 Accumulates value starting with the first element and applying [operation] from left to right to current accumulator value and each element.
 Returns `null` if the sequence is empty.

 Returns a sequence containing successive accumulation values generated by applying [operation] from left to right to each element and current accumulator value that starts with [initial] value.
 Note that `acc` value passed to [operation] function should not be mutated; otherwise it would affect the previous value in resulting sequence. The [initial] value should also be immutable (or should not be mutated) as it may be passed to [operation] function later because of sequence's lazy nature.

Returns a new string obtained by replacing each substring of this char sequence that matches the given regular expression with the given [replacement].

The [replacement] can consist of any combination of literal text and \$-substitutions. To treat the replacement string literally escape it with the [kotlin.text.Regex.Companion.escapeReplacement] method.

```

@kotlin.internal.InlineOnly
public inline fun CharSequence.replace(regex: Regex, replacement: String): String = regex.replace(this, replacement)

```

Returns a new string obtained by replacing each substring of this char sequence that matches the given regular expression with the result of the given function [transform] that takes [MatchResult] and returns a string to be used as a replacement for that match.

```

@kotlin.internal.InlineOnly
public inline fun CharSequence.replace(regex: Regex, noinline transform: (MatchResult) -> CharSequence): String =
    regex.replace(this, transform)

```

Replaces the first occurrence of the given regular expression [regex] in this char sequence with specified [replacement] expression.

@param replacement A replacement expression that can include substitutions. See [Regex.replaceFirst] for details.

```

@kotlin.internal.InlineOnly
public inline fun CharSequence.replaceFirst(regex:
    Regex, replacement: String): String = regex.replaceFirst(this, replacement)

```

Returns a copy of this string having its first character replaced with the result of the specified [transform], or the original string if it's empty.

