public fun Collection<Boolean>.toBooleanArray(): BooleanArray {
    val result = BooleanArray(size)
    var index = 0
    for (element in this)
        result[index++] = element
    return result
}

```

* Returns an array of Byte containing all of the elements of this collection.

```

public fun Collection<Byte>.toByteArray(): ByteArray {
    val result = ByteArray(size)
    var index = 0
    for (element in this)
        result[index++] = element
    return result
}

```

* Returns an array of Char containing all of the elements of this collection.

```

public fun Collection<Char>.toCharArray(): CharArray {
    val result = CharArray(size)
    var index = 0
    for (element in this)
        result[index++] = element
    return result
}

```

* Returns an array of Double containing all of the elements of this collection.

```

public fun Collection<Double>.toDoubleArray(): DoubleArray {
    val result = DoubleArray(size)
    var index = 0
    for (element in this)
        result[index++] = element
    return result
}

```

* Returns an array of Float containing all of the elements of this collection.

```

public fun Collection<Float>.toFloatArray(): FloatArray {
    val result = FloatArray(size)
    var index = 0
    for (element in this)
        result[index++] = element
    return result
}

```

* Returns an array of Int containing all of the elements of this collection.

```

public fun Collection<Int>.toIntArray(): IntArray {
    val result = IntArray(size)
    var index = 0
    for (element in this)
        result[index++] = element
    return result
}

```

* Returns an array of Long containing all of the elements of this collection.

```

public fun Collection<Long>.toLongArray(): LongArray {
    val result = LongArray(size)
    var index = 0
    for (element in this)
        result[index++] = element
    return result
}

```

* Returns an array of Short containing all of the elements of this collection.

```

public fun Collection<Short>.toShortArray(): ShortArray {
    val result = ShortArray(size)
    var index = 0
    for (element in this)
        result[index++] = element
    return result
}

```

* Returns a [Map] containing key-value pairs provided by [transform] function applied to elements of the given collection. * If any of two pairs would have the same key the last one gets added to the map. * The returned map preserves the entry iteration order of the original collection.

```

@sample samples.collections.Collections.Transformations.associate
public inline fun <T, K, V> Iterable<T>.associate(transform: (T) -> Pair<K, V>): Map<K, V> {
    val capacity = mapCapacity(collectionSizeOrDefault(10)).coerceAtLeast(16)
    return associateTo(LinkedHashMap<K, V>(capacity), transform)
}

```

* Returns a [Map] containing the elements from the given collection indexed by the key returned from [keySelector] function applied to each element. * If any two elements would have the same key returned by [keySelector] the last one gets added to the map. * The returned map preserves the entry iteration order of the original collection.

```

@sample samples.collections.Collections.Transformations.associateBy
public inline fun <T, K> Iterable<T>.associateBy(keySelector: (T) -> K): Map<K, T> {
    val capacity = mapCapacity(collectionSizeOrDefault(10)).coerceAtLeast(16)
    return associateByTo(LinkedHashMap<K, T>(capacity), keySelector)
}

```

* Returns a [Map] containing the values provided by [valueTransform] and indexed by [keySelector] functions applied to elements of the given collection. * If any two elements would have the same key returned by [keySelector] the last one gets added to the map. * The returned map preserves the entry iteration order of the original collection.

```

@sample samples.collections.Collections.Transformations.associateByWithValueTransform
public inline fun <T, K, V> Iterable<T>.associateBy(keySelector: (T) -> K, valueTransform: (T) -> V): Map<K, V> {
    val capacity = mapCapacity(collectionSizeOrDefault(10)).coerceAtLeast(16)
    return associateByTo(LinkedHashMap<K, V>(capacity), keySelector, valueTransform)
}

```

* Populates and returns the [destination] mutable map with key-value pairs, where key is provided by the [keySelector] function applied to each element of the given collection and value is the element itself. * If any two elements would have the same key returned by [keySelector] the last one gets added to the map.

```

@sample samples.collections.Collections.Transformations.associateByTo
public inline fun <T, K, M : MutableMap<in K, in T>> Iterable<T>.associateByTo(destination: M, keySelector: (T) -> K): M {
    for (element in this)
        destination.put(keySelector(element), element)
    return destination
}

```

* Populates and returns the [destination] mutable map with key-value pairs, where key is provided by the [keySelector] function and

value is provided by the [valueTransform] function applied to elements of the given collection.

If any two elements would have the same key returned by [keySelector] the last one gets added to the map.

@sample samples.collections.Collections.Transformations.associateByToWithValueTransform

```

*public inline fun <T, K, V, M : MutableMap<in K, in V>> Iterable<T>.associateByTo(destination: M,
keySelector: (T) -> K, valueTransform: (T) -> V): M {
    for (element in this) {
        destination.put(keySelector(element), valueTransform(element))
    }
    return destination
}

```

Populates and returns the [destination] mutable map with key-value pairs provided by [transform] function applied to each element of the given collection.

If any of two pairs would have the same key the last one gets added to the map.

@sample samples.collections.Collections.Transformations.associateTo

```

*public inline fun <T, K, V, M : MutableMap<in K, in V>> Iterable<T>.associateTo(destination: M, transform: (T) -> Pair<K, V>): M {
    for (element in this) {
        destination += transform(element)
    }
    return destination
}

```

Returns a [Map] where keys are elements from the given collection and values are produced by the [valueSelector] function applied to each element.

If any two elements are equal, the last one gets added to the map.

The returned map preserves the entry iteration order of the original collection.

@sample samples.collections.Collections.Transformations.associateWith

```

*SinceKotlin("1.3")
public inline fun <K, V> Iterable<K>.associateWith(valueSelector: (K) -> V): Map<K, V> {
    val result = LinkedHashMap<K, V>(mapCapacity(collectionSizeOrDefault(10)).coerceAtLeast(16))
    return associateWithTo(result, valueSelector)
}

```

Populates and returns the [destination] mutable map with key-value pairs for each element of the given collection, where key is the element itself and value is provided by the [valueSelector] function applied to that key.

If any two elements are equal, the last one overwrites the former value in the map.

@sample samples.collections.Collections.Transformations.associateWithTo

```

*SinceKotlin("1.3")
public inline fun <K, V, M : MutableMap<in K, in V>> Iterable<K>.associateWithTo(destination: M, valueSelector: (K) -> V): M {
    for (element in this) {
        destination.put(element, valueSelector(element))
    }
    return destination
}

```

Appends all elements to the given [destination] collection.

```

public fun <T, C : MutableCollection<in T>> Iterable<T>.toCollection(destination: C): C {
    for (item in this) {
        destination.add(item)
    }
    return destination
}

```

Returns a new [HashSet] of all elements.

```

public fun <T> Iterable<T>.toHashSet(): HashSet<T> {
    return toCollection(HashSet<T>(mapCapacity(collectionSizeOrDefault(12))))
}

```

Returns a [List] containing all elements.

```

public fun <T> Iterable<T>.toList(): List<T> {
    if (this is Collection) {
        return when (size) {
            0 -> emptyList()
            1 -> listOf(if (this is List) get(0) else iterator().next())
            else -> this.toMutableList()
        }
    }
    return this.toMutableList().optimizeReadOnlyList()
}

```

Returns a new [MutableList] filled with all elements of this collection.

