GNU GENERAL PUBLIC LICENSE
Version 2, June 1991

Copyright (C) 1989, 1991 Free Software Foundation, Inc.,
51 Franklin Street, Fifth Floor, Boston, MA 02110-1301 USA
Everyone is permitted to copy and distribute verbatim copies
of this license document, but changing it is not allowed.

Preamble

The licenses for most software are designed to take away your
freedom to share and change it. By contrast, the GNU General Public

License is intended to guarantee your freedom to share and change free software--to make sure the software is free for all its users. This General Public License applies to most of the Free Software Foundation's software and to any other program whose authors commit to using it. (Some other Free Software Foundation software is covered by the GNU Lesser General Public License instead.) You can apply it to your programs, too.

When we speak of free software, we are referring to freedom, not price. Our General Public Licenses are designed to make sure that you have the freedom to distribute copies of free software (and charge for this service if you wish), that you receive source code or can get it if you want it, that you can change the software or use pieces of it in new free programs; and that you know you can do these things.

To protect your rights, we need to make restrictions that forbid anyone to deny you these rights or to ask you to surrender the rights. These restrictions translate to certain responsibilities for you if you distribute copies of the software, or if you modify it.

For example, if you distribute copies of such a program, whether gratis or for a fee, you must give the recipients all the rights that you have. You must make sure that they, too, receive or can get the source code. And you must show them these terms so they know their rights.

We protect your rights with two steps: (1) copyright the software, and (2) offer you this license which gives you legal permission to copy, distribute and/or modify the software.

Also, for each author's protection and ours, we want to make certain that everyone understands that there is no warranty for this free software. If the software is modified by someone else and passed on, we want its recipients to know that what they have is not the original, so that any problems introduced by others will not reflect on the original authors' reputations.

Finally, any free program is threatened constantly by software patents. We wish to avoid the danger that redistributors of a free program will individually obtain patent licenses, in effect making the program proprietary. To prevent this, we have made it clear that any patent must be licensed for everyone's free use or not licensed at all.

The precise terms and conditions for copying, distribution and modification follow.

GNU GENERAL PUBLIC LICENSE
TERMS AND CONDITIONS FOR COPYING, DISTRIBUTION AND MODIFICATION

0. This License applies to any program or other work which contains a notice placed by the copyright holder saying it may be distributed under the terms of this General Public License. The "Program", below, refers to any such program or work, and a "work based on the Program" means either the Program or any derivative work under copyright law: that is to say, a work containing the Program or a portion of it, either verbatim or with modifications and/or translated into another language. (Hereinafter, translation is included without limitation in the term "modification".) Each licensee is addressed as "you".

Activities other than copying, distribution and modification are not covered by this License; they are outside its scope. The act of running the Program is not restricted, and the output from the Program is covered only if its contents constitute a work based on the Program (independent of having been made by running the Program). Whether that is true depends on what the Program does.

1. You may copy and distribute verbatim copies of the Program's source code as you receive it, in any medium, provided that you conspicuously and appropriately publish on each copy an appropriate copyright notice and disclaimer of warranty; keep intact all the notices that refer to this License and to the absence of any warranty; and give any other recipients of the Program a copy of this License along with the Program.

You may charge a fee for the physical act of transferring a copy, and you may at your option offer warranty protection in exchange for a fee.

2. You may modify your copy or copies of the Program or any portion of it, thus forming a work based on the Program, and copy and distribute such modifications or work under the terms of Section 1 above, provided that you also meet all of these conditions:

- a) You must cause the modified files to carry prominent notices stating that you changed the files and the date of any change.
- b) You must cause any work that you distribute or publish, that in whole or in part contains or is derived from the Program or any part thereof, to be licensed as a whole at no charge to all third parties under the terms of this License.
- c) If the modified program normally reads commands interactively when run, you must cause it, when started running for such interactive use in the most ordinary way, to print or display an announcement including an appropriate copyright notice and a notice that there is no warranty (or else, saying that you provide a warranty) and that users may redistribute the program under

these conditions, and telling the user how to view a copy of this License. (Exception: if the Program itself is interactive but does not normally print such an announcement, your work based on the Program is not required to print an announcement.)

These requirements apply to the modified work as a whole. If identifiable sections of that work are not derived from the Program, and can be reasonably considered independent and separate works in themselves, then this License, and its terms, do not apply to those sections when you distribute them as separate works. But when you distribute the same sections as part of a whole which is a work based on the Program, the distribution of the whole must be on the terms of this License, whose permissions for other licensees extend to the entire whole, and thus to each and every part regardless of who wrote it.

Thus, it is not the intent of this section to claim rights or contest your rights to work written entirely by you; rather, the intent is to exercise the right to control the distribution of derivative or collective works based on the Program.

In addition, mere aggregation of another work not based on the Program with the Program (or with a work based on the Program) on a volume of a storage or distribution medium does not bring the other work under the scope of this License.

3. You may copy and distribute the Program (or a work based on it, under Section 2) in object code or executable form under the terms of Sections 1 and 2 above provided that you also do one of the following:

a) Accompany it with the complete corresponding machine-readable source code, which must be distributed under the terms of Sections 1 and 2 above on a medium customarily used for software interchange; or,

b) Accompany it with a written offer, valid for at least three years, to give any third party, for a charge no more than your cost of physically performing source distribution, a complete machine-readable copy of the corresponding source code, to be distributed under the terms of Sections 1 and 2 above on a medium customarily used for software interchange; or,

c) Accompany it with the information you received as to the offer to distribute corresponding source code. (This alternative is allowed only for noncommercial distribution and only if you received the program in object code or executable form with such an offer, in accord with Subsection b above.)

The source code for a work means the preferred form of the work for making modifications to it. For an executable work, complete source

code means all the source code for all modules it contains, plus any associated interface definition files, plus the scripts used to control compilation and installation of the executable. However, as a special exception, the source code distributed need not include anything that is normally distributed (in either source or binary form) with the major components (compiler, kernel, and so on) of the operating system on which the executable runs, unless that component itself accompanies the executable.

If distribution of executable or object code is made by offering access to copy from a designated place, then offering equivalent access to copy the source code from the same place counts as distribution of the source code, even though third parties are not compelled to copy the source along with the object code.

4. You may not copy, modify, sublicense, or distribute the Program except as expressly provided under this License. Any attempt otherwise to copy, modify, sublicense or distribute the Program is void, and will automatically terminate your rights under this License. However, parties who have received copies, or rights, from you under this License will not have their licenses terminated so long as such parties remain in full compliance.

5. You are not required to accept this License, since you have not signed it. However, nothing else grants you permission to modify or distribute the Program or its derivative works. These actions are prohibited by law if you do not accept this License. Therefore, by modifying or distributing the Program (or any work based on the Program), you indicate your acceptance of this License to do so, and all its terms and conditions for copying, distributing or modifying the Program or works based on it.

6. Each time you redistribute the Program (or any work based on the Program), the recipient automatically receives a license from the original licensor to copy, distribute or modify the Program subject to these terms and conditions. You may not impose any further restrictions on the recipients' exercise of the rights granted herein. You are not responsible for enforcing compliance by third parties to this License.

7. If, as a consequence of a court judgment or allegation of patent infringement or for any other reason (not limited to patent issues), conditions are imposed on you (whether by court order, agreement or otherwise) that contradict the conditions of this License, they do not excuse you from the conditions of this License. If you cannot distribute so as to satisfy simultaneously your obligations under this License and any other pertinent obligations, then as a consequence you may not distribute the Program at all. For example, if a patent

license would not permit royalty-free redistribution of the Program by all those who receive copies directly or indirectly through you, then the only way you could satisfy both it and this License would be to refrain entirely from distribution of the Program.

If any portion of this section is held invalid or unenforceable under any particular circumstance, the balance of the section is intended to apply and the section as a whole is intended to apply in other circumstances.

It is not the purpose of this section to induce you to infringe any patents or other property right claims or to contest validity of any such claims; this section has the sole purpose of protecting the integrity of the free software distribution system, which is implemented by public license practices. Many people have made generous contributions to the wide range of software distributed through that system in reliance on consistent application of that system; it is up to the author/donor to decide if he or she is willing to distribute software through any other system and a licensee cannot impose that choice.

This section is intended to make thoroughly clear what is believed to be a consequence of the rest of this License.

