from another instant.
A negative duration is possible in a situation when the second instant is earlier than the
first one.
The type can store duration values up to 146 years with nanosecond precision,
and up to 146 million years with millisecond precision.
If a duration-returning operation provided in `kotlin.time`
produces a duration value that doesn't fit into the above range,
the returned `Duration` is infinite.
An infinite duration value [Duration.INFINITE] can be used to represent infinite timeouts.
To construct a duration use either the extension function [toDuration],
or the extension properties [hours], [minutes], [seconds],
and so on,
available on [Int], [Long], and [Double] numeric types.
To get the value of this duration
expressed in a particular [duration units][DurationUnit]
use the functions [toInt], [toLong], and [toDouble]
or the properties [inWholeHours], [inWholeMinutes], [inWholeSeconds], [inWholeNanoseconds],
and so on.

compiler gives same name in JavaScript, you can\n * mark one with `@JsName(...)` to prevent the compiler from
reporting error.\n * * You are writing a JavaScript library in Kotlin. The compiler produces mangled names\n *
for functions with parameters, which is unnatural for usual JavaScript developer.\n * You can put `@JsName(...)`
on functions you want to be available from JavaScript.\n * * For some reason you want to rename declaration, e.g.
there's common term in JavaScript\n * for a concept provided by the declaration, which is uncommon in Kotlin.\n
*/\n * Example:\n * *```\n * kotlin\n * class Person(val name: String) {\n * fun hello() {\n * println("Hello
$name!")\n * }\n * @JsName("helloWithGreeting")\n * fun hello(greeting: String) {\n *
println("$greeting $name!")\n * }\n * }\n * *```\n * * @property name the name which compiler uses both for

```

declaration itself and for all references to the declaration.

`@JsModule` It's required to denote a valid JavaScript identifier.

`@Retention(AnnotationRetention.BINARY)`

`@Target(CLASS, FUNCTION, PROPERTY, CONSTRUCTOR, PROPERTY_GETTER, PROPERTY_SETTER)`

public actual annotation class `JsName`(actual val name: String)

Denotes an `external` declaration that must be imported from native JavaScript library.

The compiler produces the code relevant for the target module system, for example, in case of CommonJS, it will import the declaration via the `require(...)` function.

The annotation can be used on top-level external declarations (classes, properties, functions) and files.

In case of file (which can't be `external`) the following rule applies: all the declarations in the file must be `external`. By applying `@JsModule(...)` on a file you tell the compiler to import a JavaScript object that contain all the declarations from the file.

Example:

```
kotlin
@JsModule("jquery")
external abstract class JQuery() {
 // some declarations here
}
@JsModule("jquery")
external fun JQuery(element: Element): JQuery
@property import name of a module to import declaration from.
```

It is not interpreted by the Kotlin compiler, it's passed as is directly to the target module system.

`@see JsNonModule`

`@Retention(AnnotationRetention.BINARY)`

`@Target(CLASS, PROPERTY, FUNCTION, FILE)`

public annotation class `JsModule`(val import: String)

Denotes an `external` declaration that can be used without module system.

By default, an `external` declaration is available regardless your target module system.

However, by applying `[JsModule]` annotation you can make a declaration unavailable to `plain` module system.

Some JavaScript libraries are distributed both as a standalone downloadable piece of JavaScript and as a module available as an npm package.

To tell the Kotlin compiler to accept both cases, you can augment `[JsModule]` with the `@JsNonModule` annotation.

For example:

```
kotlin
@JsModule("jquery")
@JsNonModule
@JsName("$")
external abstract class JQuery() {
 // some declarations here
}
@JsModule("jquery")
@JsNonModule
@JsName("$")
external fun JQuery(element: Element): JQuery
@see JsModule
```

`@Retention(AnnotationRetention.BINARY)`

`@Target(CLASS, PROPERTY, FUNCTION, FILE)`

public annotation class `JsNonModule`

Adds prefix to `external` declarations in a source file.