```

public fun <T> Iterable<T>.toMutableList(): MutableList<T> {
    if (this is Collection<T>) {
        return this.toMutableList()
    }
    return toCollection(ArrayList<T>())
}

```

Returns a new [MutableList] filled with all elements of this collection.

```

public fun <T> Collection<T>.toMutableList(): MutableList<T> {
    return ArrayList(this)
}

```

Returns a [Set] of all elements.

The returned set preserves the element iteration order of the original collection.

```

public fun <T> Iterable<T>.toSet(): Set<T> {
    if (this is Collection) {
        return when (size) {
            0 -> emptySet()
            1 -> setOf(if (this is List) this[0] else iterator().next())
            else -> toCollection(LinkedHashSet<T>(mapCapacity(size)))
        }
    }
    return toCollection(LinkedHashSet<T>()).optimizeReadOnlySet()
}

```

Returns a single list of all elements yielded from results of [transform] function being invoked on each element of original collection.

@sample samples.collections.Collections.Transformations.flatMap

```

public inline fun <T, R> Iterable<T>.flatMap(transform: (T) -> Iterable<R>): List<R> {
    return flatMapTo(ArrayList<R>(), transform)
}

```

Returns a single list of all elements yielded from results of [transform] function being invoked on each element of original collection.

*\n@SinceKotlin("1.5")\n@WasExperimental(ExperimentalStdlibApi::class)\npublic fun Int.digitToChar(): Char {\n    if (this in 0..9) {\n        return '0' + this\n    }\n    throw IllegalArgumentException("\nInt $this is not a decimal digit")\n}\n\n/**\n * Returns the Char that represents this numeric digit value in the specified [radix].\n * Throws an exception if the [radix] is not in the range `2..36` or if this value is not in the range `0` until radix`.\n * If this
```

```

value is less than `10`, the decimal digit Char with code `0.code + this` is returned.
 * Otherwise, the uppercase Latin letter with code `A.code + this - 10` is returned.
 * @sample samples.text.Chars.digitToChar
 *
 * Since Kotlin("1.5")
 * WasExperimental(ExperimentalStdlibApi::class)
 * public fun Int.digitToChar(radix: Int): Char {
 *     if (radix !in 2..36)
 *         throw IllegalArgumentException("Invalid radix: $radix. Valid radix values are in range 2..36")
 *     if (this < 0 || this >= radix)
 *         throw IllegalArgumentException("Digit $this does not represent a valid digit in radix $radix")
 *     return if (this < 10) {
 *         '0' + this
 *     } else {
 *         'A' + this - 10
 *     }
 * }
 *
 * Converts this character to lower case using Unicode mapping rules of the invariant locale.
 *
 * Since Kotlin("1.5")
 * WasExperimental(ExperimentalStdlibApi::class)
 * public fun Char.lowercase(): Char {
 *     return Char.toLowerCase(this)
 * }
 *
 * Converts this character to lower case using Unicode mapping rules of the invariant locale.
 *
 * This function performs one-to-one character mapping.
 *
 * To support one-to-many character mapping use the [toLowerCase] function.
 *
 * If this character has no mapping equivalent, the character itself is returned.
 *
 * @sample samples.text.Chars.toLowerCase
 *
 * Since Kotlin("1.5")
 * WasExperimental(ExperimentalStdlibApi::class)
 * public fun Char.toLowerCaseChar(): Char {
 *     return Char.toLowerCaseChar(this)
 * }
 *
 * Converts this character to lower case using Unicode mapping rules of the invariant locale.
 *
 * This function supports one-to-many character mapping, thus the length of the returned string can be greater than one.
 *
 * For example, `'\u0130'.toLowerCase()` returns `'\u0069\u0307'`, where `'\u0130` is the LATIN CAPITAL LETTER I WITH DOT ABOVE character (`\u0130`).
 *
 * If this character has no lower case mapping, the result of `toString()` of this char is returned.
 *
 * @sample samples.text.Chars.toLowerCase
 *
 * Since Kotlin("1.5")
 * WasExperimental(ExperimentalStdlibApi::class)
 * public fun Char.toLowerCase(): String {
 *     return Char.toLowerCase(this)
 * }
 *
 * Converts this character to upper case using Unicode mapping rules of the invariant locale.
 *
 * Since Kotlin("1.5")
 * WasExperimental(ExperimentalStdlibApi::class)
 * public fun Char.toUpperCase(): Char {
 *     return Char.toUpperCase(this)
 * }
 *
 * Converts this character to upper case using Unicode mapping rules of the invariant locale.
 *
 * This function performs one-to-one character mapping.
 *
 * To support one-to-many character mapping use the [toUpperCase] function.
 *
 * If this character has no mapping equivalent, the character itself is returned.
 *
 * @sample samples.text.Chars.toUpperCase
 *
 * Since Kotlin("1.5")
 * WasExperimental(ExperimentalStdlibApi::class)
 * public fun Char.toUpperCaseChar(): Char {
 *     return Char.toUpperCaseChar(this)
 * }
 *
 * Converts this character to upper case using Unicode mapping rules of the invariant locale.
 *
 * This function supports one-to-many character mapping, thus the length of the returned string can be greater than one.
 *
 * For example, `'\uFB00'.toUpperCase()` returns `'\u0046\u0046'`, where `'\uFB00` is the LATIN SMALL LIGATURE FF character (`\ufb00`).
 *
 * If this character has no upper case mapping, the result of `toString()` of this char is returned.
 *
 * @sample samples.text.Chars.toUpperCase
 *
 * Since Kotlin("1.5")

 * }
 *
 * Converts this character to title case using Unicode mapping rules of the invariant locale.
 *
 * This function supports one-to-many character mapping, thus the length of the returned string can be greater than one.
 *
 * For example, `'\uFB00'.titlecase()` returns `'\u0046\u0066'`, where `'\uFB00` is the LATIN SMALL LIGATURE FF character (`\ufb00`).
 *
 * If this character has no title case mapping, the result of [toUpperCase] is returned instead.
 *
 * @sample samples.text.Chars.titlecase
 *
 * Since Kotlin("1.5")
 * public fun Char.titlecase(): String {
 *     return Char.titlecase(this)
 * }
 *
 * Concatenates this Char and a String.
 *
 * @sample samples.text.Chars.plus
 *
 * Since Kotlin("1.5")
 * public inline operator fun Char.plus(other: String): String {
 *     return this.toString() + other
 * }

```

`other` Returns `true` if this character is equal to the `[other]` character, optionally ignoring character case. Two characters are considered equal ignoring case if `Char.toUpperCaseChar().toLowerCaseChar()` on each character produces the same result.

`@param ignoreCase true` to ignore character case when comparing characters. By default `false`.

`@sample samples.text.Chars.equals`

```

public fun Char.equals(other: Char, ignoreCase: Boolean = false): Boolean {
    if (this == other) return true
    if (!ignoreCase)
        return false
    val thisUpper = this.toUpperCaseChar()
    val otherUpper = other.toUpperCaseChar()
    return thisUpper == otherUpper || thisUpper.toLowerCaseChar() == otherUpper.toLowerCaseChar()
}

```

Returns `true` if this character is a Unicode surrogate code unit.

`@sample samples.text.Chars.isSurrogate`

```

public fun Char.isSurrogate(): Boolean = this in Char.MIN_SURROGATE..Char.MAX_SURROGATE

```

Returns the Unicode general category of this character.