@param transform function that takes the first character and returns the result of the transform applied to the character.

```

@sample samples.text.Strings.replaceFirstChar

`kotlin.internal` Specifies that the corresponding type parameter is not used for unsafe operations such as casts or 'is' checks That means it's completely safe to use generic types as argument for such parameter.

`@Target(AnnotationTarget.TYPE_PARAMETER)` `@Retention(AnnotationRetention.BINARY)` internal annotation class `PureReifiable` Specifies that the corresponding built-in method exists depending on platform. Current implementation for JVM looks whether method with same JVM descriptor exists in the module JDK. For example `MutableMap.remove(K, V)` available only if corresponding method `'java.util.Map.remove(Ljava/lang/Object;Ljava/lang/Object;)Z'` is defined in JDK (i.e. for major versions ≥ 8)

`@Target(AnnotationTarget.FUNCTION)` `@Retention(AnnotationRetention.BINARY)` internal annotation class `PlatformDependent` When applied to a function or property, enables a compiler optimization that evaluates that function or property at compile-time and replaces calls to it with the computed result.

`@Target(AnnotationTarget.CONSTRUCTOR, AnnotationTarget.FUNCTION, AnnotationTarget.PROPERTY)` `@Retention(AnnotationRetention.BINARY)` `@SinceKotlin("1.7")` internal annotation class `IntrinsicConstEvaluation`

package kotlin.coroutines
import kotlin.contracts.*
import kotlin.coroutines.intrinsics.*
import kotlin.internal.InlineOnly

Interface representing a continuation after a suspension point that returns a value of type `T`.

@SinceKotlin("1.3")
public interface Continuation<in T> {
    /**
     * The context of the coroutine that corresponds to this continuation.
     */
    public val context: CoroutineContext

    /**
     * Resumes the execution of the corresponding coroutine passing a successful or failed [result] as the return value of the last suspension point.
     */
    public fun resumeWith(result: Result<T>)

}

Classes and interfaces marked with this annotation are restricted when used as receivers for extension `suspend` functions. These `suspend` extensions can only invoke other member or extension `suspend` functions on this particular receiver and are restricted from calling arbitrary suspension functions.

@SinceKotlin("1.3")
@Target(AnnotationTarget.CLASS)
@Retention(AnnotationRetention.BINARY)
public annotation class RestrictsSuspension

Resumes the execution of the corresponding coroutine passing [value] as the return value of the last suspension point.

@SinceKotlin("1.3")
@InlineOnly
public inline fun <T> Continuation<T>.resume(value: T): Unit = resumeWith(Result.success(value))

Resumes the execution of the corresponding coroutine so that the [exception] is re-thrown right after the last suspension point.

@SinceKotlin("1.3")
@InlineOnly
public inline fun <T> Continuation<T>.resumeWithException(exception: Throwable): Unit = resumeWith(Result.failure(exception))

Creates a [Continuation] instance with the given [context] and implementation of [resumeWith] method.

@SinceKotlin("1.3")
@InlineOnly
public inline fun <T> Continuation(context: CoroutineContext, crossinline resumeWith: (Result<T>) -> Unit): Continuation<T> = object : Continuation<T> {
    override val context: CoroutineContext = context
    override fun resumeWith(result: Result<T>) = resumeWith(result)
}

Creates a coroutine without a receiver and with result type [T].

This function creates a new, fresh instance of suspendable computation every time it is invoked.

To start executing the created coroutine, invoke `resume(Unit)` on the returned [Continuation] instance.

The [completion] continuation is invoked when the coroutine completes with a result or an exception.

Subsequent invocation of any resume function on the resulting continuation will produce an [IllegalStateException].

compiler gives same name in JavaScript, you can\n * * mark one with `@JsName(...)` to prevent
the compiler from reporting error.\n * * You are writing a JavaScript library in Kotlin. The compiler produces
mangled names\n * * for functions with parameters, which is unnatural for usual JavaScript developer.\n * * You
can put `@JsName(...)` on functions you want to be available from JavaScript.\n * * For some reason you want to
rename declaration, e.g. there's common term in JavaScript\n * * for a concept provided by the declaration, which
is uncommon in Kotlin.\n */\n * Example:\n */\n * ``` kotlin\n * class Person(val name: String) {\n *     fun hello()

annotation can be used on top-level external declarations (classes, properties, functions) and files.\n * In case of file
(which can't be `external`) the following rule applies: all the declarations in\n * the file must be `external`. By
applying `@JsModule(...)` on a file you tell the compiler to import a JavaScript object\n * that contain all the
declarations from the file.\n */\n * Example:\n */\n * ``` kotlin\n * @JsModule("jquery")\n * external abstract class

PROPERTY, FUNCTION, FILE)\npublic annotation class JsModule(val import: String)\n\n**\n * Denotes an `external` declaration that can be used without module system.\n * By default, an `external` declaration is available regardless your target module system.\n * However, by applying [JsModule] annotation you can make a declaration unavailable to *plain* module system.\n * Some JavaScript libraries are distributed both as a standalone downloadable piece of JavaScript and as a module available\n * as an npm package.\n * To tell the Kotlin compiler to accept both cases, you can augment [JsModule] with the `@JsNonModule` annotation.\n * For example:\n *\n * ``` kotlin\n * @JsModule("jquery")\n * @JsNonModule\n * @JsName("\$")\n * external abstract class JQuery() {\n * // some declarations here\n * }\n * @JsModule("jquery")\n * @JsNonModule\n * @JsName("\$")\n * external fun JQuery(element: Element): JQuery\n * ```\n * @see JsModule\n *\n * @Retention(AnnotationRetention.BINARY)\n * @Target(CLASS, PROPERTY, FUNCTION, FILE)\n * public annotation class JsNonModule\n\n**\n * Adds prefix to `external` declarations in a source file.\n * JavaScript does not have concept of packages (namespaces). They are usually emulated by nested objects.