8. If the distribution and/or use of the Program is restricted in certain countries either by patents or by copyrighted interfaces, the original copyright holder who places the Program under this License may add an explicit geographical distribution limitation excluding those countries, so that distribution is permitted only in or among countries not thus excluded. In such case, this License incorporates the limitation as if written in the body of this License.

9. The Free Software Foundation may publish revised and/or new versions of the General Public License from time to time. Such new versions will be similar in spirit to the present version, but may differ in detail to address new problems or concerns.

Each version is given a distinguishing version number. If the Program specifies a version number of this License which applies to it and "any later version", you have the option of following the terms and conditions either of that version or of any later version published by the Free Software Foundation. If the Program does not specify a version number of this License, you may choose any version ever published by the Free Software Foundation.

10. If you wish to incorporate parts of the Program into other free programs whose distribution conditions are different, write to the author to ask for permission. For software which is copyrighted by the Free

Software Foundation, write to the Free Software Foundation; we sometimes make exceptions for this. Our decision will be guided by the two goals of preserving the free status of all derivatives of our free software and of promoting the sharing and reuse of software generally.

NO WARRANTY

11. BECAUSE THE PROGRAM IS LICENSED FREE OF CHARGE, THERE IS NO WARRANTY FOR THE PROGRAM, TO THE EXTENT PERMITTED BY APPLICABLE LAW. EXCEPT WHEN OTHERWISE STATED IN WRITING THE COPYRIGHT HOLDERS AND/OR OTHER PARTIES PROVIDE THE PROGRAM "AS IS" WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. THE ENTIRE RISK AS TO THE QUALITY AND PERFORMANCE OF THE PROGRAM IS WITH YOU. SHOULD THE PROGRAM PROVE DEFECTIVE, YOU ASSUME THE COST OF ALL NECESSARY SERVICING, REPAIR OR CORRECTION.

12. IN NO EVENT UNLESS REQUIRED BY APPLICABLE LAW OR AGREED TO IN WRITING WILL ANY COPYRIGHT HOLDER, OR ANY OTHER PARTY WHO MAY MODIFY AND/OR REDISTRIBUTE THE PROGRAM AS PERMITTED ABOVE, BE LIABLE TO YOU FOR DAMAGES, INCLUDING ANY GENERAL, SPECIAL, INCIDENTAL OR CONSEQUENTIAL DAMAGES ARISING OUT OF THE USE OR INABILITY TO USE THE PROGRAM (INCLUDING BUT NOT LIMITED TO LOSS OF DATA OR DATA BEING RENDERED INACCURATE OR LOSSES SUSTAINED BY YOU OR THIRD PARTIES OR A FAILURE OF THE PROGRAM TO OPERATE WITH ANY OTHER PROGRAMS), EVEN IF SUCH HOLDER OR OTHER PARTY HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

END OF TERMS AND CONDITIONS

How to Apply These Terms to Your New Programs

If you develop a new program, and you want it to be of the greatest possible use to the public, the best way to achieve this is to make it free software which everyone can redistribute and change under these terms.

To do so, attach the following notices to the program. It is safest to attach them to the start of each source file to most effectively convey the exclusion of warranty; and each file should have at least the "copyright" line and a pointer to where the full notice is found.

```
<one line to give the program's name and a brief idea of what it does.>  
Copyright (C) <year> <name of author>
```

This program is free software; you can redistribute it and/or modify it under the terms of the GNU General Public License as published by the Free Software Foundation; either version 2 of the License, or (at your option) any later version.

This program is distributed in the hope that it will be useful,
but WITHOUT ANY WARRANTY; without even the implied warranty of
MERCHANTABILITY or FITNESS FOR A PARTICULAR PURPOSE. See the
GNU General Public License for more details.

You should have received a copy of the GNU General Public License along
with this program; if not, write to the Free Software Foundation, Inc.,
51 Franklin Street, Fifth Floor, Boston, MA 02110-1301 USA.

Also add information on how to contact you by electronic and paper mail.

If the program is interactive, make it output a short notice like this
when it starts in an interactive mode:

```
Gnomovision version 69, Copyright (C) year name of author
Gnomovision comes with ABSOLUTELY NO WARRANTY; for details type `show w'.
This is free software, and you are welcome to redistribute it
under certain conditions; type `show c' for details.
```

The hypothetical commands ``show w'` and ``show c'` should show the appropriate
parts of the General Public License. Of course, the commands you use may
be called something other than ``show w'` and ``show c'`; they could even be
mouse-clicks or menu items--whatever suits your program.

You should also get your employer (if you work as a programmer) or your
school, if any, to sign a "copyright disclaimer" for the program, if
necessary. Here is a sample; alter the names:

```
Yoyodyne, Inc., hereby disclaims all copyright interest in the program
`Gnomovision' (which makes passes at compilers) written by James Hacker.
```

```
<signature of Ty Coon>, 1 April 1989
Ty Coon, President of Vice
```

This General Public License does not permit incorporating your program into
proprietary programs. If your program is a subroutine library, you may
consider it more useful to permit linking proprietary applications with the
library. If this is what you want to do, use the GNU Lesser General
Public License instead of this License.

1.4 Broadcom Femtocell SDK - Linux Kernel 2.6.29.6

1.4.1 Available under license :

NOTE! This copyright does **not** cover user programs that use kernel services by normal system calls - this is merely considered normal use of the kernel, and does **not** fall under the heading of "derived work".

Also note that the GPL below is copyrighted by the Free Software Foundation, but the instance of code that it refers to (the Linux kernel) is copyrighted by me and others who actually wrote it.

Also note that the only valid version of the GPL as far as the kernel is concerned is `_this_` particular version of the license (ie v2, not v2.2 or v3.x or whatever), unless explicitly otherwise stated.

GNU GENERAL PUBLIC LICENSE

Version 2, June 1991

Copyright (C) 1989, 1991 Free Software Foundation, Inc.

51 Franklin St, Fifth Floor, Boston, MA 02110-1301 USA

Everyone is permitted to copy and distribute verbatim copies of this license document, but changing it is not allowed.

Preamble

The licenses for most software are designed to take away your freedom to share and change it. By contrast, the GNU General Public License is intended to guarantee your freedom to share and change free software--to make sure the software is free for all its users. This General Public License applies to most of the Free Software Foundation's software and to any other program whose authors commit to using it. (Some other Free Software Foundation software is covered by the GNU Library General Public License instead.) You can apply it to your programs, too.

When we speak of free software, we are referring to freedom, not price. Our General Public Licenses are designed to make sure that you have the freedom to distribute copies of free software (and charge for this service if you wish), that you receive source code or can get it if you want it, that you can change the software or use pieces of it in new free programs; and that you know you can do these things.

To protect your rights, we need to make restrictions that forbid anyone to deny you these rights or to ask you to surrender the rights. These restrictions translate to certain responsibilities for you if you

distribute copies of the software, or if you modify it.

For example, if you distribute copies of such a program, whether gratis or for a fee, you must give the recipients all the rights that you have. You must make sure that they, too, receive or can get the source code. And you must show them these terms so they know their rights.

We protect your rights with two steps: (1) copyright the software, and (2) offer you this license which gives you legal permission to copy, distribute and/or modify the software.

Also, for each author's protection and ours, we want to make certain that everyone understands that there is no warranty for this free software. If the software is modified by someone else and passed on, we want its recipients to know that what they have is not the original, so that any problems introduced by others will not reflect on the original authors' reputations.

Finally, any free program is threatened constantly by software patents. We wish to avoid the danger that redistributors of a free program will individually obtain patent licenses, in effect making the program proprietary. To prevent this, we have made it clear that any patent must be licensed for everyone's free use or not licensed at all.

The precise terms and conditions for copying, distribution and modification follow.

GNU GENERAL PUBLIC LICENSE TERMS AND CONDITIONS FOR COPYING, DISTRIBUTION AND MODIFICATION

0. This License applies to any program or other work which contains a notice placed by the copyright holder saying it may be distributed under the terms of this General Public License. The "Program", below, refers to any such program or work, and a "work based on the Program" means either the Program or any derivative work under copyright law: that is to say, a work containing the Program or a portion of it, either verbatim or with modifications and/or translated into another language. (Hereinafter, translation is included without limitation in the term "modification".) Each licensee is addressed as "you".

