box if this project is a paid activity.
Activate	Select this check box to activate the project. A project cannot be scheduled until it is activated.
Start Date/End Date	Enter the start and end dates of the period agents can be scheduled to work on the project.
Start Time/End Time	Enter the start and end times of the period during which agents can be scheduled to work on the project.
Schedule Increment	Enter the schedule increment that determines the intervals in which the project can start. For example, if you choose an increment of 15 minutes and the start time is 08:00, then agents could start working on a project at 08:00, 08:15, 08:30, and so on.
Days Agents Can Work on the Project	Click the days on the bar to indicate which days of the week agents can be scheduled to work on the project. Selected days are blue. By default, every day of the week is selected.
Minimum Duration	Enter the minimum length of time that agents can be scheduled to work on the project. This value can not be less than the Duration Unit, and must be a multiple of the Duration Unit.

Field	Description
Maximum Duration	Enter the maximum length of time that agents can be scheduled to work on the project. This value must be a multiple of the Duration Unit and must be at least the same as the Minimum Duration.
Duration Unit	Enter the basic block of time that agents are scheduled to work on the project. For example, if the duration unit is 30 minutes and an agent is scheduled to work on the project for 60 minutes during the work shift, that time could be two sequential duration units that totals 60 minutes, or one 30-minute duration unit in the morning and another 30-minute duration unit in the afternoon.
Limit the total number of hours spent on this project per week	Select the check box if you want to limit the total number of hours spent on the project per week. When the check box is selected the Maximum Hours per Week option appears.
Maximum Hours per Week	Enter the maximum number of hours per week an agent can work on this project, and select one of two options to indicate if the agent can work multiple days per week or only one day per week on the project.
Agents	Select the agents who are to work on the project.
Color	Select a color to represent this project in the schedule.

Historical Data

The pages in this section of Application Management enable you to capture, merge, and edit historical data.

The pages are:

- View and Edit Historical Data
- Capture Historical Data
- Historical Data Merge Request
- Forecast Accuracy Compilation Request

View and Edit Historical Data

WFM requires historical data to generate distributions, forecasts, and schedules and to calculate statistics. The more accurate the historical data is, the more accurate forecasts and schedules will be. However, sometimes historical data for a service queue is incomplete, inaccurate, or missing entirely. When this happens, you can enter the missing data manually or edit existing inaccurate data using the View and Edit Historical Data page.

Reasons you might want to edit or enter historical data include the following:

- To correct data that is inaccurate due to system or network issues

- To adjust data that is unusual due to an infrequent event, such as a marketing campaign

- To input missing data when contact volume is normal but no data was captured because the system or network was down

- To create data when historical data is either unavailable or missing, such as when you first install WFM

- To support forecasting and scheduling for non-interactive service queues (such as those that handle email and social media)

> **Note**: The Generic Interface Services (GIS) API can also be used to add historical data from any ACD to the WFM database. The GIS API is part of WFM and requires no separate installation or executable to function. See the *GIS API Reference Guide* for more information.

Viewing and Editing Your Historical Data

Use the View and Edit Historical Data page (Application Management > View and Edit Historical Data) to display the historical data for a specific service queue and date.

Once you have completed the historical data parameters a table is displayed with the requested data, if any exists. If none exists for a service queue, you can enter data for that service queue and a specific day at the Interval zoom level.

You can copy and paste data in the table using standard Windows shortcut keys.

- Click and drag with your mouse to select specific rows and columns in the table, or Ctrl + A to select the entire table.

- Use Ctrl + C to copy the selected cells to the clipboard in TSV (tab separated value) format. This action copies both editable and read-only columns.

- Use Ctrl + V to paste the contents of the clipboard into table cells. The data you are pasting can be in TSV or CSV format. You can paste into a specifically chosen group of cells, or just select the cell that becomes the upper left corner of your pasted data. The data is pasted into the selected cells, unless the selected column is read-only. You cannot paste copied data into read-only columns. If the copied data is too big to fit into the selected paste area, paste expands the selection to the size of the data on the clipboard. For example, if you select a 2 × 2 area but the data on the clipboard is 3 × 3, then it will paste 3 × 3. The pasted data is highlighted in the table.

The fields on the View and Edit Historical Data page are described below.

Field	Description
Service Queue	Select the service queue whose data you want to view and/or edit.
Zoom Level	Select the level of detail you want to use to view the data. Your choices are: - I (by interval) - D (by day) - W (by week) - M (by month) - Y (by year) Data can be edited only at the Interval zoom level.
Date	Appears only when the Interval zoom level is selected. Enter the date whose data you want to view or edit.
Start Date/End Date	Appears only when the Day, Week, Month, or Year zoom level is selected. Enter the start and end date of the period whose data you want to view.

The fields in the historical data table are described below. The table shows the definition of the field for both interactive service queues and non-interactive service queues.

For more information on interactive and non-interactive service queues, see [Service Queue Types](#).

Field	Description
Contacts Handled	The number of ACD calls/contacts the agents completed during the interval.
Contacts Abandoned	The number of ACD calls routed to the service queue during the interval that were abandoned (the caller hung up while in queue or while ringing at the agent's phone). Calls are counted for the interval when the caller hangs up.
Contacts Answered	The number of ACD calls/contacts answered in the service queue during the interval. Calls are counted in the interval in which the agent answered them.
Total Answer Time	The amount of time that all calls/contacts were in the queue and answered in the interval.
Average Talk Time	Interactive service queues: The average amount of time spent talking and on hold for all calls handled in the interval. Non-interactive service queues: The average amount of time spent working on each contact for all contacts handled in the interval.
Average Work Time	Average amount of after contact work for each contact for all contacts handled in the interval.
Service Level Percentage	The percentage of contacts that met the service level objective for the interval.

Capture Historical Data

Capturing historical data from your ACD might become necessary in certain circumstances. These include:

- You want to import historical data from your ACD for the period before you installed WFM.

- You want to fill in gaps in your historical data that occurred because of interruptions in the connection to your ACD after you installed WFM.

> **Note**: This feature is not available forACDs that are classed as "generic" during WFM installation.

Capturing Historical Data

Use the Capture Historical Data page (Application Management > Capture Historical Data) to run a request to capture historical data from your ACD and import it to WFM.

> **Best Practices**: Capturing data from the ACD can put a large load on the system. We recommend that if you are requesting a large amount of data, you run this request when the contact center is closed or during a quiet period.

The fields on the Capture Historical Data page are described below.

Field	Description
Start Date	Select the start date of the data you want to capture. The default value is the current date.
Start Time	Select the start time of the data you want to capture. The default value is the beginning of the current half-hour interval you are in.
End Date	Select the end date of the data you want to capture. The default value is the current date.
End Time	Select the end time of the data you want to capture. The default value is the end of the current half-hour interval you are in.

Historical Data Merge Request

Virtual service queues are composed of multiple service queues. Often those service queues were in existence before the virtual service queue was created,

and as a result there is historical data associated with each of them for that prior period. To build historical data for the virtual service queue, the historical data of each of its component service queues must be merged into the virtual service queue. The Historical Data Merge Request enables you to do this.

The historical data for the individual service queues is preserved, so if you delete a service queue from the virtual service queue, it is still available for use.

Generating a Historical Data Merge Request

To generate a historical data merge request (Application Management > Historical Data Merge Request), follow these steps:

1. Enter a start date and end date for the period of historical data you want to merge.

2. Select the virtual service queue.

3. Schedule the request. By default the request runs immediately.

Forecast Accuracy Compilation Request

Forecast accuracy is the ratio of the forecasted contact volume to the actual contact volume. The Forecast Accuracy Compilation request calculates this ratio for one or more service queues based on historical data. It cannot tell you how accurate a forecast will be in the future, it can only evaluate the accuracy of forecasts in the past.

> **Example**: If the forecast precision level percentage for a service queue is 105%, it means that the forecasted contact volume was 5% greater than the actual contact volume.

The value calculated by this request is displayed on the Service Queues page in the Forecast Precision Level Percentage section.

Generating a Forecast Accuracy Compilation Request

To generate a forecast accuracy compilation request (Application Management > Forecast Accuracy Compilation Request), follow these steps:

1. Enter a start date and end date for the period whose forecast accuracy you want to calculate.

2. Select one or more service queues. Each service queue must have forecasts generated for them for the selected date range.

3. Schedule the request. By default the request runs immediately.

People

The pages in this section of Application Management enable you to configure users, agents, team, and views to set up agent access to WFM.

The pages are:

- Users

- Agents

- Teams

- Views

Users

A user is someone who has a role within WFM. In systems that do not sync with an ACD, users are created, edited, and deleted from within WFM.

In systems that sync with an ACD, users are created and managed in the ACD, although you can still create users in WFM. When users are synced from the ACD, both a user record and an agent record are created and the user record is automatically linked to the corresponding agent record. You cannot change these settings.

> **Note**: In synced systems, users created in WFM are not synced back to the ACD.

A user must have at least one role within WFM. The roles you can assign are agent, supervisor, and scheduler. There is no assignable administrator role, there is only the built-in system administrator. For more information on the administrator role, see About the Administrator Role.

Managing Users

Use the Users page (Application Management > Users) to create, edit, and delete users. You can edit and delete users one at a time or many at a time.

If you choose to manage multiple users, you can perform three different actions:

- Activate or deactivate them
- Assign roles to them
- Delete them

Note: It is recommended that in synced systems you create users in the ACD. You can create a user in WFM, but that user cannot be an agent (you cannot link the user record to an agent record), only a supervisor or scheduler.

Note: In synced systems, if you want to delete a user record, you must delete it first in the ACD and then in WFM. The Sync service does not delete users from WFM when they are deleted in the ACD, so it must be done manually.

Best Practices: It is recommended that you do not delete users from WFM. If they are deleted, then you lose the link between the agent record and the user record.

The fields on the Users page are described below.

Field	Description
First Name	The user's first name.
Last Name	The user's last name.
Username	The WFM user name. In an Active Directory environment, this is the user's AD username and cannot be edited.

Field	Description
Password/Confirm Password	Create or reset the user's password here. In an Active Directory environment, these fields are not displayed because the user's Active Directory password is used. The password is administered in AD.
Activate this user	Select this check box to activate the user. The user cannot log in until the user account is activated.
Creation Date	(Read only) The date the user record was created.
Deactivation Date	(Read only) The date the user record was deactivated. As long as a record is activated, this field is not visible. When visible, it displays the date of the most recent deactivation.
Display Time Zone	Select the time zone the user's schedules are displayed in. By default this is the time zone configured on the Global Settings page.
Roles	Select one or more role for this user. In a synced system, the user is automatically assigned the agent role. **Note**: If a user is an active agent and is then assigned an additional role (for example, is promoted to supervisor), and that user is no longer required to work as an agent, you should deactivate the user's agent record and also unassign the user's agent role. Otherwise WFM might not function correctly.
Link this user to an agent/Select Agent	Select the check box and then select an agent from the Select Agent drop-down list. In synced systems, the check box is selected and read only, and the agent created at the same time as the user record is linked to the record. **Note**: In a synced system, this check box and field are not visible if you are creating a user within WFM.

Field	Description
Views	Select the views for the user. You must select at least one view, and one of the selected views must be designated as the Main View. The Main View designation affects the access the user has. If a view is designated as a user's Main View, then that user has read-write access to schedules in the Agent Schedules application. Also, if an agent's Main Team is part of a supervisor's Main View, then the supervisor has access to that agent's requests in the Messaging application.
Action	If you choose to manage multiple users, the Action section appears. Select the action you want to take from the Action drop-down field and then select the desired users in the selection pane.

Agents

In a synced system, agents are automatically created when the ACD is synced to WFM. You can also create non-ACD agents in a synced system.

Best Practices: Do not edit the First Name, Last Name, or ACD ID of a synced ACD agent in WFM. Those changes should always take place in the ACD. Also, any non-ACD agents you create should be assigned an ACD ID that is unique and that does not have the potential to be a duplicate of an ACD ID created by the ACD.

In a non-synced system, you can create, edit, and delete agents without restriction. However, the agents you create in WFM must have the same names and IDs as are set up for them in your ACD. This enables WFM to associate the historical data imported from the ACD into WFM with the correct agent.

Managing Agents

Use the Agents page (Application Management > Agents) to create, edit, and delete ACD and non-ACD agents.

Note: An agent must be inactive before the agent can be deleted.

> **Best Practices**: It is recommended that you do not delete agents. If you delete an agent, all the historical data associated with the agent and all the agent's schedules are lost.

The fields on the Agents page are described below.

Field	Description
First Name	The agent's first name. In synced systems, this value comes from the ACD.
Last Name	The agent's last name. In synced systems, this value comes from the ACD.
Employee ID	The agent's ID within WFM. This value must be unique.
User Name	(Read only) The agent's WFM user name as configured on the Users record linked to this agent record. In an Active Directory system, this is the agent's AD username.
ACD ID	The agent's ID as assigned in the ACD. This number is used to connect synced agent records between the ACD and WFM, and WFM uses this number to identify the agent. In synced systems this value comes from the ACD and should not be changed. In a non-synced system, if the agent is an ACD agent, enter the agent's ID as assigned in the ACD. If the agent is not an ACD agent, enter a unique number in a range that will never conflict with any ID assigned to an ACD agent.
Company Start Date	Enter the date the agent started employment with the company. WFM uses this value to define scheduling priorities. The agent will not be scheduled before this date.
Company End Date	(Optional) Enter the date the agent will end employment with the company. The agent will not be scheduled after this date. Use this field when you know the agent's termination date.
Department Start Date	Enter the date the agent started working in the contact center. WFM uses this value to define scheduling priorities.

Field	Description
Rank	(Optional) Enter a whole number from 0 to 99999 to rank agents based on their seniority and expertise. WFM uses this value to define scheduling priorities. The exact meaning of rank depends on the service that your contact center provides. If you do not enter a rank, WFM treats it as 99999. **Note**: In version 9.2 and earlier, alphanumeric values were accepted in this field. Any existing rankings that are alphanumeric will be lost when WFM is upgraded to version 9.3 or newer.
Activate this agent	Select this check box to activate the agent in WFM. Agents must be activated in order to be scheduled.
Teams	Assign the agent to one or more teams, and designate one team as the agent's Main Team. The Main Team determines which statistics and messages the agents sees on the dashboard. By default the agent is assigned to the NewAgents team.
Skill Mappings	Assign the agent to one or more skill mappings. The skill mappings you choose determine which service queues the agent can be scheduled for. Both the agent and the service queue must be assigned to the same skill mapping in order for the agent to be scheduled for that service queue. **Note**: Skill mappings are not used if the agent is assigned to a multiskill group.

Field	Description
Work Shifts	Assign work shift rotations to the agent. When creating a work shift rotation, the first work shift moved to the Assigned pane is dated with the start date of the current week. Every subsequent work shift assigned is dated with the next week's date. There can be no gap in weeks from one work shift to the next. An agent's dynamic scheduling work shifts are ignored by WFM when doing work shift rotations. **Note**: If automatic work shift rotation is not enabled when running a schedule, there must be a work shift configured for the specific week of the schedule in order for this agent to be scheduled. Use the up and down arrows to reorder the work shifts in the rotation. The work shifts move up and down by half steps—one click up and the selected work shift is concurrent with the work shift above, becoming a split shift. Click again and the work shift moves to the week before the work shift above, and assumes that work shift's date; and all work shifts below redate themselves accordingly. The same goes for using the down arrow. See this example of work shift rotations for more information. **Note**: If the agent has completed dynamic scheduling for a specific week, the dynamic scheduling work shift is used for that week instead of these assigned/rotated work shifts.
Copy Work Shift Rotations	You can copy this agent's work shift rotation to one or more selected agents. This will replace those agents' previous work shift rotations. You must first save this agent record before you can perform the copy.

Field	Description
Assigned Exceptions	This table displays all exceptions assigned to the agent. By default the table is sorted by date in descending order, so the most current date is at the top. The table can be sorted on any column. You can delete exceptions from the table by selecting the check box next to the exception and clicking Delete. The Delete button is not enabled until at least one exception is selected. **Note**: Deleting an assigned exception here will not delete that exception from an agent's schedule that has already been generated.
Vacation Hours	This table displays the agent's current vacation hours status. The Hours Earned comes from the vacation plan assigned to the agent, or, if HRMS integration is enabled, from the HRMS. The Hours Used and Hours Approved But Not Yet Taken are calculated from the exceptions mapped to the vacation types that have been used and approved for the agent. The Hours Remaining is calculated by subtracting the Hours Used and Hours Approved But Not Yet Taken from the Hours Earned.

Example: Work Shift Rotation

The following table shows what happens when you move work shifts up and down in the Work Shifts section's Assigned pane on the Agents page.

Action	Effect on Shift Rotation	Comment
Select Shift 3	Week A | Shift 1 Week B | Shift 2 **Week C | Shift 3** Week D | Shift 4	

Action	Effect on Shift Rotation	Comment
Click Up	Week A | Shift 1 Week B | Shift 2 **Week B | Shift 3** Week C | Shift 4	Shifts 2 and 3 are now split shifts for Week B
Click Up	Week A | Shift 1 **Week B | Shift 3** Week C | Shift 3 Week D | Shift 4	Week B no longer has a split shift
Click Up	**Week A | Shift 3** Week A | Shift 1 Week B | Shift 2 Week C | Shift 4	Shifts 3 and 1 are now split shifts for Week A
Click Up	**Week A | Shift 3** Week B | Shift 1 Week C | Shift 2 Week D | Shift 4	Shift 3 is now first in the rotation and all other shifts have moved down one week

Note: A split work shift is a situation where an agent works two different shifts during the same day. Before you split a work shift, you must create two work shifts that start and end at different times or days, and that do not overlap.

Example: If an agent works four hours in the morning and four hours in the evening, you must create one work shift that covers the morning hours and another work shift that covers the evening hours.

Teams

In a synced system, some teams are created in the ACD and synced to WFM. If a team has agents assigned to it in the ACD, then in WFM, those agents have the team listed as their Main Team. For these teams, you cannot change the team name, the agents assigned to the team, or the team's status as those agents' Main Team.

However, you can create and manage teams in WFM. These teams are not synced back to the ACD.

In a non-synced system, you can create and manage teams as desired.

Managing Teams

Use the Teams page (Application Management > Teams) to create, edit, and delete teams.

> **Best Practices**: It is recommended that you do not delete teams. If you delete a team, all the historical data associated with the team is lost.

The fields on the Teams page are described below.

Field	Description
Team Name	Enter a unique name for the team. Synced team names are read only.
Agents	Assign the desired agents to the team, and for each agent, if this is that agent's Main Team, select the Main Team check box. If this is the Main Team for all selected agents, you can select the check box next to the column header to select every check box in the list. In a synced system, you cannot change the list of agents assigned to the synced team.
Include this team in productivity reports	Select this check box if you want this team's statistics to be included when the Capture service compiles all daily, weekly, monthly, and yearly productivity statistics.

Views

A view controls the scope of access a user has in WFM. A user assigned to a view has access only to the entities (teams, service queues, service queue groups, multiskill groups, skill mappings, work conditions, work shifts, exceptions, and projects) assigned to that view according to the privileges of their role.

A WFM entity can be included in multiple views, and a user can be assigned to multiple views.

The WFM system view is called EnterpriseView. This view cannot be renamed or deleted. You can use this as your primary view or create new views to suit your needs.

Managing Views

Use the Views page (Application Management > Views) to create, edit, and delete views.

The fields on the Views page are described below.

Field	Description
View Name	Enter a unique name for the view. **Note**: EnterpriseView is a system view and cannot be renamed or deleted.
Activate this view	Select this check box to activate the view. A view cannot be used unless it is activated.
Users	Select the users to assign to the view.
Teams	Select the teams to assign to the view.
Multiskill Groups	Select the multiskill groups to assign to the view.
Service Queues	Select the service queues to assign to the view.
Service Queue Groups	Select the service queue groups to assign to the view.

Field	Description
Skill Mappings	Select the skill mappings to assign to the view.
Work Conditions	Select the work conditions to assign to the view.
Work Shifts	Select the work shifts to assign to the view.
Exceptions	Select the exceptions to assign to the view.
Projects	Select the projects to assign to the view.
Work Rule Sets	Select the work rules to assign to the view.
Dynamic Scheduling Events	Select the dynamic scheduling events to assign to the view.

Schedules

The pages in this section of Application Management enable you to set up all the elements required to generate a schedule.

The pages are:

- Work Shifts
- Work Conditions
- Special Events
- Shift Budget Analysis Request
- Shrinkage
- Copy Schedule Activities
- Dynamic Scheduling Work Rules
- Dynamic Scheduling Associations
- Dynamic Scheduling Events

Work Shifts

WFM allows you to create work shifts that match agents' availability, preferred days off, start time, and length of work day. A work shift identifies the hours and days when an agent can work. You can create a work shift for one or more

agents. WFM will then schedule agents to best match their work shift preferences and business requirements. There is no limit to the number of work shifts you can create, and WFM retains the previous schedule history for each agent in the WFM database.

When configuring a work shift you need to determine what type of work shift it is. You can assign agents and work conditions to a work shift for specific weeks. WFM allows you to manage the following work shift types.

- Fixed work shift

- Assignment work shift

- Variable work shift

You can create multiple work shifts and then assign them to an agent's work shift rotation. If you use work shift rotations (an agent works different shifts over several weeks) you must define the shift and rotation sequence. See Managing Agents and Example: Work Shift Rotation for more information.

If an agent creates a dynamic schedule that falls within a work shift rotation, the dynamic schedule overrides the rotation for that week. The rotation resumes after the dynamic schedule.

For example, if an agent has a work shift rotation of three work shifts, but creates a dynamic schedule that falls on the second week of a rotation, that dynamic schedule overrides the work shift rotation for the second week. The rotation resumes for the third week, and the next rotation resumes the normal three-week rotation.

Rotation 1	Rotation 2 with Dynamic Schedule Added	Rotation 3
Work Shift 1	Work Shift 1	Work Shift 1
Work Shift 2	Dynamic Schedule	Work Shift 2
Work Shift 3	Work Shift 3	Work Shift 3

Note: If a work shift is deleted, the agent's work shift assignment is also deleted. Subsequent agent work shift assignments will not be

automatically adjusted to be adjacent to earlier assigned work shift dates. This can result in weeks where the agent has no work shift assigned.

Agents can trade work shifts. These trades must be approved by supervisors, schedulers, or administrators.

Supervisors, schedulers, and administrators can also perform ad hoc schedule trades based on business requirements and the needs of the contact center.

Fixed Work Shifts

A fixed work shift is a work shift that covers requirements for fixed hours and days and never varies. Use this type of work shift to schedule agents to support requirements for entire days or weeks.

A fixed work shift has the following characteristics:

- Work days during the week are fixed
- Hours worked each day are fixed, but do not have to be the same for each day
- The shift start time each day is fixed, but does not have to be the same for each day
- The number of hours per week specified for the work shift (Hours per Week) must equal the total number of hours scheduled for the days of the week in the work shift (Total Hours)

If you assign a fixed work shift to an agent, the agent's schedule never changes. If you assign fixed work shifts to all agents, you cannot optimize schedules to ensure adequate coverage at all times.

Assignment Work Shifts

An assignment work shift is a type of fixed work shift that does not cover requirements. Use an assignment work shift to schedule agents for out of service activities such as projects for entire days or weeks.

Variable Work Shifts

A variable work shift is a work shift that covers requirements for variable hours and days. Use this type of work shift to schedule agents to support a service

queue for variable days and weeks. In contrast to a fixed work shift, a variable work shift offers flexibility in at least one of the following ways:

- You can assign one or more days a week as an optional work day.

- You can assign the total work hours for one or more days per week as variable.

- You can assign the arrival time for one or more days a week as variable.

One or more of the following characteristics are different in a variable work shift:

Minimum and Maximum Days per Week and Hours per Week

With a variable work shift, you might want to limit the maximum number of days and hours per week to limit overtime and guarantee a reasonably rested employee. You might also need to commit a minimum number of hours per day and days per week for the agent. You specify the minimum and maximum number of days per week and hours per week for the work shift. Then you specify the minimum and maximum number of hours for each day of the week that the agent can work for the day. You might also specify the days of the week that are potential days off for the agent.

Earliest and Latest Start Times

Determine the earliest time you might want the agent to start work and when the agent can start work. Once you know the earliest and latest possible start times, you configure the earliest and latest start times for an agent in WFM for each day in a work shift.

Managing Work Shifts

The Work Shifts page (Application Management > Work Shifts) allows you to create, edit, delete, and assign work shifts. You can also view assigned work shifts.

The fields on the page when you create, edit, or delete a work shift are described below.

Field	Description
Work Shift Name	Enter a unique name for the work shift.

Field	Description
Activate	Select this check box to activate the work shift. It must be activated in order for it to be available for use. **Note**: When you deactivate a work shift, it no longer appears on agent schedules, and will not be used in new schedule requests. Agents assigned to this work shift need to be reassigned to different active work shifts or they will not be scheduled for the week.
Work Shift Type	Select the type of work shift this is. ■ Fixed: Used to cover requirements for fixed hours and days. This work shift never varies. ■ Assignment: Used for agent activities when agents are not in service. This is a type of fixed work shift. ■ Variable: Used to cover requirements for variable hours and days. This work shift varies based on forecasted need when the work shift is applied.
Weekly Occurrence	(Variable work shifts only) Enter the minimum and maximum number of hours and days per week an agent can be scheduled. These values must be consistent with the shift parameters. For example, you cannot specify a minimum of 5 days per week when only one day is configured in the shift parameters.

Field	Description
Shift Parameters	The shift parameters depend on the type of work shift you selected. As you enter parameters for each day of the week, they are displayed graphically in the work shift parameter graph. Fixed and Assignment Work Shifts: • Apply To: Select a day from the day bar to configure the parameters for that day. • Shift Start: Enter the time the shift starts. • Shift Length: Enter the length of the shift. • Days Per Week: This value is read-only, calculated based on the number of days you configure. • Hours Per Week: This value is read-only, calculated based on the number of days you configure and the shift length each day. Variable Work Shifts: • Apply To: Select a day from the day bar to configure the parameters for that day. • Shift Start: Enter the earliest and the latest times that the agent's shift can start for that day. • Shift Length: Enter the minimum and maximum shift length for that day. • Minimum Interval: Enter the minimum amount of time between work shifts. • Days Off Allowed. Select this check box if the agent can have this day off. If cleared, the agent will be required to work this day if there are hours available.
Schedule Increment	(Variable work shifts only) Select the desired shift length increment. The default value is 30 minutes.
Work Conditions	Select the work conditions that apply to the work shift.

Understanding the Work Shift Parameter Graph

The work shift parameter graph is a visual representation of the work shift you are configuring. It displays a bar for every day you set up, showing the start times and durations. For fixed and assignment work shifts the graph shows a gray bar for each scheduled day of the week. The selected day is shown in blue.

The following graph shows a fixed shift that starts at 08:00 Monday through Friday and has a duration of 8 hours daily.
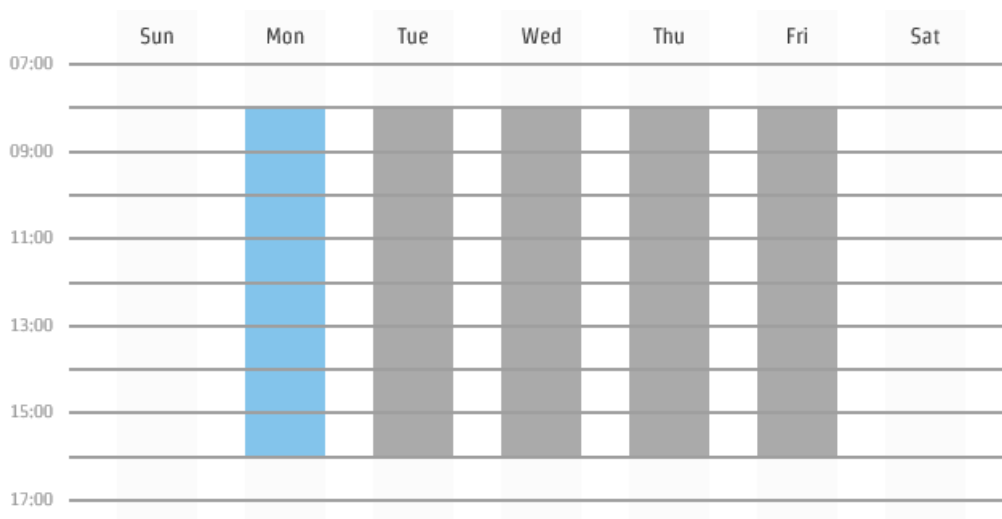

The following graph also shows a fixed work shift, but it includes two days on which the scheduled work shift crosses midnight. On Tuesday and Thursday, work starts at 18:00 and ends at 02:00 the next morning. This is shown visually by having the bar for Tuesday (the day is selected in the day bar so it shows as blue in the graph) continue into Wednesday.
The following graph shows a variable work shift. The core hours the agent works each day are shown in dark gray or blue. The variable start times and shift duration are indicated by lighter gray or blue. For example, on Monday, the agent can start work from 08:00 to 10:00, and the shift duration is between 4 and 8 hours long. The dark blue indicates that no matter when the agent starts or how long the shift is, the agent is in the contact center from 08:00 to 14:00
Viewing Assigned Work Shifts

You can use the View assigned work shifts option to see a list of the assigned work shifts for the week that includes a selected date.

When you choose a date, the Assigned Work Shifts table displays all work shifts scheduled for the week that includes your selected date, and the number of agents assigned to each work shift.

You can view the names of the agents assigned to a specific work shift by selecting that work shift in the table and clicking Display Agents.

Work Conditions

WFM differentiates between routine and non-routine activities. It categorizes activities that occur during every work shift (such as breaks and lunches) as routine. These routine activities are called work conditions. A work condition is a set of rules used to identify routine activities that prevent the agent from answering contacts.

A work condition might be linked to fixed, assignment, or variable work shifts. If the agent can work 4.5 to 6 hours during a work shift and scheduling is in half hour increments, you must configure work conditions for 4.5, 5, 5.5, and 6 hours and assign them to the agent's work shift, or have them as general conditions.

