Searches this list or its range for an element for which the given [comparison] function returns zero using the binary search algorithm.
 * The list is expected to be sorted so that the signs of the [comparison] function's return values ascend on the list elements, i.e. negative values come before zero and zeroes come before positive values.
 * Otherwise, the result is undefined.
 * If the list contains multiple elements for which [comparison] returns zero, there is no guarantee which one will be found.

inline operator fun <K, V> MutableMap<K, V>.set(key: K, value: V): Unit {

Returns `true` if the map contains the specified [key].
Allows to overcome type-safety restriction of `containsKey` that requires to pass a key of type `K`.
@kotlin.internal.InlineOnly
public inline fun
<@kotlin.internal.OnlyInputTypes K> Map<out K, *>.containsKey(key: K): Boolean =

Returns `true` if the map maps one or more keys to the specified [value].
Allows to overcome type-safety restriction of `containsValue` that requires to pass a value of type `V`.
@sample

// false warning, extension takes precedence in some cases
@kotlin.internal.InlineOnly
public inline fun <K,
@kotlin.internal.OnlyInputTypes V> Map<K, V>.containsValue(value: V): Boolean
= this.containsValue(value)

Removes the specified key and its corresponding value from this map.
@return the previous value associated with the key, or `null` if the key was not present in the map.
Allows to overcome type-safety restriction of `remove` that requires to pass a key of type `K`.

Returns the key component of the map entry.
This method allows to use destructuring declarations when working with maps, for example:
```
for ((key, value) in map) {
 // do something with the key and the value
}
^
@kotlin.internal.InlineOnly
public inline operator fun <K,

Returns the value component of the map entry.
This method allows to use destructuring declarations when working with maps, for example:
```
for ((key, value) in map) {
    // do something with the key and the value
}
^
@kotlin.internal.InlineOnly
public inline operator fun <K, V>

Converts entry to [Pair] with key being first component and value being second.
^
@kotlin.internal.InlineOnly
public inline fun <K, V> Map.Entry<K, V>.toPair():
Pair<K, V> = Pair(key, value)

Returns the value for the given key, or the result of the [defaultValue] function if there was no entry for the given key.
@sample
samples.collections.Maps.Usage.getOrElse
^
@kotlin.internal.InlineOnly
public inline fun <K, V> Map<K, V>.getOrElse(key: K, defaultValue: () -> V): V

        return defaultValue()
    } else {
        @Suppress("UNCHECKED_CAST")
        return value as V
    }
}

Returns the value for the given [key] or throws an exception if there is no such key in the map.
If the map was created by [withDefault], resorts to its `defaultValue` provider function instead of throwing an exception.
@throws NoSuchElementException when the map doesn't contain a value for the specified key and no implicit default value was provided for that map.
^
@SinceKotlin("1.1")
public fun <K, V> Map<K, V>.getValue(key: K): V
= getOrDefault(key)

Returns the value for the given key. If the key is not found in the map, calls the [defaultValue] function, puts its result into the map under the given key and returns it.
Note that the operation is not guaranteed to be atomic if the map is being modified concurrently.
@sample

 Returns `true` if the two specified arrays are *structurally* equal to one another, i.e. contain the same number of the same elements in the same order.
 * The elements are compared for equality with the [equals][Any.equals] function.
 * For floating point numbers it means that `NaN` is equal to itself and
 `-0.0` is not equal to `0.0`.

kotlin.comparisons

Compares
two values using the specified functions [selectors] to calculate the result of the comparison.
The functions are
called sequentially, receive the given values [a] and [b] and return [Comparable]
objects. As soon as the
[Comparable] instances returned by a function for [a] and [b] values do not
compare as equal, the result of that
comparison is returned.

@sample samples.comparisons.Comparisons.compareValuesByWithSelectors

public fun <T> compareValuesBy(a: T, b: T, vararg selectors: (T) -> Comparable<*>?): Int {
    require(selectors.size > 0)
    return compareValuesByImpl(a, b, selectors)
}

private fun <T>
compareValuesByImpl(a: T, b: T, selectors: Array<out (T) -> Comparable<*>?): Int {
    for (fn in selectors) {
        val v1 = fn(a)
        val v2 = fn(b)
        val diff = compareValues(v1, v2)
        if (diff != 0) return diff
    }
    return 0
}

Compares two values using the specified [selector] function to calculate the
result of the comparison.
The function is applied to the given values [a] and [b] and return [Comparable]
objects.
The result of comparison of these [Comparable] instances is returned.

@sample
samples.comparisons.Comparisons.compareValuesByWithSingleSelector

@kotlin.internal.InlineOnly
public
inline fun <T> compareValuesBy(a: T, b: T, selector: (T) -> Comparable<*>?): Int {
    return
compareValues(selector(a), selector(b))
}

Compares two values using the specified [selector] function to
calculate the result of the comparison.
The function is applied to the given values [a] and [b] and return objects
of type K which are then being
compared with the given [comparator].

@sample
samples.comparisons.Comparisons.compareValuesByWithComparator

@kotlin.internal.InlineOnly
public
inline fun <T, K> compareValuesBy(a: T, b: T, comparator: Comparator<in K>, selector: (T) -> K): Int {
    return
comparator.compare(selector(a), selector(b))
}

Not so useful without type inference for receiver of expression
compareValuesWith(v1, v2, compareBy {
    it.prop1 } thenByDescending { it.prop2 })

Compares two values using the specified [comparator].