Activities other than copying, distribution and modification are not covered by this License; they are outside its scope. The act of running the Program is not restricted, and the output from the Program is covered only if its contents constitute a work based on the Program (independent of having been made by running the Program). Whether that is true depends on what the Program does.

1. You may copy and distribute verbatim copies of the Program's source code as you receive it, in any medium, provided that you conspicuously and appropriately publish on each copy an appropriate copyright notice and disclaimer of warranty; keep intact all the notices that refer to this License and to the absence of any warranty; and give any other recipients of the Program a copy of this License along with the Program.

You may charge a fee for the physical act of transferring a copy, and you may at your option offer warranty protection in exchange for a fee.

2. You may modify your copy or copies of the Program or any portion of it, thus forming a work based on the Program, and copy and distribute such modifications or work under the terms of Section 1 above, provided that you also meet all of these conditions:

- a) You must cause the modified files to carry prominent notices stating that you changed the files and the date of any change.
- b) You must cause any work that you distribute or publish, that in whole or in part contains or is derived from the Program or any part thereof, to be licensed as a whole at no charge to all third parties under the terms of this License.
- c) If the modified program normally reads commands interactively when run, you must cause it, when started running for such interactive use in the most ordinary way, to print or display an announcement including an appropriate copyright notice and a notice that there is no warranty (or else, saying that you provide a warranty) and that users may redistribute the program under these conditions, and telling the user how to view a copy of this License. (Exception: if the Program itself is interactive but does not normally print such an announcement, your work based on the Program is not required to print an announcement.)

These requirements apply to the modified work as a whole. If identifiable sections of that work are not derived from the Program, and can be reasonably considered independent and separate works in themselves, then this License, and its terms, do not apply to those sections when you distribute them as separate works. But when you distribute the same sections as part of a whole which is a work based on the Program, the distribution of the whole must be on the terms of this License, whose permissions for other licensees extend to the entire whole, and thus to each and every part regardless of who wrote it.

Thus, it is not the intent of this section to claim rights or contest your rights to work written entirely by you; rather, the intent is to exercise the right to control the distribution of derivative or

collective works based on the Program.

In addition, mere aggregation of another work not based on the Program with the Program (or with a work based on the Program) on a volume of a storage or distribution medium does not bring the other work under the scope of this License.

3. You may copy and distribute the Program (or a work based on it, under Section 2) in object code or executable form under the terms of Sections 1 and 2 above provided that you also do one of the following:

- a) Accompany it with the complete corresponding machine-readable source code, which must be distributed under the terms of Sections 1 and 2 above on a medium customarily used for software interchange; or,
- b) Accompany it with a written offer, valid for at least three years, to give any third party, for a charge no more than your cost of physically performing source distribution, a complete machine-readable copy of the corresponding source code, to be distributed under the terms of Sections 1 and 2 above on a medium customarily used for software interchange; or,
- c) Accompany it with the information you received as to the offer to distribute corresponding source code. (This alternative is allowed only for noncommercial distribution and only if you received the program in object code or executable form with such an offer, in accord with Subsection b above.)

The source code for a work means the preferred form of the work for making modifications to it. For an executable work, complete source code means all the source code for all modules it contains, plus any associated interface definition files, plus the scripts used to control compilation and installation of the executable. However, as a special exception, the source code distributed need not include anything that is normally distributed (in either source or binary form) with the major components (compiler, kernel, and so on) of the operating system on which the executable runs, unless that component itself accompanies the executable.

If distribution of executable or object code is made by offering access to copy from a designated place, then offering equivalent access to copy the source code from the same place counts as distribution of the source code, even though third parties are not compelled to copy the source along with the object code.

4. You may not copy, modify, sublicense, or distribute the Program except as expressly provided under this License. Any attempt otherwise to copy, modify, sublicense or distribute the Program is

void, and will automatically terminate your rights under this License. However, parties who have received copies, or rights, from you under this License will not have their licenses terminated so long as such parties remain in full compliance.

5. You are not required to accept this License, since you have not signed it. However, nothing else grants you permission to modify or distribute the Program or its derivative works. These actions are prohibited by law if you do not accept this License. Therefore, by modifying or distributing the Program (or any work based on the Program), you indicate your acceptance of this License to do so, and all its terms and conditions for copying, distributing or modifying the Program or works based on it.

6. Each time you redistribute the Program (or any work based on the Program), the recipient automatically receives a license from the original licensor to copy, distribute or modify the Program subject to these terms and conditions. You may not impose any further restrictions on the recipients' exercise of the rights granted herein. You are not responsible for enforcing compliance by third parties to this License.

7. If, as a consequence of a court judgment or allegation of patent infringement or for any other reason (not limited to patent issues), conditions are imposed on you (whether by court order, agreement or otherwise) that contradict the conditions of this License, they do not excuse you from the conditions of this License. If you cannot distribute so as to satisfy simultaneously your obligations under this License and any other pertinent obligations, then as a consequence you may not distribute the Program at all. For example, if a patent license would not permit royalty-free redistribution of the Program by all those who receive copies directly or indirectly through you, then the only way you could satisfy both it and this License would be to refrain entirely from distribution of the Program.

If any portion of this section is held invalid or unenforceable under any particular circumstance, the balance of the section is intended to apply and the section as a whole is intended to apply in other circumstances.

It is not the purpose of this section to induce you to infringe any patents or other property right claims or to contest validity of any such claims; this section has the sole purpose of protecting the integrity of the free software distribution system, which is implemented by public license practices. Many people have made generous contributions to the wide range of software distributed through that system in reliance on consistent application of that system; it is up to the author/donor to decide if he or she is willing

to distribute software through any other system and a licensee cannot impose that choice.

This section is intended to make thoroughly clear what is believed to be a consequence of the rest of this License.

8. If the distribution and/or use of the Program is restricted in certain countries either by patents or by copyrighted interfaces, the original copyright holder who places the Program under this License may add an explicit geographical distribution limitation excluding those countries, so that distribution is permitted only in or among countries not thus excluded. In such case, this License incorporates the limitation as if written in the body of this License.

9. The Free Software Foundation may publish revised and/or new versions of the General Public License from time to time. Such new versions will be similar in spirit to the present version, but may differ in detail to address new problems or concerns.

Each version is given a distinguishing version number. If the Program specifies a version number of this License which applies to it and "any later version", you have the option of following the terms and conditions either of that version or of any later version published by the Free Software Foundation. If the Program does not specify a version number of this License, you may choose any version ever published by the Free Software Foundation.

10. If you wish to incorporate parts of the Program into other free programs whose distribution conditions are different, write to the author to ask for permission. For software which is copyrighted by the Free Software Foundation, write to the Free Software Foundation; we sometimes make exceptions for this. Our decision will be guided by the two goals of preserving the free status of all derivatives of our free software and of promoting the sharing and reuse of software generally.

NO WARRANTY

11. BECAUSE THE PROGRAM IS LICENSED FREE OF CHARGE, THERE IS NO WARRANTY FOR THE PROGRAM, TO THE EXTENT PERMITTED BY APPLICABLE LAW. EXCEPT WHEN OTHERWISE STATED IN WRITING THE COPYRIGHT HOLDERS AND/OR OTHER PARTIES PROVIDE THE PROGRAM "AS IS" WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. THE ENTIRE RISK AS TO THE QUALITY AND PERFORMANCE OF THE PROGRAM IS WITH YOU. SHOULD THE PROGRAM PROVE DEFECTIVE, YOU ASSUME THE COST OF ALL NECESSARY SERVICING, REPAIR OR CORRECTION.

12. IN NO EVENT UNLESS REQUIRED BY APPLICABLE LAW OR AGREED TO IN WRITING

WILL ANY COPYRIGHT HOLDER, OR ANY OTHER PARTY WHO MAY MODIFY AND/OR REDISTRIBUTE THE PROGRAM AS PERMITTED ABOVE, BE LIABLE TO YOU FOR DAMAGES, INCLUDING ANY GENERAL, SPECIAL, INCIDENTAL OR CONSEQUENTIAL DAMAGES ARISING OUT OF THE USE OR INABILITY TO USE THE PROGRAM (INCLUDING BUT NOT LIMITED TO LOSS OF DATA OR DATA BEING RENDERED INACCURATE OR LOSSES SUSTAINED BY YOU OR THIRD PARTIES OR A FAILURE OF THE PROGRAM TO OPERATE WITH ANY OTHER PROGRAMS), EVEN IF SUCH HOLDER OR OTHER PARTY HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

END OF TERMS AND CONDITIONS

How to Apply These Terms to Your New Programs

If you develop a new program, and you want it to be of the greatest possible use to the public, the best way to achieve this is to make it free software which everyone can redistribute and change under these terms.