> **Note**: If you do not assign any work conditions, WFM creates agent schedules with no breaks or lunches. You can, however, create general work conditions if you do not want to assign specific work conditions for this shift length.

For each work condition activity, you must specify the following information:

- Name of the work condition activity

- Duration of the work condition activity

- The minimum delay between the start of the work shift and the start of this work condition activity. For example, if the work shift starts at 08:00 and this work condition activity cannot start any earlier than 09:00, the minimum delay must be 1:00.

- The maximum delay between the start of the work shift and the start of this work condition activity. For example, if the work shift starts at 08:00 and this work condition activity cannot start any later than 09:20, the maximum delay must be 1:20.

- The minimum interval between the end of the previous work condition activity and the start of this work condition activity. For example, if the previous work condition activity is a 15-minute break, and this work condition activity is a one-hour lunch, and there must be at least an hour and a half between the break and the lunch, the minimum interval must be 90 minutes.

- The increment in minutes that WFM uses to schedule the work condition activity. Possible values are 00:05, 00:10, 00:15, 00:20, and 00:30.

- The portion that is paid. For example, you can indicate that 15-minute breaks are paid and that one-hour lunches are unpaid.

Note that when creating schedules, the Schedule service verifies that all the work condition activities can be applied as configured. If there is no valid time where all the work condition activities can be applied as configured, the Schedule service ignores the work condition activity with a warning in the log and debug files.

The Schedule service applies the work condition activities with the smallest minimum delay first (in chronological order). It prefers to adhere to the work condition configuration rather than to the service queue need.

One way to avoid scheduling conflicts is to use the following parameter assignments:

- Morning break maximum delay = lunch minimum delay – lunch minimum interval – morning break duration

- Lunch minimum delay = morning break maximum delay + morning break duration + lunch minimum interval

Example 1: Work Condition without Unpaid Activities

A contact center has created three work condition activities: Morning Break, Lunch, and Afternoon Break. Work shifts are eight hours long. The start and end times of work shifts are variable: start times can be as early as 07:30 and end times as late as 17:30.

The work condition activities are configured as follows.

Activity	Min Delay	Max Delay	Duration	Min Interval
Morning Break	01:30	03:00	00:15	00:00
Lunch	03:00	05:00	00:30	01:30
Afternoon Break	05:30	06:45	00:15	01:30

If an agent's work shift begins at 08:00, then that agent's morning break can start any time between 09:30 and 11:00. The agent's lunch can start any time between 11:00 and 13:00. The agent's afternoon break can start any time between 13:30 and 14:45.

For example, assume that to handle predicted call volume, WFM must schedule an agent to begin work at 08:00 and to take a lunch break from 11:00 to 11:30. WFM then schedules the agent's morning break from 09:30 to 09:45 to satisfy the minimum delay of 01:30 for that work condition activity.

However, the earliest that lunch can start is 11:15 (09:45 plus 01:30, the minimum interval between this and the previous activity). WFM cannot create a schedule that satisfies all of the parameters as configured. This situation can be corrected by decreasing the minimum delay of the morning break from 1:30 to 01:15, or by decreasing the lunch minimum interval to 01:15.

Example 2: Work Condition with Unpaid Activities

A contact center has created three work condition activities: Morning Break, Lunch, and Afternoon Break. The lunch break is unpaid time. Work shifts are eight hours long, but since there is a one-hour unpaid lunch, the work shift actually spans nine hours. The Schedule service will schedule nine hours for the agent.

The start and end times of work shifts are variable: start times can be as early as 07:30 and end times as late as 18:30.

Activity	Min Delay	Max Delay	Duration	Min Interval
Morning Break	01:15	03:00	00:15	00:00

Activity	Min Delay	Max Delay	Duration	Min Interval
Lunch	03:00	05:00	01:00 (unpaid)	01:30
Afternoon Break	08:00	08:30	00:15	01:30

If an agent's work shift begins at 08:00, then the agent's morning break can start any time between 09:30 and 11:00. The agent's lunch can start any time between 11:00 and 13:00.

The agent's afternoon break can start any time between 16:00 and 16:30. This allows for the one hour unpaid lunch. It adds the hour and allows you to put in a delay of 08:00, something you couldn't do if the lunch were a paid activity. You cannot have a delay that is the same length of the work shift unless there is unpaid time included, in this case, the agent's schedule spans a period of nine hours.

Managing Work Conditions

Use the Work Conditions page (Application Management > Work Conditions) to create, edit, and delete work conditions.

The fields on the Work Conditions page are described below.

Field	Description
Work Condition Name	Enter a name for the work condition that makes it easy to identify when assigning the work condition to agents, for example, Customer Service - 4.5 hours.
Scheduled Shift Length	Enter the length of the work shift that the work condition applies to, in increments of 15 minutes. If you enter a value that is not a 15-minute increment, the shift length will be rounded to the nearest 15 minutes.

Field	Description
This is a general condition	Select this check box if this work condition applies to every work shift with the same number of hours of work per day, and if no other work condition is associated with those work shifts. If you do not select the check box for a work condition and no other work condition is linked to a work shift, WFM will not schedule breaks or lunches to agents assigned to this work shift. **Note**: There can be only one general condition per scheduled shift length per day the work shift is applied to.
Earliest Shift Arrival Time	Select the "Apply work condition to work shifts with any arrival time" check box if you want the work condition to apply to work shifts with any arrival time, or specify a time if you want the work condition to apply to work shifts that begin at or later than a specific arrival time. These options are mutually exclusive, you can select only one of them.
Days to Include	Select at least one day of the week that the work condition applies to. By default they are all selected.

Field	Description
Activities	Click Add to add a row to the Activities table, and then specify the details of the activity. These include: • Name: Enter a name to describe the break or lunch. If you leave this field empty, WFM fills it with Break. • Type: Select Break or Lunch from the drop-down list. • Min Delay: Enter the minimum amount of time in hh:mm format that must elapse between the shift arrival time and the start of this activity. This value must be in multiples of five minutes; if anything else is entered, the value is rounded to the nearest five minutes. • Max Delay: Enter the maximum amount of time in hh:mm format that can elapse between the shift arrival time and the start of this activity. This value must be in multiples of five minutes; if anything else is entered, the value is rounded to the nearest five minutes. • Duration: Enter the length of time the activity lasts in hh:mm format. This value must be in multiples of five minutes; if anything else is entered, the value is rounded to the nearest five minutes. Activities with a value of zero (0) are ignored. • Increment: Select the increment during an hour when the activity can begin. For example, if the activity can start one hour after the shift start of 08:00 and you choose the 15-minute increment, the activity might start at 09:15, 09:30, or 09:45. • Min Interval: Enter the minimum amount of time between this and the previous activity. This value must be in multiples of five minutes; if anything else is entered, the value is rounded to the nearest five minutes. • Paid Portion: The portion of the activity in hh:mm format that is paid. Activities that are not paid extend the work shift by the unpaid duration. For example, an eight-hour work shift with a one-hour unpaid lunch will become a work shift that spans nine hours. There is a limit of 48 hours in a work condition.

Field	Description
	• Color/Color ID: Click the color field to select a color to represent this activity in the schedule. The color ID is the hex code for the selected color.
Assign Work Shifts	Assign one or more work shifts that will use this work condition. Note: If all the work conditions in your contact center are general work conditions, you do not need to assign work shifts with them.

Special Events

A special event is a type of event that causes contact volume to deviate from normal. The special event can cause volume to either increase or decrease. When you assign a special event to a service queue, WFM makes adjustments for the effect of the special event when generating distributions and forecasts.

When examining a historical special event, consider the following:

- Which service queue does the special event affect? A special event is always related to a service queue.

- What type of event is this special event? You can configure generic types of special events with default values. Once you create a generic special event, you can select it from a list of available special event types whenever you need it.

- When does the special event occur?

- How many days after the special event does the contact volume impact appear? The impact of a power outage is immediate. The impact of a bill format change happens after the postal service delivers the bills and the customers open the mail.

- How long does the contact volume impact last in days? The impact of a power outage might only last a day, if service is restored during that time.

The impact of a bill format change is likely to endure for a number of days, because customers handle bills at different times.

▪ What was the impact ratio? This is determined by dividing the contact volume that occurred with the special event by the contact volume that would most likely occur in the absence of the special event.

Impact on Distribution Requests

If the reference period you specify in a distribution request includes a special event, the special event date is excluded from the reference period. This ensures that the abnormal contact patterns (including contact handle times) on the special event day do not affect the contact distribution patterns.

Example: Consider a power outage that causes the daily contact volume to be halved—it is normal in the morning but goes to zero in the afternoon. A special event with an impact ratio of 0.5 is created. The date of this special event, if part of a reference period, will be excluded from that reference period.

Impact on Forecast Requests

If the reference period you specify in a forecast request includes a special event, the normalized contact volume is calculated by dividing the actual contact volume on the special event day by the impact factor. That is:

Normalized contact volume = Actual contact volume on special event date ÷ Impact factor

In the power outage example, let us say that the actual contact volume on the day the power outage occurred was 5,000 contacts. The power outage special event has an impact factor of 0.5. Using the above equation:

Normalized contact volume = 5,000 ÷ 0.5 = 10,000

The contact volume in the reference period has been normalized to 10,000 contacts to compensate for the effect of the special event, which makes the forecast more accurate.

Limitations of Special Events

Special events are used to negate the effects of a sudden and nonrepeating change in the contact volume in the past to ensure that forecasts do not include these anomalies.

Special events cannot be used to predict changes in contact volume due to future events, such as an upcoming marketing campaign. These types of events can be accommodated either automatically or manually during the forecasting process.

Managing Special Events

Use the Special Events page (Application Management > Special Events) to create and manage special events and assign them to service queues.

> **Best Practices**: It is recommended that you do not delete a special event. If a special event is deleted, the historical data associated with it will be lost, which can affect forecast accuracy.

The fields on the page when you create, edit, or delete a special event are described below.

Field	Description
Special Event Name	Enter a name for the special event.
Impact Delay	Enter the delay in whole days between the special event's occurrence and when it actually affects the contact center. Default value = 0.
Impact Duration	Enter the number of whole days you expect the effects of the special event to last. Default value = 1.
Impact Ratio	Enter the impact of the special event on normal contact volume. Default value = 1.

The fields on the page when you assign a special event to a service queue are described below.

Field	Description
Service Queue	Select the service queue you want to assign the special event to.

Field	Description
Special Event	Select the special event you want to assign to the service queue.
Event Date	Select the date of the special event.
Impact Delay	This field is autofilled with the value configured for the special event. You can change it if desired.
Impact Duration	This field is autofilled with the value configured for the special event. You can change it if desired.
Impact Ratio	This field is autofilled with the value configured for the special event. You can change it if desired.
Comment	Enter a comment about the special event if desired.
Assign button	Click this button to assign the event to the service queue. It is added to the Assigned Events table.
Delete button	Click this button to delete the selected special event from the Assigned Events table.

Shift Budget Analysis Request

A shift budget analysis request generates the data needed to analyze shift costs for one or more service queues.

Note: There must be a production forecast for the period you want to analyze for the request to run successfully.

Once you have run this request, you can run a shift budget analysis report.

Generating a Shift Budget Analysis Request

To generate a shift budget analysis request (Application Management > Shift Budget Analysis Request), follow these steps:

1. Enter a start date and end date for the period whose data you want to analyze.

2. Select the one or more service queues.

3. Add the parameters of the shifts you want to analyze. Click Add to add a row to the table, and then for each row, enter the shift parameters:

- Select the shift length from the drop-down list.

- Enter the desired utilization percentage. This is the percentage of time agents are in service.

- Enter the maximum number of agents available to work. If you want WFM to determine this, enter 9999.

- Select the days of the week you want to use in the analysis. Select All to select each day of the week in one click.

4. Schedule the request. By default the request runs immediately.

Shrinkage

Contact center shrinkage is how much time is lost in the contact center due to unscheduled off-phone activities. Reasons for shrinkage include a wide range of events that result in agents logged off the phone during their normal schedule. Depending upon the time frame being evaluated and what is currently scheduled, shrinkage events can include (but are not limited to) vacations, breaks, lunch, holidays, sick time, and training.

The shrinkage percentage is used to take this into account when running a schedule. When shrinkage percentages are applied, the schedule overstaffs the service queue by the shrinkage percentages configured in this table.

The number of agents available to work when a schedule is run is typically not the same as the actual number of agents available once that future date arrives. This is due to predictable and unpredictable activities that cause these agents to no longer be available to work. The percentage difference between the two numbers is the shrinkage percentage.

Example: On September 1 a schedule is run for the week of September 21. On August 31, Agents A, B, and C submitted time off exception requests for September 23. Only Agent A's request was approved on September 1 before the schedule was run, and so Agent A is not considered available to work on that day. Agent B's and Agent C's time off requests were not approved until September 3, and so were scheduled to work on September 23 despite their pending time off requests when the schedule was run.

When those requests are approved on September 3, the number of agents scheduled to work on September 23 shrinks by two agents.

The Shrinkage page enables you to enter shrinkage percentages into WFM for the current week and for up to 12 weeks into the future. Each week, the shrinkage percentage lessens as a schedule week approaches the current day. This is because the activities (such as time off) that remove agents from the pool of available agents are added to the schedule, and you do not need to allow for the same amount of shrinkage each week. You become more certain of the number of agents available to be scheduled as you draw closer to the schedule week.

The Shrinkage table is set up so you can divide your contact center's shrinkage percentages among various general categories: absenteeism, time off, meetings, training, and coaching. Note that you do not need to use those categories. WFM considers only the total percentage for each week in its calculations. You can put an overall shrinkage percentage in any of the available columns for each week.

Note: Shrinkage is applied only if that option is selected when making the schedule request. The shrinkage values configured at the time of the request are applied to that request. For example, if you schedule a schedule request with shrinkage for a future date and then change the shrinkage values before that date, the new shrinkage values are not used.

Managing Shrinkage

To enter shrinkage percentages (Application Management > Shrinkage) for your contact center, do the following.

1. Determine how many weeks out you want to enter shrinkage percentages. The Shrinkage table can accommodate up to 13 rows, the current week plus 12 weeks into the future. To add a row, click Add at the bottom of the table. New rows are always added at the bottom. To delete a row, select the row you want to delete and click Delete at the bottom of the table.

2. In each row, enter the desired shrinkage percentage for a category. You do not need to enter a percentage for every category, or to use categories at all. You can enter an aggregate shrinkage percentage in any column except the Totals column. The Totals column is automatically updated as you add percentages to the other columns in the table.

3. When you have completed entries in the table, click Save.

Copy Schedule Activities

The Copy Schedule Activities page allows you to copy activities from one agent's schedule on a particular day to other agents' schedules on selected days, or to the same agent's schedule on other days. The copy function overwrites whatever is on those agents' schedule in those time slots with the source agent's activities.

Copying Schedule Activities

Use the Copy Schedule Activities page (Application Management > Copy Schedule Activities) to copy activities from one agent's schedule to other agents' schedules.

The fields on the Copy Schedule Activities page are described below.

Field	Description
Agent	Select the agent whose schedule is the source of the activities you want to copy.
Date	Select the date of the source agent's schedule.
Schedule	Once you select an agent and date, the agent's schedule for that day appears. Select the check boxes next to the activities you want to copy.
Select Agents	Select the agents whose schedules you want to copy the activities to.
Select Dates	Select the dates you want the activities copied to. The dates must have a schedule generated for them.
Copy	Click Copy to copy the activities. This button is not enabled until you have completed all fields on the page.

Dynamic Scheduling

The Dynamic Scheduling feature enables selected agents to create their own schedules.

Before the agents can schedule themselves, you must configure WFM as follows:

1. Create a dynamic scheduling work rule. The work rule specifies the parameters for the work shift the agent will be scheduling—hours worked per week, starting times, days worked, and so on.

2. Configure the dynamic scheduling associations between a work rule, a specific work week, and an agent. This association gives the agent the opportunity to create a schedule for the specified work week. Note that a dynamic scheduling event can cover more weeks than the agent as an association for. For example, if an agent has an association for Week 1 and Week 2, but the dynamic scheduling event covers Week 1, Week 2, and Week 3, the agent will only be able to create a schedule for Week 1 and Week 2.

3. Configure the dynamic scheduling event. Choose the weeks that the agents can schedule themselves for, and then configure the dynamic scheduling event exception that will be added to the selected agents' schedules so they have a specific time to create their own schedules.

A scheduling event exception is added to each agent's schedule according to the agent's ranking or seniority and availability in the contact center. The highest ranked agent gets the first opportunity to schedule him or herself, the second highest agent gets second opportunity, and so on down the list of selected agents.

There are factors that affect when the scheduling event exception fits into an agent's schedule. You can configure which activities can be overwritten by the event exception, and if the exception can be scheduled during a period when the agent is not available. If an agent's schedule is such that the exception cannot be added to it, the agent is scheduled automatically by WFM as usual.

You can also specify how long a gap there can be between sequential event exceptions. If Agent B is not available immediately after the time when Agent A's exception is scheduled and a gap of more than the configured number of minutes exists, then Agent B is skipped over and Agent C is scheduled next

instead. Agent B's event exception will be added to the schedule as soon as possible, but Agent B will not get a chance to create a schedule in the order of his or her rank.

Dynamic Scheduling Work Rules

A dynamic scheduling work rule is used to set the parameters for the work shifts for dynamic scheduling. Work rules are assigned to agents for specific weeks.

Managing Dynamic Scheduling Work Rules

The Dynamic Scheduling Work Rules page (Application Management > Dynamic Scheduling Work Rules) allows you to create, edit, and delete work rules that apply to dynamic scheduling.

Note: Dynamic scheduling does not support split shifts (work shifts that cross midnight).

The fields on the page when you create, edit, or delete a work rule are described below.

Field	Description
Work Rule Name	Enter a unique name for the work rule.
Activate this work rule	Select this check box to activate the work rule. It must be activated in order for it to be available for use.
Work Rule Type	Select the type of work rule this is. • Uniform. The agent's work shift starts at the same time every day. Hours per day and per week are fixed. • Hybrid. The agent's work shift can start at a different time every day. Hours per day and per week are fixed. • Variable. The agent chooses start time, shift length, and weekly hours within the defined parameters.

Field	Description
Work Rule Parameters	The work rule parameters depend on the type of work rule you selected.
Shift Length	(Uniform, Hybrid) Length of the shift, in hours.
Hours per Week	(Uniform, Hybrid) Calculated read-only field: shift length × number of work days selected.
Earliest Start Time	(Uniform, Hybrid, Variable) The earliest time that the shift can be scheduled to start.
Latest Start Time	(Uniform, Hybrid, Variable) The latest time that the shift can be scheduled to start.
Minimum Hours per Shift	(Variable) The minimum number of hours the agent can work in the shift.
Maximum Hours per Shift	(Variable) The maximum number of hours the agent can work in the shift.
Minimum Hours per Week	(Variable) The minimum number of hours the agent can work in a week.
Maximum Hours per Week	(Variable) The maximum number of hours the agent an work in a week.
Minimum Consecutive Scheduled Days	(Variable) The minimum number of consecutive days the agent is required to work.
Minimum Interval Between Work Shifts	(Uniform, Hybrid, Variable) The minimum number of hours between the end of one work shift and the start of the next work shift.
Non-consecutive days off/Consecutive days off	(Variable) Choose if days off during the week can be non-consecutive or must be consecutive.
Work Days	(Uniform, Hybrid) The days of the week that agents must be scheduled to work. By default, Monday through Friday are selected.
Work Conditions	Select the work conditions to be applied to the work shift. If you do not assign any work conditions, and no general conditions apply, agents will be scheduled without breaks or lunches.

Dynamic Scheduling Associations

The Dynamic Scheduling Associations page enables you to set up an association between a specific work week, a work rule, and agents.

When those agents are given the opportunity to create their own schedules for a specific work week, the work rule that was associated with that week and those agents determines what options those agents will have when selecting their schedules.

You can set up associations for as many weeks in the future as you choose. For every week, an agent can be associated with only one work rule, but that work rule can change from week to week.

Managing Dynamic Scheduling Associations

The Dynamic Scheduling Associations page (Application Management > Dynamic Scheduling Associations) allows you to configure and manage the association between a specific week, a work rule, and an agent.

Use this page to build a list of work rule/agent associations for the selected week. The Agents table can list more than one work rule, but an agent can be associated with only one work rule per week.

> **Example**: Select Work Rule A and associate agents 1, 2, 3, and 4 with it by moving their names to the Assigned pane. Next, select Work Rule B and associate Agents 5, 6, 7, and 8 with that work rule by moving their names to the Assigned pane.

The Agents table shows the agents you have selected for dynamic scheduling, the work rule they will use to schedule themselves, and their rank and company start date (used to determine the order in which they will be able to schedule themselves). You can sort the table by any column in ascending/descending order by clicking the column header, or filter the table by agent name.

Once you have configured and saved the dynamic scheduling associations for a specific week, you can copy them to other weeks using the Copy function.

The fields on the page are described below.

Field	Description
Work Week	Select the starting date of the week you want agents to choose their own schedules. If you select a date that is not the configured first day of the week, WFM automatically changes your selection to the first day of the week of the selected week.
Work Rule	Select the work rule you want to use. The work rules listed in the drop-down list are those configured and active on the Dynamic Scheduling Work Rules page.
Agents	Select the agents who will schedule themselves according to the selected work rule for the selected week and move their names to the Assigned pane.
Copy	Select the starting date of one or more weeks other than the one you configured in the Schedule Date field and then click Copy. This copies the work rule and agents you configured to those weeks. The Copy function is not enabled until you have saved the configured associations.

Dynamic Scheduling Events

The Dynamic Scheduling Events page is used to set up the rules for the exception that will be added to the schedules of agents who are allowed to create their own schedules.

Managing Dynamic Scheduling Events

The Dynamic Scheduling Events page (Application Management > Dynamic Scheduling Events) page is used to create, edit, delete, and review a dynamic scheduling event. It can also be used to generate a report of any scheduling incentives offered for a specified date range.

The event exception is applied to the selected agents' schedules as soon as you save the event.

Note: If a schedule is rerun, the dynamic scheduling event exceptions are overwritten. You can reinsert them into the agents' schedules by resaving

the event. (Make a small change in the event to enable the Save button, such as adding a character to the event name.)

When creating and editing an event, complete fields as described below.

Field	Description
Event Name	Enter a unique name for the event.
Schedule Start Date	Select the start date of the period to be scheduled. The start date defaults to the configured first day of the week containing the date you choose.
Duration (Weeks)	Enter the number of weeks you want to schedule.
Exception	Select the exception you want to use for the event. This is the exception that appears in agent schedules.
Event Start Date	Enter the start date for the event. This is the first date that the exception can appear in agent schedules.
Event Start Time	Enter the start time for the event. This is the earliest time that the exception can appear in agent schedules on the start date. For example, if the start date is 23 September and start time is 08:00, you can select 07:00 on 24 September as long as that is within the end date and time.
Event End Date	Enter the end date of the event. This is the last date that the exception can appear in agent schedules.
Event End Time	Enter the end time for the event. This is the latest time that the exception can appear in agent schedules on the end date.
Event Length (Minutes)	Enter the length of the event, in minutes. This is the amount of time that the agent will have to create his or her schedule.

Field	Description
Gap (Minutes)	Enter the maximum number of minutes that can exist between the end of an exception and the start of the next exception for sequentially ranked agents. If Agent B's schedule is such that the exception cannot be added to his or her schedule within the configured gap after Agent A's exception, Agent B's exception will be scheduled at the first available time slot and Agent C's exception will be scheduled in Agent B's originally intended time slot.
Activities That Can Be Over-written	Select the schedule activities that can be overwritten by the event exception. If you choose "Not Available", you must complete the Start Time and End Time fields.
Start Time	(Visible only if Not Available is selected as an activity that can be over-written) Enter a start time for the range during which the Not Available activity can be overwritten.
End Time	(Visible only if Not Available is selected as an activity that can be over-written) Enter an end time for the range during which the Not Available activity can be overwritten.
Maximum Agent Percentage for Group Scheduling	Enter the maximum percentage of agents that can be scheduled in groups. This means that these agents will have a dynamic scheduling event added to their schedules in the same time slot, and those agents will all be creating their own schedules at the same time. **Example**: Enter 75 in the field to schedule 75 percent of your agents in groups. This means that 25 percent of your agents will be scheduled as individuals.
Maximum Group Size Per-centage	Enter the maximum size of the scheduling group as a percentage of the total number of agents being scheduled. **Example**: You want to schedule 100 agents in groups, but want each group to be no more than 20 agents. To get this result you enter 20 (percent) in this field.

Field	Description
Display staffing numbers on the dynamic scheduling grid display	Select this check box if you want the dynamic scheduling grid the agent sees to display staffing needs as numbers as well as icons.
Incentive Description	Optional field. Enter a description of an incentive you will offer to encourage agents to schedule themselves for a less-desirable work shift. The description can be a maximum of 60 characters.
Agents	The Agents table displays the agents who are assigned an active dynamic scheduling work rule for the weeks you chose in the Schedule Start Date and Duration fields and who have not yet been assigned a dynamic scheduling event.
Compute Time	Click Compute Time to compute the day and time the selected agents are assigned dynamic scheduling exceptions. If you change the table (for example, removing agents from the right pane) click the button again to recompute days and times.

Reviewing an Event's Status

Schedulers and administrators can use the review option to monitor the current status of a dynamic scheduling event. When you select the event from the Event Name field, a Event Status table appears.

The table lists all the agents who were assigned the event, and each agent's event status. Possible statuses are:

- Pending
- Completed
- Missed

Based on the information in the table, you can opt to do the following, reschedule, reschedule all, or clear all.

Reschedule

When you click the Reschedule button, all the agents in the review table whose status was "Missed" are automatically added to the Assigned pane in the agent selection pane in a new Dynamic Scheduling Event page for the selected event.

You can then enter new event start and end dates and times, and optionally a scheduling incentive, and then click Compute Time to generate new dynamic scheduling event exceptions.

Reschedule All

When you click the Reschedule All button, all agents in the review table regardless of their status are automatically added to the Assigned pane in the agent selection pane in a new Dynamic Scheduling Event page for the selected event. Any completed schedules are canceled.

You can then enter new event start and end dates and times, and optionally a scheduling incentive, and then click Compute Time to generate new dynamic scheduling event exceptions.

Clear All

When you click the Clear All button, all dynamic scheduling for the event is canceled and all agents in the table are removed from the event. You are brought to a new Dynamic Schedule Events page where you can start from scratch if desired. The event is still in the list, but nothing is configured for it.

Generating a Scheduling Incentives Report

Use the Generate a scheduling incentives report option to view a listing of all scheduling incentives offered and accepted for a specified date range and for specified agents.

The report can be viewed on the Dynamic Scheduling Events page, or exported as a spreadsheet in CSV format.

To generate a scheduling incentives report:

1. On the Dynamic Scheduling Events page, select the Generate a scheduling incentives report option.

2. Select a date range and the agents you want to report on.

3. Click Display Report to view the report on the page, or Export as CSV to generate a file that can be opened in Excel or other spreadsheet applications.

Services

The pages in this section of Application Management enable you to configure the service queues in your contact center.

The pages are:

- [Service Queue Types](#)
- [Service Queues](#)
- [Multiskill Groups](#)
- [Skill Mappings](#)
- [Service Queue Closed Days](#)
- [Firm Date Associations](#)
- [Service Queue Groups](#)

Service Queue Types

The service queue type describes the kind of contact a service queue handles. It allows you to group like service queues together into service queue groups and virtual service queues, and to generate forecasts for like service queues.

There are two types of contacts:

- **Interactive contacts** are agent/customer interactions that occur in real time, such as calls and chats.
- **Non-interactive contacts** are agent/customer interactions that do not occur in real time, such as email, tweets, social media, and faxes.

Each service queue type has a unique name. For example you can create a service queue type called Twitter with a contact type of Non-interactive, and another called Chat with a contact type of Interactive.

WFM comes with two system service queue types: Voice/Interactive and Email/Non-interactive. If you are upgrading from a previous version of WFM that allowed you to configure service queues for calls or email, then those service queues are automatically assigned the Voice or Email service queue type.

There are limitations on what you can do with a service queue type once it has been created.

- You cannot change its contact type. For example, if you create the ABC service queue type with a contact type of Interactive, you cannot change it to Non-interactive later on.

- If a service queue type is assigned to a service queue, you cannot delete it.

- You cannot edit or delete the system service queue types, Voice and Email.

You can, however, change the name of a service queue type you created even after it has been assigned to a service queue. The new name will be reflected throughout the system.

Managing Service Queue Types

Service queue types are configured and maintained on the Service Queue Types page (Application Management > Service Queue Types).

To create a new queue type:

1. Choose Create a new service queue type.

2. Enter a unique name for the service queue type that describes the kind of contact a service queue handles, with a maximum of 50 characters.

3. Choose the contact type, interactive or non-interactive.

4. Click Save.

To edit an existing service queue type:

1. Choose Edit or delete an existing service queue type.

2. Select the desired service queue type from the drop-down list.

3. Edit the service queue type's name as desired. You cannot change the contact type.

4. Click Save.

To delete an existing service queue type:

1. Choose Edit or delete an existing service queue type.

2. Select the desired service queue type from the drop-down list.

3. Click Delete.

Note: You cannot delete a service queue type that is assigned to a service queue, or either of the system service queue types (Voice and Email).

Service Queues

A service queue is a group of agents to which contacts are routed. It is generally associated with a specific skill.

In WFM, you schedule agents to support service queue requirements. For this reason, WFM makes service queues the focal point for schedules and forecasts.

Environments with Synchronized ACDs: WFM imports service queue data from these ACDs via the Sync service. Imported service queue data that cannot be changed in WFM (the service queue name and ID) is read-only on the Service Queues page. That data can only be changed in the ACD. Service queues you create in WFM exist only in WFM and are not added to the ACD. For more information, see Synchronizing Service Queue Data.

Environments with Non-synchronized ACDs: The service queues you create in WFM must have the same names and IDs as are set up for them in your ACD. This enables WFM to associate the historical data imported from the ACD into WFM with the correct service queue.

Managing Service Queues

Use the Service Queues page (Application Management > Service Queues) to create, edit, and delete service queues.

Best Practices: It is recommended that you do not delete service queues. If you delete a service queue, all the historical data and agent schedules associated with it are lost.