\n * The compiler turns references to `external` declarations either to plain unprefixed names (in case of *plain* modules)\n * or to plain imports.\n * However, if a JavaScript library provides its declarations in packages, you won't be satisfied with this.\n * You can tell the compiler to generate additional prefix before references to `external` declarations using the `@JsQualifier(...)`\n * annotation.\n * Note that a file marked with the `@JsQualifier(...)` annotation can't contain non-`external` declarations.\n * Example:\n *\n * ```\n * @file:JsQualifier("my.jsPackageName")\n * package some.kotlinPackage\n * external fun foo(x: Int)\n * external fun bar(): String\n * ```\n * @property value the qualifier to add to the declarations in the generated code.\n * It must be a sequence of valid JavaScript identifiers separated by the `.` character.\n * Examples of valid qualifiers are: `foo`, `bar.Baz`, `_\$0.f`\n *\n * @see JsModule\n *\n * @Retention(AnnotationRetention.BINARY)\n * @Target(AnnotationTarget.FILE)\n * public annotation class JsQualifier(val value: String)\n\n**\n * Exports top-level declaration on JS platform.\n * Compiled module exposes declarations that are marked with this annotation without name mangling.\n * This annotation can be applied to either files or top-level declarations.\n * It is currently prohibited to export the following kinds of declarations:\n * * `expect` declarations\n * * inline functions with reified type parameters\n * * suspend functions\n * * secondary constructors without `@JsName`\n * * extension properties\n * * enum classes\n * * annotation classes\n *\n * Signatures of exported declarations must only contain `exportable` types:\n * * `dynamic`, `Any`, `String`, `Boolean`, `Byte`, `Short`, `Int`, `Float`, `Double`\n * * `BooleanArray`, `ByteArray`, `ShortArray`, `IntArray`, `FloatArray`, `DoubleArray`\n * * `Array<exportable-type>`\n * * Function types with exportable parameters and return types\n * * `external` or `@JsExport` classes and interfaces\n * * Nullable counterparts of types above\n * * Unit return type. A simple wrapper around JavaScriptObject to provide [java.util.Map]-like semantics for any

Implementation notes:
A key's hashCode is the index in backingMap which should contain that key.
Since several keys may have the same hash, each value in hashCodeMap is actually an array containing all entries whose keys share the same hash.

Represents
a type projection. Type projection is usually the argument to another type in a
type usage.
For example, in the
type `Array<out Number>`, `out Number` is the covariant projection of the type
represented
by the class `Number`.
Type projection is either the star projection, or an entity
consisting of a specific type
plus optional variance.
See the [Kotlin language

for more information.

Trims leading whitespace characters followed by [marginPrefix] from every line of a source string and removes the first and the last lines if they are blank (notice difference blank vs empty).

`fun replaceIndentByMargin(newIndent: String, marginPrefix: String = "|"): String`

 * Detects a common minimal indent of all the input lines, removes it from every line and
also removes the first and the last lines if they are blank (notice difference blank vs empty).

kotlin.native.concurrent.SharedImmutable\n\n**\n * Defines deep recursive function that keeps its stack on the
heap,\n * which allows very deep recursive computations that do not use the actual call stack.\n * To initiate a call
to this deep recursive function use its [invoke] function.\n * As a rule of thumb, it should be used if recursion goes
deeper than a thousand calls.\n *\n * The [DeepRecursiveFunction] takes one parameter of type [T] and returns a
result of type [R].\n * The [block] of code defines the body of a recursive function. In this block\n *
[callRecursive][DeepRecursiveScope.callRecursive]
function can be used to make a recursive call\n * to the declared function. Other instances of
[DeepRecursiveFunction] can be called\n * in this scope with `callRecursive` extension, too.\n *\n * For example,
take a look at the following recursive tree class and a deeply\n * recursive instance of this tree with 100K nodes:\n
*\n * ```\n * class Tree(val left: Tree? = null, val right: Tree? = null)\n * val deepTree = generateSequence(Tree()) {
Tree(it) }.take(100_000).last()\n * ```\n * A regular recursive function can be defined to compute a depth of a
tree:\n * ```\n * fun depth(t: Tree?): Int =\n *     if (t == null) 0 else max(depth(t.left), depth(t.right)) + 1\n *
println(depth(deepTree)) // StackOverflowError\n * ```\n * If this `depth` function is called for a `deepTree` it
produces `StackOverflowError` because of deep recursion.\n * However, the `depth` function can be rewritten using
`DeepRecursiveFunction` in the following way, and then\n * it successfully computes
[depth(deepTree)][DeepRecursiveFunction.invoke] expression:\n * ```\n * val depth =
DeepRecursiveFunction<Tree?, Int> { t ->\n *     if (t == null) 0 else max(callRecursive(t.left),
callRecursive(t.right)) + 1\n * }\n * println(depth(deepTree)) // Ok\n * ```\n * Deep recursive functions can also
mutually call each other using a heap for the stack via\n * [callRecursive][DeepRecursiveScope.callRecursive]
extension. For example, the\n * following pair of mutually recursive functions computes the number of tree nodes at
even depth in the tree.\n * ```\n * val mutualRecursion = object {\n *     val even:
DeepRecursiveFunction<Tree?, Int> = DeepRecursiveFunction { t ->\n *         if (t == null) 0 else
odd.callRecursive(t.left) + odd.callRecursive(t.right) + 1\n *     }\n *     val odd: DeepRecursiveFunction<Tree?,
Int> = DeepRecursiveFunction { t ->\n *         if (t == null) 0 else even.callRecursive(t.left) +
even.callRecursive(t.right)\n *     }\n * }\n * ```\n *
@param [T] the function parameter type.\n * @param [R] the function result type.\n * @param block the function
body.\n *\n@SinceKotlin("1.7")\n@WasExperimental(ExperimentalStdlibApi::class)\npublic class
DeepRecursiveFunction<T, R>(\n    internal val block: suspend DeepRecursiveScope<T, R>.(T) -> R\n)\n\n**\n *

```