To do so, attach the following notices to the program. It is safest to attach them to the start of each source file to most effectively convey the exclusion of warranty; and each file should have at least the "copyright" line and a pointer to where the full notice is found.

```
<one line to give the program's name and a brief idea of what it does.>  
Copyright (C) <year> <name of author>
```

This program is free software; you can redistribute it and/or modify it under the terms of the GNU General Public License as published by the Free Software Foundation; either version 2 of the License, or (at your option) any later version.

This program is distributed in the hope that it will be useful, but WITHOUT ANY WARRANTY; without even the implied warranty of MERCHANTABILITY or FITNESS FOR A PARTICULAR PURPOSE. See the GNU General Public License for more details.

You should have received a copy of the GNU General Public License along with this program; if not, write to the Free Software Foundation, Inc., 51 Franklin St, Fifth Floor, Boston, MA 02110-1301 USA

Also add information on how to contact you by electronic and paper mail.

If the program is interactive, make it output a short notice like this when it starts in an interactive mode:

```
Gnomovision version 69, Copyright (C) year name of author  
Gnomovision comes with ABSOLUTELY NO WARRANTY; for details type 'show w'.  
This is free software, and you are welcome to redistribute it
```

under certain conditions; type 'show c' for details.

The hypothetical commands 'show w' and 'show c' should show the appropriate parts of the General Public License. Of course, the commands you use may be called something other than 'show w' and 'show c'; they could even be mouse-clicks or menu items--whatever suits your program.

You should also get your employer (if you work as a programmer) or your school, if any, to sign a "copyright disclaimer" for the program, if necessary. Here is a sample; alter the names:

Yoyodyne, Inc., hereby disclaims all copyright interest in the program 'Gnomovision' (which makes passes at compilers) written by James Hacker.

<signature of Ty Coon>, 1 April 1989

Ty Coon, President of Vice

This General Public License does not permit incorporating your program into proprietary programs. If your program is a subroutine library, you may consider it more useful to permit linking proprietary applications with the library. If this is what you want to do, use the GNU Library General Public License instead of this License.

GNU LIBRARY GENERAL PUBLIC LICENSE

Version 2, June 1991

Copyright (C) 1991 Free Software Foundation, Inc.

675 Mass Ave, Cambridge, MA 02139, USA

Everyone is permitted to copy and distribute verbatim copies of this license document, but changing it is not allowed.

[This is the first released version of the library GPL. It is numbered 2 because it goes with version 2 of the ordinary GPL.]

Preamble

The licenses for most software are designed to take away your freedom to share and change it. By contrast, the GNU General Public Licenses are intended to guarantee your freedom to share and change free software--to make sure the software is free for all its users.

This license, the Library General Public License, applies to some specially designated Free Software Foundation software, and to any other libraries whose authors decide to use it. You can use it for your libraries, too.

When we speak of free software, we are referring to freedom, not price. Our General Public Licenses are designed to make sure that you have the freedom to distribute copies of free software (and charge for this service if you wish), that you receive source code or can get it if you want it, that you can change the software or use pieces of it in new free programs; and that you know you can do these things.

To protect your rights, we need to make restrictions that forbid anyone to deny you these rights or to ask you to surrender the rights. These restrictions translate to certain responsibilities for you if you distribute copies of the library, or if you modify it.

For example, if you distribute copies of the library, whether gratis or for a fee, you must give the recipients all the rights that we gave you. You must make sure that they, too, receive or can get the source code. If you link a program with the library, you must provide complete object files to the recipients so that they can relink them with the library, after making changes to the library and recompiling it. And you must show them these terms so they know their rights.

Our method of protecting your rights has two steps: (1) copyright the library, and (2) offer you this license which gives you legal permission to copy, distribute and/or modify the library.

Also, for each distributor's protection, we want to make certain that everyone understands that there is no warranty for this free library. If the library is modified by someone else and passed on, we want its recipients to know that what they have is not the original version, so that any problems introduced by others will not reflect on the original authors' reputations.

Finally, any free program is threatened constantly by software patents. We wish to avoid the danger that companies distributing free software will individually obtain patent licenses, thus in effect transforming the program into proprietary software. To prevent this, we have made it clear that any patent must be licensed for everyone's free use or not licensed at all.

Most GNU software, including some libraries, is covered by the ordinary GNU General Public License, which was designed for utility programs. This license, the GNU Library General Public License, applies to certain designated libraries. This license is quite different from the ordinary one; be sure to read it in full, and don't assume that anything in it is the same as in the ordinary license.

The reason we have a separate public license for some libraries is that they blur the distinction we usually make between modifying or adding to a program and simply using it. Linking a program with a library, without

changing the library, is in some sense simply using the library, and is analogous to running a utility program or application program. However, in a textual and legal sense, the linked executable is a combined work, a derivative of the original library, and the ordinary General Public License treats it as such.

Because of this blurred distinction, using the ordinary General Public License for libraries did not effectively promote software sharing, because most developers did not use the libraries. We concluded that weaker conditions might promote sharing better.

However, unrestricted linking of non-free programs would deprive the users of those programs of all benefit from the free status of the libraries themselves. This Library General Public License is intended to permit developers of non-free programs to use free libraries, while preserving your freedom as a user of such programs to change the free libraries that are incorporated in them. (We have not seen how to achieve this as regards changes in header files, but we have achieved it as regards changes in the actual functions of the Library.) The hope is that this will lead to faster development of free libraries.

The precise terms and conditions for copying, distribution and modification follow. Pay close attention to the difference between a "work based on the library" and a "work that uses the library". The former contains code derived from the library, while the latter only works together with the library.

Note that it is possible for a library to be covered by the ordinary General Public License rather than by this special one.

GNU LIBRARY GENERAL PUBLIC LICENSE TERMS AND CONDITIONS FOR COPYING, DISTRIBUTION AND MODIFICATION

0. This License Agreement applies to any software library which contains a notice placed by the copyright holder or other authorized party saying it may be distributed under the terms of this Library General Public License (also called "this License"). Each licensee is addressed as "you".

A "library" means a collection of software functions and/or data prepared so as to be conveniently linked with application programs (which use some of those functions and data) to form executables.

The "Library", below, refers to any such software library or work which has been distributed under these terms. A "work based on the Library" means either the Library or any derivative work under copyright law: that is to say, a work containing the Library or a portion of it, either verbatim or with modifications and/or translated

straightforwardly into another language. (Hereinafter, translation is included without limitation in the term "modification".)

"Source code" for a work means the preferred form of the work for making modifications to it. For a library, complete source code means all the source code for all modules it contains, plus any associated interface definition files, plus the scripts used to control compilation and installation of the library.

Activities other than copying, distribution and modification are not covered by this License; they are outside its scope. The act of running a program using the Library is not restricted, and output from such a program is covered only if its contents constitute a work based on the Library (independent of the use of the Library in a tool for writing it). Whether that is true depends on what the Library does and what the program that uses the Library does.

1. You may copy and distribute verbatim copies of the Library's complete source code as you receive it, in any medium, provided that you conspicuously and appropriately publish on each copy an appropriate copyright notice and disclaimer of warranty; keep intact all the notices that refer to this License and to the absence of any warranty; and distribute a copy of this License along with the Library.

You may charge a fee for the physical act of transferring a copy, and you may at your option offer warranty protection in exchange for a fee.

2. You may modify your copy or copies of the Library or any portion of it, thus forming a work based on the Library, and copy and distribute such modifications or work under the terms of Section 1 above, provided that you also meet all of these conditions:

- a) The modified work must itself be a software library.
- b) You must cause the files modified to carry prominent notices stating that you changed the files and the date of any change.
- c) You must cause the whole of the work to be licensed at no charge to all third parties under the terms of this License.
- d) If a facility in the modified Library refers to a function or a table of data to be supplied by an application program that uses the facility, other than as an argument passed when the facility is invoked, then you must make a good faith effort to ensure that, in the event an application does not supply such function or table, the facility still operates, and performs whatever part of

its purpose remains meaningful.