`@SinceKotlin("1.5")`

```

public expect val Char.category: CharCategory

```

Returns `true` if this character (Unicode code point) is defined in Unicode. A character is considered to be defined in Unicode if its `[category]` is not `[CharCategory.UNASSIGNED]`.

`@SinceKotlin("1.5")`

```

public expect fun Char.isDefined(): Boolean

```

Returns `true` if this character is a letter. A character is considered to be a letter if its `[category]` is `[CharCategory.UPPERCASE_LETTER]`, `[CharCategory.LOWERCASE_LETTER]`, `[CharCategory.TITLECASE_LETTER]`, `[CharCategory.MODIFIER_LETTER]`, or `[CharCategory.OTHER_LETTER]`.

`@sample samples.text.Chars.isLetter`

```

@SinceKotlin("1.5")
public expect fun Char.isLetter(): Boolean

```

Returns `true` if this character is a letter or digit.

`@see isLetter`

`@see isDigit`

`@sample samples.text.Chars.isLetterOrDigit`

```

@SinceKotlin("1.5")
public expect fun Char.isLetterOrDigit(): Boolean

```

Returns `true` if this character is a digit. A character is considered to be a digit if its `[category]` is `[CharCategory.DECIMAL_DIGIT_NUMBER]`.

`@sample samples.text.Chars.isDigit`

```

@SinceKotlin("1.5")
public expect fun Char.isDigit(): Boolean

```

Returns `true` if this character is an upper case character if its `[category]` is `[CharCategory.UPPERCASE_LETTER]`, or it has contributory property `Other_Uppercase` as defined by the Unicode Standard.

`@sample samples.text.Chars.isUpperCase`

```

@SinceKotlin("1.5")
public expect fun Char.isUpperCase(): Boolean

```

Returns `true` if this character is lower case. A character is considered to be a lower case character if its `[category]` is `[CharCategory.LOWERCASE_LETTER]`, or it has contributory property `Other_Lowercase` as defined by the Unicode Standard.

`@sample samples.text.Chars.isLowerCase`

```

@SinceKotlin("1.5")
public expect fun Char.isLowerCase(): Boolean

```

Returns `true` if this character is a title case letter. A character is considered to be a title case letter if its `[category]` is `[CharCategory.TITLECASE_LETTER]`.

`@sample samples.text.Chars.isTitleCase`

```

@SinceKotlin("1.5")
public expect fun Char.isTitleCase(): Boolean

```

Returns `true` if this character is an ISO control character. A character is considered to be an ISO control character if its `[category]` is `[CharCategory.CONTROL]`, meaning the `Char` is in the range `      ..      ` or in the range `      ..      `.

`@sample samples.text.Chars.isISOControl`

```

@SinceKotlin("1.5")
public expect fun Char.isISOControl(): Boolean

```

Determines whether a character is whitespace according to the Unicode standard. Returns `true` if the character is whitespace.

`@sample samples.text.Chars.isWhitespace`

```

public expect fun Char.isWhitespace(): Boolean

```

`package kotlin`

Creates a `Char` with the specified `[code]`, or throws an exception if the `[code]` is out of `Char.MIN_VALUE..Char.MAX_VALUE`. If the program that calls this function is written in a way that only valid `[code]` is passed as the argument, using the overload that takes a `[UShort]` argument is preferable.

`(Char(intValue.toUShort()))`. That overload doesn't check validity of the argument, and may improve program performance when the function is called routinely inside a loop.

`@sample samples.text.Chars.charFromCode`

```

@WasExperimental(ExperimentalStdlibApi::class)
@kotlin.internal.InlineOnly

