via a proper concatenation script that understands anonymous AMD modules. A named AMD is safest and most robust way to register. Lowercase jquery is used because AMD module names are derived from file names, and jQuery is normally delivered in a lowercase file name. Do this after creating the global so that if an AMD module wants to call noConflict to hide this version of jQuery, it will work. Note that for maximum portability, libraries that are not jQuery should declare themselves as anonymous modules, and avoid setting a global if an AMD loader is present. jQuery is a special case.  /\*\*  
 \* Modifier used to prevent the popper from being positioned outside the boundary.  
 \* A scenario exists where the reference itself is not within the boundaries.  
 \* We can say it has "escaped the boundaries" — or just "escaped".  
 \* In this case we need to decide whether the popper should either:  
 \* - detach from the reference and remain "trapped" in the boundaries, or  
 \* - if it should ignore the boundary and "escape with its reference".  
 \* When `escapeWithReference` is set to `true` and reference is completely outside its boundaries, the popper will overflow (or completely leave) the boundaries in order to remain attached to the edge of the reference.

Modifier used to hide the popper when its reference element is outside of the popper boundaries. It will set a `x-out-of-boundaries` attribute which can be used to hide with a CSS selector the popper when its reference is out of boundaries.

- Requires the `preventOverflow` modifier before it in order to work.

```

@memberof modifiers
@inner
hide: {
  /** @prop {number} order=800 - Index used to define the order of execution */
  order: 800,
  /** @prop {Boolean} enabled=true - Whether the modifier is enabled or not */
  enabled: true,
  /** @prop {ModifierFn} */
  fn: hide
},

```

Computes the style that will be applied to the popper element to get it properly positioned.

- Note that this modifier will not touch the DOM, it just prepares the styles so that `applyStyle` modifier can apply it. This separation is useful in case you need to replace `applyStyle` with a custom implementation.
- This modifier has `850` as `order` value to maintain backward compatibility with previous versions of Popper.js. Expect the modifiers ordering method to change in future major versions of the library.

```

  /** @prop {number} order=850 - Index used to define the order of execution */
  order: 850,
  /** @prop {Boolean} enabled=true - Whether the modifier is enabled or not */
  enabled: true,
  /** @prop {ModifierFn} */
  fn: computeStyle,
  /** @prop {Boolean} gpuAcceleration=true
   * If true, it uses the CSS 3D transformation to position the popper.
   * Otherwise, it will use the `top` and `left` properties
   */
  gpuAcceleration: true,
  /** @prop {string} [x='bottom']
   * Where to anchor the X axis ('bottom' or 'top'). AKA X offset origin.
   * Change this if your popper should grow in a direction different from `bottom`
   */
  x: 'bottom',
  /** @prop {string} [x='left']
   * Where to anchor the Y axis ('left' or 'right'). AKA Y offset origin.
   * Change this if your popper should grow in a direction different from `right`
   */
  y: 'right'
},

```

Applies the computed styles to the popper element.

- All the DOM manipulations are limited to this modifier. This is useful in case you want to integrate Popper.js inside a framework or view library and you want to delegate all the DOM manipulations to it.
- Note that if you disable this modifier, you must make sure the popper element has its position set to `absolute` before Popper.js can do its work!
- Just disable this modifier and define your own to achieve the desired effect.

```

applyStyle: {
  /** @prop {number} order=900 - Index used to define the order of execution */
  order: 900,

  fn: applyStyle,
  /** @prop {Function} */

   * Otherwise, it will use the `top` and `left` properties

    Implementation Summary
    1. Enforce API surface and semantic compatibility with 1.9.x branch
    2. Improve the module's maintainability by reducing the storage
    paths to a single mechanism.
    3. Use the same single mechanism to support "private" and "user" data.
    4. _Never_ expose "private" data to user code (TODO: Drop _data, _removeData)
    5. Avoid exposing implementation details on user objects (eg. expando properties)
    6. Provide a clear path for implementation upgrade to WeakMap in 2014

via a proper concatenation script that understands anonymous AMD modules. A named AMD is safest and most robust way to register. Lowercase jquery is used because AMD module names are derived from file names, and jQuery is normally delivered in a lowercase file name. Do this after creating the global so that if an AMD module wants to call noConflict to hide this version of jQuery, it will work. Note that for maximum portability, libraries that are not jQuery should declare themselves as anonymous modules, and avoid setting a global if an AMD loader is present. jQuery is a special case.  \* A scenario exists where the reference itself is not within the boundaries.  
 \* We can say it has "escaped the boundaries" — or just "escaped".  
 \* In this case we need to decide whether the popper should either:  
 \* - detach from the reference and remain "trapped" in the boundaries, or  
 \* - if it should ignore the boundary and "escape with its reference".  
 \* When `escapeWithReference` is set to `true` and reference is completely outside its boundaries, the popper will overflow (or completely leave) the boundaries in order to remain attached to the edge of the reference.