JavaScript does not have concept of packages (namespaces). They are usually emulated by nested objects.

The compiler turns references to `external` declarations either to plain unprefix names (in case of `plain` modules) or to plain imports.

However, if a JavaScript library provides its declarations in packages, you won't be satisfied with this.

You can tell the compiler to generate additional prefix before references to `external` declarations using the `@JsQualifier(...)` annotation.

Note that a file marked with the `@JsQualifier(...)` annotation can't contain non-`external` declarations.

Example:

```
@file:JsQualifier("my.jsPackageName")
package some.kotlinPackage
external fun foo(x: Int)
external fun bar(): String
@property value the qualifier to add to the declarations in the generated code.
```

It must be a sequence of valid JavaScript identifiers separated by the `.` character.

Examples of valid qualifiers are: `foo`, `bar.Baz`, `\_.\$.f`.

`@see JsModule`

`@Retention(AnnotationRetention.BINARY)`

`@Target(AnnotationTarget.FILE)`

public annotation class `JsQualifier`(val value: String)

Exports top-level declaration on JS platform.

Compiled module exposes declarations that are marked with this annotation without name mangling.

This annotation can be applied to either files or top-level declarations.

It is currently prohibited to export the following kinds of declarations:

- expect declarations
- inline functions with reified type parameters
- suspend functions
- secondary constructors without `@JsName`
- extension properties
- enum classes
- annotation classes

Signatures of exported declarations must only contain `exportable` types:

- dynamic
- Any
- String
- Boolean
- Byte
- Short
- Int
- Float
- Double
- BooleanArray
- ByteArray
- ShortArray
- IntArray
- FloatArray
- DoubleArray
- Array<exportable-type>
- Function types with exportable parameters and return types
- external or @JsExport classes and interfaces
- Nullable counterparts of types above
- Unit return type. Must not be nullable

This annotation is experimental, meaning that restrictions mentioned above are subject to change.

`@ExperimentalJsExport`

`@Retention(AnnotationRetention.BINARY)`

`@Target(CLASS, PROPERTY, FUNCTION, FILE)`

`@SinceKotlin("1.3")`

public actual annotation class `JsExport`

Forces a top-level

The least significant bits pushed out from the right side reenter the number as the most significant bits on the left side.

package kotlin.reflect
import findAssociatedObject

The experimental marker for associated objects API.
Any usage of a declaration annotated with `@ExperimentalAssociatedObjects` must be accepted either by
- annotating that usage with the [OptIn] annotation, e.g. `@OptIn(ExperimentalAssociatedObjects::class)`
- or by using the compiler argument `-opt-in=kotlin.reflect.ExperimentalAssociatedObjects`

@RequiresOptIn(level = RequiresOptIn.Level.ERROR)

Makes the annotated annotation class an associated object key.
An associated object key annotation should have single [KClass] parameter.
When applied to a class with reference to an object declaration as an argument, it binds the object to the class, making this binding discoverable at runtime using [findAssociatedObject].

When this annotation is placed on a generic function parameter of a function, it enables to infer the type arguments of that generic function from the lambda body passed to that parameter. The calls that affect inference are either members of the receiver type of an annotated function parameter or extensions for that type. The extensions must be themselves annotated with `@BuilderInference`. Example: we declare `fun <T> sequence(@BuilderInference block: suspend SequenceScope<T>().->Unit): Sequence<T>` and use it like `val result = sequence { yield("result") }`. Here the type argument of the resulting sequence is inferred to `String` from the argument of the [SequenceScope.yield] function, that is called inside the lambda passed to [sequence]. Note: this annotation is experimental, see [ExperimentalTypeInference] on how to opt-in for it.