```

```

c inline fun Char(code: Int): Char {
    if (code < Char.MIN_VALUE.code || code > Char.MAX_VALUE.code) {
        throw IllegalArgumentException("Invalid Char code: $code")
    }
    return code.toChar()
}

Creates a Char with the specified [code].

V, M : MutableMap<in K, in V>> Sequence<T>.associateByTo(destination:

M, keySelector: (T) -> K, valueTransform: (T) -> V): M {
 for (element in this) {
 destination.put(keySelector(element), valueTransform(element))
 }
 return destination
 }
 Populates and returns the [destination] mutable map with key-value pairs provided by [transform] function applied to each element of the given sequence.
 If any of two pairs would have the same key the last one gets added to the map.
 The operation is `_terminal_`.
 @sample
 samples.collections.Collections.Transformations.associateTo
 public inline fun <T, K, V, M : MutableMap<in K, in V>> Sequence<T>.associateTo(destination: M, transform: (T) -> Pair<K, V>): M {
 for (element in this) {
 destination += transform(element)
 }
 return destination
 }
 Returns a [Map] where keys are elements from the given sequence and values are produced by the [valueSelector] function applied to each element.
 If any two elements are equal, the last one gets added to the map.
 The returned map preserves the entry iteration order of the original sequence.
 The operation is `_terminal_`.
 @sample
 samples.collections.Collections.Transformations.associateWith
 public inline fun <K, V> Sequence<K>.associateWith(valueSelector: (K) -> V): Map<K, V> {
 val result = LinkedHashMap<K, V>()
 return associateWithTo(result, valueSelector)
 }
 Populates and returns the [destination] mutable map with key-value pairs for each element of the given sequence, where key is the element itself and value is provided by the [valueSelector] function applied to that key.
 If any two elements are equal, the last one overwrites the former value in the map.
 The operation is `_terminal_`.
 @sample
 samples.collections.Collections.Transformations.associateWithTo
 public inline fun <K, V, M : MutableMap<in K, in V>> Sequence<K>.associateWithTo(destination: M, valueSelector: (K) -> V): M {
 for (element in this) {
 destination.put(element, valueSelector(element))
 }
 return destination
 }
 Appends all elements to the given [destination] collection.
 The operation is `_terminal_`.
 public fun <T, C : MutableCollection<in T>> Sequence<T>.toCollection(destination: C): C {
 for (item in this) {
 destination.add(item)
 }
 return destination
 }
 Returns a new [HashSet] of all elements.
 The operation is `_terminal_`.
 public fun <T> Sequence<T>.toHashSet(): HashSet<T> {
 return toCollection(HashSet<T>())
 }
 Returns a [List] containing all elements.
 The operation is `_terminal_`.
 public fun <T> Sequence<T>.toList(): List<T> {
 return this.toMutableList().optimizeReadOnlyList()
 }
 Returns a new [MutableList] filled with all elements of this sequence.
 The operation is `_terminal_`.
 public fun <T> Sequence<T>.toMutableList(): MutableList<T> {
 return toCollection(ArrayList<T>())
 }
 Returns a [Set] of all elements.
 The returned set preserves the element iteration order of the original sequence.
 The operation is `_terminal_`.
 public fun <T> Sequence<T>.toSet(): Set<T> {
 return toCollection(LinkedHashSet<T>()).optimizeReadOnlySet()
 }
 Returns a single sequence of all elements from results of [transform] function being invoked on each element of original sequence.
 The operation is `_intermediate_` and `_stateless_`.
 @sample
 samples.collections.Collections.Transformations.flatMap
 public inline fun <T, R> Sequence<T>.flatMap(transform: (T) -> Iterable<R>): Sequence<R> {
 return FlatteningSequence(this, transform, Iterable<R>::iterator)
 }
 Returns a single sequence of all elements from results of [transform] function being invoked on each element of original sequence.
 The operation is `_intermediate_` and `_stateless_`.
 @sample
 samples.collections.Collections.Transformations.flatMap
 public fun <T, R> Sequence<T>.flatMap(transform: (T) -> Sequence<R>): Sequence<R> {
 return FlatteningSequence(this, transform, Sequence<R>::iterator)
 }
 Returns a single sequence of all elements yielded from results of [transform] function being invoked on each element and its index in the original sequence.
 The operation is `_intermediate_` and `_stateless_`.

    if (other.isEmpty())
        return this@minus.iterator()
    else
        return this@minus.filterNot { it in other }.iterator()
}

Returns a sequence containing all elements of the original sequence without the first occurrence of the given [element].

The operation is _intermediate_ and _stateless_.
@kotlin.internal.InlineOnly
public inline fun <T> Sequence<T>.minusElement(element: T): Sequence<T> {
    return minus(element)
}

Splits the original sequence into pair of lists, where *first* list contains elements for which [predicate] yielded `true`, while *second* list contains elements for which [predicate] yielded `false`.

The operation is _terminal_.
@sample samples.collections.Sequences.Transformations.partition
public inline fun <T> Sequence<T>.partition(predicate: (T) -> Boolean): Pair<List<T>, List<T>> {
    val first = ArrayList<T>()
    val second = ArrayList<T>()
    for (element in this) {
        if (predicate(element))
            first.add(element)
        else
            second.add(element)
    }
    return Pair(first, second)
}

Returns a sequence containing all elements of the original sequence and then the given [element].

The operation is _intermediate_ and _stateless_.
public operator fun <T> Sequence<T>.plus(element: T): Sequence<T> {
    return sequenceOf(this, sequenceOf(element)).flatten()
}

Returns a sequence containing all elements of original sequence and then all elements of the given [elements] array.

Note that the source sequence and the array being added are iterated only when an `iterator` is requested from the resulting sequence. Changing any of them between successive calls to `iterator` may affect the result.

The operation is _intermediate_ and _stateless_.
public operator fun <T> Sequence<T>.plus(elements: Array<out T>): Sequence<T> {
    return this.plus(elements.asList())
}

Returns a sequence containing all elements of original sequence and then all elements of the given [elements] collection.

Note that the source sequence and the collection being added are iterated only when an `iterator` is requested from the resulting sequence. Changing any of them between successive calls to `iterator` may affect the result.

The operation is _intermediate_ and _stateless_.
public operator fun <T> Sequence<T>.plus(elements: Iterable<T>): Sequence<T> {
    return sequenceOf(this, elements.asSequence()).flatten()
}

Returns a sequence containing all elements of original sequence and then all elements of the given [elements] sequence.

Note that the source sequence and the sequence being added are iterated only when an `iterator` is requested from the resulting sequence. Changing any of them between successive calls to `iterator` may affect the result.

The operation is _intermediate_ and _stateless_.
public operator fun <T> Sequence<T>.plus(elements: Sequence<T>): Sequence<T> {
    return sequenceOf(this, elements).flatten()
}

Returns a sequence containing all elements of the original sequence and then the given [element].

The operation is _intermediate_ and _stateless_.
@kotlin.internal.InlineOnly
public inline fun <T> Sequence<T>.plusElement(element: T): Sequence<T> {
    return plus(element)
}

Returns a sequence of snapshots of the window of the given [size] sliding along this sequence with the given [step], where each snapshot is a list.

Several last lists may have fewer elements than the given [size].

Both [size] and [step] must be positive and can be greater than the number of elements in this sequence.

@param size the number of elements to take in each window
@param step the number of elements to move the window forward by on an each step, by default 1
@param partialWindows controls whether or not to keep partial windows in the end if any, by default `false` which means partial windows won't be preserved

@sample samples.collections.Sequences.Transformations.takeWindows
@SinceKotlin("1.2")
public fun <T> Sequence<T>.windowed(size: Int, step: Int = 1, partialWindows: Boolean = false): Sequence<List<T>> {
    return windowedSequence(size, step, partialWindows, reuseBuffer = false)
}

Returns a sequence of results of applying the given [transform] function to an each list representing a view over the window of the given [size] sliding along this sequence with the given [step].

Note that the list passed to the [transform] function is ephemeral and is valid only inside that function.

You should not store it or allow it to escape in some way, unless you made a snapshot of it.

Several last lists may have fewer elements than the given [size].

Both [size] and [step] must be positive and can be greater than the number of elements in this sequence.

@param size the number of elements

```

```

CharSequence.windowed(size: Int, step: Int = 1, partialWindows: Boolean = false): List<String> {
    return windowed(size, step, partialWindows) { it.toString() }
}

Returns a list of results of applying the given [transform] function to an each char sequence representing a view over the window of the given [size] sliding along this char sequence with the given [step]. Note that the char sequence passed to the [transform] function is ephemeral and is valid only inside that function. You should not store it or allow it to escape in some way, unless you made a snapshot of it. Several last char sequences may have fewer characters than the given [size]. Both [size] and [step] must be positive and can be greater than the number of elements in this char sequence.

@param size the number of elements to take in each window
@param step the number of elements to move the window forward by on an each step, by default 1
@param partialWindows controls whether or not to keep partial windows in the end if any, by default `false` which means partial windows won't be preserved

@sample samples.collections.Sequences.Transformations.averageWindows

@SinceKotlin("1.2")
public fun <R> CharSequence.windowed(size: Int, step: Int = 1, partialWindows: Boolean = false, transform: (CharSequence) -> R): List<R> {
    checkWindowSizeStep(size, step)
    val thisSize = this.length
    val resultCapacity = thisSize / step + if (thisSize % step == 0) 0 else 1
    val result = ArrayList<R>(resultCapacity)
    var index = 0
    while (index in 0 until thisSize) {
        val end = index + size
        val coercedEnd = if (end < 0 || end > thisSize) { if (partialWindows) thisSize else break } else end
        result.add(transform(subSequence(index, coercedEnd)))
        index += step
    }
    return result
}

Returns a sequence of snapshots of the window of the given [size] sliding along this char sequence with the given [step], where each snapshot is a string. Several last strings may have fewer characters than the given [size]. Both [size] and [step] must be positive and can be greater than the number of elements in this char sequence.

@param size the number of elements to take in each window
@param step the number of elements to move the window forward by on an each step, by default 1
@param partialWindows controls whether or not to keep partial windows in the end if any, by default `false` which means partial windows won't be preserved

@sample samples.collections.Sequences.Transformations.takeWindows

@SinceKotlin("1.2")
public fun CharSequence.windowedSequence(size: Int, step: Int = 1, partialWindows: Boolean = false): Sequence<String> {
    return windowedSequence(size, step, partialWindows) { it.toString() }
}

Returns a sequence of results of applying the given [transform] function to an each char sequence representing a view over the window of the given [size] sliding along this char sequence with the given [step]. Note that the char sequence passed to the [transform] function is ephemeral and is valid only inside that function. You should not store it or allow it to escape in some way, unless you made a snapshot of it. Several last char sequences may have fewer characters than the given [size]. Both [size] and [step] must be positive and can be greater than the number of elements in this char sequence.

@param size the number of elements to take in each window
@param step the number of elements to move the window forward by on an each step, by default 1
@param partialWindows controls whether or not to keep partial windows in the end if any, by default `false` which means partial windows won't be preserved

@sample samples.collections.Sequences.Transformations.averageWindows

@SinceKotlin("1.2")
public fun <R> CharSequence.windowedSequence(size: Int, step: Int = 1, partialWindows: Boolean = false, transform: (CharSequence) -> R): Sequence<R> {
    checkWindowSizeStep(size, step)
    val windows = (if (partialWindows) indices else 0 until length - size + 1) step step
    return windows.asSequence().map { index -> val end = index + size
        val coercedEnd = if (end < 0 || end > length) length else end
        transform(subSequence(index, coercedEnd)) }
}

Returns a list of pairs built from the characters of `this` and the [other] char sequences with the same index. The returned list has length of the shortest char sequence.

@sample samples.text.Strings.zip

@SinceKotlin("1.2")
public infix fun CharSequence.zip(other: CharSequence): List<Pair<Char, Char>> {
    return zip(other) { c1, c2 -> c1 to c2 }
}

Returns a list of values built from the characters of `this` and the [other] char sequences with the same index using the provided [transform] function applied to each pair of characters. The returned list has length of the shortest char sequence.

@sample

```

```

at the beginning\n * to the specified [length] with the specified character or space.\n *^n * @param length the desired
string length.\n * @param padChar the character to pad string with, if it has length less than the [length] specified.