The fields on the Service Queues page are described below.

Field	Description
Service Queue ID	The unique ID that identifies the service queue. In synced systems, the ID is created in the ACD. Once an ID is assigned to a service queue, it cannot be changed.

Field	Description
Service Queue Name	The service queue's name. In synced systems, the name is created and maintained in the ACD.
Do not generate forecasts or schedules for this service queue	Select this check box to deactivate the service queue. It will no longer be available when generating distributions, forecasts, and schedules. However, you will still be able to view its historical data. **Note**: If you select this check box, be sure to remove the service queue from all multiskill groups it is associated with. If you do not, a schedule request for those multiskill group will fail.
Service Queue Type	Select the service queue type that describes the kind of contacts this service queue handles. See *Service Queue Types* for more information.
Redistribution Type	(Non-interactive service queues only) Select the redistribution type that determines how non-interactive contacts that arrive during the service queue's closed hours are redistributed among target intervals for forecasting purposes. Target intervals are determined by the handling threshold. Your options are the following: • None: Contacts that arrive during closed hours are ignored and not redistributed (default). • Proportional: Contacts are redistributed proportionally among target intervals based on the target intervals' distribution ratios. • Even: Contacts are redistributed evenly among the target intervals.

Field	Description
Service Queue Priority	Enter the service queue priority, any number from 0 to 999, with 0 being the highest priority. The service queue priority allows WFM to resolve scheduling conflicts when agents are assigned to multiple service queues. **Example**: You designate some of your agents to support two service queues. If WFM generates the schedules for the two service queues and discovers that there are not enough agents to support all forecast requirements for both, it compares the priority value of each service queue and schedules agents for the service queue with the highest priority first.
Average Talk Time	Enter the average amount of time, in seconds, that a contact lasts for this service queue. WFM uses this information to determine the number of agents needed to meet requirements when it generates a distribution for this service queue. You can opt to let WFM calculate this value for you automatically when it generates a distribution by selecting the check box in the Service Queue Standard Times section of the Distribution Request page.
Average After Contact Work Time	Enter the average amount of time, in seconds, that an agent spends in after contact work for this service queue. WFM uses this information to determine the number of agents needed to meet requirements when it generates a distribution for this service queue. You can opt to let WFM calculate this value for you automatically when it generates a distribution by selecting the check box in the Service Queue Standard Times section of the Distribution Request page.
Handling Threshold	(Non-interactive service queues with a proportional or even redistribution type only) Enter the amount of time in which contacts must be handled, in minutes. Valid values are from 0 to 4,320 minutes (72 hours).

Field	Description
Service Level Objective	(Interactive service queues only) Enter the percentage of contacts to be answered within a specified number of seconds. The number of seconds must be greater than zero. WFM uses this goal to determine the number of agents needed to meet requirements when it generates a distribution and forecast for the service queue.
Forecast Precision Level Percentage	This read-only value is calculated when you run a forecast accuracy computation request for the service queue. If you have not done this, then the value displayed is 0%. The forecast precision level is a measure of how accurate a forecast was by comparing forecasted contact volume with actual contact volume. For example, if the forecast precision level is 105%, the forecasted contact volume was 5% greater than the actual contact volume.
Opening and Closing Hours	Enter the days and hours of operation of the service queue. A check indicates that the service queue is active, or open, on a particular day. The hours of operation are in 24-hour format, and must be in multiples of five minutes. If anything else is entered, the value is rounded to the nearest five minutes. The exception is the value 23:59, meaning midnight.
Multiskill Groups	This section displays the name of each multiskill group that this service queue is a part of. Assign a priority (from 0 to 999, with 0 being the highest) to each multiskill group. The priority you assign here helps to determine how agents are scheduled to support the service queues that make up the multiskill groups.

Field	Description
Skill Mappings	Assign one or more skill mappings to the service queue and set their priorities (0-999, with 0 being the highest). Skill mappings link agents to service queues. In order for agents to be scheduled to support this service queue, both the agents and the service queue must be assigned to the same skill mapping. Assigning a priority to each skill mapping allows WFM to resolve scheduling conflicts when agents with multiple skills belong to multiple service queues.
Virtual Service Queue	Select the check box if this service queue is a virtual service queue. Once you do this, a service queue selection pane opens so you can assign service queues to be members of the virtual service queue. The available service queues all have the same service queue type. **Note**: Do not make a synced service queue a virtual service queue. Select this check box only if you created the service queue in WFM.

Field	Description
Scheduling Order	Use the table to configure the order in which agents are scheduled for the service queue. WFM compares the agents based on this order and schedules the highest priority agents first. If you want to reset the order to the system default, click the Restore Default button. The criteria used are the following: • Maximum hours available: The sum of the maximum number of hours an agent can be scheduled each day of the week • Minimum hours available: The sum of the minimum number of hours an agent can be scheduled each day of the week • Maximum hours per week: The maximum number of hours per week configured for the agent's work shift (from the Work Shifts page) • Minimum hours per week: The minimum number of hours per week configured for the agent's work shift (from the Work Shifts page) • Rank: The agent's ranking in the contact center based on expertise (from the Agents page) • Company start date: The date the agent started working for the company (from the Agents page) • Department start date: The date the agent started working for the department (from the Agents page)
Color	Select the color you want to represent this service queue in the schedule. This color is used only for in-service scheduled activities; closed service queue and overtime scheduled activities for the service queue use standard, non-editable colors.

Virtual Service Queues

A virtual service queue is a collection of service queues with the same service queue type. Virtual service queues exist only in WFM.

Once you create a virtual service queue, WFM starts collecting historical data for it. If historical data already exists for each service queue in the virtual

service queue, you can merge the historical data from the source service queues into the virtual service queue using a [Historical Data Merge Request](#).

Create a virtual service queue when you want to generate a single forecast, distribution, or schedule for a group of like service queues. The following are examples of some situations where a virtual service queue is useful.

> **Example**: A contact center has one service queue for premium customers and another for regular customers. Premium customers reach an agent faster and receive higher value services. The agents who handle customer calls are members of both service queues. Creating a virtual service queue that is comprised of the premium and regular customer service queues simplifies scheduling.

> **Example**: An organization has IT help desks in multiple locations. The contact center uses a service queue for each location to account for multiple time zones, and to allow reporting by location. The contact center routing consolidates the agents from each location into a single pool, and distributes calls to the next available agent regardless of location. By grouping the service queues into a virtual service queue, WFM can schedule the agents as a single group in a pattern that is consistent with the routing and time zones.

Multiskill Groups

A multiskill group is used to schedule agents to support multiple service queues during the same period of time. A multiskill group is made up of a number of service queues. Each service queue is weighted by percentage to indicate how much of an agent's time is spent supporting that service queue within the multiskill group.

Scheduling agents for multiskill groups is reflected in calculations such as Agents Scheduled and Service Level Scheduled. Because the agents split their time among multiple service queues, their contribution to each service queue by percentage is reflected in these calculations.

Managing Multiskill Groups

Use the Multiskill Groups page (Application Management > Multiskill Groups) to create, edit, and delete multiskill groups.

> **Best Practices**: It is recommended that you do not delete multiskill groups. If you delete a multiskill group, all the agent schedules associated with it are also deleted.

The fields on the Multiskill Groups page are described below.

Field	Description
Multiskill Group Name	The multiskill group's name.
Service Queues	Assign one or more service queues to the multiskill group, and then assign a weight (percentage) to each service queue. The weight is the percentage of time an agent assigned to this multiskill group spends supporting that service queue. The weights must add up to 100%. **Note**: If a service queue is deleted or has the "Do not generate forecasts or schedules for this service queue" check box selected, its weighting is not automatically redistributed to the other service queues in the multiskill group.
Agents	Assign one or more agents to the multiskill group. An agent can belong to only one multiskill group. **Note**: You are not warned if an agent belongs to another multiskill group.
Color	Select the color you want to represent this multiskill group in the schedule.

Skill Mappings

Skill mappings provide links between service queues and agents. The agents assigned to a skill mapping generally have the same skills.

To schedule an agent to support a service queue, you must assign the agent to the skill mapping or multiskill group associated with the service queue. You can assign an agent to more than one skill mapping. Agents not assigned to a skill mapping or multiskill group cannot be scheduled.

Note: When WFM imports service queue information from synced ACDs, it automatically creates a skill mapping for each service queue on a one-to-one basis. The skill mapping has the same name as the service queue, and the service queue is automatically assigned to it. The sync happens only once. If you delete the skill mapping it will not be recreated the next time synchronization occurs.

The service queues assigned to the skill mapping are prioritized. This enables WFM to resolve scheduling conflicts when agents are assigned to multiple service queues—the agent will be scheduled for the highest priority service queue first.

Example: You designate some of your agents to support two service queues and assign a priority to each service queue. When WFM generates the schedules for the two service queues and discovers there are not enough agents to support all forecast requirements for each service queue, it compares the priority value assigned to the service queues. WFM then schedules agents for the service queue with the highest priority first. If a service queue has more than one skill mapping or multiskill group, agents associated with the higher skill mapping or multiskill group priority will be scheduled before agents associated with the lower skill mapping or multiskill group priority.

Managing Skill Mappings

Use the Skill Mappings page (Application Management > Skill Mappings) to create, edit, and delete skill mappings.

Note: In environments that sync with the ACD, any new skill mappings you create in WFM will not be added back into the ACD.

> **Best Practices:** It is recommended that when you configure the synced skill mapping, you change its name to distinguish it from its service queue.

> **Best Practices**: It is recommended that you do not delete skill mappings. If you delete a skill mapping, all the historical data associated with it is lost.

The fields on the Skill Mappings page are described below.

Field	Description
Skill Mapping Name	Enter a unique name for the skill mapping.
Service Queues	Assign service queues to the skill mapping.
Priority	Assign a priority to each selected service queue, from 0 to 999, with 0 being the highest priority. This priority enables WFM to resolve scheduling conflicts when agents are assigned to multiple service queues.
Agents	Assign agents to the skill mapping. The assigned agents will then be able to be scheduled for the assigned service queues.

Service Queue Closed Days

Use the Service Queue Closed Days page to designate dates on which a service queue is closed and therefore not able to handle customer contacts. Typical closed days are national holidays.

Closed days should not be used for the days when the service queue is routinely closed. For example, a service queue might be open Monday through Friday and closed on Saturday and Sunday. This is more appropriately configured on the Service Queues page in the Opening and Closing Hours section.

In WFM, all service queues are assumed to be open every day of the year unless configured otherwise.

If closed days are the same from year to year for a service queue, or the same for multiple service queues, you can configure them for one service queue and then copy them to other years and other service queues.

Note: Designating a day as closed changes the forecast for that day to zero contacts. However, it does not affect any schedule that is already generated for that day. If agents are scheduled to work on a day that is designated as closed, they remain scheduled for that day. A solution for this situation is to create an exception and assign it to the service queue for that day. If a date is designated as closed after the forecast has been generated, the Schedule service still treats the forecast for that date as zero even if the forecast shows positive values.

Best Practices: It is recommended that you update a service queue's closed days at least once a year.

Managing Service Queue Closed Days

Use the Service Queue Closed Days page (Application Management > Service Queue Closed Days) to create, edit, and delete closed days.

The fields on the Service Queue Closed Days page are described below.

Field	Description
Service Queue	Select the service queue whose closed days you want to configure.
Year	Select the year that contains the closed days.
Select Closed Days	Select the closed days from the calendar.
Copy To	Once you have configured closed days and saved the record, you can copy those closed days to another year for the same service queue or to any year for another service queue. Select the desired year and/or service queue and then click Copy.

Firm Date Associations

A firm date association is a link between two dates that fall on different days of the week from year to year. Firm date associations are useful because when WFM generates a forecast, it uses historical data from the same day of the week.

To ensure that WFM uses a date with similar data for its forecast, you must create firm date associations.

> **Example**: To generate a forecast for Wednesday, January 1, 2014, WFM uses data from Wednesday, January 2, 2013. However, the 2014 date is New Year's Day and the 2013 date is the day after New Year's Day. The contact data for the two dates is probably going to be significantly different because of the holiday. Creating a firm date association between January 1, 2014 and January 1, 2013 corrects this when generating a forecast.

If you do not have adequate historical data in the WFM database to use firm date associations, you can generate a forecast and then edit the data for that specific date to reflect correct information.

Managing Firm Date Associations

Use the Firm Date Associations page (Application Management > Firm Date Associations) to create, edit, and delete associated dates for individual service queues.

Once you set up firm date associations for one service queue, you can copy them to another service queue.

You cannot edit associated dates once you have set them up, but you can edit their descriptions. If you have made an error in selecting the two dates, delete the date association and start again.

The fields on the Firm Date Associations page are described below.

Field	Description
Service Queue	Select the service queue you want to create firm date associations for.

Field	Description
Associate this future target date	Select the date in the future you want to link to a past reference date. This is the date you will be creating forecasts for.
With this historical reference date	Select the date in the past that has historical data similar to what you expect on the future date.
Description	Enter a description of the associated dates to identify them, such as "New Year's Day" or "Annual Sales Event." This is the only field you can edit once you save a firm date association.
Add button	Click the Add button to add the associated dates to the table.
Delete button	If you want to delete a date association, select the check box next to it in the table and click Delete.
Copy to Service Queue	Once you have saved firm dates for a service queue, you can copy them to another service queue. Select the target service queue in this field and then click Copy. **Note**: The Copy action overwrites any firm date associations that might have been set up for the target service queue.

Service Queue Groups

The Service Queue Groups page (Application Management > Service Queue Groups) allows you to create and manage service queue groups.

A service queue group is a collection of individual service queues of the same service queue type. When service queues are combined into one service queue group, all the data for the individual service queues is rolled up into a total number for each metric.

Managing Service Queue Groups

Use the Service Queue Groups page (Application Management > Service Queue Groups) to create, edit, and delete service queue groups.

The fields on the Service Queue Groups page are described below.

Field	Description
Service Queue Group Name	Enter the name of the service queue group.
Select Service Queue Type	Select the service queue type for the service queue group.
Service Queues	Select the desired service queues from the list of the available service queues of the service queue type you selected.
Color	Select the color you want to assign to the service queue group.

System Configuration

The pages in this section of Application Management enable you to configure system-wide settings in the WFM environment and manage user requests.

The pages are:

- [Global Settings](#)
- [User Requests](#)
- [Adherence State Mapping](#)

Global Settings

The Global Settings page enables the administrator to set up system-wide parameters for WFM. These parameters are defined in the following table.

Updates to global settings do not go into effect on client desktops until users refresh or restart their browsers.

Parameter	Description
First Day of the Week	Sets the first day of the week of the schedule. The default value is Sunday. Do not change this setting if you have already set up and assigned work shift rotations. If you do change it you will have to create new work shift rotations to incorporate the change. If agents have completed dynamic scheduling, you will have to reschedule all the dynamic scheduling.
Number of Weeks Visible in Agent Schedules	Sets the number of past and future weeks that are displayed in agent schedules.
Default Time Zone	Sets the time zone that is used by default in agent schedules. If you change it again, it applies to all users who are configured from that point on. You can apply the changed time zone to all current users by clicking the Apply to All Users button.

User Requests

Schedulers and administrators can send requests to the server to produce various scheduling and planning results. These requests are put into a queue and processed one at a time.

> **Note**: Administrators can see all requests. Schedulers can see only the requests that they generate.

The User Requests page (Application Management > User Requests) lists all the requests that are run. The list displays the request type, the time and date the request was submitted, the name of the user who made the request, and the current status of the request.

The requests can be filtered and sorted by any column. Requests stay in the list until they are deleted.

Note: Requests that are scheduled to be run at a later date and time than when they are submitted are shown as Pending until they run.

Note: If a capture request is in pending state for longer than seems reasonable, consult the log for possible reasons the request is not being processed.

Managing User Requests

By default all requests are displayed on the User Request page, with the most recent request at the top of the list.

- To filter the list, enter your selection criteria and click Display User Requests.

- To sort the list, click any column header to sort the table in ascending or descending order.

- To view more details about a request, double-click anywhere in the request's row to display a popup with the details.

- To delete one or more requests from the list, select the check box next to the request and click Delete. To select all requests for deletion, select the check box at the top of the table.

Note: You cannot delete requests that are tagged as In Progress. Requests that are tagged as Success, Failure, and Pending can be deleted.

Adherence State Mappings

The Adherence State Mappings page (Application Management > Adherence State Mappings) enables you to specify which agent states and reason codes determine if an agent is or is not in adherence for a scheduled activity, and which schedule activities are used to calculate agent adherence percentages.

The default settings are the most common method for calculating adherence, and it is not necessary for you to change them. However, the settings can be customized for your contact center if desired.

Agents will be shown to be in adherence if they are in one of the agent states mapped to a specific scheduled activity. If they are in an agent state not mapped to the scheduled activity, they will be shown to be out of adherence.

> **Example**: In the following figure an administrator has mapped two ACD agent states, Out of Service (with reason code 2) and Not Ready (with reason codes 3 and 5), to the Assignment schedule activity. This means that when an agent is scheduled with an assignment activity, that agent must be in the Out of Service agent state with reason code 2 or the Not Ready agent state with reason code 3 or 5 in order to be in adherence. Any other agent state/reason code during the scheduled time will result in the agent being shown not in adherence.

Assignment		
Assigned Agent State	**Reason Codes**	**CALCULATE ADHERENCE**
Out of Service	2	○ Yes
Not Ready	3,5	● No
Add Delete		

The administrator has also decided that whether or not an agent is in adherence for the Assignment schedule activity will not be considered when calculating that agent's adherence percentage score. The Calculate Adherence option is set to "No".

The following table lists the columns that appear in the Adherence State Mapping page.

Scheduling columns

Name	Description
Assigned Agent State	The agent state and reason code used to calculate agent adherence to the schedule activity.
Reason Codes	The reason codes associated with the agent state and used to calculate agent adherence to the schedule activity.
Calculate Adherence	Select Yes to include or No to exclude time adherence data for the schedule activity in the calculation of the agent's adherence percentage.

Managing Adherence State Mappings

To customize how adherence is shown and calculated in your contact center, do the following.

1. For each schedule activity, configure at least one agent state you want considered to be in adherence. Select the appropriate agent state from the agent state drop-down list. If you need to add an agent state field, click Add. If you need to delete an agent state field, select the field and click Delete.

2. Configure the reason codes you want to consider as being in adherence for the schedule activities that use reason codes. Valid values are 1–65535.

    - A blank field indicates all reason codes are considered.

    - A dash between numbers indicates a range. "1–3" means reason codes 1, 2, and 3 are considered.

    - A comma between numbers indicates specific numbers. "1,3,5" means reason codes 1, 3, and 5 are considered.

    - You can use a combination of a range of numbers and specific numbers, for example, "1–5,7,9,12".

3. Select the Calculate Adherence option you want. Select Yes to include or No to exclude time adherence data for the schedule activity in the calculation of the agent's adherence percentage.

4. Click Save to save your changes.

To revert the adherence state mapping settings to the default configuration, click Reset.

Adherence State Mapping for Non-Interactive Service Queues

Adherence can be calculated for non-interactive service queues (for example, those that handle customer email). Since the default settings are intended for service queues that support interactive customer contacts, you must configure custom mappings of all ACD states that agents are allowed to be in when handling non-interactive contacts.

> **Example**: Your contact center might want to map the following agent states to the In Service activity for a service queue that supports non-interactive customer contacts:
>
> • Ready Available
> • Talk
> • After Contact Work
> • Hold
> • Out of Service (reason code 10)
> • Not Ready (reason code 20)

Strategic Planning

The pages in this section of Application Management enable you to estimate future contact center requirements and costs.

The pages are:

- [Strategic Resources](#)
- [Strategic Forecast Request](#)
- [Strategic Forecast](#)
- [Hiring Steps](#)
- [Hiring Plans](#)

Strategic Resources

Strategic resources are the people and capital equipment that make up your contact center. The strategic resources you configure here are used to generate strategic planning reports that estimate future costs and requirements.

The base resource is the agent. All other resources are calculated directly or indirectly in terms of the number of agents in the contact center.

Example: You configure one administrator for every 50 supervisors, and configure one supervisor for every 20 agents. A supervisor has a direct relationship to the number of agents, and an administrator has an indirect relationship to the number of agents through the number of supervisors.

Managing Strategic Resources

Use the Strategic Resources page (Application Management > Strategic Resources) to create, edit, and delete strategic resources.

Note: The Agent resource is a system resource. You can edit the details of the Agent resource, but you cannot delete it.

The fields on the Strategic Resources page are described below.

Field	Description
Resource Name	Enter a unique name for this resource.
Resource Category	Choose the type of resource this is: a human resource (employees and contractors) or a capital item (equipment, furniture, and fixtures).
Resource Cost	Enter the resource cost per month or per year, or as a one-time expenditure. If you choose one-time expenditure, enter the resource's lifespan in months.

Field	Description
Resource Ratio	Complete the statement to describe the ratio of this strategic resource to another resource. Directly or indirectly, every resource is defined in relation to the Agent resource. **Note**: This field is not present for the Agent system resource, since the agent is the base resource.
Current Number of Resources	Enter the number of this strategic resource you currently have in the contact center. If the resource is a human resource, use the number of FTE agents. If the strategic resource is a one-time expenditure, use the number of resources whose cost has not yet been fully amortized.

Strategic Forecast Request

A strategic forecast request generates a strategic forecast for one or more service queues for the period starting on the first of the next month and going forward five years. The forecast details the number of agents needed per month to meet the service queue's projected requirements.

Note: Strategic forecast requests are successful only for interactive service queues. They will fail if run for a non-interactive service queue.

In order for a strategic forecast to be generated, there must be a production distribution for each service queue.

The forecast is calculated based on these factors:

- The contact volume trend calculated from the service queue historical data in the two reference ranges you select
- The Average Talk Time, Average After Contact Work Time, and Service Level Objective from the production distribution

This reference period consists of two ranges. Range 1 must be for a period earlier than Range 2, and the two ranges cannot overlap.

> **Best Practices**: We recommend you choose your reference periods to maximize the accuracy of the calculated trend. Longer reference periods are more accurate than shorter ones. Choosing periods that do not include significant aberrations from normal operations (for example, a lengthy power outage) that can affect the calculated trend is also a good idea.

Generating a Strategic Forecast Request

To generate a strategic forecast request (Application Management > Strategic Forecast Request), follow these steps:

1. Select one or more service queues.

2. Select start and end dates for Range 1 and Range 2 reference periods. Range 1 must be earlier than Range 2 and the two ranges cannot overlap.

3. Schedule the request. By default the request runs immediately.

Strategic Forecasts

A strategic forecast is produced by running a [strategic forecast request](#). The forecast displays the number of agents required per month to meet the requirements of a service queue starting the first of the month following the date of the request and going forward five years.

The strategic forecast is used to generate various strategic planning reports. These reports are:

- Budgetary Planning
- Facility Planning
- Staff Planning
- Hiring Plans

You can [edit the strategic forecast](#) if desired.

Viewing and Editing Strategic Forecast Data

Use the Strategic Forecast page (Application Management > Strategic Forecast) to view and edit a strategic forecast for a specific service queue.

> **Note**: You must run a [strategic forecast request](#) for the service queue first in order to view and edit a strategic forecast.

1. Select the desired service queue to display the strategic forecast for that service queue.
2. In the displayed table, edit the data as desired and then click Save.

Hiring Steps

A hiring step is a component of a hiring plan. The metrics you configure for each step are used to determine how many candidates must enter the hiring pipeline to meet future agent requirements as determined by a strategic forecast.

Managing Hiring Steps

Use the Hiring Steps page (Application Management > Hiring Steps) to create, edit, and delete hiring steps.

You can edit and delete steps that are being used as part of a hiring plan. Once a step is added to a hiring plan, the step's attributes remain as they were at that time. The step can be deleted here and not affect the plan it was made a part of.

The fields on the Hiring Steps page are described below.

Field	Description
Select Hiring Plan Step	Select an existing step for editing or deletion.
Step Name	Enter the name of the hiring step.
Duration	Enter the number of days the step lasts. This value must be a whole number.
Attrition Rate	Enter the percentage of candidates that drop out from the hiring process during this step. This value must be a whole number.

Hiring Plans

A hiring plan is a sequence of hiring steps that describes the process of hiring agents to meet future requirements in your contact center. Hiring plans are used in conjunction with strategic resources and the strategic forecast to generate the Strategic Hiring Plan Report.

Managing Hiring Plans

Use the Hiring Plans page (Application Management > Hiring Plans) to create, edit, and delete hiring plans.

The fields on the Firm Date Associations page are described below.

Field	Description
Plan Name	Enter a unique name for the hiring plan.
Plan Details	Select the desired hiring steps from the left pane and move them to the right pane. You can rearrange the hiring steps in the right pane using the up and down arrows.

Vacation Planning

The pages in this section of Application Management enable you to configure and manage agent time off.

The pages are:

- Vacation Plans
- Full Time Equivalents Profiles
- Vacation Type Mapping
- Time Off Report
- Time Off Allotments

HRMS Integration

WFM can be configured (using the WFM Configuration Setup utility) to integrate with your Human Resources Management System (HRMS). This means that vacation plans are imported from the HRMS to WFM, and the number of vacation hours used by agents are exported from WFM to the HRMS. In this way, the Vacation Hours section on the Agents page contains current information for each vacation type:

- Hours of vacation earned
- Hours used
- Hours approved (but not yet taken)
- Hours remaining

Systems that do not have HRMS integration use vacation plans created on the Vacation Plans page. Systems that do have HRMS integration do not include the Vacation Plans page—the information from the HRMS replaces the information that is configured there.

For more information on how to integrate HRMS with WFM, see the *WFM Installation Guide*.

Vacation Plans

Vacation plans are the time off plans assigned to agents. There can be multiple vacation plans in order to manage time off for various types of agents, for example, part-time agents and full-time agents. How this is managed is specific to your contact center.

There are four types of time off in each vacation plan:

- Days off
- Floating holidays
- Personal days
- Vacation

How each of these vacation types are defined is up to your contact center. In order to track hours used against each of these vacation types, you map exceptions to each type.

> **Note**: The Vacation Plans page is present only in systems that do not use [HRMS integration](#). Systems that do use HRMS integration get their vacation plans from the HRMS.

Managing Vacation Plans

Use the Vacation Plans page (Application Management > Vacation Plans) to assign create, edit, and delete vacation plans.

The fields on the Vacation Plans page are described below.

Fields	Description
Plan Name	Enter a unique name for the plan. An example of a name is "Full time up to 5 years service"
Vacation Types/Allocated Hours	Enter the number of hours allocated for each vacation type.
Assign Agents	Select the agents assigned to this plan. An agent can be assigned to only one vacation plan.

Full Time Equivalents Profiles

If you are using the strategic planning and vacation features, you must create full time equivalents profiles and assign agents to these profiles. WFM uses full time equivalents profiles when creating strategic plans and analyzing vacation requests.

A full time equivalent (FTE) is equal to the number of total scheduled person hours divided by the number of hours per week that constitute a full time person (for example, 40 hours or 35 hours). An FTE might consist of several part time individuals whose combined work hours in a week equal the full time person, but might not incur benefits expenses.

For forecasting and planning purposes you need to establish the number of hours an agent is paid per week (for example, 20, 35, or 40 hours). WFM uses this value to determine the number of FTE agents required for a forecast. If the number of paid hours is 40 and the forecast calls for 80 hours, you need two full time agents.

Example: A contact center has 100 agents. An FTE is 40 paid hours a week (160 hours a month), and an FTE agent earns $3,000 a month. All agents are required to take eight hours of training this month. That is 800 hours of training for the month (100 × 8). If you change the number of hours training to FTEs, you would need five FTEs (800 ÷ 160), which corresponds to $15,000 spent on training for this month (5 × $3,000). By using strategic planning to determine costs in advance, managers can ask for fewer training hours in relation to their budget or spread the training out over a period of two or three months.

Managing Full Time Equivalents Profiles

Use the Full Time Equivalents Profiles page (Application Management > Full Time Equivalents Profiles) to create, edit, and delete full time equivalent profiles.

The fields on the Full Time Equivalents Profiles page are described below.

Field	Description
FTE Name	Enter a unique name for the FTE profile.
Minimum Hours per Week	Enter the minimum number of paid hours per week for this profile.
Maximum Hours per Week	Enter the maximum number of paid hours per week for this profile.
Assign Agents	Assign agents to this profile. This is required for vacation planning. An agent cannot request time off unless the agent is assigned to an FTE profile.

Vacation Type Mapping

The Vacation Type Mapping page enables you to associate exceptions with the four types of vacation built into the system. These types are:

- Personal Days
- Days Off
- Floating Holiday
- Vacation

This lets you customize exactly what each vacation type means in your contact center. An exception can be mapped to only one vacation type.

WFM then can track how many hours of each type of vacation have been used by an agent. In systems with [HRMS integration](#), this information is exported to a file that can be imported into the HRMS on a daily basis. In systems without HRMS integration, this information is applied to the vacation plan configured for each agent. In both systems, the vacation hours available to an agent are displayed on the Agents page.

Managing Vacation Type Mapping

Use the Vacation Type Mapping page (Application Management > Vacation Type Mapping) to assign exceptions to each of four vacation types.

The fields on the Vacation Type Mapping page are described below.

Field	Description
Vacation Type	Select one of the four available vacation types. Each in turn should be configured.
Exceptions	Assign the desired exceptions to the vacation type. Each exception can be assigned to only one vacation type.

Time Off Report

The Time Off Report (Application Management > Time Off Report) is a quick way to see a list of agents who have time off scheduled on a selected date. As soon as a date is selected in the Date field, the list of agents is displayed.

The list if read-only. If desired, you can export the list as a comma-separated values (CSV) file by clicking the Save as CSV button.

Time Off Allotments

Time off allotments are used to assist in managing time off requests. A scheduler or administrator sets the maximum number of FTEs per service queue that can have time off for each day of the year. When an agent requests time off, the agent can display a table showing the current available number of FTEs on a specific day and the gap between the forecasted FTEs and scheduled

FTEs for that day. If the gap is negative, the service queue is understaffed; if it is positive, the service queue is overstaffed. The allotted FTE number reflects how much time off has already been approved for that day.