(For example, a function in a library to compute square roots has a purpose that is entirely well-defined independent of the application. Therefore, Subsection 2d requires that any application-supplied function or table used by this function must be optional: if the application does not supply it, the square root function must still compute square roots.)

These requirements apply to the modified work as a whole. If identifiable sections of that work are not derived from the Library, and can be reasonably considered independent and separate works in themselves, then this License, and its terms, do not apply to those sections when you distribute them as separate works. But when you distribute the same sections as part of a whole which is a work based on the Library, the distribution of the whole must be on the terms of this License, whose permissions for other licensees extend to the entire whole, and thus to each and every part regardless of who wrote it.

Thus, it is not the intent of this section to claim rights or contest your rights to work written entirely by you; rather, the intent is to exercise the right to control the distribution of derivative or collective works based on the Library.

In addition, mere aggregation of another work not based on the Library with the Library (or with a work based on the Library) on a volume of a storage or distribution medium does not bring the other work under the scope of this License.

3. You may opt to apply the terms of the ordinary GNU General Public License instead of this License to a given copy of the Library. To do this, you must alter all the notices that refer to this License, so that they refer to the ordinary GNU General Public License, version 2, instead of to this License. (If a newer version than version 2 of the ordinary GNU General Public License has appeared, then you can specify that version instead if you wish.) Do not make any other change in these notices.

Once this change is made in a given copy, it is irreversible for that copy, so the ordinary GNU General Public License applies to all subsequent copies and derivative works made from that copy.

This option is useful when you wish to copy part of the code of the Library into a program that is not a library.

4. You may copy and distribute the Library (or a portion or derivative of it, under Section 2) in object code or executable form

under the terms of Sections 1 and 2 above provided that you accompany it with the complete corresponding machine-readable source code, which must be distributed under the terms of Sections 1 and 2 above on a medium customarily used for software interchange.

If distribution of object code is made by offering access to copy from a designated place, then offering equivalent access to copy the source code from the same place satisfies the requirement to distribute the source code, even though third parties are not compelled to copy the source along with the object code.

5. A program that contains no derivative of any portion of the Library, but is designed to work with the Library by being compiled or linked with it, is called a "work that uses the Library". Such a work, in isolation, is not a derivative work of the Library, and therefore falls outside the scope of this License.

However, linking a "work that uses the Library" with the Library creates an executable that is a derivative of the Library (because it contains portions of the Library), rather than a "work that uses the library". The executable is therefore covered by this License. Section 6 states terms for distribution of such executables.

When a "work that uses the Library" uses material from a header file that is part of the Library, the object code for the work may be a derivative work of the Library even though the source code is not. Whether this is true is especially significant if the work can be linked without the Library, or if the work is itself a library. The threshold for this to be true is not precisely defined by law.

If such an object file uses only numerical parameters, data structure layouts and accessors, and small macros and small inline functions (ten lines or less in length), then the use of the object file is unrestricted, regardless of whether it is legally a derivative work. (Executables containing this object code plus portions of the Library will still fall under Section 6.)

Otherwise, if the work is a derivative of the Library, you may distribute the object code for the work under the terms of Section 6. Any executables containing that work also fall under Section 6, whether or not they are linked directly with the Library itself.

6. As an exception to the Sections above, you may also compile or link a "work that uses the Library" with the Library to produce a work containing portions of the Library, and distribute that work under terms of your choice, provided that the terms permit modification of the work for the customer's own use and reverse engineering for debugging such modifications.

You must give prominent notice with each copy of the work that the Library is used in it and that the Library and its use are covered by this License. You must supply a copy of this License. If the work during execution displays copyright notices, you must include the copyright notice for the Library among them, as well as a reference directing the user to the copy of this License. Also, you must do one of these things:

- a) Accompany the work with the complete corresponding machine-readable source code for the Library including whatever changes were used in the work (which must be distributed under Sections 1 and 2 above); and, if the work is an executable linked with the Library, with the complete machine-readable "work that uses the Library", as object code and/or source code, so that the user can modify the Library and then relink to produce a modified executable containing the modified Library. (It is understood that the user who changes the contents of definitions files in the Library will not necessarily be able to recompile the application to use the modified definitions.)
- b) Accompany the work with a written offer, valid for at least three years, to give the same user the materials specified in Subsection 6a, above, for a charge no more than the cost of performing this distribution.
- c) If distribution of the work is made by offering access to copy from a designated place, offer equivalent access to copy the above specified materials from the same place.
- d) Verify that the user has already received a copy of these materials or that you have already sent this user a copy.

For an executable, the required form of the "work that uses the Library" must include any data and utility programs needed for reproducing the executable from it. However, as a special exception, the source code distributed need not include anything that is normally distributed (in either source or binary form) with the major components (compiler, kernel, and so on) of the operating system on which the executable runs, unless that component itself accompanies the executable.

It may happen that this requirement contradicts the license restrictions of other proprietary libraries that do not normally accompany the operating system. Such a contradiction means you cannot use both them and the Library together in an executable that you distribute.

7. You may place library facilities that are a work based on the Library side-by-side in a single library together with other library facilities not covered by this License, and distribute such a combined library, provided that the separate distribution of the work based on the Library and of the other library facilities is otherwise permitted, and provided that you do these two things:

- a) Accompany the combined library with a copy of the same work based on the Library, uncombined with any other library facilities. This must be distributed under the terms of the Sections above.
- b) Give prominent notice with the combined library of the fact that part of it is a work based on the Library, and explaining where to find the accompanying uncombined form of the same work.

8. You may not copy, modify, sublicense, link with, or distribute the Library except as expressly provided under this License. Any attempt otherwise to copy, modify, sublicense, link with, or distribute the Library is void, and will automatically terminate your rights under this License. However, parties who have received copies, or rights, from you under this License will not have their licenses terminated so long as such parties remain in full compliance.

9. You are not required to accept this License, since you have not signed it. However, nothing else grants you permission to modify or distribute the Library or its derivative works. These actions are prohibited by law if you do not accept this License. Therefore, by modifying or distributing the Library (or any work based on the Library), you indicate your acceptance of this License to do so, and all its terms and conditions for copying, distributing or modifying the Library or works based on it.

10. Each time you redistribute the Library (or any work based on the Library), the recipient automatically receives a license from the original licensor to copy, distribute, link with or modify the Library subject to these terms and conditions. You may not impose any further restrictions on the recipients' exercise of the rights granted herein. You are not responsible for enforcing compliance by third parties to this License.

11. If, as a consequence of a court judgment or allegation of patent infringement or for any other reason (not limited to patent issues), conditions are imposed on you (whether by court order, agreement or otherwise) that contradict the conditions of this License, they do not excuse you from the conditions of this License. If you cannot distribute so as to satisfy simultaneously your obligations under this License and any other pertinent obligations, then as a consequence you

may not distribute the Library at all. For example, if a patent license would not permit royalty-free redistribution of the Library by all those who receive copies directly or indirectly through you, then the only way you could satisfy both it and this License would be to refrain entirely from distribution of the Library.

If any portion of this section is held invalid or unenforceable under any particular circumstance, the balance of the section is intended to apply, and the section as a whole is intended to apply in other circumstances.

It is not the purpose of this section to induce you to infringe any patents or other property right claims or to contest validity of any such claims; this section has the sole purpose of protecting the integrity of the free software distribution system which is implemented by public license practices. Many people have made generous contributions to the wide range of software distributed through that system in reliance on consistent application of that system; it is up to the author/donor to decide if he or she is willing to distribute software through any other system and a licensee cannot impose that choice.

This section is intended to make thoroughly clear what is believed to be a consequence of the rest of this License.

12. If the distribution and/or use of the Library is restricted in certain countries either by patents or by copyrighted interfaces, the original copyright holder who places the Library under this License may add an explicit geographical distribution limitation excluding those countries, so that distribution is permitted only in or among countries not thus excluded. In such case, this License incorporates the limitation as if written in the body of this License.

13. The Free Software Foundation may publish revised and/or new versions of the Library General Public License from time to time. Such new versions will be similar in spirit to the present version, but may differ in detail to address new problems or concerns.

Each version is given a distinguishing version number. If the Library specifies a version number of this License which applies to it and "any later version", you have the option of following the terms and conditions either of that version or of any later version published by the Free Software Foundation. If the Library does not specify a license version number, you may choose any version ever published by the Free Software Foundation.