```

Space is used by default.

`@return` Returns a char sequence of length at least [length] consisting of `this` char sequence prepended with [padChar] as many times as are necessary to reach that length.

`@sample` `samples.text.Strings.padStart`

```

public fun CharSequence.padStart(length: Int, padChar: Char = ' '): CharSequence {
    if (length < 0) throw IllegalArgumentException("Desired length $length is less than zero.")
    if (length <= this.length) return this.subSequence(0, this.length)
    val sb = StringBuilder(length)
    for (i in 1..(length - this.length)) sb.append(padChar)
    sb.append(this)
    return sb
}

```

Pads the string to the specified [length] at the beginning with the specified character or space.

`@param` length the desired string length.

`@param` padChar the character to pad string with, if it has length less than the [length] specified. Space is used by default.

`@return` Returns a string of length at least [length] consisting of `this` string prepended with [padChar] as many times as are necessary to reach that length.

`@sample` `samples.text.Strings.padStart`

```

public fun String.padStart(length: Int, padChar: Char = ' '): String =
    (this as CharSequence).padStart(length, padChar).toString()

```

Returns a char sequence with content of this char sequence padded at the end to the specified [length] with the specified character or space.

`@param` length the desired string length.

`@param` padChar the character to pad string with, if it has length less than the [length] specified. Space is used by default.

`@return` Returns a char sequence of length at least [length] consisting of `this` char sequence appended with [padChar] as many times as are necessary to reach that length.

`@sample` `samples.text.Strings.padEnd`

```

public fun CharSequence.padEnd(length: Int, padChar: Char = ' '): CharSequence {
    if (length < 0) throw IllegalArgumentException("Desired length $length is less than zero.")
    if (length <= this.length) return this.subSequence(0, this.length)
    val sb = StringBuilder(length)
    sb.append(this)
    for (i in 1..(length - this.length)) sb.append(padChar)
    return sb
}

```

Pads the string to the specified [length] at the end with the specified character or space.

`@param` length the desired string length.

`@param` padChar the character to pad string with, if it has length less than the [length] specified. Space is used by default.

`@return` Returns a string of length at least [length] consisting of `this` string appended with [padChar] as many times as are necessary to reach that length.

`@sample` `samples.text.Strings.padEnd`

```

public fun String.padEnd(length: Int, padChar: Char = ' '): String =
    (this as CharSequence).padEnd(length, padChar).toString()

```

Returns `true` if this nullable char sequence is either `null` or empty.

`@sample` `samples.text.Strings.stringIsNullOrEmpty`

```

@kotlin.internal.InlineOnly
public inline fun CharSequence?.isNullOrEmpty(): Boolean {
    contract {
        returns(false)
        implies (this@isNullOrEmpty != null)
    }
    return this == null || this.length == 0
}

```

Returns `true` if this char sequence is empty (contains no characters).

`@sample` `samples.text.Strings.stringIsEmpty`

```

@kotlin.internal.InlineOnly
public inline fun CharSequence.isEmpty(): Boolean = length == 0

```

Returns `true` if this char sequence is not empty.

`@sample` `samples.text.Strings.stringIsNotEmpty`

```

@kotlin.internal.InlineOnly
public inline fun CharSequence.isNotEmpty(): Boolean = length > 0

```

implemented differently in JVM and JS

```

public fun String.isBlank(): Boolean = length() == 0 || all { it.isWhitespace() }

```

Returns `true` if this char sequence is not empty and contains some characters except of whitespace characters.

`@sample` `samples.text.Strings.stringIsNotBlank`

```

@kotlin.internal.InlineOnly
public inline fun CharSequence.isNotBlank(): Boolean = !isBlank()

```

Returns `true` if this nullable char sequence is either `null` or empty or consists solely of whitespace characters.

`@sample` `samples.text.Strings.stringIsNullOrBlank`

```

@kotlin.internal.InlineOnly
public inline fun CharSequence?.isNullOrBlank(): Boolean {
    contract {
        returns(false)
        implies (this@isNullOrBlank != null)
    }
    return this == null || this.isBlank()
}

```

Iterator for characters of the given char sequence.

```

public operator fun CharSequence.iterator(): CharIterator = object : CharIterator() {
    private var index = 0
    public override fun nextChar(): Char = get(index++)
    public override fun hasNext(): Boolean = index < length
}

```

Returns the string if it is not `null`, or the empty string otherwise.

```

@kotlin.internal.InlineOnly
public inline fun String?.orEmpty(): String = this ?: ""

```

Returns this

```

```

@param limit The maximum number of substrings to return. Zero by default means no limit is set.

To avoid ambiguous results when strings in [delimiters] have characters in common, this method proceeds from the beginning to the end of this string, and finds at each position the first element in [delimiters] that matches this string at that position.

```

public fun CharSequence.splitToSequence(vararg delimiters: String, ignoreCase: Boolean = false, limit: Int = 0): Sequence<String> =
    rangesDelimitedBy(delimiters, ignoreCase = ignoreCase, limit = limit).map { substring(it) }

```

Splits this char sequence to a list of strings around occurrences of the specified [delimiters].

@param delimiters One or more strings to be used as delimiters.

@param ignoreCase `true` to ignore character case when matching a delimiter. By default `false`.

@param limit The maximum number of substrings to return. Zero by default means no limit is set.

To avoid ambiguous results when strings in [delimiters] have characters in common, this method proceeds from the beginning to the end of this string, and matches at each position the first element in [delimiters] that is equal to a delimiter in this instance at that position.

```

public fun CharSequence.split(vararg delimiters: String, ignoreCase: Boolean = false, limit: Int = 0): List<String> {
    if (delimiters.size == 1) {
        val delimiter = delimiters[0]
        if (!delimiter.isEmpty()) {
            return split(delimiter, ignoreCase, limit)
        }
    }
    return rangesDelimitedBy(delimiters, ignoreCase = ignoreCase, limit = limit).asIterable().map {
        substring(it)
    }
}

```

Splits this char sequence to a sequence of strings around occurrences of the specified [delimiters].

@param delimiters One or more characters to be used as delimiters.

@param ignoreCase `true` to ignore character case when matching a delimiter. By default `false`.