The impact of an agent's time off on the daily allotment is calculated as a fraction of the Default FTE per Day (configured on the Global Settings page). The agent's daily FTE is used for a whole day off. (The agent's daily FTE is calculated by dividing the agent's weekly FTE by five.)

For example, if three agents ask for September 10 off, and their daily FTEs differ, the following table shows how that impacts the time off allotment for that day. In this case, the Default FTE per Day is configured to be 8 hours and the time off allotment for that day is 3 FTEs.

Time Off Requester	Daily FTE	Impact Calculation
Agent A	4	4 ÷ 8 = 0.5 FTE
Agent B	6	6 ÷ 8 = 0.75 FTE
Agent C	8	8 ÷ 8 = 1.0 FTE
TOTAL		2.25 FTEs

Therefore, after these agents' time off requests are approved, the time off allotment remaining for September 10 is 0.75 FTE.

> **Note**: If an agent belongs to multiple service queues, the supervisor who approves a time off request determines which service queue's FTE allotment it applies to.

Managing Time Off Allotments

Use the Time Off Allotments page (Application Management > Time Off Allotments) to create, edit, and delete time off allotments for service queues.

The fields on the Time Off Allotments page are described below.

Field	Description
Service Queue	Select the service queue whose allotments you want to configure.

Field	Description
Year	Select the year to configure.
Month	Select the month to configure. If you select a specific month, you will be able to configure the allotments for that month only. If you select All, you will be able to configure the allotments for the entire year.
Quick Entry	To quickly enter values in the allotment table, enter the desired allotment for each day of the week. That value is then written to each corresponding day of the week in the allotment table. When your cursor is in the field for a specific day, the corresponding days in the allotment table are highlighted in blue. You can edit the values in the allotment table after you have filled it using Quick Entry.
Copy To	Once you have configured and saved the allotments for the service queue, you can copy those values to another year for this service queue, or to another service queue for any year. Even if you configure only one specific month's allotments, the copy action fills all other days with blanks and overwrites the entire year's allotments for the other service queue or year.

My Schedule

The My Schedule application allows you to view your schedule by day, week, or month.
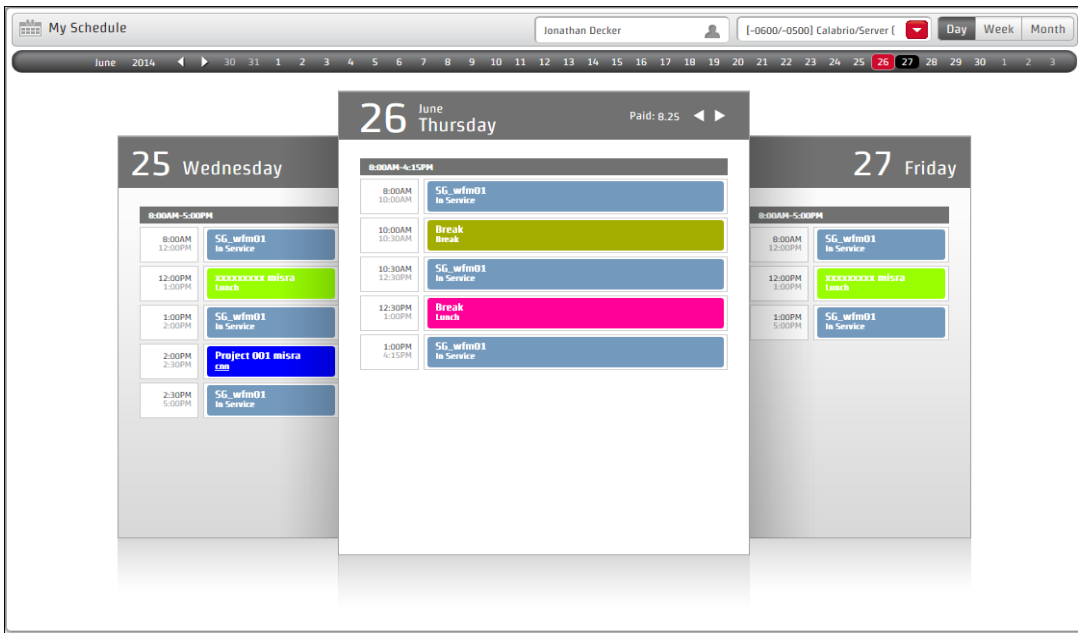

By default, the My Schedule application displays today's schedule in Day view in the time zone configured for you by the administrator. You can also view your schedule in Week and Month view for any date a schedule has been created.

If you are a supervisor, you can view your own schedule and the schedules for agents on your teams, and change the time zone a schedule is displayed in.

Activities are color-coded according to their types. The colors are configured by the administrator. For example, breaks might be displayed in purple and meetings in blue. The color-coding is visible on any schedule view you choose, either as background for the activity listing or as a stripe or square next to the activity.

My Schedule Views

The My Schedule toolbar allows you to view your schedule by day, week, or month.

The graphic below displays the toolbar, calendar bar, and header seen by supervisors, schedulers, and administrators. The agent's view is identical except that the Select Agent and Select Time Zone fields are not present on the toolbar.
The following table describes the My Schedule toolbar, calendar bar, and header functionality.

Field	Description
Toolbar	
Select Agent	(Supervisors, administrators, and schedulers only) Select the agent from the drop-down list whose schedule you want to view.
Select Time Zone	(Supervisors only) Select a time zone in which to view an agent's schedule. By default the schedule is displayed in your display time zone. See Time Zone Considerations for a detailed explanation of time zones and how they relate to schedules.
Day/Week/Month	Click to select the schedule view desired. The default view is Day view for the current date. Click the left and right arrows to view schedules in the past or future, or select a specific day or month from the calendar bar.
Calendar Bar	
Month and year	The month and year displayed is shown at the left end of the calendar bar. You can quickly navigate to another date by clicking the month and year and choosing the desired period from the drop-down menu.

| Field	Description
Day view/Week view	Click any specific date from the 5 weeks of dates displayed in the calendar bar to view the schedule for that date or the week that includes that date. Each date has a tooltip that names the day of the week. Click the left and right arrows to change the month displayed. The displayed date is highlighted in red. Today's date is highlighted in black. In the Week view, details of each activity are displayed in a tooltip when you hover the mouse over the activity. The Day and Week views can also include a hyperlink related to the schedule activity. For example, if you are scheduled for e-learning, you click the hyperlink in the schedule to view the e-learning training website.
Month view	Click any month from the 12 months displayed to view the schedule for that month. Six weeks are displayed in Month view, starting with the week the first day of the selected month is in. Click the left and right arrows to change the year displayed. The displayed month is highlighted in red. The current month is high-lighted in black. The activities for each day's schedule are limited to four listed events. "More" appears at the bottom of the date square if there are more than four activities on that day. The entire schedule is summarized in a tooltip when you hover the mouse over the bar at the top of each calendar square.
Header	
Paid	The total paid hours scheduled on the displayed day, week, or month.
Time	(Week view only) Displays each day's schedule to show the length of each activity on an hourly grid. If a schedule crosses midnight, all activities after midnight are displayed on the next day.
Event	(Week view only) Displays each day's schedule as a list of activities. All activities for the shift are displayed on the day the shift starts, even if the shift crosses midnight into the following day. This view is recommended for printing a schedule.
Today	(Week and Month view only) Click to display the week or month that contains today's schedule.
Left/Right Arrows	Click to move you one day, one week, or one month back and forth in the schedule, depending on the view you are using.

Time Zone Considerations

All WFM users are assigned a display time zone by the administrator. The default setting is the time zone in which the WFM server is located (the server time zone). For a contact center with all locations in that same time zone, the default setting is likely used for all WFM users. However, if the contact center has locations in multiple time zones, users located in time zones other than the WFM server time zone can be assigned a user-specific display time zone so they see their schedules in local time.

> **Example**: If the WFM server is located in Chicago in the Central Time zone, then the default server time zone is Central Time. Agent A is in Chicago so his display time zone is the default server time zone. However, Agent B is in Los Angeles, so her display time zone is set to Pacific Time, and Agent C is in New York City, so his display time zone is set to Eastern Time. All three agents see their schedules in their local time zone.

It is important to note that when a supervisor changes the display time zone, only the time labels (the hours) on the displayed schedule change, and not the day/date labels. The day/date labels continue to reflect the supervisor's configured display time zone.

Time zone: -1100 GMT

Day/date label

Summary bar

Time label

| 2 September Tuesday | Paid: 8.25 ◀ ▶ |

2:00AM-10:15AM

| 2:00AM 4:00AM | SG_wfm01 In Service |
| 4:00AM 4:30AM | Break Break |

Time zone: GMT

| 2 September Tuesday | Paid: 8.25 ◀ ▶ |

2:00PM-10:15PM

| 2:00PM 4:00PM | SG_wfm01 In Service |
| 4:00PM 4:30PM | Break Break |

Time zone: +1100 GMT

| 2 September Tuesday | Paid: 8.25 ◀ ▶ |

12:00AM Wednesday – 8:15AM Wednesday

| 12:00AM 2:00AM | SG_wfm01 In Service |
| 2:00AM 2:30AM | Break Break |

The figure above shows the same schedule in three different time zones. Note that, while the time labels change, the day/date labels do not.

If the time shift forces the schedule onto another day, that is shown in the summary bar.

The day/date labels show the supervisor's display time zone. The time labels show the time zone selected to view the schedule.

It is possible for users to see their schedules in a different time zone than where they are actually located. It all depends on how the administrator has configured their display time zones. As a result, the times shown in the My Schedule application and widget do not necessarily match the local time shown on your computer.

Supervisors, schedulers, and administrators also see their schedules and the schedules of the agents on their teams in the time zone assigned to the their user account. For example, if a supervisor located in the Central Time zone views the schedule of an agent located in the Pacific Time zone, that agent's schedule will be shown in Central Time, because that is the supervisor's display time zone.

Supervisors, schedulers, and administrators can control which time zone is shown in My Schedule by changing it in the time zone drop-down list. For example, a supervisor might want to see an agent's schedule as the agent sees it, especially if that agent is located far away from the supervisor and the time difference is more than a few hours. In that case, the supervisor selects the agent's local time zone from the time zone drop-down list.

> **NOTE:** The time zone shown in the Select Time Zone drop-down list is not the display time zone assigned to the user whose schedule is displayed in My Schedule. It only reflects the time zone chosen by the supervisor to view an agent's schedule. The only way you can know what is a user's display time zone is to look up the display time zone set on the user's Users record.

Printing a Schedule

Use your browser's print functionality to print a schedule. The recommended view to print is the Week view set to show the daily schedules by event, not by time.

You might have to change the print default settings to achieve an optimal result (adjusting page orientation, margins, and so on). Consult your browser's documentation on how to work with the print settings.

Accessing Your Schedule Outside of Work

Agents can view their schedules outside of work through an email client or calendar application on a mobile device or personal computer. The email client or calendar application displays your WFM schedule as it appears in the WFM interface by reading the iCalendar data file from the WFM iCalendar Service.

> **Note:** The iCalendar feature is only supported for agents, not supervisors, schedulers, or administrators.

> **Note:** Agents can view only their own schedule.

> **Note:** The color coding that appears in the WFM interface is not displayed when you view the WFM schedule on your mobile device or personal computer.

The following clients and devices are supported:

- Apple devices such as an iPhone or iPad (in conjunction with the Apple Calendar app)
- Microsoft Outlook
- Android devices such as a tablet or phone (in conjunction with a calendar app that can read an .ics file)

Consult your client or device documentation for exact instructions on how to add or import a calendar. Your mobile device or email client will typically access your WFM schedule via a URL. Ask your administrator for the correct URL. The format for the URL is as follows, where <base server> is the IP address of the WFM base server:

`https://<base server>:4430/calendar` (secure) or

`http://<base server>:8086/calendar` (unsecure)

You will be prompted for a username and password. These are the same login credentials you enter when logging in to WFM. If you are using Active Directory, you must use <domain>\<username>.

> **Note**: If you are integrating your schedule into Microsoft Outlook, you must use two back slashes (\\<domain>\<username>).

Agent Dynamic Scheduling

The dynamic scheduling feature enables you to create your own schedule for specific weeks if configured to do so by your administrator or scheduler.

If you are included in a dynamic scheduling event, you will see an event exception appear in your daily schedule. The exception includes a link that will take you to the Agent Dynamic Scheduling page.

> **Note**: The only time you can create your schedule is during the exception. Once that time is past, you can only view, not edit, the Agent Dynamic Scheduling page.

When you first access the page you will see the following:

- Work rule parameters for the schedule you will be creating. There are three kinds of work rules: uniform, hybrid, and variable.

- Staffing icons that give you an idea of the staffing needs for the intervals that cover the times you can start your shift. In this graphic, the parameters say that you can start work any time between 07:00 and 12:00, so the staffing icons are displayed for every half hour interval between those times.

- A countdown timer that tells you how much time is left for you to create and submit your schedule. Once the countdown timer reaches zero, you can no longer edit or submit your schedule.

When you select your schedule, it is depicted by gray bars underneath the staffing icon section.

Staffing Icons

The staffing icons depict the relative need for staffing for a shift starting in that interval.

You might see a number on a staffing icon (if your administrator configured dynamic scheduling to include them). The number conveys the same information as the staffing icon, it is just an alternative way to display it.

5

The staffing icon and number are determined according to the kind of work rule configured for the work shift.

Work Rule	Calculation
Uniform	The average staffing need across all work days for shifts beginning in that interval.
Hybrid	The average staffing need for the shift length for that day beginning in that interval.
Variable	The average staffing need for the selected shift length for that day beginning in that interval. When you first view the page, the icon displayed is based on the configured minimum shift length. When you specify a shift length, the icon and number can change accordingly.

Creating Your Own Schedule

Important! You have a limited time to create your schedule. Keep an eye on the countdown timer so you don't run out of time. Once the timer reaches zero, you can no longer edit or submit your schedule.

To create your own schedule, follow these steps:

1. Click the link in the dynamic scheduling exception in your schedule to access the Agent Dynamic Scheduling page.

2. Based on the work rule parameters listed to the right of the scheduling grid, select the start time for each day you will work. Use the staffing icons to help you determine which shifts have the most staffing requirements and choose accordingly.

Days that are set aside as days off display a gray column instead of any staffing icons.

If you are scheduling according to a variable work rule, and you are allowed to select a day off, do not select a staffing icon for that day.

3. When every day in the week has been configured with a work shift, a check mark appears in the date box to tell you that the work week is complete:

4. If you are to schedule more than one week, click the right arrow next to the date box to go to the next week, and create a schedule for that week.

> **Note**: A different type of work rule might apply to each week you schedule.

5. When you have scheduled every week, click Submit.

Agent Schedules

Agent Schedules allows supervisors, schedulers, and administrators to manage the schedule for selected agents by updating the production schedule.
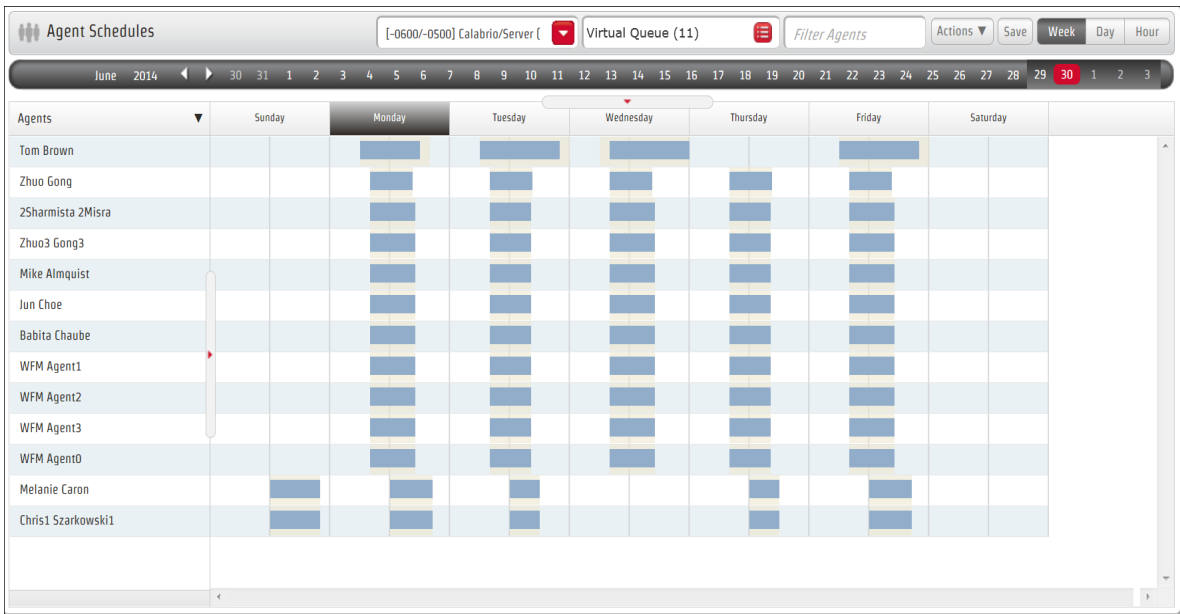

The process of scheduling agents for non-service activities (for example, meetings or training) after a schedule has been generated is called post-production planning. You can use Agents Schedules to find times when you can schedule agents for activities so that the service level is least affected.

By default, Agent Schedules opens to today's date. You can quickly navigate to another date by clicking the month and year and choosing the desired period from the drop-down menu.

Use Agent Schedules to complete the following tasks.

- Determine the optimal time to schedule an activity so that it has the least impact on the service level and insert the activity
- Trade schedules between agents

- Monitor real time adherence and conformance and other performance statistics

You can edit schedules only for the agents who are assigned to a team in your Main View. Agents who are not assigned to a team in your Main View are read-only and show a lock icon next to their names.

A popup appears when you hover over a schedule in the Agent Schedules page for the Day or Week option. The popup identifies the agent, the agent's start and end time, and displays the number of hours the agent is paid for.

Craig Kopinski

Start Time:	8:00 am
End Time:	5:00 pm
Paid:	8.00
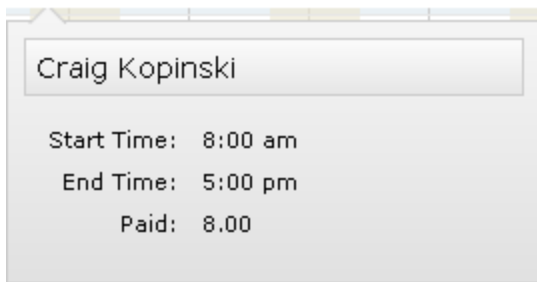

A popup appears when you hover over a scheduled activity in the Agent Schedules page for the Hour option. The popup identifies the activity, service queue, or multiskill group, the agent associated with the activity, service queue or multiskill group, the start and end time, whether or not the activity is paid, and the work shift.

Break

Type:	1st Break
Agent Name:	Matt Kleczka
Start Time:	10:15 am
End Time:	10:30 am
Paid:	Yes
Work Shift:	8am, 8hrs, _MTWTF_
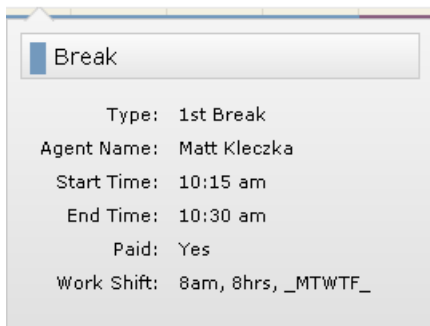

Note: Sometimes the popup appears to show an incorrect start or end time for the activity. The reason for this is that activities are in two layers.

The bottom layer in the schedule display is used for in service, overtime, assignment and closed service activities. The upper layer is used for breaks, lunches, projects, and exceptions. If you hover over a bottom layer activity, the popup shows the full length of time of that activity without taking into consideration any upper layer activities that might be on top of it.

Agent Schedules Toolbar

The Agent Schedules toolbar controls which agents you see in the Agent Schedules page. Its fields and buttons are described in the table below.

Note: Until you select a service queue group, service queue, or team, the Agent Schedules page is blank.

When you pick a service queue, schedules are shown for the entire week. The schedules that appear are for agents who fit one or more of these criteria:

- They are in a team that is in your view
- They have at least one activity scheduled for the selected service queue and are working the queue
- They have schedules and are mapped to the selected service queue via skill mapping and can work the queue
- They have schedules and are mapped to the selected service queue via multiskill groups and can work the queue

Note: When you schedule an agent with at least one activity, who is mapped to a selected service queue on a Saturday, the agent will appear on the schedule for the following week.

Field/Button	Description
Select Time zone	Choose your time zone preference from the drop-down list. The server's time zone appears in this field by default. When you change this value your selected time zone appears in the Time Zone row. The server's time zone appears in the Agents row.
Select Criteria	Choose the service queue group, service queue, or team to display those agents' schedules. To see agents who are scheduled for a multiskill group, select the service queues associated with the multiskill group or the agent's team. You can type all or part of the name in the field to find it more easily. This field is not case sensitive. Your selection persists until you change it.
Filter Agents	Filter agents by typing letters in an agent's name. For example, if you type "br" in the field, only names that contain the letters "br" are displayed. This field is not case sensitive.
Actions	This button allows you to modify agents' schedules by inserting activities and trading schedules. It also can take you to today's schedule in one click and discard any changes you made but have not yet saved, and find an optimal time for an activity you want to insert.
Save	This button saves the changes to the database and updates the production schedule.
Week/Day/Hour	These buttons enables you to display the agent schedules by week, day, or hour. Changes to the date and view persist from session to session.

Time Zones

By default, the Agent Schedules page displays schedules in the server time zone. However, if you select a time zone from the Time Zone drop-down list that is different from the server time zone, a row is added to the schedule grid showing that time zone as well.

> **Example**: The time zone row in the schedule grid below shows that the America/Los Angeles time zone has been selected. As a result, a row labeled with the time zone name has been added to the top of the schedule grid, which shows schedule times in the server time zone. The added time zone row is the only place where times in the selected time zone are displayed. Everywhere else in the schedule, the server time zone is used.

Sorting the List of Agents

Use the triangle icon in the Agents column header to control how the agents are sorted in the schedule grid. You can sort agents in ascending order by the following:

- First name

- Last name

- Arrival time. Agents are sorted according to the first scheduled activity on the schedule, and then by first name and last name. Agents who are available but not scheduled are listed after scheduled agents, and agents who are unavailable and not scheduled are listed last.

- Rank. Agents are sorted based on their ranking as assigned on the Agents

page. Agents of equal ranking are then sorted by first name.

- Company start date. Agents are sorted by their seniority in the company, with the least senior listed first.

- Department start date. Agents are sorted by their seniority in the department, with the least senior listed first.

The list of agents can be further refined by pinning an agent to the top of the list. When an agent is pinned, the agent is not subject to any sorting and always appears at the top of the list of agents in the schedule. You can pin multiple agents, and the one most recently pinned is at the top.

You pin an agent by hovering your mouse over the agent's name, and then clicking the pin icon that appears at the right side of the cell (see below). To unpin the agent, click the icon again and the agent is immediately subject to the sorting method used in the list of agents.
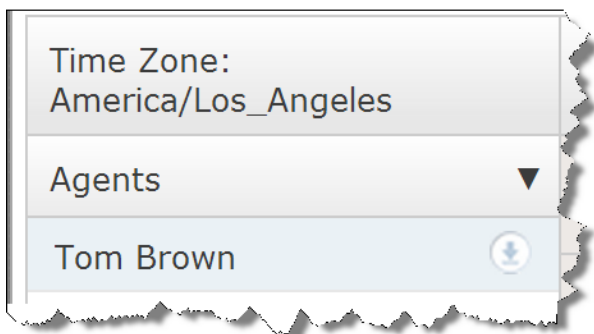

Drawers

A drawer is a pane that is opened and closed by clicking a control in the Agent Schedules page.
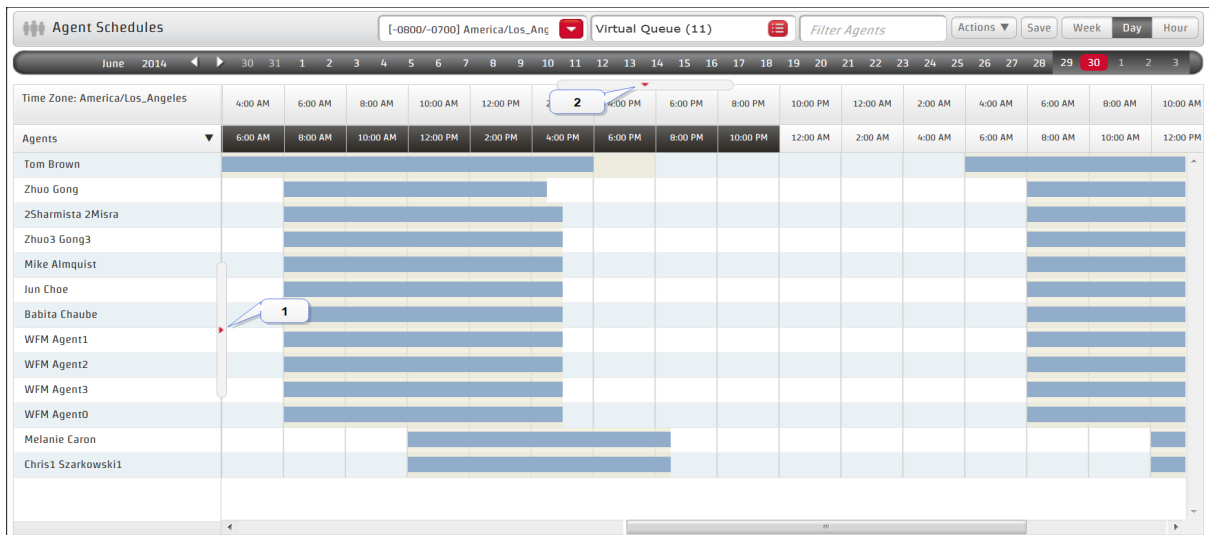

There are three drawers available:

- Agent Adherence Details drawer, displayed by clicking an agent's name in the Agents list

- Adherence drawer, displayed by clicking the arrow control (number 1 in the figure) to the right of the Agents list

- Coverage drawer, displayed by clicking the arrow control (number 2 in the figure) below the calendar bar

> **Note**: The Coverage drawer is not available when the agent schedules are filtered by service queue group or team.

Adherence Details Drawer

The Adherence Details drawer is opened and closed by clicking an agent's name in the Agents list. It shows how well the agent has maintained schedule adherence since the start of the day. Adherence is calculated using agent state data captured from the ACD in real time. For this reason, the values displayed at the top of the Adherence Details drawer (Scheduled Total, Scheduled In Service, Actual In Service, and Out of Adherence) reflect the data at the time you opened the drawer, and might differ from the values shown in the detail portion. You can refresh the data in the drawer by closing it and then reopening it.

You can use the Adherence Details drawer to:

- Compare the agent's scheduled activities with real-time statistics about the agent from the ACD.
- Interpret adherence statistics

The following table describes the Adherence Details drawer fields.

Column	Description
Adherence %	The agent's adherence score. The percentage value is updated every millisecond and displayed as a decimal value. **Note:** This value might differ from the A % value in the Adherence drawer because each drawer refreshes at a different rate, and because the values are rounded in the Adherence drawer.

Column	Description
Conformance %	The agent's conformance score. The percentage value is updated every millisecond and displayed as a decimal value. **Note:** This value might differ from the C % value in the Adherence drawer because each drawer refreshes at a different rate, and because the values are rounded in the Adherence drawer.
Scheduled Total	The total time the agent is scheduled to work for the selected date. If the selected date is the current date, the value is calculated to the current time. This value includes only paid time, not unpaid time.
Scheduled In Service	The total time the agent is scheduled to be in service and available to handle calls for the current date so far. When agents are in service they are either ready to handle a call or handling a call.
Actual In Service	The total time the agent is ready or handling calls so far for the current date.
Out of Adherence	The total time the agent is out of adherence so far for the current date.
Scheduled	A list of scheduled activities and their start times for the selected day.
Actual	• Agent State—The agent's state from the ACD. • Reason Code—The reason code associated with the Out of Service and Not Ready states. • In—The time when the agent entered the agent state.
In Adherence	The time in adherence for each agent state. If the selected date is the current date, the value is calculated to the current time.
Out of Adherence	The time out of adherence for each agent state. If the selected date is the current date, the value is calculated to the current time.

Adherence Drawer

The Adherence drawer is opened and closed by clicking the arrow control to the right of the Agents list. It displays the real-time agent data and adherence

and conformance percentages for the agents in the Agents list. When displayed, the data is refreshed every 30 seconds.

WFM collects real-time agent state data from the ACD and compares it with the agent schedules to calculate the adherence and conformance percentages.

> **Note:** The adherence and conformance percentages in the Adherence drawer are updated every 30 seconds and rounded up to a whole number. These percentages might be different than the percentages displayed in the Adherence Details drawer because each drawer refreshes at a different rate, and the Adherence Details drawer displays the adherence and conformance percentages as a decimal instead of a whole number.

The following table lists the fields in the Adherence drawer.

Field	Description
Agents	The agent's name.
Red or green ball	A green ball indicates that the agent is in adherence. A red ball indicates that the agent is out of adherence.
Schedule Activity	The agent's current scheduled activity.
Agent State	The agent's ACD agent state.
RC	The reason code (if any) associated with the agent's ACD state.
A %	The agent's adherence percentage. Adherence is the percentage of time that agents follow their schedules. When calculating adherence, WFM considers scheduled arrival and departure times, breaks, lunches, and time spent on scheduled activities, and compares the actual activity to the scheduled activity each millisecond through the work shift. For example, an agent who is scheduled to be in service at 09:00 and log out at 16:00, and who sticks to that schedule for the entire day, is 100 percent in adherence. Adherence is calculated by the following formula: [(configured schedule adherence minutes - minutes not in adherence) ÷ configured schedule adherence minutes] × 100 Where "configured schedule adherence minutes" is the sum of time scheduled for activities for which the Calculate Adherence column in the Application Management application is set to Yes. **Note:** If the formula produces a negative number, the field displays a zero.