14. If you wish to incorporate parts of the Library into other free programs whose distribution conditions are incompatible with these, write to the author to ask for permission. For software which is

copyrighted by the Free Software Foundation, write to the Free Software Foundation; we sometimes make exceptions for this. Our decision will be guided by the two goals of preserving the free status of all derivatives of our free software and of promoting the sharing and reuse of software generally.

NO WARRANTY

15. BECAUSE THE LIBRARY IS LICENSED FREE OF CHARGE, THERE IS NO WARRANTY FOR THE LIBRARY, TO THE EXTENT PERMITTED BY APPLICABLE LAW. EXCEPT WHEN OTHERWISE STATED IN WRITING THE COPYRIGHT HOLDERS AND/OR OTHER PARTIES PROVIDE THE LIBRARY "AS IS" WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. THE ENTIRE RISK AS TO THE QUALITY AND PERFORMANCE OF THE LIBRARY IS WITH YOU. SHOULD THE LIBRARY PROVE DEFECTIVE, YOU ASSUME THE COST OF ALL NECESSARY SERVICING, REPAIR OR CORRECTION.

16. IN NO EVENT UNLESS REQUIRED BY APPLICABLE LAW OR AGREED TO IN WRITING WILL ANY COPYRIGHT HOLDER, OR ANY OTHER PARTY WHO MAY MODIFY AND/OR REDISTRIBUTE THE LIBRARY AS PERMITTED ABOVE, BE LIABLE TO YOU FOR DAMAGES, INCLUDING ANY GENERAL, SPECIAL, INCIDENTAL OR CONSEQUENTIAL DAMAGES ARISING OUT OF THE USE OR INABILITY TO USE THE LIBRARY (INCLUDING BUT NOT LIMITED TO LOSS OF DATA OR DATA BEING RENDERED INACCURATE OR LOSSES SUSTAINED BY YOU OR THIRD PARTIES OR A FAILURE OF THE LIBRARY TO OPERATE WITH ANY OTHER SOFTWARE), EVEN IF SUCH HOLDER OR OTHER PARTY HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

END OF TERMS AND CONDITIONS

Appendix: How to Apply These Terms to Your New Libraries

If you develop a new library, and you want it to be of the greatest possible use to the public, we recommend making it free software that everyone can redistribute and change. You can do so by permitting redistribution under these terms (or, alternatively, under the terms of the ordinary General Public License).

To apply these terms, attach the following notices to the library. It is safest to attach them to the start of each source file to most effectively convey the exclusion of warranty; and each file should have at least the "copyright" line and a pointer to where the full notice is found.

```
<one line to give the library's name and a brief idea of what it does.>  
Copyright (C) <year> <name of author>
```

This library is free software; you can redistribute it and/or

modify it under the terms of the GNU Library General Public License as published by the Free Software Foundation; either version 2 of the License, or (at your option) any later version.

This library is distributed in the hope that it will be useful, but WITHOUT ANY WARRANTY; without even the implied warranty of MERCHANTABILITY or FITNESS FOR A PARTICULAR PURPOSE. See the GNU Library General Public License for more details.

You should have received a copy of the GNU Library General Public License along with this library; if not, write to the Free Software Foundation, Inc., 675 Mass Ave, Cambridge, MA 02139, USA.

Also add information on how to contact you by electronic and paper mail.

You should also get your employer (if you work as a programmer) or your school, if any, to sign a "copyright disclaimer" for the library, if necessary. Here is a sample; alter the names:

Yoyodyne, Inc., hereby disclaims all copyright interest in the library `Frob' (a library for tweaking knobs) written by James Random Hacker.