public annotation class BuilderInference /\*\* Enables overload selection based on the type of the value returned from lambda argument. When two or more function overloads have otherwise the same parameter lists that differ only in the return type of a functional parameter, this annotation enables overload selection by the type of the value returned from the lambda function passed to this functional parameter. Example: `@OverloadResolutionByLambdaReturnType fun create(intProducer: () -> Int): Int fun create(doubleProducer: () -> Double): Double val newValue = create { 3.14 }`. The annotation being applied to one of overloads allows to resolve this ambiguity by analyzing what value is returned from the lambda function. This annotation is also used to discriminate the annotated overloads in case if overload selection still cannot choose one of them even taking in account the result of lambda parameter analysis. In that case a warning is reported. Note: this annotation is experimental, see [ExperimentalTypeInference] on how to opt-in for it.

 * As the result type of the [block] is declared as `Any?` and cannot be correctly type-checked, its proper return type remains on the conscience of the suspend function's author.
 * Invocation of [Continuation.resumeWith] resumes coroutine directly in the invoker's thread without going through the [ContinuationInterceptor] that might be present in the coroutine's [CoroutineContext].
 * It is the invoker's responsibility to ensure that a proper invocation context is established.
 * [Continuation.intercepted] can be used to acquire the intercepted continuation.

kotlin.native.concurrent.SharedImmutable\n\n /**\n * Defines deep recursive function that keeps its stack on the
heap,\n * which allows very deep recursive computations that do not use the actual call stack.\n * To initiate a call
to this deep recursive function use its [invoke] function.\n * As a rule of thumb, it should be used if recursion goes
deeper than a thousand calls.\n * \n * The [DeepRecursiveFunction] takes one parameter of type [T] and returns a
result of type [R].\n * The [block] of code defines the body of a recursive function. In this block\n *
[callRecursive][DeepRecursiveScope.callRecursive] function can be used to make a recursive call\n * to the
declared function. Other instances of [DeepRecursiveFunction] can be called\n * in this scope with `callRecursive`
extension, too.\n * \n * For example, take a look at the following recursive tree class and a deeply\n * recursive
instance of this tree with 100K nodes:\n * \n * ```\n * class Tree(val left: Tree? = null, val right: Tree? = null)\n * val
deepTree = generateSequence(Tree()) { Tree(it) }.take(100_000).last()\n * \n * A regular recursive function
can be defined to compute a depth of a tree:\n * \n * ```\n * fun depth(t: Tree?): Int =\n * if (t == null) 0 else
max(depth(t.left), depth(t.right)) + 1\n * println(depth(deepTree)) // StackOverflowError\n * \n * \n * If this
`depth` function is called for a `deepTree` it produces [StackOverflowError] because of deep recursion.\n *
However, the `depth` function can be rewritten using `DeepRecursiveFunction` in the following way, and then\n * it
successfully computes [depth(deepTree)][DeepRecursiveFunction.invoke] expression:\n * \n * ```\n * val depth =
DeepRecursiveFunction<Tree?, Int> { t ->\n * if (t == null) 0 else max(callRecursive(t.left),
callRecursive(t.right)) + 1\n * }\n * println(depth(deepTree)) // Ok\n * \n * \n * Deep recursive functions can also
mutually call each other using a heap for the stack via\n * [callRecursive][DeepRecursiveScope.callRecursive]
extension. For example, the\n * following pair of mutually recursive functions computes the number of tree nodes at
even depth in the tree.\n * \n * ```\n * val mutualRecursion = object {\n * val even:
DeepRecursiveFunction<Tree?, Int> = DeepRecursiveFunction { t ->\n * if (t == null) 0 else
odd.callRecursive(t.left) + odd.callRecursive(t.right) + 1\n * }\n * val odd: DeepRecursiveFunction<Tree?,
Int> = DeepRecursiveFunction { t ->\n * if (t == null) 0 else even.callRecursive(t.left) +
even.callRecursive(t.right)\n * }\n * }\n * \n * \n * @param [T] the function parameter type.\n * @param [R]