@Suppress("NOTHING_TO_INLINE")
public inline fun <T> compareValuesWith(a: T, b: T, comparator:
Comparator<T>): Int = comparator.compare(a, b)

Compares two nullable [Comparable] values. Null
is considered less than any value.

@sample samples.comparisons.Comparisons.compareValues

public
fun <T : Comparable<*>> compareValues(a: T?, b: T?): Int {
    if (a === b) return 0
    if (a == null) return -1
    if (b == null) return 1
    @Suppress("UNCHECKED_CAST")
    return (a as
Comparable<Any>).compareTo(b)
}

Creates a comparator using the sequence of functions to calculate a
result of comparison.
The functions are called sequentially, receive the given values `a` and `b` and return
[Comparable]
objects. As soon as the [Comparable] instances returned by a function for `a` and `b` values do not
compare as
equal, the result of that comparison is returned from the [Comparator].

@sample
samples.comparisons.Comparisons.compareByWithSelectors

public fun <T> compareBy(vararg selectors: (T)
-> Comparable<*>?): Comparator<T> {
    require(selectors.size > 0)
    return Comparator { a, b ->
compareValuesByImpl(a, b, selectors) }
}

Creates a comparator using the function to transform value
to a [Comparable] instance for comparison.

@sample
samples.comparisons.Comparisons.compareByWithSingleSelector

@kotlin.internal.InlineOnly
public inline
fun <T> compareBy(crossinline selector: (T) -> Comparable<*>?): Comparator<T> =
Comparator { a, b ->
compareValuesBy(a, b, selector) }

Creates a comparator using the [selector] function to transform values
being compared and then applying
the specified [comparator] to compare transformed
values.

@sample samples.comparisons.Comparisons.compareByWithComparator

@kotlin.internal.InlineOnly
public inline fun <T, K> compareBy(comparator: Comparator<in K>, crossinline

`replace(regex: Regex, replacement: String): String` * Returns a new string obtained by replacing each substring of this char sequence that matches the given regular expression with the given [replacement]. The [replacement] can consist of any combination of literal text and \$-substitutions. To treat the replacement string literally escape it with the [kotlin.text.Regex.Companion.escapeReplacement] method.

`replace(regex: Regex, replacement: String): String` * Returns a new string obtained by replacing each substring of this char sequence that matches the given regular expression with the result of the given function [transform] that takes [MatchResult] and returns a string to be used as a replacement for that match.

`replace(regex: Regex, noinline transform: (MatchResult) -> CharSequence): String` * Replaces the first occurrence of the given regular expression [regex] in this char sequence with specified [replacement] expression. @param replacement A replacement expression that can include substitutions. See [Regex.replaceFirst] for details.

`replaceFirst(regex: Regex, replacement: String): String` * Returns a copy of this string having its first character replaced with the result of the specified [transform], or the original string if it's empty. @param transform function that takes the first character and returns the result of the transform applied to the character.

`replaceFirstChar(transform: (Char) -> Char): String` * Returns a copy of this string having its first character replaced with the result of the specified [transform], or the original string if it's empty. @param transform function that takes the first character and returns the result of the transform applied to the character.

`replaceFirstChar(transform: (Char) -> CharSequence): String` * Returns a copy of this string having its first character replaced with the result of the specified [transform], or the original string if it's empty. @param transform function that takes the first character and returns the result of the transform applied to the character.

`matches(regex: Regex): Boolean` * Implementation of [regionMatches] for CharSequences. Invoked when it's already known that arguments are not Strings, so that no additional type checks are performed.

`regionMatchesImpl(thisOffset: Int, other: CharSequence, otherOffset: Int, length: Int, ignoreCase: Boolean): Boolean` * Returns true if this char sequence matches the given regular expression.

`startsWith(char: Char, ignoreCase: Boolean = false): Boolean` * Returns true if this char sequence starts with the specified character.

`startsWith(prefix: CharSequence, ignoreCase: Boolean = false): Boolean` * Returns true if this char sequence starts with the specified prefix.

`endsWith(char: Char, ignoreCase: Boolean = false): Boolean` * Returns true if this char sequence ends with the specified character.

@SinceKotlin("1.2")
@InlineOnly
public actual inline fun atan(x: Float): Float = nativeMath.atan(x.toDouble()).toFloat()
Returns the angle `theta` of the polar coordinates `(r, theta)` that correspond to the rectangular coordinates `(x, y)` by computing the arc tangent of the value [y] / [x]; the returned value is an angle in the range from `-PI` to `PI` radians.
Special cases:
    - `atan2(0.0, 0.0)` is `0.0`
    - `atan2(0.0, x)` is `0.0` for `x > 0` and `PI` for `x < 0`
    - `atan2(-0.0, x)` is `-0.0` for `x > 0` and `-PI` for `x < 0`
    - `atan2(y, +Inf)` is `0.0` for `0 < y < +Inf` and `-0.0` for `-Inf < y < 0`
    - `atan2(y, -Inf)` is `PI` for `0 < y < +Inf` and `-PI` for `-Inf < y < 0`
    - `atan2(y, 0.0)` is `PI/2` for `y > 0` and `-PI/2` for `y < 0`