<signature of Ty Coon>, 1 April 1990
Ty Coon, President of Vice

That's all there is to it!

```
/* nicstar.c v0.22 Jawaid Bazyar (bazyar@hypermall.com)
 * nicstar.c, M. Welsh (matt.welsh@cl.cam.ac.uk)
 *
 * Hacked October, 1997 by Jawaid Bazyar, Interlink Advertising Services Inc.
 * http://www.hypermall.com/
 * 10/1/97 - commented out CFG_PHYIE bit - we don't care when the PHY
 * interrupts us (except possibly for removal/insertion of the cable?)
 * 10/4/97 - began heavy inline documentation of the code. Corrected typos
 * and spelling mistakes.
 * 10/5/97 - added code to handle PHY interrupts, disable PHY on
 * loss of link, and correctly re-enable PHY when link is
 * re-established. (put back CFG_PHYIE)
 *
 * Modified to work with the IDT7721 nicstar -- AAL5 (tested) only.
 *
 * R. D. Rechenmacher <ron@fnal.gov>, Aug. 6, 1997
 *
 * Linux driver for the IDT77201 NICStAR PCI ATM controller.
 * PHY component is expected to be 155 Mbps S/UNI-Lite or IDT 77155;
 * see init_nicstar() for PHY initialization to change this. This driver
 * expects the Linux ATM stack to support scatter-gather lists
 * (skb->atm.iovnt != 0) for Rx skb's passed to vcc->push.
```

```

*
* Implementing minimal-copy of received data:
* IDT always receives data into a small buffer, then large buffers
* as needed. This means that data must always be copied to create
* the linear buffer needed by most non-ATM protocol stacks (e.g. IP)
* Fix is simple: make large buffers large enough to hold entire
* SDU, and leave <small_buffer_data> bytes empty at the start. Then
* copy small buffer contents to head of large buffer.
* Trick is to avoid fragmenting Linux, due to need for a lot of large
* buffers. This is done by 2 things:
* 1) skb->destructor / skb->atm.recycle_buffer
*    combined, allow nicstar_free_rx_skb to be called to
*    recycle large data buffers
* 2) skb_clone of received buffers
* See nicstar_free_rx_skb and linearize_buffer for implementation
* details.
*

The files in this directory and elsewhere which refer to this LICENCE file are part of JFFS2, the Journalling Flash File System v2.

Copyright © 2001-2007 Red Hat, Inc. and others

JFFS2 is free software; you can redistribute it and/or modify it under the terms of the GNU General Public License as published by the Free Software Foundation; either version 2 or (at your option) any later version.

JFFS2 is distributed in the hope that it will be useful, but WITHOUT ANY WARRANTY; without even the implied warranty of MERCHANTABILITY or FITNESS FOR A PARTICULAR PURPOSE. See the GNU General Public License for more details.

You should have received a copy of the GNU General Public License along with JFFS2; if not, write to the Free Software Foundation, Inc., 59 Temple Place, Suite 330, Boston, MA 02111-1307 USA.

As a special exception, if other files instantiate templates or use macros or inline functions from these files, or you compile these files and link them with other works to produce a work based on these files, these files do not by themselves cause the resulting work to be covered by the GNU General Public License. However the source code for these files must still be made available in accordance with section (3) of the GNU General Public License.

This exception does not invalidate any other reasons why a work based on this file might be covered by the GNU General Public License.

1.5 busybox 1.18 :4

1.5.1 Available under license :

--- A note on GPL versions

BusyBox is distributed under version 2 of the General Public License (included in its entirety, below). Version 2 is the only version of this license which this version of BusyBox (or modified versions derived from this one) may be distributed under.

GNU GENERAL PUBLIC LICENSE

Version 2, June 1991

Copyright (C) 1989, 1991 Free Software Foundation, Inc.

51 Franklin St, Fifth Floor, Boston, MA 02110-1301 USA

Everyone is permitted to copy and distribute verbatim copies of this license document, but changing it is not allowed.

Preamble

The licenses for most software are designed to take away your freedom to share and change it. By contrast, the GNU General Public License is intended to guarantee your freedom to share and change free software--to make sure the software is free for all its users. This General Public License applies to most of the Free Software Foundation's software and to any other program whose authors commit to using it. (Some other Free Software Foundation software is covered by the GNU Library General Public License instead.) You can apply it to your programs, too.

When we speak of free software, we are referring to freedom, not price. Our General Public Licenses are designed to make sure that you have the freedom to distribute copies of free software (and charge for this service if you wish), that you receive source code or can get it if you want it, that you can change the software or use pieces of it in new free programs; and that you know you can do these things.

To protect your rights, we need to make restrictions that forbid anyone to deny you these rights or to ask you to surrender the rights. These restrictions translate to certain responsibilities for you if you distribute copies of the software, or if you modify it.

For example, if you distribute copies of such a program, whether

gratis or for a fee, you must give the recipients all the rights that you have. You must make sure that they, too, receive or can get the source code. And you must show them these terms so they know their rights.

We protect your rights with two steps: (1) copyright the software, and (2) offer you this license which gives you legal permission to copy, distribute and/or modify the software.

Also, for each author's protection and ours, we want to make certain that everyone understands that there is no warranty for this free software. If the software is modified by someone else and passed on, we want its recipients to know that what they have is not the original, so that any problems introduced by others will not reflect on the original authors' reputations.

Finally, any free program is threatened constantly by software patents. We wish to avoid the danger that redistributors of a free program will individually obtain patent licenses, in effect making the program proprietary. To prevent this, we have made it clear that any patent must be licensed for everyone's free use or not licensed at all.

The precise terms and conditions for copying, distribution and modification follow.

GNU GENERAL PUBLIC LICENSE

TERMS AND CONDITIONS FOR COPYING, DISTRIBUTION AND MODIFICATION

0. This License applies to any program or other work which contains a notice placed by the copyright holder saying it may be distributed under the terms of this General Public License. The "Program", below, refers to any such program or work, and a "work based on the Program" means either the Program or any derivative work under copyright law: that is to say, a work containing the Program or a portion of it, either verbatim or with modifications and/or translated into another language. (Hereinafter, translation is included without limitation in the term "modification".) Each licensee is addressed as "you".

Activities other than copying, distribution and modification are not covered by this License; they are outside its scope. The act of running the Program is not restricted, and the output from the Program is covered only if its contents constitute a work based on the Program (independent of having been made by running the Program). Whether that is true depends on what the Program does.

1. You may copy and distribute verbatim copies of the Program's source code as you receive it, in any medium, provided that you conspicuously and appropriately publish on each copy an appropriate

copyright notice and disclaimer of warranty; keep intact all the notices that refer to this License and to the absence of any warranty; and give any other recipients of the Program a copy of this License along with the Program.

You may charge a fee for the physical act of transferring a copy, and you may at your option offer warranty protection in exchange for a fee.

2. You may modify your copy or copies of the Program or any portion of it, thus forming a work based on the Program, and copy and distribute such modifications or work under the terms of Section 1 above, provided that you also meet all of these conditions:

- a) You must cause the modified files to carry prominent notices stating that you changed the files and the date of any change.
- b) You must cause any work that you distribute or publish, that in whole or in part contains or is derived from the Program or any part thereof, to be licensed as a whole at no charge to all third parties under the terms of this License.
- c) If the modified program normally reads commands interactively when run, you must cause it, when started running for such interactive use in the most ordinary way, to print or display an announcement including an appropriate copyright notice and a notice that there is no warranty (or else, saying that you provide a warranty) and that users may redistribute the program under these conditions, and telling the user how to view a copy of this License. (Exception: if the Program itself is interactive but does not normally print such an announcement, your work based on the Program is not required to print an announcement.)

These requirements apply to the modified work as a whole. If identifiable sections of that work are not derived from the Program, and can be reasonably considered independent and separate works in themselves, then this License, and its terms, do not apply to those sections when you distribute them as separate works. But when you distribute the same sections as part of a whole which is a work based on the Program, the distribution of the whole must be on the terms of this License, whose permissions for other licensees extend to the entire whole, and thus to each and every part regardless of who wrote it.

Thus, it is not the intent of this section to claim rights or contest your rights to work written entirely by you; rather, the intent is to exercise the right to control the distribution of derivative or collective works based on the Program.

In addition, mere aggregation of another work not based on the Program

with the Program (or with a work based on the Program) on a volume of a storage or distribution medium does not bring the other work under the scope of this License.

3. You may copy and distribute the Program (or a work based on it, under Section 2) in object code or executable form under the terms of Sections 1 and 2 above provided that you also do one of the following:

a) Accompany it with the complete corresponding machine-readable source code, which must be distributed under the terms of Sections 1 and 2 above on a medium customarily used for software interchange; or,

b) Accompany it with a written offer, valid for at least three years, to give any third party, for a charge no more than your cost of physically performing source distribution, a complete machine-readable copy of the corresponding source code, to be distributed under the terms of Sections 1 and 2 above on a medium customarily used for software interchange; or,

c) Accompany it with the information you received as to the offer to distribute corresponding source code. (This alternative is allowed only for noncommercial distribution and only if you received the program in object code or executable form with such an offer, in accord with Subsection b above.)

The source code for a work means the preferred form of the work for making modifications to it. For an executable work, complete source code means all the source code for all modules it contains, plus any associated interface definition files, plus the scripts used to control compilation and installation of the executable. However, as a special exception, the source code distributed need not include anything that is normally distributed (in either source or binary form) with the major components (compiler, kernel, and so on) of the operating system on which the executable runs, unless that component itself accompanies the executable.

If distribution of executable or object code is made by offering access to copy from a designated place, then offering equivalent access to copy the source code from the same place counts as distribution of the source code, even though third parties are not compelled to copy the source along with the object code.

4. You may not copy, modify, sublicense, or distribute the Program except as expressly provided under this License. Any attempt otherwise to copy, modify, sublicense or distribute the Program is void, and will automatically terminate your rights under this License. However, parties who have received copies, or rights, from you under this License will not have their licenses terminated so long as such

parties remain in full compliance.

5. You are not required to accept this License, since you have not signed it. However, nothing else grants you permission to modify or distribute the Program or its derivative works. These actions are prohibited by law if you do not accept this License. Therefore, by modifying or distributing the Program (or any work based on the Program), you indicate your acceptance of this License to do so, and all its terms and conditions for copying, distributing or modifying the Program or works based on it.

6. Each time you redistribute the Program (or any work based on the Program), the recipient automatically receives a license from the original licensor to copy, distribute or modify the Program subject to these terms and conditions. You may not impose any further restrictions on the recipients' exercise of the rights granted herein. You are not responsible for enforcing compliance by third parties to this License.

7. If, as a consequence of a court judgment or allegation of patent infringement or for any other reason (not limited to patent issues), conditions are imposed on you (whether by court order, agreement or otherwise) that contradict the conditions of this License, they do not excuse you from the conditions of this License. If you cannot distribute so as to satisfy simultaneously your obligations under this License and any other pertinent obligations, then as a consequence you may not distribute the Program at all. For example, if a patent license would not permit royalty-free redistribution of the Program by all those who receive copies directly or indirectly through you, then the only way you could satisfy both it and this License would be to refrain entirely from distribution of the Program.

If any portion of this section is held invalid or unenforceable under any particular circumstance, the balance of the section is intended to apply and the section as a whole is intended to apply in other circumstances.

It is not the purpose of this section to induce you to infringe any patents or other property right claims or to contest validity of any such claims; this section has the sole purpose of protecting the integrity of the free software distribution system, which is implemented by public license practices. Many people have made generous contributions to the wide range of software distributed through that system in reliance on consistent application of that system; it is up to the author/donor to decide if he or she is willing to distribute software through any other system and a licensee cannot impose that choice.

This section is intended to make thoroughly clear what is believed to be a consequence of the rest of this License.

8. If the distribution and/or use of the Program is restricted in certain countries either by patents or by copyrighted interfaces, the original copyright holder who places the Program under this License may add an explicit geographical distribution limitation excluding those countries, so that distribution is permitted only in or among countries not thus excluded. In such case, this License incorporates the limitation as if written in the body of this License.

9. The Free Software Foundation may publish revised and/or new versions of the General Public License from time to time. Such new versions will be similar in spirit to the present version, but may differ in detail to address new problems or concerns.

Each version is given a distinguishing version number. If the Program specifies a version number of this License which applies to it and "any later version", you have the option of following the terms and conditions either of that version or of any later version published by the Free Software Foundation. If the Program does not specify a version number of this License, you may choose any version ever published by the Free Software Foundation.

10. If you wish to incorporate parts of the Program into other free programs whose distribution conditions are different, write to the author to ask for permission. For software which is copyrighted by the Free Software Foundation, write to the Free Software Foundation; we sometimes make exceptions for this. Our decision will be guided by the two goals of preserving the free status of all derivatives of our free software and of promoting the sharing and reuse of software generally.

NO WARRANTY

11. BECAUSE THE PROGRAM IS LICENSED FREE OF CHARGE, THERE IS NO WARRANTY FOR THE PROGRAM, TO THE EXTENT PERMITTED BY APPLICABLE LAW. EXCEPT WHEN OTHERWISE STATED IN WRITING THE COPYRIGHT HOLDERS AND/OR OTHER PARTIES PROVIDE THE PROGRAM "AS IS" WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. THE ENTIRE RISK AS TO THE QUALITY AND PERFORMANCE OF THE PROGRAM IS WITH YOU. SHOULD THE PROGRAM PROVE DEFECTIVE, YOU ASSUME THE COST OF ALL NECESSARY SERVICING, REPAIR OR CORRECTION.

12. IN NO EVENT UNLESS REQUIRED BY APPLICABLE LAW OR AGREED TO IN WRITING WILL ANY COPYRIGHT HOLDER, OR ANY OTHER PARTY WHO MAY MODIFY AND/OR REDISTRIBUTE THE PROGRAM AS PERMITTED ABOVE, BE LIABLE TO YOU FOR DAMAGES, INCLUDING ANY GENERAL, SPECIAL, INCIDENTAL OR CONSEQUENTIAL DAMAGES ARISING

OUT OF THE USE OR INABILITY TO USE THE PROGRAM (INCLUDING BUT NOT LIMITED TO LOSS OF DATA OR DATA BEING RENDERED INACCURATE OR LOSSES SUSTAINED BY YOU OR THIRD PARTIES OR A FAILURE OF THE PROGRAM TO OPERATE WITH ANY OTHER PROGRAMS), EVEN IF SUCH HOLDER OR OTHER PARTY HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

END OF TERMS AND CONDITIONS

How to Apply These Terms to Your New Programs

If you develop a new program, and you want it to be of the greatest possible use to the public, the best way to achieve this is to make it free software which everyone can redistribute and change under these terms.

To do so, attach the following notices to the program. It is safest to attach them to the start of each source file to most effectively convey the exclusion of warranty; and each file should have at least the "copyright" line and a pointer to where the full notice is found.