Field	Description
C %	The agent's conformance percentage. Conformance is the percentage of time an agent works the right amount of time regardless of the time of day the agent works. Schedule conformance does not take arrival and departure times into account. For example, an agent who is scheduled to work from 08:00 to 16:00 but instead works from 10:00 to 18:00 would be conforming, but not adhering, to the schedule. Conformance is calculated according to the following formula: (total time an agent is in a ready, talk, hold, or work state) ÷ (total current scheduled in-service time) ×100 In-service time does not include lunch, breaks, projects, or exceptions.

Coverage Drawer

The Coverage drawer is applicable only to interactive service queues. It is opened and closed by clicking the arrow control below the calendar bar.

The Coverage drawer has four views:

- [Coverage: Scheduled](#) (default view)
- [Coverage: Shrinkage](#)
- [Coverage: Reforecast](#)
- [Intraday: Data](#)

You can use the Coverage drawer to see how WFM predicts what the service queue will do for each day and interval. It shows you if your forecast is accurate when compared to the production schedule, and allows you to make post-production schedule changes.

> **Note:** The service level data in all coverage pages are calculated using daily totals in the Hour and Day views, and weekly totals in the Week view.

Based on the metrics displayed in the Coverage drawer, you can edit the schedule to improve the overall service level goal. For example, you could reschedule an agent's break to occur 30 minutes later to resolve a staffing issue.

This schedule flexibility can make a big difference towards maintaining the daily service level goal.

The metrics in this drawer update automatically when you change the production schedule.

You can choose what information is displayed in a coverage chart by clicking the metrics buttons at the left of the chart on and off. You can tell if a button has been turned on if the button's border changes from light gray to dark gray.

A popup appears when you click a bar in any of the coverage drawers.

10:00 AM		
	Agents	**% SVL**
Forecast:	4	80
Scheduled:	27	100
Actual:	26	100
Shrinkage:	-	-
Reforecast:	-	-
% SVL Goal:	80	
% Shrinkage:	10	
% Reforecast:	-	

The information in the popup is detailed in the following table.

Field	Description
Forecast	The number of agents and service level percentage forecasted for the interval.
Scheduled	The number of agents and service level percentage scheduled for the interval. **Note**: If an agent is scheduled for a multiskill group, the agent will contribute the service queue weight to the number of scheduled agents. For example, if the service queue has a weight of 30% in the multiskill group, an agent scheduled for the multiskill group will contribute 0.3 scheduled agents for that service queue.
Actual	The actual number of agents and service level percentage for the interval.
Shrinkage	The number of agents after shrinkage is applied to the number of scheduled agents and the service level percentage expected for that number of agents.

Field	Description
Reforecast	The reforecasted number of agents based on the reforecasted number of contacts and reforecasted average handle time given the desired service level goal (percent and seconds).
% SVL Goal	The service level percentage goal.
% Shrink-age	The shrinkage percentage applied to the interval
% Refore-cast	The reforecast service level percentage.

Coverage: Scheduled View

The Coverage: Scheduled view is the default view in the Coverage drawer. It shows how well the service queue is meeting its service level goal by comparing real-time data to the production schedule.
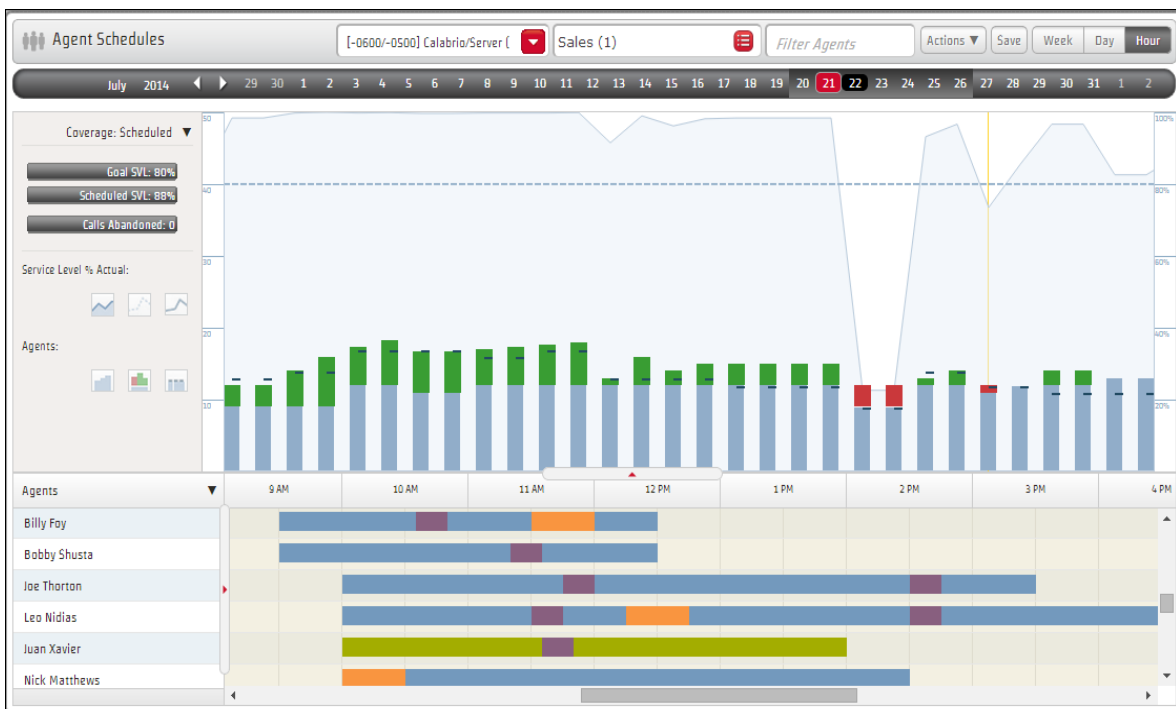

The chart can display any or all of following metrics by clicking the appropriate metric buttons on and off:

- Service level % scheduled
- Service level % goal
- Service level % actual
- Agents Scheduled
- Agents Forecast
- Agents Actual

The left panel also displays the following metrics for the selected time period:

- Goal SVL %
- Scheduled SVL %
- Calls Abandoned

Interpreting the Chart

The Coverage: Scheduled view chart displays a stacked bar and line graph for a specific day. The bars and lines are color-coded to aid in interpretation. Each bar represents a 15-minute interval on the day and hour views, and a 60-minute interval on the week view.

The following table describes the colors used in the stacked bar for each interval.

Color	Agents Scheduled
Light Blue	Number of agents scheduled.
Dark Blue	Actual number of agents.
Red	Number of agents forecasted indicates there is a shortage of agents.
Green	Number of agents forecasted indicates there is a surplus of agents scheduled.

To determine the least disruptive time to insert an activity, compare the Agents Scheduled to Agents Forecast in the chart. You can use the gap to determine the number of agents who are available for the planned activity without affecting the coverage.

If there are extra agents available, you can schedule an activity without affecting the service level goal. For example, if the interval from 10:30 to 11:00 has a surplus of 4 agents scheduled, you can schedule a 30-minute meeting with 4 agents during that time.

If there are fewer agents scheduled than the forecast requires, you need to change the agents' schedules to fulfill the schedule requirement.

The following table describes the lines used to represent the different service levels. The chart displays the scheduled, goal, and actual service level score. You can compare the actual service level scores to the service level scheduled and service level goal to see what exactly is happening in the contact center. The chart shows how closely the contact center achieved its service level goal.

Line	Service Level
Light blue line	Service Level % Scheduled
Dashed blue line	Service Level % Goal
Dark blue line	Service Level % Actual

Coverage: Shrinkage View

The Coverage: Shrinkage view shows the effect of shrinkage on the schedule's ability to meet the service level. You can adjust the shrinkage percentage to see how that affects meeting the service level goal.
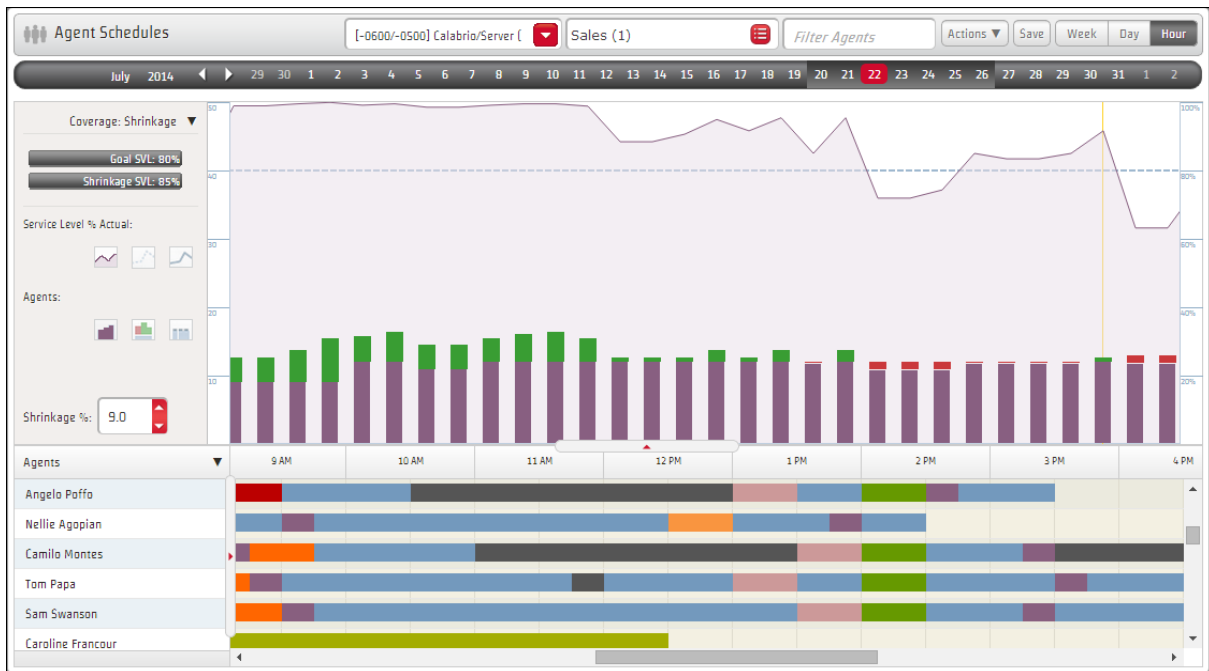

The chart can display any or all of following metrics by clicking the appropriate metric buttons on and off:

- Service Level % Shrinkage

- Service Level % Goal

- Service Level % Actual

- Agents Shrinkage

- Agents Forecast

- Agents Actual

The % Shrinkage field always shows the configured shrinkage percentage, whether the schedule was run with shrinkage applied or not. If a schedule is run with no shrinkage or with shrinkage rates set to 0, and then the shrinkage percentage is changed after the fact, then the current shrinkage percentage is displayed.

You can adjust that percentage up and down to see how those changes impact the schedule, and use that information to decide if the schedule needs to be adjusted so that the service level goal is met.

To adjust the shrinkage percentage, do the following:

1. In the Shrinkage % field, use the up and down arrows to change the shrinkage percentage to a new value.

2. Click anywhere in the chart to apply the new shrinkage percentage to each interval. The chart updates to reflect the new shrinkage percentage.

The Shrinkage % value reverts to the default value when you refresh the window. You cannot save the revised shrinkage percentage,

Coverage: Reforecast View

The Coverage: Reforecast view shows the impact of reforecast metrics on the coverage data so that schedules can be edited based on what the reforecast metrics say might happen.

> **Note**: The zoom level must be set to Hour in order to display the Reforecast view.
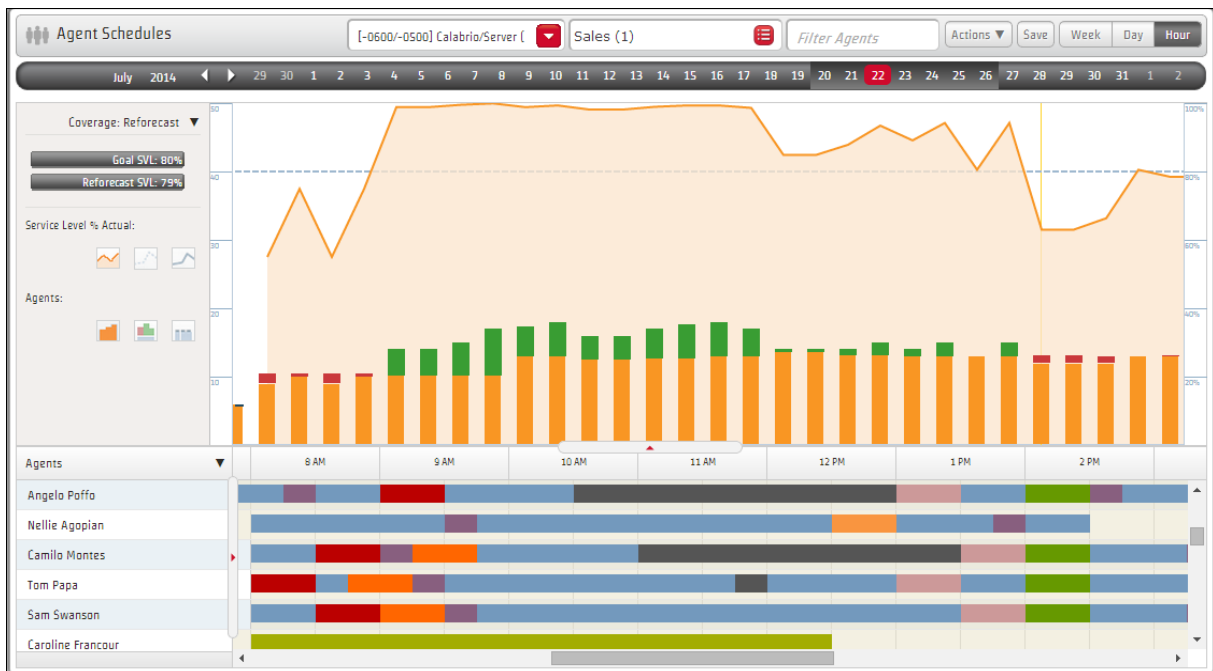

The chart can display any or all of following metrics by clicking the appropriate metric buttons on and off:

- Service Level Reforecast

- Service Level % Goal

- Service Level % Actual

- Agents Scheduled

- Agents Reforecast

- Agents Actual

Intraday: Data View

The Intraday: Data view shows actual data compared to forecast data in chart form.

> **Note**: The zoom level must be set to Hour in order to display the Intraday: Data view.
The chart can display any or all of following metrics by clicking the appropriate metric buttons on and off:

- Service Level %—Scheduled, Goal, and Actual (always available)

- Contacts Offered—Forecast, Actual, and Reforecast (available when the Show in Graph button on the Contacts Offered drawer is clicked)

- Average Handle Time—Forecast, Actual, and Reforecast (available when the Show in Graph button on the Average Handle Time drawer is clicked)

- Agents—Scheduled, Forecast, Actual, and Reforecast (available when the Show in Graph button on the Agents drawer is clicked)

- Service Level—Reforecast (available when the Show in Graph button on the Service Level drawer is clicked)

The data used to create the chart is provided in tabular form in drawers at the bottom of the chart. The tabular drawers show the following metrics for 30-minute intervals:

- Contacts Offered (Forecast, Actual, and Reforecast)

- Average Handle Time (Forecast, Actual, and Reforecast)

- Agents (Forecast, Scheduled, Actual, and Reforecast)

- Service Level (Forecast, Scheduled, Actual, and Reforecast)

The tabular data can be exported in CSV format by clicking the CSV download icon to the right of the Metrics label.

Insert Activity

The Insert Activity dialog box allows you to add an activity to the agents' schedule.

The following table describes the fields in the Insert Activity dialog box.

Field	Description
Agents	The agents involved in this activity. Click the Agent Selection field to choose one or more agents from the list. Only agents who are assigned to the team in your Main View appear in this list.
Remove	Deletes one or more selected agents from the list.
Range	Choose a date range option, Start & End Time or Start Time with Duration.
Start Time	The time and date when the activity begins. • Time field—displays 12:00 AM by default. You can type the start time in 5-minute increments in the time field, or you can select the start time from the drop-down list in half-hour increments. • Date field—the date chosen for the activity. Default date is today.
Duration	The duration of the activity in hours and minutes. This option only appears when you select Start Time with Duration.

Field	Description
End Time	The time and date when the activity ends. • Time field–displays 12:00 AM by default. You can type the start time in 5-minute increments in the time field, or you can select the start time from the drop-down list in half-hour increments. • Date field–the date chosen for the activity. Default date is tomorrow.
Select Activity	Select the type of activity to be inserted in the schedule.
Search Criteria	Select the type of activity. The Select Type field appears only for activities that can be further specified.
Paid	Select the Paid check box if the scheduled activity counts toward the agent's number of hours worked during the week. The check box is selected or cleared by default depending on the activity you select.
Assign Schedule Exception	Enabled only when you select Exception as the activity. Select the check box if you want the schedule exception to be saved to the agent's schedule exception list so that if the schedule is rerun, the exception will appear in the agent's schedule. If you do not select the check box, the exception will be lost if the schedule is rerun.

Inserting an Activity

Follow these steps to insert an activity in one or more agent's schedules. The agent schedule for the desired service queue group, service queue, or team should be displayed.

1. In the Agent Schedules page, do one of the following:

    • Choose Actions > Insert Activity from the Agent Schedules toolbar to display a blank Insert Activity dialog box.

    • Right-click the desired agent's scheduled activity on the schedule and select Insert to display the Insert Activity dialog box with information for the scheduled activity entered.

2. Complete the fields in the dialog box as desired and click Insert to insert the new activity in the agent's schedule.

3. Click Save to save the schedule change.

Trade Schedule

The Trade Schedule dialog box allows you to trade schedules between two agents.

You can trade schedules for the same day, different days, or multiple days. When trading agent schedules, note that when a schedule crosses midnight, the agent is scheduled to start work the day the schedule began.

The following table describes the fields in the Trade Schedule dialog box.

Field	Description
Trade Type	The type of trade for this action. Your options are: • Same Day—trade schedules on the same day. When you choose this option, the Schedule Date field appears. This option is selected by default. For example, you can use this option to trade Agent A's 07:00-15:00 schedule with Agent B's 09:00-17:00 schedule on the same day. • Different Days—trade schedules on two days. When you choose this option, the From Date and To Date fields appear. This option works exactly as the Same Day option does, only on two separate days. For example, if you choose 1/23/2012 in the From Date field and 1/25/2012 in the To Date field, Agent A's Monday (23rd) and Wednesday (25th) schedules are traded with Agent B's Monday and Wednesday schedules. • Multiple Days—trade multiple day schedules. When you choose this option, the Start Date and End Date fields appear. For example, if you choose 1/23/2012 in the Start Date field and 1/27/2012 in the End Date field, then you will trade Agent A's Monday (23rd) 07:00-15:00 schedule with Agent B's Monday (23rd) 09:00-17:00 schedule plus Tuesday (24th), Wednesday (25th), Thursday (26th) and Friday (27th).
Agent Information	The agents' involved in the trade. • From Agent—the first agent whose schedule you want to trade • To Agent—the second agent whose schedule you want to trade Only agents who are assigned to the team in your Main View appear in the From Agent or To Agent list.
Dates	The dates involved in the trade. The possible trade dates are: • Schedule Date—the date you want to trade schedules. Type the date, in mm/dd/yyyy format, or click the field and choose the date from the Calendar popup. • From Date—the first scheduled date involved in the trade. • To Date—the second scheduled date involved in the trade. • Start Date—the first day of the work shift that you want to trade. • End Date—the last day of the work shift that you want to trade.

Field	Description
Agent Schedules	The schedule for both agents displayed side-by-side allows you to compare the agents' schedules before you click Apply. • From Agent Schedule–the first agent's current schedule • To Agent Schedule–the second agent's current schedule You are provided with information about the To Agent's availability, teams, time zone, exceptions, service queue, overlapping shifts, and skill mapping to help you decide if the trade is feasible.

Trading Schedules Between Agents

To trade schedules between two agents:

1. Click actions > Trade Schedule to display the Trade Schedule dialog box.

2. Complete the fields.

3. Click Apply. The traded schedules are applied immediately to the production schedule.

> **Note**: Both agents must be included in a schedule that was run for the trade's time frame in order to trade schedules.

Find Optimal Time

The Find Optimal Time dialog box helps you find the best time in the agent schedule to insert an activity so that it has as little impact on the service level as possible.

The following table describes the fields in the Find Optimal Time dialog box.

Field	Description
Start Date	Enter the start date of the date range in which the activity should take place. By default this is the first day of the week whose schedule you are viewing. You can choose a date within this week.
End Date	Enter the end date of the date range in which the activity should take place. By default this is the end of the week whose schedule you are viewing. You can choose any date within the week.
Start Time	The earliest time at which the activity can start.
End Time	The latest time at which the activity can start.
Duration	The amount of time the activity should last.

Field	Description
No. of Agents	The number of agents you want to perform the activity.

Finding an Optimal Time

After completing the fields in the Find Optimal Time dialog box, click Analyze. WFM finds the best times for the activity and lists them in the Analysis Results flyout.

The Analysis Results table lists candidate time slots for the activity. The fields in the table are the following:

Field	Description
Date	Date of the time slot.
Start Time	Start time of the time slot.
End Time	End time of the time slot.
In Service Agents	The number of agents who are in service the entire duration of the time slot.
Scheduled	The number of agents who are scheduled during the time slot. They can be doing anything: in service, on break, in a meeting, and so on.
Gap	The positive or negative gap between the number of forecasted agents and actual scheduled agents. A positive number indicates overstaffing, and a negative number indicates understaffing.

Use the gap value to help you decide which time slot to use for the activity.

Once you decide, click the hyperlinked number in the In Service Agents or Scheduled Agents fields in your selected time slot. This opens the Insert Activity dialog box with the Range fields autofilled based on your time slot selection.

The names of the agents who were the In Service Agents or Scheduled in the Analysis Results table are listed in the Agents pane. Select the agents you want to perform the activity, complete the Exception Assignment and Activity sections, and click Insert and then Save to add the activity to those agents' schedules.

Modifying Schedules Using Drag and Drop

You can change the start and end times of an agent's schedule and move scheduled activities within a day's schedule using drag and drop techniques.

With the schedules displayed in Hour view, double-click the agent's schedule bar to initiate drag and drop. When you do so, the schedule bar splits in two. General time, such as In Service time, becomes the bottom bar, and specific time, such as exceptions and breaks, becomes the top bar.

- Use your cursor to drag the ends of the bottom bar left and right to change the start and end times.

- On the top bar, use your cursor to drag a scheduled activity to a new time.

Note: A dynamic scheduling event exception that is outside of the agent's In Service time cannot be moved.

You must click Save to save the changes you have made to the schedule. If you want to cancel changes you have made but not yet saved, click the browser Refresh button to reload the page with the original schedule.

Dynamic Scheduling

If agents have been configured to create their own schedules using the dynamic scheduling feature, those requested schedules are available for review and editing by administrators and schedulers before the actual schedule is run.

To review and edit an agent's dynamic scheduling page:

1. On the toolbar, select Schedules and Planning > My Schedule.

2. Select the agent whose dynamic scheduling page you want to view, and then navigate to the schedule on the day that the agent received the dynamic scheduling event exception.

3. Click the link in the exception to view the page.

4. Review and edit as desired, then click Submit.

For information on agent dynamic scheduling, see the following pages:

Agent Dynamic Scheduling

Staffing Icons

Creating Your Own Schedule

Planning

The Planning application is used to generate distributions, forecasts, and schedules.

The scheduling process follows these steps:

- Historical data is used to generate a <u>distribution</u>
- The distribution and historical data is used to generate a <u>forecast</u>
- The forecast is used to create a <u>schedule</u>

Navigating the Planning Page

The Planning page displays forecasts and distributions in both tabular and graphical format.
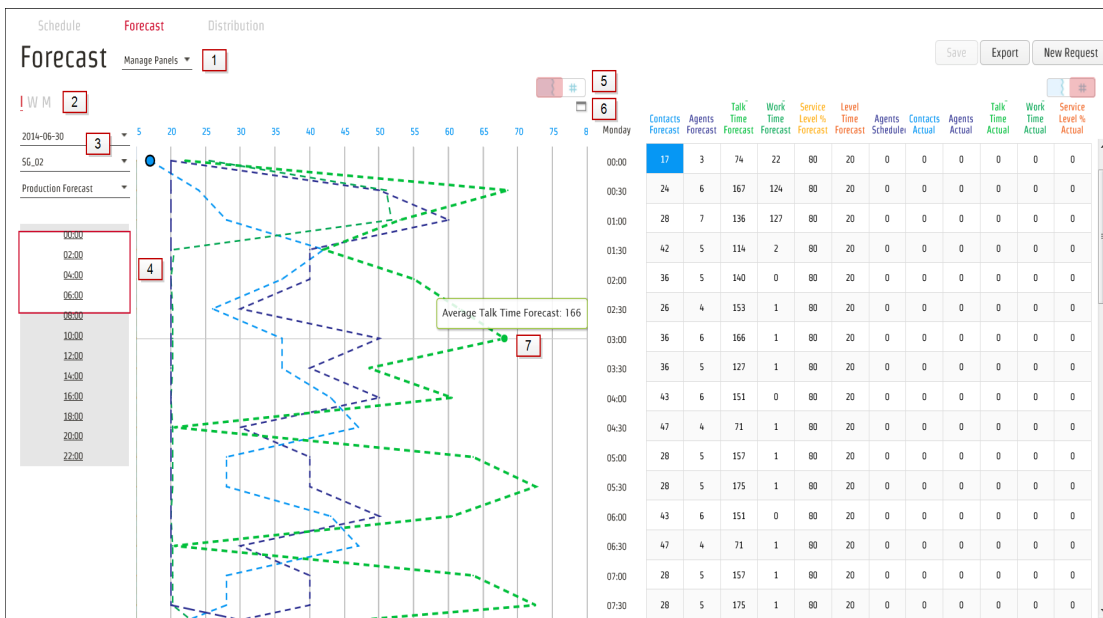

The following table describes each numbered area in this figure of the Forecast page.

Callout	Description
1	Click Manage Panels to configure the graphs and tables displayed on the page. See Panel Manager for more information.
2	Control the zoom level here. click I, W or M to view your data by: • Interval (I). Data is displayed by half-hour interval for one day. • Week (W). Data is displayed in 3-hour intervals for 7 days. • Month (M). Data is displayed by day for each day of the month. The zoom level control is found only on the Forecast view.
3	Select the date (forecasts) or day (distributions), service queue, and the specific forecast or distribution you want to view from these three drop-down lists.
4	The long view slider shows the range of data you are viewing. Slide it up and down to change the dates viewed (week or month view) or hours viewed (interval view).
5	Graph/table control. Click the left button (graph) or right button (table) to toggle between the two views of the data in the panel.
6	Horizontal graph button. Click this button to display the graph in horizontal format rather than the default vertical format.
7	Data points. Select a point on a line in the graph and the corresponding value in the table is highlighted (the reverse is also true: select a value in the table and the corresponding point on a line is highlighted). The lines are the same color as the column header of the data associated with it in the table. Hover text displays information about the data point. In Interval View, you can drag data points left and right to change their values. See Editing a Forecast or Distribution for more information.

Panel Manager

Use the Panel Manager to configure what is displayed on a forecast or distribution page.
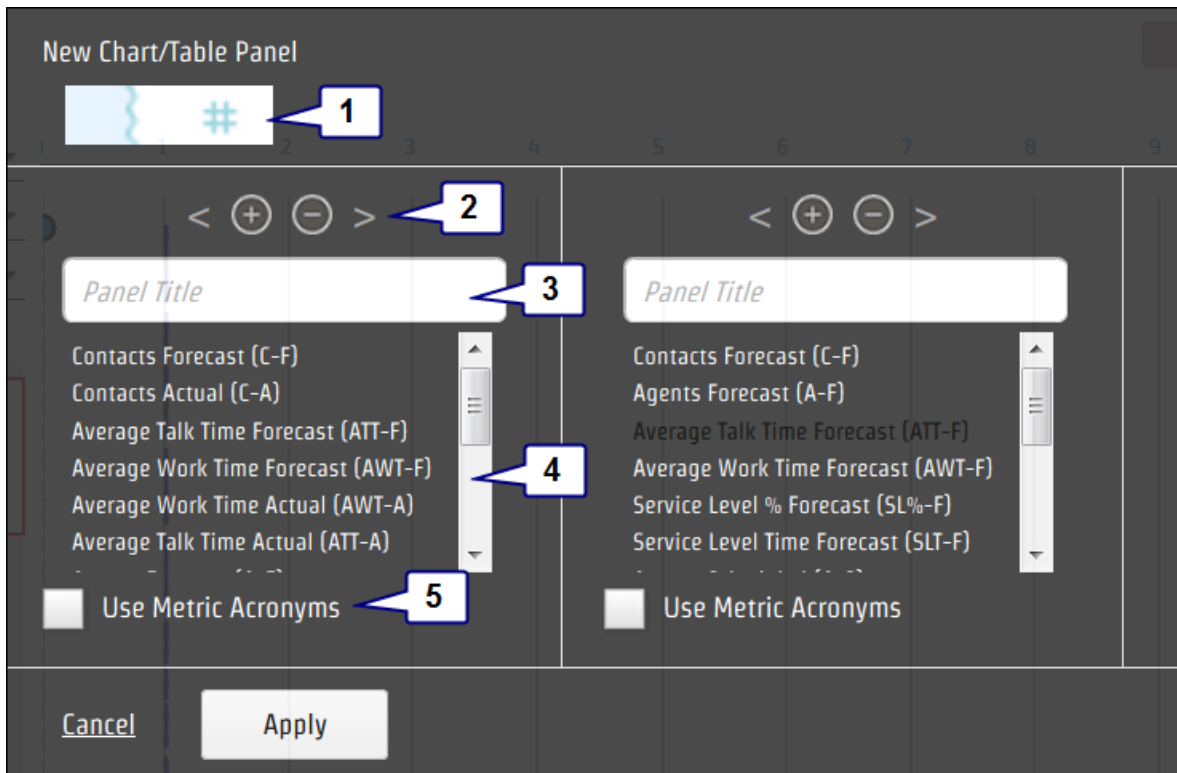

The following table describes each numbered area in this figure of the Panel Manager.

