Returns new array which is a copy of the original array, resized to the given [newSize]. The copy is either truncated or padded at the end with zero values if necessary. If [newSize] is less than the size of the original array, the copy array is truncated to the [newSize]. Returns a list of pairs of each two adjacent characters in this char sequence. The returned list is empty if this char sequence contains less than two characters.

@SinceKotlin("1.2")
public fun CharSequence.zipWithNext(): List<Pair<Char, Char>> {

Returns a list containing the results of applying the given [transform] function to an each pair of two adjacent characters in this char sequence. The returned list is empty if this char sequence contains less than two characters.

@sample samples.collections.Collections.Transformations.zipWithNextToFindDeltas

Creates an [Iterable] instance that wraps the original char sequence returning its characters when being iterated.

public fun CharSequence.asIterable(): Iterable<Char> {

library provides its declarations in packages, you won't be satisfied with this.\n * You can tell the compiler to
generate additional prefix before references to `external` declarations using the `@JsQualifier(...)`\n * annotation.\n
*\n * Note that a file marked with the `@JsQualifier(...)` annotation can't contain non-`external` declarations.\n *\n
* Example:\n *\n

fun foo(x: Int)\n *\n * external fun bar(): String\n * ````\n *\n * @property value the qualifier to add to the

kotlin.experimental.ExperimentalTypeInference\n      * \n/**\n      * Allows to infer generic type arguments of a function

from the calls in the annotated function parameter of that function.

`* When this annotation is placed on a generic function parameter of a function, it enables to infer the type arguments of that generic function from the lambda body passed to that parameter. The calls that affect inference are either members of the receiver type of an annotated function parameter or extensions for that type. The extensions must be themselves annotated with @BuilderInference.`

`* Example: we declare`

```
fun <T> sequence(@BuilderInference block: suspend SequenceScope<T>().->Unit): Sequence<T>
```

`* and use it like`

```
val result = sequence { yield("result") }
```

`* Here the type argument of the resulting sequence is inferred to String from the argument of the [SequenceScope.yield] function, that is called inside the lambda passed to [sequence].`

`* Note: this annotation is experimental, see [ExperimentalTypeInference] on how to opt-in for it.`

```
@Target(VALUE_PARAMETER, FUNCTION, PROPERTY)
@Retention(AnnotationRetention.BINARY)
@SinceKotlin("1.3")
@ExperimentalTypeInference
public annotation class BuilderInference
```

`* Enables overload selection based on the type of the value returned from lambda argument. When two or more function overloads have otherwise the same parameter lists that differ only in the return type of a functional parameter, this annotation enables overload selection by the type of the value returned from the lambda function passed to this functional parameter.`

`* Example:`

```
@OverloadResolutionByLambdaReturnType
fun create(intProducer: () -> Int): Int
fun create(doubleProducer: () -> Double): Double
val newValue = create { 3.14 }
```