@param limit The maximum number of substrings to return.

```

public fun CharSequence.splitToSequence(vararg delimiters: Char, ignoreCase: Boolean = false, limit: Int = 0): Sequence<String> =
    rangesDelimitedBy(delimiters, ignoreCase = ignoreCase, limit = limit).map { substring(it) }

```

Splits this char sequence to a list of strings around occurrences of the specified [delimiters].

@param delimiters One or more characters to be used as delimiters.

@param ignoreCase `true` to ignore character case when matching a delimiter. By default `false`.

@param limit The maximum number of substrings to return.

```

public fun CharSequence.split(vararg delimiters: Char, ignoreCase: Boolean = false, limit: Int = 0): List<String> {
    if (delimiters.size == 1) {
        return split(delimiters[0].toString(), ignoreCase, limit)
    }
    return rangesDelimitedBy(delimiters, ignoreCase = ignoreCase, limit = limit).asIterable().map { substring(it) }
}

```

Splits this char sequence to a list of strings around occurrences of the specified [delimiter].

This is specialized version of split which receives single non-empty delimiter and offers better performance.

@param delimiter String used as delimiter

@param ignoreCase `true` to ignore character case when matching a delimiter. By default `false`.

@param limit The maximum number of substrings to return.

```

private fun CharSequence.split(delimiter: String, ignoreCase: Boolean, limit: Int): List<String> {
    requireNonNegativeLimit(limit)
    var currentOffset = 0
    var nextIndex = indexOf(delimiter, currentOffset, ignoreCase)
    if (nextIndex == -1 || limit == 1) {
        return listOf(this.toString())
    }
    val isLimited = limit > 0
    val result = ArrayList<String>(if (isLimited) limit.coerceAtMost(10) else 10)
    do {
        result.add(substring(currentOffset, nextIndex))
        currentOffset = nextIndex + delimiter.length // Do not search for next occurrence if we're reaching limit
        if (isLimited && result.size == limit - 1) break
        nextIndex = indexOf(delimiter, currentOffset, ignoreCase)
    } while (nextIndex != -1)
    result.add(substring(currentOffset, length))
    return result
}

```

Splits this char sequence to a list of strings around matches of the given regular expression.

@param limit Non-negative value specifying the maximum number of substrings to return. Zero by default means no limit is set.

```

@kotlin.internal.InlineOnly
public inline fun CharSequence.split(regex: Regex, limit: Int = 0): List<String> =
    regex.split(this, limit)

```

Splits this char sequence to a sequence of strings around matches of the given regular expression.

@param limit Non-negative value specifying the maximum number of substrings to return. Zero by default means no limit is set.

@sample samples.text.Strings.splitToSequence

```

@SinceKotlin("1.6")
@WasExperimental(ExperimentalStdlibApi::class)
@kotlin.internal.InlineOnly
public inline fun CharSequence.splitToSequence(regex: Regex, limit: Int = 0): Sequence<String> =

```

`regex.splitToSequence(this, limit)` Splits this char sequence to a sequence of lines delimited by any of the following character sequences:

```
CRLF, LF or CR.

The lines returned do not include terminating line separators.

public fun
CharSequence.lineSequence(): Sequence<String> = splitToSequence("\\r\\n", "\\n", "\\r")

Splits this
char sequence to a list of lines delimited by any of the following character sequences: CRLF, LF or CR.

The
lines returned do not include terminating line separators.

public fun CharSequence.lines(): List<String> =
lineSequence().toList()

Returns `true` if the contents of this char sequence are equal to the contents of the
specified [other], i.e. both char sequences contain the same number of the same characters in the same order.

@sample samples.text.Strings.contentEquals

Since Kotlin(1.5)
public expect infix fun
CharSequence?.contentEquals(other: CharSequence?): Boolean

Returns `true` if the contents of this char
sequence are equal to the contents of the specified [other], optionally ignoring case difference.

@param ignoreCase `true` to ignore character case when comparing contents.

@sample
samples.text.Strings.contentEquals

Since Kotlin(1.5)
public expect fun
CharSequence?.contentEquals(other: CharSequence?, ignoreCase: Boolean): Boolean

internal fun
CharSequence?.contentEqualsIgnoreCaseImpl(other: CharSequence?): Boolean {
    if (this is String && other is
String) {
        return this.equals(other, ignoreCase = true)
    }
    if (this === other) return true
    if (this ==
null || other == null || this.length != other.length) return false
    for (i in 0 until length) {
        if
(!this[i].equals(other[i], ignoreCase = true)) {
            return false
        }
    }
    return true
}

internal fun
CharSequence?.contentEqualsImpl(other: CharSequence?): Boolean {
    if (this is String && other is String) {
        return this == other
    }
    if (this === other) return true
    if (this == null || other == null || this.length
!= other.length) return false
    for (i in 0 until length) {
        if (this[i] != other[i]) {
            return false
        }
    }
    return true
}

Returns `true` if the content of this string is equal to the word "true", `false`
if it is equal to "false", and throws an exception otherwise.

There is also a lenient version of the
function available on nullable String, [String?.toBoolean].

Note that this function is case-sensitive.

@sample samples.text.Strings.toBooleanStrict

Since Kotlin(1.5)
public fun String.toBooleanStrict():
Boolean = when (this) {
    "true" -> true
    "false" -> false
    else -> throw IllegalArgumentException("The
string doesn't represent a boolean value: $this")
}

Returns `true` if the content of this string is equal to
the word "true", `false` if it is equal to "false", and `null` otherwise.

There is also a lenient version of
the function available
on nullable String, [String?.toBoolean].

Note that this function is case-sensitive.

@sample
samples.text.Strings.toBooleanStrictOrNull

Since Kotlin(1.5)
public fun
String.toBooleanStrictOrNull(): Boolean? = when (this) {
    "true" -> true
    "false" -> false
    else ->
null
},

```

[COROUTINE_SUSPENDED] if it suspends. In the latter case, the [completion] continuation is invoked when the coroutine completes

with a result or an exception. The coroutine is started directly in the invoker's thread without going through the [ContinuationInterceptor] that might be present in the completion's [CoroutineContext]. It is the invoker's responsibility to ensure that a proper invocation context is established. This function is designed to be used from inside of [suspendCoroutineUninterceptedOrReturn] to resume the execution of the suspended coroutine using a reference to the suspending function.

```

@SinceKotlin("1.3")
@InlineOnly
public actual inline fun <T> (suspend () -> T).startCoroutineUninterceptedOrReturn(
    completion: Continuation<T>): Any? = this.asDynamic()(completion, false)

```

Starts an unintercepted coroutine with receiver type [R] and result type [T] and executes it until its first suspension. Returns the result of the coroutine or throws its exception if it does not suspend or [COROUTINE_SUSPENDED] if it suspends. In the latter case, the [completion] continuation is invoked when the coroutine completes with a result or an exception.