Callout	Description
1	Click the button to add a new panel.
2	These four icons allow you to move, copy, and delete a panel. From left to right, they are: • Move this panel to the left • Add a copy of this panel • Delete this panel • Move this panel to the right
3	Enter a name to identify the panel.

Callout	Description
4	This is a list of all the metrics available to be displayed in the panel. They are selected if in white text, and deselected when the text is black (see the panel to the right, with one deselected metric).
5	Select this check box to use metric acronyms instead of the full names as table column headers. Note that selecting this for a graph has no effect on the graph, it applies only to tables.

Editing a Forecast or Distribution

Forecasts and distributions can be edited in a number of ways.

Dragging Lines in the Graph

In Interval View, you can drag the data points on the lines in the graph to increase or decrease the value that data point represents.

Note: You cannot drag lines in a graph that is displayed horizontally.

- Forecasts: You must be displaying the data at the Interval (I) zoom level in order to edit the forecast data. Note that you cannot edit any actual data (such as the Contacts Actual) or the number of agents scheduled (Agents Scheduled).

- Distributions: Distributions are displayed only at the Interval zoom level, so can be edited. Note that you cannot edit the contact ratio data, but you can edit the other values in the distribution.

Editing Data in the Table

You can edit fields in the table. Changes you make are reflected immediately in the graph.

- Double-click a table cell to edit it. Tab out of the cell or press Enter for the new value to "stick".

- Press Tab to move cell to cell to the right.

- Press Shift+Tab to move cell to cell to the left.

- Press Enter to move down one cell at a time

- Press Shift+Enter to move up one cell at a time.

Copying and Pasting Data in the Table

You can copy and paste data in the table using standard Windows shortcut keys.

- Click and drag with your mouse to select specific rows and columns in the table, or Ctrl + A to select the entire table.

- Use Ctrl + C to copy the selected cells to the clipboard in TSV (tab separated value) format. This action copies both editable and read-only columns.

- Use Ctrl + V to paste the contents of the clipboard into table cells. The data you are pasting can be in TSV or CSV format. You can paste into a specifically chosen group of cells, or just select the cell that becomes the upper left corner of your pasted data. The data is pasted into the selected cells, unless the selected column is read-only. You cannot paste copied data into read-only columns. If the copied data is too big to fit into the selected paste area, paste expands the selection to the size of the data on the clipboard. For example, if you select a 2 × 2 area but the data on the clipboard is 3 × 3, then it will paste 3 × 3. The pasted data is highlighted in the table.

Applying an Adjustment Factor to a Column

You can apply an adjustment factor to edit every value in a forecast table column by the same percentage. For example, to increase the values in a column by 20%, you apply an adjustment factor of 1.2.

To apply the adjustment factor, double-click the column header and enter the desired value in the dialog box. The dialog box is available only for columns you can edit this way. This feature is not available for distributions.

Distributions

A distribution consists of one week's worth of contact data for every 30-minute interval of the day. The data includes the following:

- Contact Ratio—Percentage of the day's total contacts

- Contacts Distribution—Number of contacts received

- Average Talk Time—Average talk or processing time

- Average Work Time—Average after contact work time

The distribution determines the general pattern of contacts for a service queue, which days and hours have a high volume and which have a low volume.

This is how WFM generates a distribution:

1. WFM calculates the average number of contacts received in the reference period for each schedule interval for every day of the week selected in the distribution request. Days with special events are disregarded.

   > **Example**: To calculate the average contact volume for the 08:30 to 09:00 interval on Monday, WFM takes the sum of the volume for the 08:30 to 09:00 interval for each Monday in the reference period and divides the total by the number of Mondays in the reference period.

2. WFM then divides the result for each half hour by the average number of contacts received for the entire day to determine the percentage of the day's contacts that arrive during this interval.

3. WFM calculates the average talking time (interactive service queues) or processing time (non-interactive service queues) and after contact work time values per contact for each half hour.

   > **Example**: To calculate the average talking time/processing time for the 08:30 to 09:00 interval on Monday, WFM takes the sum of talking time/processing time for each contact between 09:00 and 09:30 for each Monday in the reference period and divides the total by the number of contacts to determine the average talking time/processing time. WFM uses the same method to calculate average work time.

The future does not always repeat the past. Future events can cause a contact distribution to change. If you know about upcoming events that might affect a

distribution, you can use the edit the distribution to account for those events. For any half-hour interval, you can change the number of contacts likely to arrive, the average talk or processing time, and the average after contact work time. See [Editing a Forecast or Distribution](#) for more information.

Guidelines for Generating a Distribution

Choosing an appropriate reference period is important for generating a distribution suitable for your forecast period.

You can generate a distribution once and reuse it for every forecast or generate a new distribution every time you generate a forecast. A distribution and forecast are linked automatically—a service queue can only have one production distribution and one production forecast at any given time.

The type of distribution you generate depends on the type of service queue you are generating it for. Use the following guidelines when generating a distribution.

- If your daily or weekly contact data fluctuate wildly, choose a longer reference period. If your contact data is fairly stable, choose a shorter reference period.

- If your contact data is fairly stable or seasonal, choose a longer reference period from the same period last year.

- If you have at least a year's worth of historical data and your business and routing patterns have not changed dramatically, use a reference period from a year earlier that is similar to the forecast period. This will include seasonal patterns.

- If you have less than a year's worth of historical data or your contact center conditions have changed dramatically, identify a more recent period that is likely to have contact data that is similar to the forecast period.

- If the contact data is reasonably stable throughout the year, you might go several months without having to generate a new distribution.

- If the contact data varies frequently or shows seasonal variation, you might need to regenerate your distribution at least once a month or every time you create a forecast.

Note: Distributions ignore dates within your reference period that have special events assigned to them, and dates that are tagged as closed days.

Managing Distributions

Use the Distribution Requests page (Schedules and Planning > Planning > Distribution > New Request) to do the following:

- Submit a production distribution request
- Submit an existing named distribution request
- Submit a new named distribution request

The production distribution is used by default to generate a forecast (although you can specify to use a named distribution instead). There can be only one production distribution.

In contrast, there can be many named distributions. Named distributions are used to analyze how different conditions affect contact volumes and agent schedules. A named distribution can be generated with historical data like a production distribution is, but it can also be generated without any historical data and then populated manually.

Note: If you are confident that the contact volume and distribution at your contact center are stable, then you only need to generate one distribution and one forecast, and you do not need to use named distributions.

Generating a Production Distribution

To generate a production distribution, follow these steps:

1. On the Distribution Request page, select the Submit a production distribution request option.

2. Select one or more service queues. The available service queues listed are those that do not have the "Do not generate forecasts or schedules for this service queue" check box selected on the Service Queues page.

3. Enter the start date and end date of the desired reference period. The reference period should have historical data that closely resembles the dates for which you want to generate a forecast. There should be data for every selected day of the week in your reference period. If there is no data, WFM will fill those periods with zeros.

4. Select the days of the week you want to calculate a distribution for. By default every day of the week is selected.

5. Decide if you want the service queue standard times (Average Talk Time and Average After Contact Work Time) to be updated based on this distribution.

6. Schedule when you want the request to run. By default the request is run immediately.

7. Click Run.

Once your request has run successfully, you can view the distribution and edit it as needed.

Generating a Named Distribution

Use the Distribution Request page to submit a named distribution request. The request can generate a new named distribution or reuse an existing named distribution name to overwrite that named distribution with new data.

To generate a named distribution, follow these steps:

1. On the Distribution Request page, select the desired option: submit a new named distribution request or submit an existing named distribution request.

2. Select a service queue. Note that while you can select multiple service queues for a production distribution, you can select only one service queue for a named distribution.

3. Enter a unique name for the named distribution if this is a new request, or select the existing named distribution name if you are reusing an existing named distribution name.

4. Enter the start date and end date of the desired reference period. The reference period should have historical data that closely resembles the dates

for which you want to generate a forecast. There should be data for every selected day of the week in your reference period. If there is no data, WFM will fill those periods with zeros.

5. Select the days of the week you want to calculate a distribution for. By default every day of the week is selected.

6. Decide if you want the service queue standard times (Average Talk Time and Average After Contact Work Time) to be updated based on this distribution.

7. Schedule when you want the request to run. By default the request is run immediately.

8. Click Run.

Once your request has run successfully, you can view the distribution and edit it as needed.

Managing a Named Distribution

Once a named distribution is run, there are a number of actions you can take with it besides editing it. These actions are controlled by the buttons in the upper right corner of the Distribution page.

With these buttons, you can:

- Save the edited production or named distribution.

- Rename the named distribution. This function does not copy the distribution, but changes the name of this distribution. Once changed, you will not see the old name in any list of named distributions for this service queue.

- Delete the named distribution.

- Copy the named distribution to production. This function overwrites the data in the existing production distribution with the data from this named distribution. For example, if the named distribution has data only for Monday and Tuesday, but the production distribution had data for every day of the week, after the copy, the production distribution will also contain data only for Monday and Tuesday.

- Export the data in the production or named distribution as a CSV-format file named export.csv for use in a spreadsheet application such as Excel.

The data exported is that of the currently-displayed day. If you want to export the data for the entire week, you must do it one day at a time.

Viewing a Distribution

To view a distribution, follow these steps:

1. On the Planning page, select Distribution.

2. Select the service queue you ran the distribution for.

3. Select the production or named distribution. The distribution appears in both tabular and graphical form.

4. Select the day of the week you want to view from the drop-down list, or scroll the displayed data up or down and click the black bar at the bottom to view the next day's data or the black bar at the top to view the previous day's data.

Data in the Distribution Summary

The data in the Distribution Summary row is calculated as described in the following table.

Column	Summary Calculation
Contact Ratio	Total of column values
Contacts Distribution	Total of column values
Average Talk Time	Weighted average by contact
Average Work Time	Weighted average by contact

Forecasts

A forecast is a prediction of the number of contacts that a contact center will receive over a specific period of time.

WFM uses historical contact data to generate a distribution, then uses the historical data and the distribution to generate a forecast. The forecasts are then used to create a schedule.

The Forecasting Process

To create a forecast, you must complete these tasks.

Select a Reference Period

WFM uses historical data to project future requirements. You need to identify the reference period with the historical data that most closely resembles the period for which you want to generate a forecast.

A reference period should reflect any weekly or seasonal patterns that are likely to occur during the forecast period. Choosing a reference period from a year prior to the forecast period often provides the best reflection of weekly and seasonal patterns.

To view the historical data available to you for the service queue and the reference period you are considering, use the View and Edit Historical Data page.

Generate a Distribution

Generate a distribution for the service queue and reference period you selected.

Edit the Distribution

If needed, edit the distribution. For example, if you expect the contact volume to be lower on a certain day of the week in your forecast period, you can decrease the contact volume on that day in the distribution.

> **Note**: If a special event was assigned to that day, then WFM normalizes the contact volume so that distributions are more accurate. There is no need for you to manually adjust the distribution in that case.

Generate the Forecast

When you launch the forecast request, WFM performs these steps:

1. Applies any special event adjustments you assigned for the service queue in the historical reference period.

2. Generates the average contact volume for each day of the week using data from the reference period.

3. If you opted to use trends, determines the trend percentage by day and adjusts the volume projections accordingly.

4. Adjusts the volume projection for each day by the adjustment factor.

5. Applies the contact ratios from the distribution for each interval in the day. Contacts are redistributed for non-interactive service queues that use even or proportional redistribution during closed hours. Otherwise, the number of contacts is taken from the contacts arriving during service queue open hours. If the service queue is closed during an interval, the number of contacts is zero.

6. Multiplies the projected contacts for each interval by the average handling time to estimate the amount of agent handling time required.

7. Performs statistical analysis of the agent handling time estimates and the service level goals to determine the number of agents required per interval.

Note: If there is a date with a firm date association within the forecast period, WFM uses the volume from the firm date association reference date, but the distribution of that contact volume by interval for the day comes from the distribution.

Review the Forecast

If you do not think the forecast values are on target, edit the forecast.

Managing Forecasts

Use the Forecast Requests page (Schedules and Planning > Planning > Forecast > New Request) to do the following:

- Submit a production forecast request
- Submit an existing named forecast request
- Submit a new named forecast request

There can be only one production forecast, but there can be many named forecasts.

Generating a Production Forecast

To generate a production forecast, follow these steps:

1. On the Forecast Request page, select the Submit a production forecast request option.

2. Select the start and end dates of the period the forecast will cover.

3. Select the service queue type.

4. Select the one or more service queues the forecast is for. The available service queues are all of the service queue type you selected and that do not have the "Do not generate forecasts or schedules for this service queue" check box selected on the Service Queues page.

5. Select the distribution to be used. If you selected multiple service queues, this must be the production distribution. If you selected one service queue, then this can be either the production distribution or a named distribution. Whichever type of distribution you choose, it must have been run for the service queues you selected.

6. If you want to use trends to calculate the forecast, select the "Use trends when calculating the forecast" check box. See [Using Trends in Forecasting](#) for more information on how the trend is calculated.

7. If you selected the "Use trends when calculating the forecast" check box, enter two reference ranges to be used to calculate the trend. Range 1 must be before Range 2, and the two ranges cannot overlap. If you did not select the Trends check box, enter the start and end dates of the reference period.

8. Choose the source of the contact handling time metrics used to calculate the forecast. You can use the average talk time and average after contact work time values calculated by the distribution you selected, or the values entered on the Service Queues page of each of the service queues this forecast is for.

9. If desired, enter an adjustment factor to adjust the forecasted contact volume up or down. The default value is 1.0, which means no change.

10. **For Interactive service queues**: If you want to configure the service level objective by intervals, select the "Configure the service level objective" check box. When you select it, a table is displayed that contains service level objective values. If the forecast is for a single service queue, the table shows the standard service level objective configured on that service queue's Service Queues page. If the forecast is for multiple service

queues, the table shows a default service level objective of 80% and 20 seconds. You can then modify the service level percentage by interval as desired. **For non-interactive service queues**: If you want to configure the handling threshold, select the "Configure the service level objective" check box. When you select it, the Handling Threshold field is displayed. Enter the number of minutes (from 0 to 4320) in which contacts must be handled.

11. Schedule when you want the request to run. By default the request is run immediately.

12. Click Run.

Once your request has run successfully, you can view the forecast and edit it as needed.

To view the forecast, follow these steps:

1. On the Planning page, select Forecast.

2. Select the date of the forecast.

3. Select the service queue you ran the forecast for.

4. Select Production Forecast. The forecast appears in both tabular and graphical form.

Generating a Named Forecast

Use the Forecast Request page to submit a named forecast request. The request can generate a new named forecast or reuse an existing named forecast name to overwrite that named forecast with new data.

To generate a named forecast, follow these steps:

1. On the Forecast Request page, select the Submit a new named forecast request option.

2. Select the start and end dates of the period the forecast will cover.

3. Select the service queue type.

4. Select the service queue the forecast is for. The available service queues are all of the service queue type you selected and that do not have the "Do not generate forecasts or schedules for this service queue" check box selected on the Service Queues page.

5. Enter a unique name for the forecast.

6. Select the distribution to be used. This can be the production distribution or a named distribution for the selected service queue.

7. If you want to use trends to calculate the forecast, select the Trends check box.

8. If you selected the Trends check box, enter two reference ranges to be used to calculate the trend. Range 1 must be before Range 2, and the two ranges cannot overlap. If you did not select the Trends check box, enter the start and end dates of the reference period.

9. Choose the source of the contact handling time metrics used to calculate the forecast. You can use the average talk time and average after contact work time values calculated by the distribution you selected, or the values entered on the Service Queues page of the service queue this forecast is for.

10. If desired, enter an adjustment factor to adjust the forecasted contact volume up or down. The default value is 1.0, which means no change.

11. **For Interactive service queues**: If you want to configure the service level objective by intervals, select the Service Level Objectives check box. When you select it, a table is displayed that contains the standard service level objective configured on that service queue's Service Queues page. You can then modify the service level percentage by interval as desired. **For non-interactive service queues**: If you want to configure the handling threshold, select the Service Level Objectives check box. When you select it, the Handling Threshold field is displayed. Enter the number of minutes (from 0 to 4320) in which contacts must be handled.

12. Schedule when you want the request to run. By default the request is run immediately.

13. Click Run.

Once your request has run successfully, you can view the forecast and edit it as needed.

To view the forecast, follow these steps:

1. On the Planning page, select Forecast.

2. Select the date of the forecast.

3. Select the service queue you ran the forecast for.

4. Select the named forecast. The forecast appears in both tabular and graph-ical form.

> **Note**: In previous versions of WFM, you were able to select to view and edit a named forecast/named distribution combination. If you upgraded to the current version of WFM from earlier versions, those named forecast/named distribution combinations are now listed in the Forecast drop-down list as <forecast name>-<distribution name>.

Using Trends in Forecasting

When you choose to generate a forecast with trends, WFM calculates an annual growth rate in contact volume from two reference periods that do not overlap.

The choice of reference periods is an art that should take into account any seasonal fluctuations in the historical data. If historical data is seasonal, it is best to use the same portions of two different years to determine the trend.

Trends are exponential. This means that if the contact center experiences 5% growth per year in contact volume, then in two years, it will experience 10.25% growth (from 1.05 squared, which is 1.1025).

For each of the two trend reference periods, the average contact volume for each day of the week is computed, as well as the median date for each day of the week. The median date for a day of the week is the middle instance of that day within the date range. For example, if there are five instances of Wednesday in the reference period, the median Wednesday is the third instance of that day.

Additionally, for each reference period, an overall average contact volume and mean date is computed. Then, the results from the two reference periods are combined to produce a growth rate and growth duration. From this the annual growth rate is computed.

For example, suppose the two reference periods result in the following average contact volume and mean dates:

Reference Period 1 (2012-07-01 through 2012-08-04)

Day of the Week	Median Date	Average Contact Volume
Sunday	2012-07-15	400

Day of the Week	Median Date	Average Contact Volume
Monday	2012-07-16	3000
Tuesday	2012-07-17	2800
Wednesday	2012-07-18	2600
Thursday	2012-07-19	2400
Friday	2012-07-20	2200
Saturday	2012-07-21	2000
OVERALL	2012-07-18	2200

Reference Period 2 (2013-01-01 through 2013-02-04)

Day of the Week	Median Date	Average Contact Volume
Sunday	2013-01-20	425
Monday	2013-01-21	3126
Tuesday	2013-01-15	2940
Wednesday	2013-01-16	2730
Thursday	2013-01-17	2544
Friday	2013-01-18	2310
Saturday	2013-01-19	2095
OVERALL	2013-01-18	2310

For each day of week and for the overall averages WFM computes the growth factor and growth period (in years, using 365.2425 as the length of one year). Finally, WFM computes the annual growth rate from the formula:

$$\text{Annual growth factor} = \text{growth factor}^{(1 - \text{growth period})}$$

where the growth factor and growth period are computed from the two trend reference data periods.

Computation of the annual growth factor

Day of the Week	Growth Period (Days)	Growth Period (Years)	Growth Factor	Annual Growth Factor
Sunday	189	0.517464	1.0625	1.124296
Monday	189	0.517464	1.0420	1.082753
Tuesday	182	0.498299	1.0500	1.102867
Wednesday	182	0.498299	1.0500	1.12867
Thursday	182	0.498299	1.0600	1.124047
Friday	182	0.498299	1.0500	1.102867
Saturday	182	0.498299	1.0475	1.097604
OVERALL	184	0.503775	1.0500	1.101694

These annual growth factors (by day of the week, and by the overall factor if there was no data for a particular day of week) form the forecasting trend.

Data in the Forecast Summary

The data in the Forecast Summary row is calculated as described in the following table.

Column	Summary Calculation
Contacts Forecast	Total of column values
Agents Forecast	Weighted average by period duration
Average Talk Time Forecast	Weighted average by contact
Average Work Time Forecast	Weighted average by contact
Service Level % Forecast	Weighted average by contact

Column	Summary Calculation
Service Level Time Forecast	Weighted average by contact
Agents Scheduled	Weighted average by period duration
Contacts Actual	Total of column values
Agents Actual	Weighted average by period duration
Average Talk Time Actual	Weighted average by contact
Average Work Time Actual	Weighted average by contact
Service Level % Actual	Weighted average by contact

Schedules

A schedule lists the times when agents are in service for a service queue. For each agent, a schedule includes the start and end times for work shifts, breaks, lunches, exceptions, overtime, and projects.

Schedules are based on the agents' work shifts. When WFM generates a schedule, it takes into account the agents' work shifts and the forecast associated with the agents' service queue. WFM looks at the requirements and the agents' availabilities to create the most optimal schedules for the contact center and its agents.

WFM can also use shrinkage metrics when creating schedules. Shrinkage is applied against a full 24-hour period and increases the number of actual FTEs scheduled.

When creating a schedule, WFM sorts the service queues (both those individually selected and those assigned to the selected multiskill groups) by the service queue priority, and for each service queue, sorts the agents by skill mapping priority and multiskill group priority, followed by the service queue scheduling order.

Agents assigned to fixed and dynamically scheduled work shifts are scheduled before agents assigned to variable work shifts. Agents assigned to assignment work shifts are scheduled last. After sorting agents, WFM schedules the first

agent based on the agent's work shift preferences and optimizes the agents' breaks, lunches, and projects based on the minimum and maximum delays entered. The work shifts, breaks, lunches, and projects are influenced by coverage requirements. After scheduling the first agent, WFM schedules the next agent, and so on.

Scheduling Options

When scheduling agents, you have the option of using single service queues, virtual service queues, and multiskill groups. Each has attributes that make it suitable for different situations.

- Single service queues are suitable in contact centers where single-skilled agents support a service queue. For example, there could be an English voice service queue and a Spanish voice service queue. The agents assigned to the English voice service queue handle calls from English-speaking customers all day, every day.

- Virtual service queues are suitable when you wish to combine similar service queues of the same contact type (interactive or non-interactive). For example, you can combine several low-volume voice service queues into one virtual service queue. This aggregates enough volume so that accurate forecasting and scheduling can occur. Statistics for the individual low-volume service queues will not be available through WFM (but would be obtainable from the ACD), but that might not be of importance in your contact center.

- Multiskill groups are suitable when you want to aggregate multiple service queues and multiple contact types and schedule agents proportionally to support them. For example, a multiskill group might include service queues for English voice contacts and email contacts for Product A and Spanish voice contacts and email contacts for Product A. Because the multiskill group is set up to allocate specific percentages of an agent's time to each specific service queue, coverage forecasts and schedules will be more accurate for each service queue. The agent statistics are also allocated by percentage to each service queue and so are more accurate.

All three types of scheduling methods can use block scheduling (formerly known as multiskill agent queuing, or MSAQ). In block scheduling, an agent performs multiple activities, each activity during a specified block of time. In

contrast, in non-block scheduling, an agent performs one activity only for the entire schedule.

An agent's schedule can include a combination of single service queues, virtual service queues, and multiskill groups. For example, an agent might support a single service queue from 8 to 11 am and a multiskill group from 1 to 4 pm.

The needs of your contact center will guide you in choosing what scheduling option you use. You might find that a virtual service queue serves your purpose best, or that you want to be able to allocate agents to multiple contact types and multiple service queues during the same block of time and so opt to use multiskill groups.

IMPORTANT: The weights allocated to the service queues that make up a multiskill group should be as accurate as possible. If they are not accurate, the coverage for specific service queues will be too high or too low in the generated schedule.

Closed Days and Fixed Work Shifts

When WFM schedules an agent with a fixed or dynamically scheduled work shift, it schedules the agent for days, hours, and arrival times exactly as specified in the work shift configuration. It does not take into account a closed day for a service queue. As a result, an agent with a fixed work shift can be scheduled to work on a day when the contact center is closed (for example, a mid-week holiday).

To prevent this situation, create an exception and assign it to agents with fixed work shifts who would ordinarily be working on the closed day.

Scheduling Order

WFM allows contact centers to define the scheduling order for each service queue (in the Scheduling Order section on the Service Queues page) by these criteria:

- Maximum hours available
- Minimum hours available
- Maximum hours per week

- Minimum hours per week

- Rank

- Company start date

- Department start date

This allows you to manage customer contact operations while maximizing the available agents for the most important activities.

Depending on your contact center's policies, you can schedule agents based on availability for a work shift, their seniority, or their ranking in the contact center.

Service Queue Priority

Assigning a priority number to a service queue allows WFM to resolve scheduling conflicts when agents are assigned to multiple service queues. Zero (0) is the highest priority.

To generate a schedule for a service queue, WFM finds the agents who are assigned to a skill mapping that is associated with the desired service queue. To generate a schedule for a multiskill group, WFM finds the agents who are assigned to the multiskill group. WFM then determines which agents have a work shift with available hours on the specified day. If the agent supports multiple service queues, WFM uses service queue priority to determine which service queue will be assigned to the agent for this schedule.

> **Example**: You designate some of your agents to support two service queues and assign a priority to each service queue. If WFM generates the schedules for the two service queues and discovers there are not enough agents to support all forecast requirements across both service queues, it compares the priority value for the two service queues and schedules agents for the service queue with the highest priority first.

Generating a Schedule

To generate a schedule, follow these steps:

1. Access the Schedule Request page (Schedules and Planning > Planning > Schedule).

2. Select the scheduling method you want to use.

   - The Balanced option equalizes staffing as best as possible across the day's intervals based on user configurations and work shifts, resulting in schedules that spread out available agents more evenly.

   - The Default option concentrates available staff in the earliest intervals they can be scheduled, resulting in schedules that tend to meet staffing requirements earlier in the day over those later in the day.

3. Select the one or more multiskill groups and/or service queues to be scheduled.

4. Enter the start date and the number of weeks for the period you want to schedule. The start date used is the configured first day of the week of the week that contains the date you enter.

5. Select the "Apply shrinkage percentage to the schedule" check box if you want to apply shrinkage to the schedule to compensate for time lost due to vacation, breaks, holidays, illnesses, and so on. Shrinkage percentages are configured on the [Shrinkage](#) page.

   > **Note**: The values in the shrinkage table are applied relative to the submit date of the request, not the current date.

6. Select the "Rotate work shifts" check box if you want WFM to automatically rotate work shifts according to the work shift rotations configured for each agent scheduled. If the check box is not selected, you must configure a work shift for the specific week on the agent's Agents page, or the agents must have completed their dynamic scheduling work shift selection for those weeks.

7. Schedule when you want the request to run. By default the request is run immediately.

8. Click Run.

> **Note**: A schedule request will fail if there is no forecasted data for any of the days you are running the schedule for. Also, if any of the multiskill

groups or service queues are associated with agents whose work shifts include the last day of the week, there must be forecasted data for the first two days of the next week or the request will fail. The extra days might be needed in case unpaid work condition activities are applied that push the work shift from the last day of the week across midnight into the first two days of the next week (the extended work shift day after applying the work condition can be a maximum of 48 hours when unpaid durations are included).

Messaging

The Messaging application allows you to manage schedule requests.

Agents can request time off, exceptions, mentoring, and schedule offers and trades with the other agents on the team in their view. They can also accept or reject schedule trades and offers and mentoring requests, and edit their own requests.

Supervisors and schedulers use Messaging to approve or deny agent requests.

Messaging for Agents

The Messaging application for agents consists of a menu for creating new requests and three mail boxes:

- The Inbox, which contains all requests you receive
- The Outbox, which contains all requests you make
- The Public Box, which contains public schedule trades and mentoring requests

The default view is the Outbox. Requests can be retained from 6 to 99 months, with the default retention period set to 13 months. You cannot delete requests from any mail boxes yourself. They are deleted by the system when they pass the configured retention period.

Request statuses change as the request makes its way through the system. It is important to periodically refresh the mail box so you see the latest statuses. Use standard browser page refreshing methods, such as pressing F5 or clicking the Refresh button on the browser toolbar. Note that the Outbox is displayed after the refresh, even if you were viewing the Inbox or Public Box.

Access your mail boxes by clicking the mail box's icon in the Messaging toolbar. From left to right, the icons are Outbox, Inbox, Public Box, and New Requests.

Outbox

The Outbox contains all requests you have made in ascending scheduled date order. You can view the details of a request, and edit or delete the request if it has not yet been approved or denied.

The following table describes the fields in the Outbox.

Field	Description
Status	The status of the request. Possible statuses are: • Approved. Your request was approved by your supervisor. • Pending. Your schedule trade or schedule offer request is waiting for a response from another agent. Can be edited or deleted. • Waiting. A schedule offer or schedule trade request is waiting for your response. Can be accepted or rejected. • Submitted. Your request is waiting for a response from your supervisor. Can be edited or deleted. • Denied. Your request was denied by your supervisor. • Error. Your request contains an error. • Refused. Another agent has refused your schedule trade request. • Rejected. You rejected another agent's schedule trade request.
Request Type	The general type of request.
Type	The specific type of request. For example, if the Request Type is Time Off, the Type might be Vacation.
Scheduled Date	The date that the requested event occurs. By default, the Outbox is sorted by this date in ascending order. You can click the column header to toggle between ascending and descending order.
Submitted Date	The date and time when the request was submitted. Note that public trade offers do not display a submitted date until someone accepts them.

Working With Your Outbox

To view the details of a request:

▪ Double-click the request.

