`annotation class JsName(val name: String)`
`*` Marks experimental JS export annotations.
`*` Note that behavior of these annotations will likely be changed in the future.
`*` Usages of such annotations will be reported as warnings unless an explicit opt-in with the `[OptIn]` annotation, e.g. `@OptIn(ExperimentalJsExport::class)`, or with the `-Xopt-in=kotlin.js.ExperimentalJsExport` compiler option is given.

`public annotation class ExperimentalJsExport`
`*` Exports top-level declaration on JS platform.
`*` Compiled module exposes declarations that are marked with this annotation without name mangling.
`*` This annotation can be applied to either files or top-level declarations.
`*` It is currently prohibited to export the following kinds of declarations:
`*` ``expect`` declarations
`*` inline functions with reified type parameters
`*` suspend functions
`*` secondary constructors without `@JsName`
`*` extension properties
`*` enum classes
`*` annotation classes
`*` Signatures of exported declarations must only contain "exportable" types:
`*` ``dynamic``, ``Any``, ``String``, ``Boolean``, ``Byte``, ``Short``, ``Int``, ``Float``, ``Double``
`*` ``BooleanArray``, ``ByteArray``, ``ShortArray``, ``IntArray``, ``FloatArray``, ``DoubleArray``
`*` ``Array<exportable-type>``
`*` Function types with exportable parameters and return types
`*` ``external`` or `@JsExport` classes and interfaces
`*` Nullable counterparts of types above
`*` Unit return type. Must not be nullable.
`*` This annotation is experimental, meaning that restrictions mentioned above are subject to change.

The coroutine is started directly in the invoker's thread without going through the [ContinuationInterceptor] that might be present in the completion's [CoroutineContext]. It is the invoker's responsibility to ensure that a proper invocation context is established.

Creates unintercepted coroutine without receiver and with result type [T]. This function creates a new, fresh instance of suspendable computation every time it is invoked. To start executing the created coroutine, invoke `resume(Unit)` on the returned [Continuation] instance. The [completion] continuation is invoked when coroutine completes with result or exception. This function returns unintercepted continuation. Invocation of `resume(Unit)` starts coroutine immediately in the invoker's call stack without going through the [ContinuationInterceptor] that might be present in the completion's [CoroutineContext]. It is the invoker's responsibility to ensure that a proper invocation context is established. Note that [completion] of this function may get invoked in an arbitrary context. [Continuation.intercepted] can be used to acquire the intercepted continuation. Invocation of `resume(Unit)` on intercepted continuation guarantees that execution of both the coroutine and [completion] happens in the invocation context established by [ContinuationInterceptor]. Repeated invocation of any resume function on the resulting continuation corrupts the state machine of the coroutine and may result in arbitrary behaviour or exception.

```

Intercepts this continuation with [ContinuationInterceptor]. This function shall be used on the immediate result of [createCoroutineUnintercepted] or [suspendCoroutineUninterceptedOrReturn], in which case it checks for [ContinuationInterceptor] in the continuation's [context][Continuation.context], invokes [ContinuationInterceptor.interceptContinuation], caches and returns the result. If this function is invoked on other [Continuation] instances it returns `this` continuation unchanged.

are writing a JavaScript library in Kotlin. The compiler produces mangled names\n * for functions with
parameters, which is unnatural for usual JavaScript developer.\n * You can put `@JsName(...)` on functions you
want to be available from JavaScript.\n * * For some reason you want to rename declaration, e.g. there's common
term in JavaScript\n * for a concept provided by the declaration, which is uncommon in Kotlin.\n * Example:\n *
``` kotlin\n * class Person(val name: String) {\n * fun hello() {\n * println("Hello