The coroutine is started directly in the invoker's thread without going through the [ContinuationInterceptor] that might be present in the completion's [CoroutineContext]. It is the invoker's responsibility to ensure that a proper invocation context is established. This function is designed to be used from inside of [suspendCoroutineUninterceptedOrReturn] to resume the execution of the suspended coroutine using a reference to the suspending function.

```

@SinceKotlin("1.3")
@InlineOnly
public actual inline fun <R, T> (suspend R.() -> T).startCoroutineUninterceptedOrReturn(
    receiver: R, completion: Continuation<T>): Any? = this.asDynamic()(receiver, completion, false)

```

internal actual inline fun <R, P, T> (suspend R.(P) -> T).startCoroutineUninterceptedOrReturn(
 receiver: R, param: P, completion: Continuation<T>): Any? = this.asDynamic()(receiver, param, completion, false)

Creates unintercepted coroutine without receiver and with result type [T]. This function creates a new, fresh instance of suspendable computation every time it is invoked. To start executing the created coroutine, invoke `resume(Unit)` on the returned [Continuation] instance. The [completion] continuation is invoked when coroutine completes with result or exception. This function returns unintercepted continuation. Invocation of `resume(Unit)` starts coroutine immediately in the invoker's call stack without going through the [ContinuationInterceptor] that might be present in the completion's [CoroutineContext]. It is the invoker's responsibility to ensure that a proper invocation context is established. Note that [completion] of this function may get invoked in an arbitrary context. [Continuation.intercepted] can be used to acquire the intercepted continuation.

Invocation of `resume(Unit)` on intercepted continuation guarantees that execution of both the coroutine and [completion] happens in the invocation context established by [ContinuationInterceptor]. Repeated invocation of any resume function on the resulting continuation corrupts the state machine of the coroutine and may result in arbitrary behaviour or exception.

```

@SinceKotlin("1.3")
public actual fun <T> (suspend () -> T).createCoroutineUnintercepted(
    completion: Continuation<T>): Continuation<Unit> = // Kotlin/JS
suspend lambdas have an extra parameter `suspended`
if (this.asDynamic().length == 2) { // When
`suspended` is true the continuation is created, but not executed
this.asDynamic()(completion, true) } else
{ createCoroutineFromSuspendFunction(completion) { this.asDynamic()(completion) } }

```

Creates unintercepted coroutine with receiver type [R] and result type [T]. This function creates a new, fresh instance of suspendable computation every time it is invoked. To start executing the created coroutine, invoke `resume(Unit)` on the returned [Continuation] instance. The [completion] continuation is invoked when coroutine completes with result or exception. This function returns unintercepted continuation. Invocation of `resume(Unit)` starts coroutine immediately in the invoker's call stack without going through the [ContinuationInterceptor] that might be present in the completion's [CoroutineContext]. It is the invoker's responsibility to ensure that a proper invocation context is established. Note that [completion] of this function may get invoked in an arbitrary context. [Continuation.intercepted] can be used to acquire the intercepted continuation. Invocation of `resume(Unit)` on intercepted continuation guarantees that execution of both the coroutine and [completion] happens in

annotation class marker\n * \n * /**\n * \n * * Gives a declaration (a function, a property or a class) specific name in
JavaScript.\n * \n * * This may be useful in the following cases:\n * \n * * * There are two functions for which the
compiler gives same name in JavaScript, you can\n * \n * * * mark one with `@JsName(...)` to prevent
the compiler from reporting error.\n * \n * * * You are writing a JavaScript library in Kotlin. The compiler produces
mangled names\n * \n * * * for functions with parameters, which is unnatural for usual JavaScript developer.\n * \n * * * You
can put `@JsName(...)` on functions you want to be available from JavaScript.\n * \n * * * For some reason you want to
rename declaration, e.g. there's common term in JavaScript\n * \n * * * for a concept provided by the declaration, which
is uncommon in Kotlin.\n * \n * * * Example:\n * \n * * * ``` kotlin\n * \n * * class Person(val name: String) {\n * \n * *     fun hello()\n * \n * *     println("Hello $name!")\n * \n * *     }\n * \n * *     @JsName("helloWithGreeting")\n * \n * *     fun hello(greeting:
String) {\n * \n * *         println("$greeting $name!")\n * \n * *     }\n * \n * * }\n * \n * * ```\n * \n * * \n * \n * * @property name the name which
compiler uses both for declaration itself and for all references to the declaration.\n * \n * *     It's required to denote a
valid JavaScript identifier.\n * \n * * \n * \n * @Retention(AnnotationRetention.BINARY)\n * \n * @Target(CLASS,

```

FUNCTION, PROPERTY, CONSTRUCTOR, PROPERTY_GETTER, PROPERTY_SETTER)\npublic actual annotation class JsName(actual val name: String)\n\n**\n * Denotes an `external` declaration that must be imported from native JavaScript library.\n\n * The compiler produces the code relevant for the target module system, for example, in case of CommonJS,\n\n * it will import the declaration via the `require(...)` function.\n\n * The annotation can be used on top-level external declarations (classes, properties, functions) and files.\n\n * In case of file (which can't be `external`) the following rule applies: all the declarations in\n\n * the file must be `external`. By applying `@JsModule(...)` on a file you tell the compiler to import a JavaScript object\n\n * that contain all the declarations from the file.\n\n * Example:\n\n * ``` kotlin\n\n * @JsModule("jquery")\n\n * external abstract class JQuery() {\n\n * // some declarations here\n\n * }\n\n * @JsModule("jquery")\n\n * external fun JQuery(element: Element): JQuery\n\n * ```\n\n * \n\n * @property import name of a module to import declaration from.\n\n * It is not interpreted by the Kotlin compiler, it's passed as is directly to the target module system.\n\n * @see JsNonModule\n\n * \n\n * @Retention(AnnotationRetention.BINARY)\n\n * @Target(CLASS, PROPERTY, FUNCTION, FILE)\n\n\npublic annotation class JsModule(val import: String)\n\n\n**\n\n * Denotes an `external` declaration that can be used without module system.\n\n * By default, an `external` declaration is available regardless your target module system.\n\n * However, by applying [JsModule] annotation you can make a declaration unavailable to *plain* module system.\n\n * Some JavaScript libraries are distributed both as a standalone downloadable piece of JavaScript and as a module available\n\n * as an npm package.\n\n * To tell the Kotlin compiler to accept both cases, you can augment [JsModule] with the `@JsNonModule` annotation.\n\n * For example:\n\n * ``` kotlin\n\n * @JsModule("jquery")\n\n * @JsNonModule\n\n * @JsName("\$")\n\n * external abstract class JQuery() {\n\n * // some declarations here\n\n * }\n\n * @JsModule("jquery")\n\n * @JsNonModule\n\n * @JsName("\$")\n\n * external fun JQuery(element: Element): JQuery\n\n * ```\n\n * \n\n * @see JsModule\n\n * \n\n * @Retention(AnnotationRetention.BINARY)\n\n * @Target(CLASS, PROPERTY, FUNCTION, FILE)\n\n\npublic annotation class JsNonModule\n\n\n**\n\n * Adds prefix to `external` declarations in a source file.\n\n * JavaScript does not have concept of packages (namespaces). They are usually emulated by nested objects.\n\n * The compiler turns references to `external` declarations either to plain unprefix names (in case of *plain* modules)\n\n * or to plain imports.\n\n * However, if a JavaScript library provides its declarations in packages, you won't be satisfied with this.\n\n * You can tell the compiler to generate additional prefix before references to `external` declarations using the `@JsQualifier(...)`\n\n * annotation.\n\n * Note that a file marked with the `@JsQualifier(...)` annotation can't contain non-`external` declarations.\n\n * Example:\n\n * ``` kotlin\n\n * @file:JsQualifier("my.jsPackageName")\n\n * package some.kotlinPackage\n\n * external fun foo(x: Int)\n\n * external fun bar(): String\n\n * ```\n\n * \n\n * @property value the qualifier to add to the declarations in the generated code.\n\n * It must be a sequence of valid JavaScript identifiers separated by the `.` character.\n\n * Examples of valid qualifiers are: `foo`, `bar.Baz`, `_.\$.f`.\n\n * \n\n * @see JsModule\n\n * \n\n * @Retention(AnnotationRetention.BINARY)\n\n * @Target(AnnotationTarget.FILE)\n\n\npublic annotation class JsQualifier(val value: String)\n\n\n**\n\n * Exports top-level declaration on JS platform.\n\n * Compiled module exposes declarations that are marked with this annotation without name mangling.\n\n * This annotation can be applied to either files or top-level declarations.\n\n * It is currently prohibited to export the following kinds of declarations:\n\n * * `expect` declarations\n\n * * inline functions with reified type parameters\n\n * * suspend functions\n\n * * secondary constructors without `@JsName`\n\n * * extension properties\n\n * * enum classes\n\n * * annotation classes\n\n * Signatures of exported declarations must only contain `exportable` types:\n\n * * `dynamic`, `Any`, `String`, `Boolean`, `Byte`, `Short`, `Int`, `Float`, `Double`\n\n * * `BooleanArray`, `ByteArray`, `ShortArray`, `IntArray`, `FloatArray`, `DoubleArray`\n\n * * `Array<exportable-type>`\n\n * * Function types with exportable parameters and return types\n\n * * `external` or `@JsExport` classes and interfaces\n\n * * Nullable counterparts of types above\n\n * * Unit return type. Must not be nullable\n\n * This annotation is experimental, meaning that restrictions mentioned above are subject to change.\n\n * \n\n * @ExperimentalJsExport\n\n * @Retention(AnnotationRetention.BINARY)\n\n * @Target(CLASS, PROPERTY, FUNCTION, FILE)\n\n * @SinceKotlin("1.3")\n\n\npublic actual annotation class JsExport\n\n\n**\n\n * Forces a top-level property to be initialized eagerly, opposed to lazily on the first access to file and/or property.\n\n

annotated with `@ExperimentalStdlibApi` must be accepted either by

- annotating that usage with the `[OptIn]` annotation, e.g. `@OptIn(ExperimentalStdlibApi::class)`, or by using the compiler argument `-opt-in=kotlin.ExperimentalStdlibApi`.
- using the `@RequiresOptIn(level = RequiresOptIn.Level.ERROR)` annotation.

`@Retention(AnnotationRetention.BINARY)`

`@Target(CLASS, ANNOTATION_CLASS, PROPERTY, FIELD, LOCAL_VARIABLE, VALUE_PARAMETER, CONSTRUCTOR, FUNCTION, PROPERTY_GETTER, PROPERTY_SETTER, TYPEALIAS)`

`@package kotlin`

`import kotlin.annotation.AnnotationTarget`

`import kotlin.experimental.ExperimentalTypeInference`

`/**` Allows to infer generic type arguments of a function from the calls in the annotated function parameter of that function.

`*/` When this annotation is placed on a generic function parameter of a function, it enables to infer the type arguments of that generic function from the lambda body passed to that parameter.

The calls that affect inference are either members of the receiver type of an annotated function parameter or extensions for that type. The extensions must be themselves annotated with `@BuilderInference`.

Example: we declare