To edit a request that has not yet been approved or accepted:

1. Double-click the request to view the details.

2. Edit as desired.

3. Click Submit.
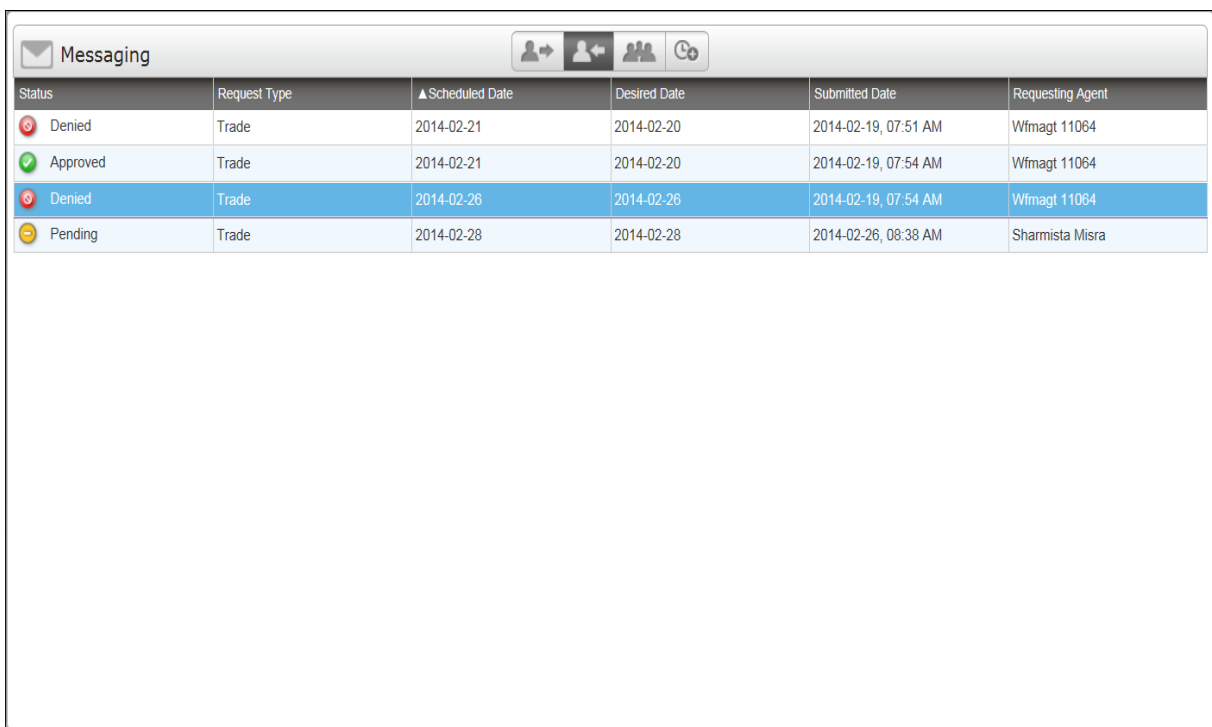

To delete a request that has not yet been approved or accepted:

1. Double-click the request.

2. Click Delete.

Inbox

The Inbox contains all requests you have received in scheduled date order. You can view the details of a request, and edit or delete the request if it has not yet been approved or denied.

> **Note**: Supervisors have final authority over any schedule trades and mentoring requests, so a trade or mentoring request you accept might be rejected by your supervisor.

Status	Request Type	▲ Scheduled Date	Desired Date	Submitted Date	Requesting Agent
🔴 Denied	Trade	2014-02-21	2014-02-20	2014-02-19, 07:51 AM	Wfmagt 11064
🟢 Approved	Trade	2014-02-21	2014-02-20	2014-02-19, 07:54 AM	Wfmagt 11064
🔴 Denied	Trade	2014-02-26	2014-02-26	2014-02-19, 07:54 AM	Wfmagt 11064
🟡 Pending	Trade	2014-02-28	2014-02-28	2014-02-26, 08:38 AM	Sharmista Misra

The following table describes the fields in the Inbox.

Field	Description
Status	The status of the request. Possible statuses are: • Approved. Your request was approved and your schedule updated accordingly. • Pending. An accepted request is waiting for a response from another agent. Can be edited or deleted. • Submitted. The request is waiting for a response from your supervisor. Can be edited or deleted. • To-Do. The request is waiting for a response from you. Can be accepted or rejected. • Denied. Your request was denied by your supervisor. • Error. There is an error in the request. • Refused. You refused another agent's schedule trade request • Rejected. Another agent rejected your schedule trade request
Request Type	The general type of request.
Scheduled Date	The date that the requested event occurs. By default, the Inbox is sorted by this date in ascending order. You can click the column header to toggle between ascending and descending order.
Desired Date	The date the requesting agent wants to receive (the Scheduled Date in a schedule offer request and schedule trade request).
Submit Date	The date and time when the request was submitted. Note that public trade offers do not display a submitted date until someone accepts them.
Requesting Agent	The name of the agent requesting a schedule trade, offer, or mentoring request.

Working With Your Inbox

To accept or reject a schedule trade request:

1. Double-click the request to open it.

2. Click Analyze to compare your schedule to the requesting agent's schedule on the two days. This tells you if you are available to accept the trade.

3. Click Accept or Reject.

To confirm or reject an accepted schedule offer request:

1. Double-click the request to open it.

2. Click Analyze to compare your schedule for the specified day with the offered schedule.

3. Click Confirm to accept the offer request, or Reject to deny the offer request.

To confirm or reject an accepted mentoring request:

1. Double-click the request to open it.

2. Review the accepted request.

3. Click Confirm to accept the mentor, or Reject to refuse the mentor.

Public Box

The Public box contains all available public schedule offers and trades and mentoring requests from the agents in your view. A public offer, trade, and mentoring request are those that are available for any agent to accept. You can view the details of a request, evaluate the request, and then accept it if desired.

Note: Supervisors have final authority over any schedule trades, offers, and mentoring requests, so a trade, offer, or mentoring request you accept might be rejected by your supervisor.

The following table describes the fields in the Public Box.

Public fields

Field	Description
Request Type	The general type of request.
Schedule Date	The date that the requester wants to give up or schedule the mentoring session. By default, the Public Box is sorted by this date in ascending order.
Expire Date	The date the request expires. The request expires at 23:59 of this date, after which you can no longer accept or cancel the request.

Field	Description
Last Comment	The last comment entered on the request.
Requesting Agent	The name of the agent requesting a schedule trade, offer, or mentoring request.

Working With the Public Box

To accept a schedule trade request:

1. Double-click the request to open it.

2. Select a date you want to trade for the date in the request.

3. Click Analyze to compare the two schedules and ensure that your proposed date works.

4. Click Accept.

To accept a schedule offer request:

1. Double-click the request to open it.

2. Click Analyze to compare your schedule for the specified day with the offered schedule.

3. Click Accept if you want to accept the offer, or Cancel to close the request without accepting it.

To accept a mentoring request:
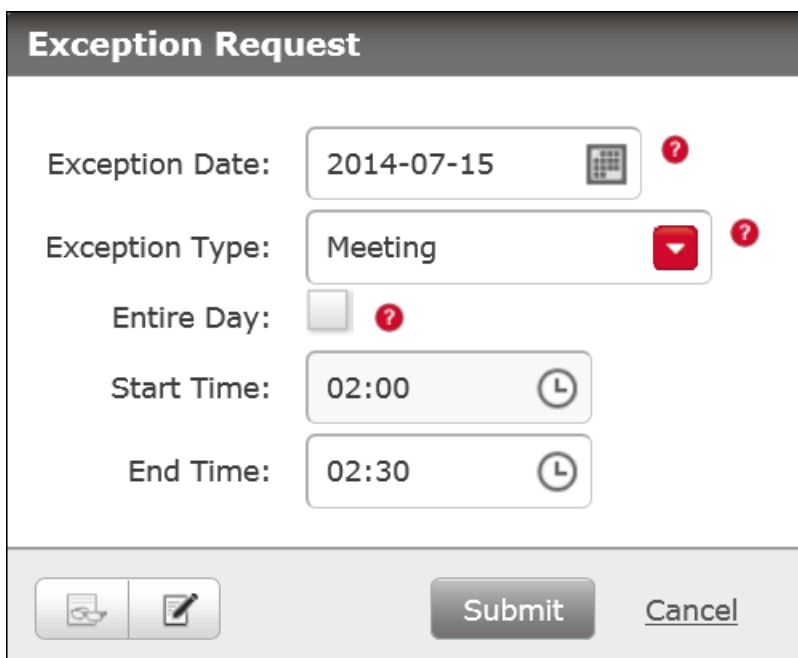

1. Double-click the request to open it.

2. Review the details of the mentoring request, and compare your schedule to that of the requester's to make sure the time slot works for you.

3. Click Accept if you want to accept the mentoring request, or Cancel to close the request without accepting it.

Requests

The New Request menu enables you to create a request for exceptions, time off, schedule offers, schedule trades, and mentoring.

Requesting an Exception

Use an exception request to request a change in your schedule for unplanned activities such as meetings, training sessions, unscheduled breaks, and absenteeism. Your request is sent to your supervisor for approval.

Exceptions can be requested for both future and past dates. Exceptions for past dates are used to correct your adherence percentage. For example, if you had to go home sick yesterday, your statistics would show you out of adherence because you did not follow your schedule. Requesting an exception for personal time off for the time you were out of the office corrects the schedule and your adherence percentage for that day.

The following table describes the fields in the Exception Request dialog box.

Exception Request fields

Field	Description
Exception Date	The date you want the exception to occur. The current date is shown by default.
Exception Type	Drop-down list of the available exception types.
Entire Day	Select the check box to indicate that the exception is for the entire day. When selected the Start Time and End Time fields are hidden.
Start Time	The time the exception starts.
End Time	The time the exception ends.
Write Comment	Click to enter an optional comment (maximum of 140 characters) regarding the exception request.

An exception request flows through the system as outlined in the following table.

Exception request flow

User	Action	Shows Up Here	Status
Agent A	Creates new request	Agent A Outbox	Submitted
Supervisor	Receives request	Supervisor To-Do Box	To-Do
Supervisor	Approves/denies exception	Agent A Inbox	Approved/Denied
		Supervisor All Box	Approved/Denied

Creating a New Exception Request

To create a new exception request:

1. Click New Request and choose Exception Request from the menu.

2. Complete the fields.

3. Click Submit.

Requesting Time Off

Use a time off request to schedule various types of time off from work. You can request multiple days and types of time off in one request. For example, if you want a week off but do not have enough vacation days to cover five days, you can also use time off from one of the other categories to make up the difference.

Time Off Request

Type	Total Hours	Used Hours	Approved Hours	Pending Hours	Remaining Hours
Vacation	101.00	1.00	8.00	0.00	100.00
Floating Holidays	301.00	1.00	8.00	8.00	300.00
Days Off	401.00	1.00	8.00	16.00	400.00
Personal Days	201.00	1.00	8.00	0.00	200.00

First | Second | Third

Type	Date	Day	Start Time	End Time	Duration

Type ▼ | Choice ▼ | Date 📅

Entire Day: ✔ | Start Time 🕐 | End Time 🕐 | Add

Time Off Allotments | List Days | Submit | Cancel

You can submit multiple choices for time off in order of preference (first, second, or third choice). For example, you might want to take a week off in June as your first choice for vacation, but you also indicate that a week off in July is

your second choice and a week off in August is your third choice. Your supervisor will approve one of your three choices.

The Time Off Request dialog box includes a table that shows how much time off you have available, how much you have used, and how much remains, in each of the time off categories. This information is compiled from the time off requests you have submitted.

There are buttons that can help you when requesting time off:

- List Days button, which displays a summary of your time off requests
- Time Off Allotments button (available only if configured by your administrator), which allows you to check if there are time off hours available on the day you want to take off.

The following table describes the fields in the Time Off Request dialog box.

Field	Description
Type	The type of time off: Floating Holidays, Days Off, Personal Days, and Vacation. How each of these types of time off is defined is determined by your contact center.
Total Hours	The total number of hours available to you for the time off type.
Used Hours	The number of hours you have used for the time off type.
Approved Hours	The number of hours that have been approved for the time off type, but not yet taken.
Pending Hours	The number of hours that you have requested for the time off type that have not yet been approved by your supervisor.
Remaining Hours	The number of hours for the time off type you have remaining.
First, Second, and Third Choice	Tabs that display your time off request preferences in this request.
Type	Select the type of time off you are requesting.
Choice	Choose the preference for the time off from the drop-down list.

Field	Description
Date	Select the day you want off from the calendar. You must select each day separately. Click Add to add the date to the 1st, 2nd, or 3rd Choice tab.
Entire Day	Select this check box if you want to take off the entire day. When selected, the Start Time and End Time fields are disabled.
Start Time	If you are taking a partial day off, enter the start time of the time off.
End Time	If you are taking a partial day off, enter the end time of the time off.

Creating a New Time Off Request

To create a new time off request:

1. Click New Request and choose Time Off Request from the menu.
2. From the Type drop-down list, choose the type of time off desired.
3. From the Choice drop-down list, choose the preference for the time off.
4. From the Date field, click the calendar icon to select a day. Dates with a gray background in the calendar are not available for time off. You cannot add the same day twice in the same request (for example, in both a first and second choice).
5. Click Add.
6. Repeat adding dates to the request, using the first, second, and third choice option as desired.
7. Add an optional comment by clicking the Write Comment button.
8. Click Submit.

> **Note**: If you do not have enough available hours for the type of time off you requested, the request will fail.

Viewing a Summary of your Time Off Requests

The Time Off Summary popup lists all your approved and pending time off requests in date order.

To view a summary of all your time off requests:

1. Click New Request and choose Time Off Request from the menu.

2. Click List Days to display your time off summary.

3. After closing the Time Off Summary dialog box, click Cancel to dismiss the Time Off Request dialog box.

Viewing Time Off Allotments

Note: This feature is available only if the administrator has configured WFM to display the Time Off Allotments button.

The Time Off Allotments popup displays the current available time off allotted for a service queue for a selected month. It shows the available FTEs (full time equivalents) allotted for each day of a selected month, and the average gap between the scheduled and forecasted FTEs for that day. A negative number indicates understaffing, and a positive number indicates overstaffing. A day that shows allotted FTEs and a positive gap might be a better choice for time off than a day that shows a negative gap.

To view a summary of the time off allotments:

1. Click New Request and choose Time Off Request from the menu.

2. Click Time Off Allotments and select the desired service queue, month, and year.

3. After closing the Time Off Allotments dialog box, click Cancel to dismiss the Time Off Request dialog box.

Requesting a Schedule Offer

Use a schedule offer request to make a day you are scheduled to work available for another agent to work. For example, if you have an obligation away from work on Wednesday, you offer your shift to anyone else who can work that day. The schedule offer is posted to the Public Box of all agents in your view.

The following table describes the fields in the Schedule Offer Request dialog box.

Field	Description
Scheduled Date	The date you want to offer to other agents to work. By default it displays tomorrow's date. You cannot choose a date in the past.
Expiration Date	The date your request expires. At that time it no longer appears in your Outbox or in the Public Box. The expiration date must be before the Scheduled Date.
Confirm	Select this check box if you want to confirm an agent's acceptance of the offer before it is sent to your supervisor for approval.

A schedule offer request without confirmation flows through the system as outlined in the following table.

Schedule offer request without confirmation flow

User	Action	Shows Up Here	Status
Agent A	Creates new request	Agent A Outbox	Pending
All agents	Receive offer	Agents' Public Box	Not applicable
Agent B	Accepts offer	Agent B Inbox	Submitted
		Agent A Outbox	Submitted

User	Action	Shows Up Here	Status
Supervisor	Receives accepted offer	Supervisor To-Do Box	To-Do
Supervisor	Approves/denies offer	Supervisor All Box	Approved/Denied
		Agent A Outbox	Approved/Denied
		Agent B Inbox	Approved/Denied

A schedule offer request with confirmation flows through the system as outlined in the following table.

Schedule offer request with confirmation flow

User	Action	Shows Up Here	Status
Agent A	Creates new request	Agent A Outbox	Pending
All agents	Receive offer	Agents' Public Box	Not applicable
Agent B	Accepts offer	Agent B Inbox	Pending
Agent A	Receives accepted offer	Agent A Outbox	To-Do
		Agent B Inbox	Pending
Agent A	Confirms/rejects offer	Agent A Outbox	Submitted/Denied (Rejecting the request creates a copy of the request that shows Denied on it and the original request goes back to Pending)
		Agent B Inbox	Submitted/Denied

User	Action	Shows Up Here	Status
Supervisor	Receives accepted offer	Supervisor To-Do Box	To-Do
		Supervisor All Box	Approved/Denied
		Agent A Outbox	Approved/Denied
		Agent B Inbox	Approved/Denied

Creating a New Schedule Offer Request

To create a new schedule offer request:

1. Click New Request and choose Schedule Offer Request from the menu.

2. Complete the fields.

3. Click Submit.

Requesting a Schedule Trade

Use the schedule trade request to trade a scheduled work day with someone else's scheduled work day. These trade requests can be with a specified agent (a private trade) or with any agent in your view (a public trade). You can ask to trade shifts on the same day (for example, you might want to trade your 7 am-3 pm shift with someone else's 10 am-6 pm shift) or for different days (for example, you might want to trade your Monday off for a Friday off).

The following table describes the fields in the Schedule Trade Request dialog box.

Field	Description
Public Trade	Select this check box to post your schedule trade in the Public Box of all agents in your view.
Confirm	(Public trades only) A reminder that you will be asked to confirm or reject a proposed trade from the replying agent. This check box is read-only and cannot be cleared.
Trade With	(Private trades only) Select the name of the agent with whom you want to trade schedules.
Scheduled Date	The date you want to trade. By default it displays tomorrow's date.
Desired Schedule Date	(Private trades only) The date you want to trade for. By default it displays tomorrow's date.
Expiration Date	(Public trades only) The date the request expires.

A private schedule trade request flows through the system as outlined in the following table.

Private schedule trade request flow

User	Action	Shows Up Here	Status
Agent A	Creates new request	Agent A Outbox	Pending
Agent B	Receives trade request	Agent B Inbox	To-Do
Agent B	Accepts/refuses trade request	Agent B Outbox	Submitted/Denied
Agent A	Receives Agent B's answer	Agent A Inbox	Submitted/Denied
Supervisor	Receives accepted trade request for approval	Supervisor To Do Box	To-Do
Supervisor	Approves/denies trade	Agent A Outbox	Approved/Denied
		Agent B Inbox	Approved/Denied
		Supervisor All Box	Approved/Denied

A public schedule trade request flows through the system as outlined in the following table.

Public schedule trade request flow

User	Action	Shows Up Here	Status
Agent A	Creates new request	Agent A Outbox	Pending
All Agents	Sees trade in Public Box	Agents' Public Box	Not applicable
Agent B	Accepts trade request	Agent B Inbox	Pending
Agent A	Receives Agent B's answer	Agent A Outbox	To-Do

User	Action	Shows Up Here	Status
Agent A	Confirms/rejects Agent B's acceptance	Agent A Outbox	Submitted/denied (Rejecting the request creates a copy of the request that shows Denied on it and the original request goes back to Pending)
	Agent B receives Agent A's con-firmation/rejection	Agent B Inbox	Submitted/denied
Supervisor	Receives accepted and confirmed trade request for approval	Supervisor To-Do Box	To-Do
Supervisor	Approves/denies trade	Agent A Outbox	Approved/Denied
		Agent B Inbox	Approved/Denied
		Supervisor All Box	Approved/Denied

Creating a New Schedule Trade Request

To create a new schedule trade request:

1. Click New Request and choose Schedule Trade Request from the menu.

2. Complete the fields.

3. If this is a private trade, click Analyze to compare your schedule on the proposed trade date with that of the person with whom you want to trade to make sure that the trade is possible.

4. If desired, click Write Comment and enter a comment.

5. Click Submit.

Requesting Mentoring

Use a mentoring request to ask for one-on-one coaching from a fellow agent. All mentoring requests are posted in the Public Box, and any agent can

respond. A supervisor, scheduler, or administrator must approve the mentoring request. When the request is approved the exception is added to your schedule and to your mentor's schedule.

Mentoring Request

Mentoring Date:	9/19/2014
Exception Type:	Meeting Exception T'
Start Time:	01:30
End Time:	02:00
Description:	Need help with updating customer records

Submit   Cancel

The following table describes the fields in the Mentoring Request dialog box.

Field	Description
Mentoring Date	The date on which you want to schedule the mentoring session.
Exception Type	Select the appropriate exception from the drop-down list.
Start Time	The start time of the mentoring session.
End Time	The end time of the mentoring session.
Description	A description of the purpose for the mentoring session. The description can be a maximum of 251 characters.

A mentoring request flows through the system as outlined in the following table.

Mentoring request flow

User	Action	Shows Up Here	Status
Agent A	Creates new request	Agent A Outbox	Pending
All Agents	Sees request in Public Box	Agents' Public Box	Not applicable
Agent B	Accepts mentoring request	Agent B Inbox	Pending
Agent A	Receives Agent B's answer	Agent A Outbox	To-Do
Agent A	Confirms/rejects Agent B's acceptance	Agent A Outbox	Submitted/Denied (Rejecting the request creates a copy of the request that shows Denied on it and the original request goes back to Pending)
	Agent B receives Agent A's con-firmation/rejection	Agent B Inbox	Submitted/Denied
Supervisor	Receives accepted and confirmed ment-oring request for approval	Supervisor To-Do Box	To-Do
Supervisor	Approves/denies ment-oring request	Agent A Outbox	Approved/Denied
		Agent B Inbox	Approved/Denied
		Supervisor All Box	Approved/Denied

Creating a Mentoring Request

To create a new mentoring request:

1. Click New Request and choose Mentoring Request from the menu.

2. Complete the fields.

3. Click Submit.

Editing or Deleting a Request

Requests can be edited or deleted in certain situations. The following table describes when you can edit or delete a request.

Request Type	Status	Action Allowed
Schedule Offer (public)	Pending	Edit, Delete
Schedule Trade (private)	Pending	Edit
Schedule Trade (public)	Pending	Edit, Delete
Mentoring	Pending	Edit, Delete
Exception	Submitted	Edit, Delete
Time Off	Submitted	Edit. Delete

Editing a Request

1. Double-click the request to open it.

2. Edit the request as desired.

3. Click Submit.

Deleting a Request

1. Double-click the request to open it.

2. Click Delete.

Messaging for Supervisors, Schedulers, and Administrators

The Messaging application for supervisors, schedulers, and administrators consists of two mail boxes:

- The To-Do Box, which displays all requests that require action from you (the default view)
- The All Box, which contains all requests sent to you

Requests can be retained from 6 to 99 months in the All Box, with the default retention period set to 13 months.

Access your mail boxes by clicking the mail box's icon in the Messaging toolbar. From left to right, the icons are the To-Do Box and the All Box.

> **Note**: Supervisors who are also agents have a dual mailbox, one with the agent's view and one with the supervisor's view. You can switch between the two views using the My Requests and All Requests buttons. Click My Requests to see the agent mailbox, and All Requests to see the supervisor mailbox.

Navigating in your Mailboxes

To the right of the mailbox toolbar are the page view controls. These controls help you navigate through the multiple pages of your mailboxes.
Use the single arrows to move backward and forward one page at a time and the double arrows to move to the beginning or end page in the mailbox. Control the number of requests displayed in one page using the drop-down list at the right. You can select one of the standard numbers (20, 40, 60, or 80) or enter your own number from 1 to 999.

Jump to a specific page by clicking the dark gray center of the controls. This brings up a field you can type a page number in, for example "5" to jump to page 5 of 10.

Approving or Denying Requests

Requests that require your approval appear in your To-Do Box. Once you have approved or denied a request, it is removed from your To-Do Box. All requests that you have received are archived in your All Box.

Exception Requests

The Approve Exception Request dialog box enables you to approve or deny an agent's exception request.

The following table describes the fields in the Approve Exception Request dialog box.

Field	Description
From	The name of the agent requesting the exception.
Request	The type of request.
Received Date	The time and date you received the request. This is the same time and date the agent submitted the request.
Type	The type of exception, as chosen by the agent.
Schedule Date	The date of the exception.
Duration	The duration of the exception.
Schedule Exception	Select the exception description that will appear in the schedule if the exception is approved.

Approving or Denying an Exception Request

To approve or deny an exception request:

1. In the To-Do Box, double-click the request to open it.

2. If approving the request, select the appropriate schedule exception from the drop-down list. This is what appears in the schedule. Click Read Comment if any comments are attached to the exception request. You can also type a comment, if desired.

3. Click Approve or Deny.

Time Off Requests

The following table describes the fields in the Approve Time Off Request dialog box.

Field	Description
From	The name of the agent requesting time off.
Request	The type of request.
Received Date	The time and date you received the request. This is the same time and date the agent submitted the request.
Service Queue	Select the appropriate service queue from the drop-down list. This service queue is used to determine the Forecast Gap.

Field	Description
First, Second, Third tabs	Tabs that display the first, second, and third choices for time off requested by the agent.
Type	The type of time off request.
Date	The date of the requested time off.
Day	The day of the week of the requested time off.
Start Time	The start time of the requested time off.
End Time	The end time of the requested time off.
Forecast Gap	The difference in FTEs between the number of scheduled agents and the number of forecasted agents in the current strategic plan for the service queue selected. You can use this number as a guide for determining if there is enough coverage that day to grant the time off request. **Note:** There is a value in this field only if a strategic plan has been generated.
Allotment Gap	The available FTEs allotted for time off on the requested day.
Schedule Exception	Select the exception description that will appear in the schedule if the exception is approved.

Approving or Denying a Time Off Request

To approve or deny a time off request:

1. Double-click the request to open it.

2. Select the appropriate service queue from the drop-down list.

3. Click the First, Second, and Third tabs to view the agent's ranked time off requests.

4. If desired, click Hours to view a summary of the agent's total, used, approved, pending, and remaining time off hours. Click Read Comment to view any comments that are attached to the request.

5. If you decide to deny the request, click Deny.

6. If approving the request, select the appropriate schedule exception from the drop-down list. This is what appears in the schedule.

7. Click the choice tab for the request you want to approve, and then click Approve.

Approve Trade or Offer Request

The Approve Trade Request dialog box allows you to analyze, and then approve or deny a trade request or an offer request. The same dialog box is used for both trades and offers.

The following table describes the fields in the Approve Trade Request dialog box.

Field	Description
From	The name of the agent who requested the trade.
Request	The Trade high-level request type.
Type	The type of trade request.
Received Date	The date and time the request was submitted.
To	The name of the other agent involved in the trade.
From Date	The first scheduled date involved in the trade.
To Date	The second scheduled date involved in the trade. This field only appears when different days are involved in the trade request.
From Agent Schedule	The schedule for the agent requesting the trade. Use the scroll bar to view the agent's entire schedule.
Name	The name of the agent.
Date	The date specified in the trade request.
To Agent Schedule	The schedule for the agent accepting the trade.
Availability	Indicates if the From agent's schedule fits into the To agent's schedule.
Service Queue	Indicates if the two agents support the same or different service queues.
Teams	Indicates if the two agents belong to the same or different teams.
Overlapping Shifts	Indicates if the two agents have overlapping shifts.
Time Zone	Indicates if the two agents are in the same or different time zone.
Skill Mapping	Indicates if the two agents belong to the same or different skill mapping.
Exception	Indicates if either agent's schedule includes an exception.

Approving or Denying a Schedule Trade or Offer Request

To approve or deny a schedule trade or offer request:

1. In the To-Do Box, double-click the request to open it.

2. Use the Agent Schedules section to analyze the two schedules to make sure they can be traded. Click Read Comment if any comments are attached to the trade or offer request.

3. Click Approve or Deny.

Approve Mentoring Request

The Approve Mentoring Request dialog box allows you to analyze and then approve or deny a mentoring request.

The following table describes the fields in the Approve Mentoring Request dialog box.

Field	Description
From	The name of the agent who requested the mentoring.
Exception Type	The exception type chosen by the agent making the request.
To	The name of the agent who accepted the mentoring request.
Mentoring Date	The date of the mentoring session.
Request	The type of request.
Start Time	The start time of the mentoring session.
Received Date	The date and time the request was submitted.
End Time	The end time of the mentoring session.
Schedule Exception	The exception that will appear in the agents' schedules.
Both agents in service	Yes/No. Indicates if both the requesting and accepting agent is or is not in service during the proposed mentoring time slot.

Approving or Denying a Mentoring Request

To approve or deny a mentoring request:

1. In the To-Do Box, double-click the request to open it.

2. Review the details of the mentoring request. Click Comments if any comments are attached to the mentoring request.

3. Click Approve or Deny.

   If you approve the request, both agents' schedules are updated immediately to show the mentoring session.

Reporting

The Reporting application is a common (multi-product) application that contains reports for all the products you are logged into. The reports that you can access are determined by your role.

Reporting Roles and Scope

Your role determines which reports you can access. If you are assigned multiple roles (for example you are both a supervisor and an agent), you will have access to the reports available to each of those roles.

Role	Scope
Agent	Reports that pertain only to the agent
Supervisor	Reports for the agents, teams, projects, work conditions, work shifts, and exceptions within the supervisor's view
Scheduler	Reports for the service queues, skill mappings, teams, projects, work conditions, work shifts, and exceptions within the scheduler's views
Administrator	All reports

Running a Report

Follow these steps to run a report:

1. In the Reporting application toolbar, click one of these buttons:

   - The button for the product whose reports you want to run. If you use a shared login, there will be a button for each product.

   - The Saved button to access reports that have already been set up and saved for reuse.

2. From the resulting page, click the report you want to run to display that report's setup page.

3. Complete the report setup information. Choose the criteria, the date range, the format, and the fields to be included in the report.

4. If WFM is configured to email reports, and if your role enables you to, set the recurrence of the report. You can set up the report to run automatically at specified intervals for a specified length of time or indefinitely. Recurring reports are emailed to the email addresses you enter in the Destination section. At least one email address is required. Email addresses are separated by semicolons, for example:

   john.smith@example.com;mary.jones@example.com

   > **Note:** To use the Recurrence feature, you must save the report for future use.

5. Click Run Report to run the report immediately, or Save As to save the report for future use.

Points to Remember

When running reports, remember the following points:

- When you save a report, the settings are saved for that report. For example, you can save a report for one service queue, and then modify the report and save it for another service queue.

- Some reports allow you to choose the fields that appear in the report and the order in which those fields appear. When you click Run Report or Save As, the selected fields become the default fields for the report.

- If enabled, supervisors, schedulers, and administrators can schedule a report to run on a recurring basis and specify when to run the report. The report is sent by email to specified email addresses.

- The email for a scheduled report includes the email address of the user who scheduled the report in the From field. If the user's email address is not available, the email address will be <First name>.<Last name>@automated.report. Where <First name> and <Last name> is the name of the user.

Customizing the Report Logo

Reports output in HTML, PDF, and XLS format contain a logo in the upper left corner next to the report title.

An administrator can customize the logo by replacing the default logo with a new logo. This is done in the WFM Configuration Setup (Postinstall.exe) utility.

For information on how to customize the report logo, see "Configuring WFM" in the *WFM Installation Guide*.

