Returns a new string obtained by replacing each substring of this char sequence that matches the given regular expression with the given [replacement]. The [replacement] can consist of any combination of literal text and \$-substitutions. To treat the replacement string literally escape it with the [kotlin.text.Regex.Companion.escapeReplacement] method.

```

```

Returns a new string obtained by replacing each substring of this char sequence that matches the given regular expression with the result of the given function [transform] that takes [MatchResult] and returns a string to be used as a replacement for that match.

```

@kotlin.internal.InlineOnly
public inline fun CharSequence.replace(regex: Regex, noinline transform: (MatchResult) -> CharSequence): String = regex.replace(this, transform)

```

Replaces the first occurrence of the given regular expression [regex] in this char sequence with specified [replacement] expression.

```

@param replacement A replacement expression that can include substitutions. See [Regex.replaceFirst] for details.
@kotlin.internal.InlineOnly
public inline fun CharSequence.replaceFirst(regex: Regex, replacement: String): String = regex.replaceFirst(this, replacement)

```

Returns a copy of this string having its first character replaced with the result of the specified [transform], or the original string if it's empty.

```

@param transform function that takes the first character and returns the result of the transform applied to the character.

Returns `true` if this string is empty or consists solely of whitespace characters.

@sample samples.text.Strings.stringIsBlank
public actual fun CharSequence.isBlank(): Boolean = length == 0 || indices.all { this[it].isWhitespace() }

Returns `true` if this string is equal to [other], optionally ignoring character case.

Two strings are considered to be equal if they have the same length and the same character at the same index.

If [ignoreCase] is true, the result of `Char.toUpperCaseChar().toLowerCaseChar()` on each character is compared.

@param ignoreCase `true` to ignore character case when comparing strings. By default `false`.

Returns a copy of this string having its first letter titlecased using the rules of the default locale, or the original string if it's empty or already starts with a title case letter.

The title case of a character is usually the same as its upper case with several exceptions.

The particular list of characters with the special title case form depends on the underlying platform.

kotlin.coroutines.intrinsics.*\nimport kotlin.native.concurrent.SharedImmutable\n\n/**\n * Defines deep recursive
function that keeps its stack on the heap,\n * which allows very deep recursive computations that do not use the
actual call stack.\n * To initiate a call to this deep recursive function use its [invoke] function.\n * As a rule of
thumb, it should be used if recursion goes deeper than a thousand calls.\n * \n * The [DeepRecursiveFunction] takes
one parameter of type [T] and returns a result of type [R].\n * \n * The [block] of code defines the body of a recursive
function. In this block\n * [callRecursive][DeepRecursiveScope.callRecursive] function can be used to make a
recursive call\n * to the declared function. Other instances of [DeepRecursiveFunction] can be called\n * in this
scope with `callRecursive` extension, too.\n * \n * For example, take a look at the following recursive tree class and
a deeply\n * recursive instance of this tree with 100K nodes:\n * \n * ```\n * class Tree(val left: Tree? = null, val
right: Tree? = null)\n * val deepTree = generateSequence(Tree()) { Tree(it) }.take(100_000).last()\n * ```\n * \n * A
regular recursive function can be defined to compute a depth of a tree:\n * \n * ```\n * fun depth(t: Tree?): Int =\n *
if (t == null) 0 else max(depth(t.left), depth(t.right)) + 1\n * println(depth(deepTree)) // StackOverflowError\n * ```\n *
\n * If this `depth` function is called for a `deepTree` it produces `StackOverflowError` because of deep
recursion.\n * However, the `depth` function can be rewritten using `DeepRecursiveFunction` in the following way,
and then\n * it successfully computes [depth(deepTree)][DeepRecursiveFunction.invoke] expression:\n * \n * ```\n
* val depth = DeepRecursiveFunction<Tree?, Int> { t ->\n * if (t == null) 0 else max(callRecursive(t.left),
callRecursive(t.right)) + 1\n * }\n * println(depth(deepTree)) // Ok\n * ```\n * \n * Deep recursive functions can also
mutually call each other using a heap for the stack via\n * [callRecursive][DeepRecursiveScope.callRecursive]
extension. For example, the\n * following pair of mutually recursive functions computes the number of tree nodes at
even depth in the tree.\n * \n * ```\n * val mutualRecursion = object {\n * val even:
DeepRecursiveFunction<Tree?, Int> = DeepRecursiveFunction { t ->\n * if (t == null) 0 else
odd.callRecursive(t.left) + odd.callRecursive(t.right) + 1\n * }\n * val odd: DeepRecursiveFunction<Tree?,

```

```

Int> = DeepRecursiveFunction { t ->\n * if (t == null) 0 else even.callRecursive(t.left) +
even.callRecursive(t.right)\n * }\n * }\n * ```\n * }\n * @param [T] the function parameter type.\n * @param [R]
the function result type.\n * @param block the function body.\n