```
fun <T> sequence(@BuilderInference block: suspend SequenceScope<T>(). -> Unit): Sequence<T>
```

and use it like

```
val result = sequence { yield("result") }
```

Here the type argument of the resulting sequence is inferred to `String` from the argument of the `[SequenceScope.yield]` function, that is called inside the lambda passed to `[sequence]`.

Note: this annotation is experimental, see `[ExperimentalTypeInference]` on how to opt-in for it.

`@Target(VALUE_PARAMETER, FUNCTION, PROPERTY)`

`@Retention(AnnotationRetention.BINARY)`

`@SinceKotlin("1.3")`

`@ExperimentalTypeInference` public annotation class `BuilderInference`

Enables overload selection based on the type of the value returned from lambda argument.

When two or more function overloads have otherwise the same parameter lists that differ only in the return type of a functional parameter, this annotation enables overload selection by the type of the value returned from the lambda function passed to this functional parameter.

Example:

```
@OverloadResolutionByLambdaReturnType
fun create(intProducer: () -> Int): Int
fun create(doubleProducer: () -> Double): Double
```

`val newValue = create { 3.14 }`

The annotation being applied to one of overloads allows to resolve this ambiguity by analyzing what value is returned from the lambda function.

This annotation is also used to discriminate the annotated overloads in case if overload selection still cannot choose one of them even taking in account the result of lambda parameter analysis. In that case a warning is reported.

Note: this annotation is experimental, see `[ExperimentalTypeInference]` on how to opt-in for it.

kotlin.coroutines.*\nimport kotlin.coroutines.intrinsics.*\nimport
kotlin.native.concurrent.SharedImmutable\n\n/**\n * Defines deep recursive function that keeps its stack on the
heap,\n * which allows very deep recursive computations that do not use the actual call stack.\n * To initiate a call to
this deep recursive function use its [invoke] function.\n * As a rule of thumb, it should be used if recursion goes
deeper than a thousand calls.\n *\n * The [DeepRecursiveFunction] takes one parameter of type [T] and returns a
result of type [R].\n * The [block] of code defines the body of a recursive function. In this block\n *
[callRecursive][DeepRecursiveScope.callRecursive]
function can be used to make a recursive call\n * to the declared function. Other instances of
[DeepRecursiveFunction] can be called\n * in this scope with `callRecursive` extension, too.\n *\n * For example,
take a look at the following recursive tree class and a deeply\n * recursive instance of this tree with 100K nodes:\n
*\n * ```\n * class Tree(val left: Tree? = null, val right: Tree? = null)\n * val deepTree = generateSequence(Tree()) {
Tree(it) }.take(100_000).last()\n * ```\n *\n * A regular recursive function can be defined to compute a depth of a
tree:\n *\n * ```\n * fun depth(t: Tree?): Int =\n *     if (t == null) 0 else max(depth(t.left), depth(t.right)) + 1\n *
println(depth(deepTree)) // StackOverflowError\n * ```\n *\n * If this `depth` function is called for a `deepTree` it
produces `StackOverflowError` because of deep recursion.\n * However, the `depth` function can be rewritten using
`DeepRecursiveFunction` in the following way, and then\n * it successfully computes
[depth(deepTree)][DeepRecursiveFunction.invoke] expression:\n *\n * ```\n * val depth =
DeepRecursiveFunction<Tree?, Int> { t ->\n *     if (t == null) 0 else max(callRecursive(t.left),
callRecursive(t.right)) + 1\n * }\n * println(depth(deepTree)) // Ok\n * ```\n *\n * Deep recursive functions can also
mutually call each other using a heap for the stack via\n * [callRecursive][DeepRecursiveScope.callRecursive]

```

```

extension. For example, the following pair of mutually recursive functions computes the number of tree nodes at
even depth in the tree.
val mutualRecursion = object {
    val even: DeepRecursiveFunction<Tree?, Int> = DeepRecursiveFunction { t ->
        if (t == null) 0 else
        odd.callRecursive(t.left) + odd.callRecursive(t.right) + 1
    }
    val odd: DeepRecursiveFunction<Tree?, Int> = DeepRecursiveFunction { t ->
        if (t == null) 0 else even.callRecursive(t.left) +
        even.callRecursive(t.right)
    }
}

@param [T] the function parameter type.