Recalculating Data for Agent and Team Performance Reports

It might become necessary to correct a schedule for a past day and recompute adherence and conformity calculations so that agent and team productivity statistics are correct.

The WFM Adherence Conformity Calculator (ACC) service processes data from the daily schedule and agent status table and computes the adherence and conformity percentages for historical productivity reports every day.

If you make changes in a past schedule and need to recompute this data, perform the following steps.

1. On the server that hosts the Transaction services, open the ..\WFO_WFM\Schedule\conf\com_odysoft_calabrio_scheduler.properties file in a text editor.

2. Locate the lastHistoricalDay property section.

3. Change the value (the default value is -5, meaning 5 days in the past) to a value that includes the date whose schedule you changed. Note that the higher the value you enter, the longer it will take for the data to be recalculated. The recommended maximum value is -14.

4. Save your changes.

5. Restart the ACC service so that the property value takes effect.

WFM Reports

The reports available in WFM are the following.

> **Note**: Reports are not available for non-interactive service queues.

Agent and Team Performance Reports

- [Agent and Team Productivity Report]

Agent and Team Productivity Report

This is an Agent and Team Performance report.

The Agent and Team Productivity report displays the agent's or team's productivity statistics over a selected date range, by day, week, or month. Statistics are reported only for time periods during which the agent is logged in.

To display the report, you must select:

- Team or Team and Agent

- Date(s)

- Group Dates By (Day, Week, or Month)

- Format

> **Note**: If you just select one or more teams, then a Team Productivity Report is produced. If you select one or more teams and one or more agents, then an Agent Productivity Report is produced.

> **Note**: The values for Adherence % and Conformance % in this report are based on data calculated before adherence/conformance calculation enhancements were made. As a result, the values are simple averages and not weighted averages.

You can also select which fields to display, except for Agent or Team, which are required. By default, all fields are selected.

The following are the fields that you can select to appear in the report. You can customize the order in which the fields appear from left to right.

Agent Interval Report

This is a Service Queue Performance report.

The Agent Interval report displays the selected agents' activity over half-hour intervals on a selected date.

To display the report, you must select:

- Scope (team or skill mapping)
- Team or skill mapping

- Agents

- Date(s)

- Format

You can also select which fields to display, except for Agent and Interval, which are required. By default, all fields are selected.

The following are the fields that you can select to appear in the report. You can customize the order in which the fields appear from left to right.

Average Handle Time

Agent Report Card

This is a Performance Analysis report.

The Agent Report Card report displays performance information for a selected date range; agents, teams, or teams and agents; and team or skill mapping.

You must select the following to display the report:

- Scope (agent, team, or team agent)
- Filter By (team or skill mapping)
- Team
- Agent
- Evaluation form
- Goal metrics
- Date(s)
- Format

If Recording and Quality Management is installed and if WFM is configured to import evaluation form information, the Evaluation Form drop-down list displays a list of the evaluation forms used in Recording and Quality Management to evaluate agent performance. You must select one of the evaluation forms. The data in the Agent Report Card will reflect only data from agent evaluations using the selected evaluation form and meeting all other report selection criteria.

The goal metrics section displays the default field values set for the following statistics.

Statistic	Default Value
Average Quality Score	75
Average Calls Per Hour	10
Adherence %	75
Conformity %	0
Occupancy %	0
Utilization %	0
Average Handle Time	0
Average Talk Time	0
Average Work Time	0
Average Hold Time	0
Average Ready Time	0

You can modify these goals as desired. When the Agent Report Card is generated, the agent's or team's performance against these goals is indicated. The values displayed are weighted averages.

You can also select which fields to display, except for Agent and Team, which are required. By default, all fields are selected.

The following are the fields that you can select to appear in the report. You can customize the order in which the fields appear from left to right.

Assigned Exception Report

This is a Schedule View report.

The Assigned Exception report displays all occurrences of a selected exception type assigned to selected agents over a selected date range. Exception types are created and maintained in the Activities section under the Application Management application.

> **Note**: It is possible to have all-day exceptions on dates for which schedules have not yet been run. If that is the case, then the Start, End, and Duration fields for those exceptions will be empty. Once a schedule has been run for those dates, the report will display values in those fields.

To display the report, you must select:

- Scope (team or skill mapping)
- Team or skill mapping
- Agent
- Exception
- Date(s)
- Format

You can also select which fields to display, except for Last Name and First Name, which are required. By default, all fields are selected.

The following are the fields that you can select to appear in the report. You can customize the order in which the fields appear from left to right.

Budgetary Planning Report

This is a Strategic Planning report.

The Budgetary Planning report displays the estimated wage cost per role for the identified time frame.

In order to run this report, you must already have a strategic forecast generated for the service queue.

The human resources displayed in this report are configured on the Strategic Resources page. No matter how the resource cost is configured (monthly, yearly, or as a one-time expenditure) on the Strategic Resources page, the value is converted to a monthly cost. This value is used in calculating this report.

How the report is calculated

The number of each human resource type to be planned for any given month equals (forecasted agent count for the month) × (resource ratio of the base resource to the agent resource) × (resource ratio for this resource) × (resource cost)

> **Example**: If there is 1 supervisor for every 10 agents, and 1 manager for every 2 supervisors and the cost per manage is $5,000, then the formula to compute the cost of managers needed in a month where the forecasted number of agents is 100 is:

100 × (1/10) × (1/2) × 5000 = $25,000

To view the report, you must select:

- Service queues
- Start year
- End year
- Start month
- End month
- Format

The fields that appear in the report depend on the human resources that are configured on the Strategic Resources page. You cannot customize the order in which the fields appear.

Facility Planning (hardware) Report

This is a Strategic Planning report.

The Facility Planning (hardware) report displays the capital items (equipment, furniture, and fixtures) that are projected to be used by the select service queue during the selected date range.

The capital items displayed in this report are configured on the Strategic Resources page.

In order to run this report, you must already have a strategic forecast generated for the service queue.

How the report is calculated

> The number of a capital item to be planned for any given month = (forecasted agent count for the month) × (resource ratio of the base resource to the agent resource) × (resource ratio for this resource)

Example: If there is 1 supervisor for every 10 agents, and 1 phone for every 2 supervisors, then the formula to compute the number of phones needed in a month where the forecasted number of agents is 100 is:

100 × (1/10) × (1/2) = 5 phones

To view the report, you must select:

- Service queues
- Start year
- End year
- Start month
- End month
- Format

The fields that appear in the report depend on the capital items that are configured on the Strategic Resources page. The Month field is required. You cannot customize the order in which the fields appear.

Hiring Plan Report

This is a Strategic Planning report.

The Hiring Plan report displays the projected number of employees required to be at each hiring stage to meet required staffing levels during the identified time frame.

- The human resources displayed in this report are configured on the Strategic Resources page.
- In order to run this report, you must already have a strategic forecast generated for the service queue.
- The current resource count from the Strategic Resources page is used as the starting point in the report.
- The attrition value you enter as part of the report request is applied to the current resource count. The difference between this computed value and the forecasted resource requirement for the month in the hiring plan is the resource gap that needs to be filled by the hiring plan.
- The attrition rate for each of the hiring steps is applied. Working backwards from this figure, the required resource count at the beginning of each step is calculated.

To view the report, you must select:

- Service queues
- Strategic resource
- Hiring plan (configured on the Hiring Plans page)
- Target year
- Target month
- Attrition rate (the current attrition rate of the contact center)
- Format

The following are the fields that appear in the report. You cannot customize the order in which the fields appear.

Service Queue Schedule By Agent Report

This is a Schedule View report.

The Service Queue Schedule By Agent report displays agent schedules for a selected date, agent category, and service queue.

To display the report, you must select:

- Service queue
- Agent category
- Date(s)
- Format

The possible agent categories are:

- All Agents For Service
- Agents For Service With Available Time
- Agents Scheduled For Service

This report shows the hourly schedule for the selected day. Each agent's schedule is coded to show the activity scheduled for each hour. Coverage for each service queue is also shown.

Agent activity codes are as follows:

Code	Description
X	In service

Code	Description
B	Break
L	Lunch
A	Assignment
C	Closed service
P	Project
E	Exception
-	Not available
<blank>	Available but not scheduled

Service queue coverage codes are as follows:

Code	Description
-	Fewer agents scheduled in service than forecast requirements
*	Agents scheduled in service match forecast requirements
+	More agents scheduled in service than forecast requirements

Service Queue Schedule By Interval Report

This is a Schedule View report.

The Service Queue Schedule by Interval report displays the schedule for selected service queues for a selected date by half-hour intervals.

To display the report, you must select:

- Service queue
- Date(s)
- Format

You can also select which fields to display, except for Service and Date, which are required. By default, all fields are selected.

The following are the fields that you can select to appear in the report. You can customize the order in which the fields appear from left to right.

Staff Planning Report

This is a Strategic Planning report.

The Staff Planning report displays the projected number of employees needed to meet required staffing levels for the identified time frame.

The human resources displayed in this report are configured on the [Strategic Resources](#) page.

In order to run this report, you must already have a [strategic forecast generated for the service queue](#).

How the report is calculated

The number of each human resource type to be planned for any given month equals (forecasted agent count for the month) × (resource ratio of the base resource to the agent resource) × (resource ratio for this resource)

> **Example**: If there is 1 supervisor for every 10 agents, and 1 manager for every 2 supervisors, then the formula to compute the number of managers needed in a month where the forecasted number of agents is 100 is:
>
> 100 × (1/10) × (1/2) = 5 managers

To view the report you must select:

Report Field Dictionary

This section is an alphabetical listing and description of all fields that appear in WFM reports.

ABANDON %

> The percentage of calls abandoned during the interval.
>
> > Abandoned % = (A ÷ B) × 100
>
> Where:
>
> > A = Number of calls abandoned while the call was in queue or ringing at the agent's phone for the service queue during the interval, whether or not the call persisted less than the service level seconds.
> >
> > B = Number of calls offered for the service queue during the interval.

ACD ID

> The agent's identifier in the ACD.

ACTIVITY DURATION

> The duration of a scheduled activity, in minutes.

ACTIVITY END TIME

> An activity's scheduled ending time.

ACTIVITY START TIME

> An activity's scheduled starting time.

ACTIVITY TYPE

> The type of activity: assignment, break, closed service, exception, lunch, or project.

ADHERENCE %

The percentage describing how well agents stick to their planned work schedule.

Adherence % = [(A − B) ÷ C] × 100

For data collected before WFM 8.9 was installed, these variables are defined as follows:

A = Total time during the interval the agent was scheduled to be in service and was actually in service

B = Total time during the interval the agent was scheduled to not be in service and was actually not in service

C = Total time during the period that agent was scheduled to be in service and not in service

For data collected after WFM 8.9 was installed, these variables are defined as follows:

A = Total configured schedule adherence minutes

B = Total minutes not in adherence

C = Total configured schedule adherence minutes

AGENT ID

The agent's system ID number.

AGENT

The agent's name.

AGENT NUMBER

The agent's ID number.

AGENTS ACTUAL

The count of full time equivalent (FTE) agents supporting the service queue during the interval. Agent time is included only when the agent is in service.

Agents actual = A ÷ 1800

Where:

A = In service time in seconds for agents scheduled to support the service queue during the interval

AGENTS ACTUAL − AGENTS FORECAST

The number of Agents Actual minus the number of Agents Forecast.

AGENTS ACTUAL − AGENTS SCHEDULED

The number of Agents Actual minus the number of Agents Scheduled.

AGENTS FORECAST

The number of forecasted agents required for the service queue during the interval.

Agents forecast = Sum(forecasted agents) ÷ Number of intervals with at least one forecasted agent

AGENTS PROJECTED

The projected number of agents required for the service queue during the interval. This is a trend calculation based on the current trend of actual and forecasted agents.

Agents projected = sum of agents projected ÷ number of intervals with at least one projected agent

AGENTS SCHEDULED

The number of agents scheduled for the service queue during the interval.

AGENTS SCHEDULED − AGENTS FORECASTED

The number of Agents Scheduled minus the number of Agents Forecast.

AGENTS SHRINKAGE

The number of agents expected after shrinkage is applied.

Agents Shrinkage = (Agents Scheduled) – (Agents Forecast)

ASSIGNMENT

The time scheduled for the agent and classified as assignment type work.

ASSIGNMENT PAID

The amount of paid time classified as assignment type work.

ASSIGNMENT UNPAID

The amount of unpaid time classified as assignment type work.

ATTRITION RATE

The rate of loss of employees to promotion, transfer, or termination.

AVERAGE CALLS PER HOUR

The calculation of the average number of calls per hour.

Average calls per hour = 3600 ÷ (A + B)

Where:

A = Talk time in seconds for ACD calls completed during the interval

B = After call work time in seconds for ACD calls completed during the interval

AVERAGE HANDLE TIME

The average handle time during the interval.

Average handle time = (A + B) ÷ C

Where:

A = Total talk time for ACD calls completed during the interval

B = Total after contact work time for ACD calls completed during the interval

C = Total number of ACD calls completed during the interval

AVERAGE HANDLE TIME ACTUAL

The actual average handle time during the interval.

Average handle time actual = Total handle time actual ÷ calls handled

AVERAGE HANDLE TIME FORECAST

The forecasted average handle time during the interval.

Average handle time forecast = Total handle time forecast ÷ calls offered forecast

AVERAGE HOLD TIME

The average amount of time agents placed calls on hold during the interval, including hold time for transfers and conferences.

Average hold time = A ÷ B

Where:

A = Amount of time agents placed calls on hold during the interval, including hold time for transfers and conferences

B = Number of calls placed on hold during the period. The call might have been placed on hold multiple times.

AVERAGE NOT READY TIME

The average amount of time the agent is in the Not Ready agent state.

Average not ready time = A ÷ B

Where:

A = The amount of time the agent is in the Not Ready agent state during the interval

B = Number of contacts completed during the interval

AVERAGE QUALITY SCORE

The average quality score of calls the agent completed during the interval. The quality scores come from calls that are evaluated using

Recording and Quality Management.

Average quality score = A ÷ B

Where:

A = Sum of the overall quality scores for evaluated calls the agent completed during the interval

B = Total evaluated calls the agent completed during the interval

AVERAGE READY TIME

The average amount of time the agent is in the Ready agent state.

Average ready time = A ÷ B

Where:

A = The amount of time the agent is in the Ready agent state during the interval

B = Number of contacts completed during the interval

AVERAGE SPEED OF ANSWER

The average amount of time callers spend in queue waiting for their calls to be answered.

Average speed of answer = A ÷ B

Where:

A = Queue time of calls that were answered during the interval. Queue time includes the time from when the ACD queues the call to the service queue until the time when the agent answers the call.

B = Number of calls for the service queue that were answered during the interval

AVERAGE SPEED OF ANSWER TIME ACTUAL

The actual average amount of time callers spend in queue waiting for their calls to be answered.

AVERAGE SPEED OF ANSWER TIME FORECAST

The forecasted average amount of time calls spend in queue waiting for their calls to be answered.

AVERAGE TALK TIME

The average talk time during the interval.

Average talk time = A ÷ B

Where:

A = Talk time for ACD calls completed during the interval

B = Number of ACD calls completed during the interval

The value for A includes Hold time in the following reports:

- Agent Interval Report
- Interval Service Queue Report
- Agent Service Queue Interval Report
- Service Queue Agent Interval Report
- Team Agent Interval Report
- Team Interval Report

For all other reports that include Average Talk Time, the value for A does not include Hold time.

AVERAGE TALK TIME ACTUAL

The actual average talk time during the interval.

AVERAGE TALK TIME FORECAST

The forecasted average talk time for the interval.

AVERAGE AFTER CONTACT WORK TIME ACTUAL

The actual after contact work time during the interval.

AVERAGE AFTER CONTACT WORK TIME FORECAST

The forecasted average after contact work time during the interval.

AVERAGE WORK TIME

The average after contact work time during the interval.

Average work time = A ÷ B

Where:

A = After contact work time for contacts completed during the interval

B = Number of contacts completed during the interval

BREAK

The amount of break time scheduled for the agent during the interval.

BREAK PAID

The amount of paid break time scheduled for the agent during the interval.

BREAK UNPAID

The amount of unpaid break time scheduled for the agent during the interval.

BUSY OTHER STATE TIME

The amount of time the agent is logged in but is not in service during the interval.

CALLS ABANDONED

The number of ACD calls routed to the service queue during the interval where the caller hung up while in queue or while ringing at the agent's phone. Calls are counted for the interval in which the caller hung up.

CALLS ANSWERED

The number of ACD calls answered during the interval for the service queue. Calls are counted in the interval in which they are answered.

CALLS HANDLED

The number of ACD calls the agent completed during the interval.

CALLS INBOUND

The number of inbound ACD calls the agent completed during the interval.

CALLS OFFERED ACTUAL

The actual number of calls routed to the service queue during the interval. The total includes calls that are initially offered and then dequeued and calls that are queued to multiple service queues. In most cases the call is counted in the interval during which it is routed to the service queue.

CALLS OFFERED FORECAST

The forecasted number of calls routed to the service queue during the interval.

CALLS PER HOUR

The number of ACD calls received per hour.

Calls per hour = (A × 3600) ÷ B

Where:

A = Number of calls handled during the hour

B = Total in service time in seconds during the hour

CALLS PER PAID HOUR

The number of total calls handled divided by the number of paid hours.

CALLS REFORECAST

The reforecasted number of calls routed to the service queue during the interval.

CALLS TRANSFERRED

The number of ACD calls the agent transferred during the interval.

CLOSED

The amount of closed time scheduled for the agent during the interval. Closed time is time scheduled for the agent during contact center closed hours, when the contact center is not accepting calls for the service queue.

CLOSED PAID

The amount of paid closed time scheduled for the agent during the interval.

CLOSED UNPAID

The amount of unpaid closed time scheduled for the agent during the interval.

CONFORMANCE %

Conformance is the percentage of time an agent works the right amount of time regardless of the time of day the agent works. Schedule conformance does not take arrival and departure times into account. For example, an agent who is scheduled to work from 08:00 to 16:00 but instead works from 10:00 to 18:00 would be conforming, but not adhering, to the schedule.

Conformance is calculated according to the following formula:

Conformance % = (A ÷ B) × 100

Where:

A = Total time during the interval the agent is in service, whether or not scheduled to be in service

B = Total time during the interval the agent is scheduled to be in service, whether or not the agent is actually in service

COST PER CALL

> The average cost per call for the day.

DAILY BUDGET

> The calculated total cost for the day.

DATE

> The date of the reported information.

DAYS OFF APPROVED HOURS

> The total amount of days off hours that have been approved for an agent to date.

DAYS OFF REMAINING HOURS

> The total amount of days off hours that an agent has remaining to date.

DAYS OFF TOTAL HOURS

> The total amount of days off hours available to an agent.

DAYS OFF USED HOURS

> The total amount of days off hours used by the agent to date.

DURATION

> The length of time an activity lasts.

END

> The end of the day or interval.

END DATE

> The end date of the reported information.

END TIME

> The end time of day.

ENTIRE DAY

An exception that lasts the entire work shift.

EXCEPTION

The name of the exception.

EXCEPTION PAID

The amount of paid exception time scheduled for the agent during the interval.

EXCEPTION UNPAID

The amount of unpaid exception time scheduled for the agent during the interval.

FIRST NAME

The agent's first name.

FLOATING HOLIDAY APPROVED HOURS

The total amount of floating holiday hours that have been approved for an agent to date.

FLOATING HOLIDAYS REMAINING HOURS

The total amount of floating holidays hours that an agent has remaining to date.

FLOATING HOLIDAYS TOTAL HOURS

The total amount of floating holidays hours available to an agent.

FLOATING HOLIDAYS USED HOURS

The total amount of floating holidays hours used by the agent to date.

FORECAST ACCURACY

The percentage of forecasted calls to actual calls offered for the service queue during the interval.

Forecast accuracy = (A ÷ B) × 100

Where:

A = Forecasted calls for the service queue during the interval

B = Actual calls offered for the service queue during the interval

FORECAST AVERAGE HANDLE TIME

The forecasted average talk time plus the forecasted average work time.

Forecast average handle time = Total forecast handle time ÷ Forecast calls offered

FORECAST CALLS OFFERED

The number of ACD calls forecasted to be routed to the service queue during the interval.

FTE

The number of full time equivalent (FTE) employees.

HANDLED %

The percentage of calls handled by the agent out of he total number of calls offered to the agent.

Handled % = (A ÷ B) × 100

Where:

A = The number of ACD calls handled by the agent while logged in during the interval

B = The total number of ACD calls offered to the agent while logged in during the interval

HANDLE TIME ACCURACY

A measure of how accurate the forecast handle time is.

Handle time accuracy = (A ÷ B) × 100

Where:

A = Forecast average handle time

B = Actual average handle time

HOURLY RATE

The wage rate used in the calculations of the report.

HOURS IN SERVICE

The total number of in service hours for the day.

HOURS PAID

The total number of paid hours per day.

IN SERVICE

The amount of agent in service time scheduled during the interval for the service queue.

IN SERVICE HOURS

The number of hours the agent is scheduled to be in service.

IN SERVICE TIME

The amount of time the agent is logged in during the interval.

INTERVAL

The start time of the half-hour schedule interval.

INTERVAL BUDGET

The total cost for the interval requested.

LAST NAME

The agent's last name.

LUNCH

The amount of lunch time scheduled for the agent for the interval.

LUNCH PAID

The amount of paid lunch time scheduled for the agent for the interval.

LUNCH UNPAID

The amount of unpaid lunch time scheduled for the agent for the interval.

MONTH

The name of the month in ISO format (MM).

NUMBER OF DAYS

The total number of days of the week included in the report. For example, if the report is broken out by days of the week, and the report covers three weeks, there will be three Mondays, three Tuesdays, and so on. The number of days for Monday is therefore 3.

OCCUPANCY %

The percentage of time the agent spends answering ACD calls to the total amount of time the agent is logged in and ready to take calls during the interval.

Occupancy % = A ÷ B

Where:

A = The total handle time

B = Total in service time

OCCUPANCY % ACTUAL

The actual percentage of time the agent spends answering ACD calls to the total amount of time the agent is logged in and ready to take calls during the interval.

Occupancy % actual = (A − B) ÷ A

Where:

A = In service time

B = Ready time

OCCUPANCY % FORECAST

The forecasted percentage of time the agent spends answering ACD calls to the total amount of time the agent is logged in and ready to take calls during the interval.

Occupancy % forecast = Sum(occupancy forecast) ÷ Sum(calls offered forecast)

PAID HOURS ASSIGNMENT

The amount of paid assignment time scheduled for the agent for the interval.

PAID HOURS BREAK

The amount of paid break time scheduled for the agent for the interval.

PAID HOURS CLOSED SERVICE

The amount of paid closed service queue time scheduled for the agent for the interval.

PAID HOURS EXCEPTION

The amount of paid exception time scheduled for the agent for the interval.

PAID HOURS LUNCH

The amount of paid lunch time scheduled for the agent for the interval.

PAID HOURS PROJECT

The amount of paid project time scheduled for the agent for the interval.

PAID HOURS TOTAL

The total paid hours for the interval.

Paid hours total = In Service Hours + Paid Hours Break + Paid Hours Lunch + Paid Hours Exception + Paid Hours Project + Paid Hours Assignment + Paid Hours Closed Service

PERCENT ASSIGNMENT

The percentage of scheduled assignment time for the interval.

Percent assignment = (A ÷ B) × 100

Where:

A = Scheduled assignment work time for the interval

B = Total scheduled time for the interval

PERCENT BREAK

The percentage of scheduled break time for the interval.

Percent break = (A ÷ B) × 100

Where:

A = Scheduled beak time for the interval

B = Total scheduled time for the interval

PERCENT CLOSED

The percentage of closed time for the interval.

Percent closed = (A ÷ B) × 100

Where:

A = Scheduled closed time for the interval

B = Total scheduled time for the interval

PERCENT EXCEPTION

The percentage of exception time for the interval.

Percent exception = (A ÷ B) × 100

Where:

A = Scheduled exception time or the interval

B = Total scheduled time for the interval

PERCENT IN SERVICE

The percentage of in service time for the interval.

Percent in service = (A ÷ B) × 100

Where:

A = Scheduled in service time for the interval

B = Total scheduled time for the interval

PERCENT LUNCH

The percentage of lunch time for the interval.

Percent lunch = (A ÷ B) × 100

Where:

A = Scheduled lunch time for the interval

B = Total scheduled time for the interval

PERCENT OVERTIME

The percentage of overtime time for the interval.

Percent overtime = (A ÷ B) × 100

Where:

A = Scheduled overtime time for the interval

B = Total scheduled time for the interval

PERCENT PROJECT

The percentage of project time for the interval.

Percent project = (A ÷ B) × 100

Where:

A = Scheduled project time for the interval

B = Total scheduled time for the interval

PERSONAL DAYS APPROVED HOURS

The total amount of personal days hours that have been approved for an agent to date.

PERSONAL DAYS USED HOURS

The total amount of personal days hours that an agent has remaining to date.

PERSONAL DAYS TOTAL HOURS

The total amount of personal days hours available to an agent.

PERSONAL DAYS USED HOURS

The total amount of personal days hours used by the agent to date.

PRECISION %

The gap between forecasted calls and actual offered calls, expressed as a percentage.

Precision % = (A ÷ B) × 100

Where:

A = Forecasted calls

B = Actual calls offered

PROJECT

The amount of project time scheduled for the agent for the interval.

PROJECT PAID

The amount of paid project time scheduled for the agent for the interval.

PROJECT UNPAID

> The amount of unpaid project time scheduled for the agent for the interval.

READY STATE TIME

> The amount of time the agent is logged in and waiting to take an ACD call during the interval.

SECONDS SERVICE LEVEL SCHEDULED

> The scheduled number of seconds within which a call must be answered if it is to meet the service level objective.

SERVICE

> The service queue that the agent is supporting.

SERVICE LEVEL

> The percentage that describes the achievement of goals for customer call handling per interval.
>
> For example, if your goal is an average speed of answer of 20 seconds or less, and 80% of your calls are answered in 20 seconds or less, then your service level is 80%.

> Service level percentage = $[(A + B) \div (C + D)] \times 100$

Where:

> A = The number of calls for the service queue the caller abandoned during the interval and were in queue less than the service level number of seconds

> B = The number of calls for the service queue an agent answered during the interval and for which the queue time was less than the service level number of seconds

> C = The number of calls for the service queue that the caller abandoned during the interval, regardless of the time the call was in queue

D = The number of calls for the service queue an agent answered during the interval, regardless of the time the call was in queue

Service Level Type 2: Abandoned calls have negative impact

service level percentage = [(calls) ÷ (calls offered –router calls dequeued)] × 100

Service Level Type 3: Abandoned calls have positive impact

service level percentage = [(calls + calls abandoned) ÷ [(calls offered – router calls dequeued)] × 100

SERVICE LEVEL % ACTUAL

The actual service level percentage, a speed of answer goal that is often expressed as a percentage for answering calls within a specified number of seconds.

See for how this value is calculated.

SERVICE LEVEL % FORECAST

The forecasted percentage of calls answered within the service level threshold time per interval.

See for how this value is calculated.

SERVICE LEVEL % GOAL

The goal percentage of calls to be answered within the service level threshold time, per interval.

See for how this value is calculated.

SERVICE LEVEL % SCHEDULED

The anticipated percentage of calls answered within the service level threshold time, per interval. This is a real time calculation made when the report is generated.

See for how this value is calculated.

SERVICE LEVEL % SHRINKAGE

The anticipated service level percentage based on the anticipated agents after shrinkage.

For example, if you have a Service Level % Scheduled of 80%, and 10 agents scheduled with a Shrinkage % of 10%, then Agents Shrinkage would be closer to 9 agents and the Service Level % Shrinkage would be less than 80%.

See for how this value is calculated.

SERVICE QUEUE

The name of the service queue that the agent supports.

SHIFT LENGTH

The length of a work shift for a service queue.

SHRINKAGE %

The shrinkage rate that is configured on the Shrinkage page (Application Management > Shrinkage).

START

The start time of the day or period.

START DATE

The start date of the reported information.

START TIME

The start time of the work shift.

TEAM

The name of the team.

TEAM NAME

The name of the team.

TOTAL

The total time scheduled for the agents supporting the service queue for the interval.

Total = In Service + Break + Lunch + Exception + Project + Assignment + Closed

TOTAL CALLS

The total number of calls for the day.

TOTAL HANDLE TIME

For service queues:

Total handle time = Talk time (including hold time) + After contact work time

For agents:

Total handle time = Talk time + Hold time + After contact work time

TOTAL HOLD TIME

Total hold time is the total time the agent placed calls on hold, including hold time for transfers and conferences, during the interval.

TOTAL IN SERVICE TIME

Total in service time is the total time, in seconds, during the period the agent was in a state ready to take an ACD call or was handling an ACD call.

TOTAL LOGIN TIME

The total login time for the agent during the interval.

TOTAL NOT READY TIME

Total not ready time is the total time the agent was in the Not Ready agent state during the interval.

TOTAL PAID

> The total hours of paid time scheduled for the interval.

> > Paid in-service hours + Paid break hours + Paid lunch hours + Paid exception hours + Paid project hours + Paid assignment hours + Paid closed hours

TOTAL READY TIME

> Total ready time is the total time the agent was in the Ready agent state during the interval.

TOTAL TALK TIME

> Total talk time is the total time, in seconds, the agent was on ACD calls. The time runs from when the agent answers an ACD call until when the agent disconnects the call, and includes hold time.

TOTAL UNPAID

The total hours of unpaid time scheduled for the interval.

TOTAL WORK TIME

> Total work time is the total time the agent was in the Work agent state during the interval.

USERNAME

The agent's username.

UTILIZATION %

> Utilization percentage is the percentage of time the agent spends answering ACD calls to the total amount of time the agent is logged in during the interval.

> > Utilization % = A ÷ B

Where:

> > A = Total handle time

B = Total in session (login) time

VACATION APPROVED HOURS

The total amount of vacation hours that have been approved for an agent to date.

VACATION REMAINING HOURS

The total amount of vacation hours that an agent has remaining to date.

VACATION TOTAL HOURS

The total amount of vacation hours available to an agent.

VACATION USED HOURS

The total amount of vacation hours used by the agent to date.

WEEKLY BUDGET

The total cost for the week.