top-level external declarations (classes, properties, functions) and files.\n * In case of file (which can't be `external`)\n
the following rule applies: all the declarations in\n * the file must be `external`. By applying `@JsModule(...)` on a
file you tell the compiler to import a JavaScript object\n * that contain all the declarations from the file.\n * Example:\n *
``` kotlin\n * @JsModule("jquery")\n * external abstract class JQuery() {\n * // some

 * Hash table based implementation of the [MutableMap] interface, which additionally preserves the insertion order of entries during the iteration.
 * The insertion order is preserved by maintaining a doubly-linked list of all of its entries.
 * The public actual open class LinkedHashMap<K, V> : HashMap<K, V>, MutableMap<K, V> {
 * The entry we use includes next/prev pointers for a doubly-linked circular list with a head node. This reduces the special cases we have to deal with in the list operations.
 * Note that we duplicate the key from the underlying hash map so we can find the eldest entry. The alternative would have been to modify HashMap so more of the code was directly usable here, but this would have added some overhead to HashMap, or to reimplement most of the HashMap code here with small modifications. Paying a small storage cost only if you use LinkedHashMap and minimizing code size seemed like a better tradeoff.

Maximum number of bytes needed to encode a single char. Code points in `0..0x7F` are encoded in a single byte. Code points in `0x80..0x7FF` are encoded in two bytes. Code points in `0x800..0xD7FF` or in `0xE000..0xFFFF` are encoded in three bytes. Surrogate code points in `0xD800..0xDFFF` are not Unicode scalar values, therefore aren't encoded. Code points in `0x10000..0x10FFFF` are represented by a pair of surrogate `Char`s and are encoded in four bytes.

thread without going through the `[ContinuationInterceptor]` that might be present in the coroutine's `[CoroutineContext]`. It is the invoker's responsibility to ensure that a proper invocation context is established. `[Continuation.intercepted]` can be used to acquire the intercepted continuation. Note that it is not recommended to call either `[Continuation.resume]` nor `[Continuation.resumeWithException]` functions synchronously in the same stackframe where suspension function is run. Use `[suspendCoroutine]` as a safer way to obtain current continuation instance.

get() = DurationUnit.NANOSECONDS\n
Represents the amount of time one instant of time is away from
another instant.\n
A negative duration is possible in a situation when the second instant is earlier than the first
one.\n
An infinite duration value [Duration.INFINITE] can be used to represent infinite timeouts.\n
To
construct a duration use either the extension function [toDuration],\n
or the extension properties [hours],
[minutes], [seconds], and so on,\n
available on [Int], [Long], and [Double] numeric types.\n
To get the value
of this duration expressed in a particular [duration units][DurationUnit]\n
use the functions [toInt], [toLong], and
[toDouble]\n
or the properties [inHours], [inMinutes], [inSeconds], [inNanoseconds], and so on.\n

kotlin\n\nimport kotlin.coroutines.*\nimport kotlin.coroutines.intrinsics.*\n\n/**\n * Defines deep recursive function
that keeps its stack on the heap,\n * which allows very deep recursive computations that do not use the actual call
stack.\n * To initiate a call to this deep recursive function use its [invoke] function.\n * As a rule of thumb, it
should be used if recursion goes deeper than a thousand calls.\n * \n * The [DeepRecursiveFunction] takes one parameter of
type [T] and returns a result of type [R].\n * The [block] of code defines the body of a recursive function. In this
block\n * [callRecursive][DeepRecursiveScope.callRecursive] function can be used to make a recursive call\n * to
the declared function. Other instances of [DeepRecursiveFunction] can be called\n * in this scope with
`callRecursive` extension, too.\n * \n * For example, take a look at the following recursive tree class and a deeply\n *
recursive instance of this tree with 100K nodes:\n * \n * ```\n * class Tree(val left: Tree? = null, val right: Tree? =
null)\n * val deepTree = generateSequence(Tree()) { Tree(it) }.take(100_000).last()\n * ```\n * \n * A regular
recursive function can be defined to compute a depth of a tree:\n * \n * ```\n * fun depth(t: Tree?): Int =\n *     if (t ==
null) 0 else max(depth(t.left), depth(t.right)) + 1\n *     println(depth(deepTree)) // StackOverflowError\n * ```\n * \n *
If this `depth` function is called for a `deepTree` it produces [StackOverflowError] because of deep recursion.\n *
However, the `depth` function can be rewritten using `DeepRecursiveFunction` in the following way, and then\n * it
successfully computes [depth(deepTree)][DeepRecursiveFunction.invoke] expression:\n * \n * ```\n * val depth =
DeepRecursiveFunction<Tree?, Int> { t ->\n *     if (t == null) 0 else max(callRecursive(t.left),
callRecursive(t.right)) + 1\n *     println(depth(deepTree)) // Ok\n * ```\n * \n * Deep recursive functions can also
mutually call each other using a heap for the stack via\n * [callRecursive][DeepRecursiveScope.callRecursive]
extension. For example, the\n * following pair of mutually recursive functions computes the number of tree nodes at
even depth in the tree.\n * \n * ```\n * val mutualRecursion = object {\n *     val even:
DeepRecursiveFunction<Tree?, Int> = DeepRecursiveFunction { t ->\n *         if (t == null) 0 else
odd.callRecursive(t.left) + odd.callRecursive(t.right) + 1\n *     }\n *     val odd: DeepRecursiveFunction<Tree?,
Int> = DeepRecursiveFunction { t ->\n *         if (t == null) 0 else even.callRecursive(t.left) +
even.callRecursive(t.right)\n *     }\n * }\n * \n * \n * @param [T] the function parameter type.\n * @param [R]
the function result type.\n * @param block the function body.\n