```
<one line to give the program's name and a brief idea of what it does.>  
Copyright (C) <year> <name of author>
```

This program is free software; you can redistribute it and/or modify it under the terms of the GNU General Public License as published by the Free Software Foundation; either version 2 of the License, or (at your option) any later version.

This program is distributed in the hope that it will be useful, but WITHOUT ANY WARRANTY; without even the implied warranty of MERCHANTABILITY or FITNESS FOR A PARTICULAR PURPOSE. See the GNU General Public License for more details.

You should have received a copy of the GNU General Public License along with this program; if not, write to the Free Software Foundation, Inc., 51 Franklin St, Fifth Floor, Boston, MA 02110-1301 USA

Also add information on how to contact you by electronic and paper mail.

If the program is interactive, make it output a short notice like this when it starts in an interactive mode:

```
Gnomovision version 69, Copyright (C) year name of author  
Gnomovision comes with ABSOLUTELY NO WARRANTY; for details type 'show w'.  
This is free software, and you are welcome to redistribute it  
under certain conditions; type 'show c' for details.
```

The hypothetical commands 'show w' and 'show c' should show the appropriate

parts of the General Public License. Of course, the commands you use may be called something other than 'show w' and 'show c'; they could even be mouse-clicks or menu items--whatever suits your program.

You should also get your employer (if you work as a programmer) or your school, if any, to sign a "copyright disclaimer" for the program, if necessary. Here is a sample; alter the names:

Yoyodyne, Inc., hereby disclaims all copyright interest in the program 'Gnomovision' (which makes passes at compilers) written by James Hacker.

<signature of Ty Coon>, 1 April 1989
Ty Coon, President of Vice

This General Public License does not permit incorporating your program into proprietary programs. If your program is a subroutine library, you may consider it more useful to permit linking proprietary applications with the library. If this is what you want to do, use the GNU Library General Public License instead of this License.

bzip2 applet in busybox is based on lightly-modified source of bzip2 version 1.0.4. bzip2 source is distributed under the following conditions (copied verbatim from LICENSE file)

=====

This program, "bzip2", the associated library "libbzip2", and all documentation, are copyright (C) 1996-2006 Julian R Seward. All rights reserved.

GNU GENERAL PUBLIC LICENSE

Version 2, June 1991

Copyright (C) 1989, 1991 Free Software Foundation, Inc.

59 Temple Place, Suite 330, Boston, MA 02111-1307 USA

Everyone is permitted to copy and distribute verbatim copies
of this license document, but changing it is not allowed.

Preamble

The licenses for most software are designed to take away your freedom to share and change it. By contrast, the GNU General Public License is intended to guarantee your freedom to share and change free software--to make sure the software is free for all its users. This General Public License applies to most of the Free Software Foundation's software and to any other program whose authors commit to using it. (Some other Free Software Foundation software is covered by the GNU Library General Public License instead.) You can apply it to your programs, too.

When we speak of free software, we are referring to freedom, not price. Our General Public Licenses are designed to make sure that you have the freedom to distribute copies of free software (and charge for

this service if you wish), that you receive source code or can get it if you want it, that you can change the software or use pieces of it in new free programs; and that you know you can do these things.

To protect your rights, we need to make restrictions that forbid anyone to deny you these rights or to ask you to surrender the rights. These restrictions translate to certain responsibilities for you if you distribute copies of the software, or if you modify it.

For example, if you distribute copies of such a program, whether gratis or for a fee, you must give the recipients all the rights that you have. You must make sure that they, too, receive or can get the source code. And you must show them these terms so they know their rights.

We protect your rights with two steps: (1) copyright the software, and (2) offer you this license which gives you legal permission to copy, distribute and/or modify the software.

Also, for each author's protection and ours, we want to make certain that everyone understands that there is no warranty for this free software. If the software is modified by someone else and passed on, we want its recipients to know that what they have is not the original, so that any problems introduced by others will not reflect on the original authors' reputations.

Finally, any free program is threatened constantly by software patents. We wish to avoid the danger that redistributors of a free program will individually obtain patent licenses, in effect making the program proprietary. To prevent this, we have made it clear that any patent must be licensed for everyone's free use or not licensed at all.

The precise terms and conditions for copying, distribution and modification follow.

GNU GENERAL PUBLIC LICENSE TERMS AND CONDITIONS FOR COPYING, DISTRIBUTION AND MODIFICATION

0. This License applies to any program or other work which contains a notice placed by the copyright holder saying it may be distributed under the terms of this General Public License. The "Program", below, refers to any such program or work, and a "work based on the Program" means either the Program or any derivative work under copyright law: that is to say, a work containing the Program or a portion of it, either verbatim or with modifications and/or translated into another language. (Hereinafter, translation is included without limitation in the term "modification".) Each licensee is addressed as "you".

Activities other than copying, distribution and modification are not covered by this License; they are outside its scope. The act of running the Program is not restricted, and the output from the Program is covered only if its contents constitute a work based on the Program (independent of having been made by running the Program). Whether that is true depends on what the Program does.

1. You may copy and distribute verbatim copies of the Program's source code as you receive it, in any medium, provided that you conspicuously and appropriately publish on each copy an appropriate copyright notice and disclaimer of warranty; keep intact all the notices that refer to this License and to the absence of any warranty; and give any other recipients of the Program a copy of this License along with the Program.

You may charge a fee for the physical act of transferring a copy, and you may at your option offer warranty protection in exchange for a fee.

2. You may modify your copy or copies of the Program or any portion of it, thus forming a work based on the Program, and copy and distribute such modifications or work under the terms of Section 1 above, provided that you also meet all of these conditions:

- a) You must cause the modified files to carry prominent notices stating that you changed the files and the date of any change.
- b) You must cause any work that you distribute or publish, that in whole or in part contains or is derived from the Program or any part thereof, to be licensed as a whole at no charge to all third parties under the terms of this License.
- c) If the modified program normally reads commands interactively when run, you must cause it, when started running for such interactive use in the most ordinary way, to print or display an announcement including an appropriate copyright notice and a notice that there is no warranty (or else, saying that you provide a warranty) and that users may redistribute the program under these conditions, and telling the user how to view a copy of this License. (Exception: if the Program itself is interactive but does not normally print such an announcement, your work based on the Program is not required to print an announcement.)

These requirements apply to the modified work as a whole. If identifiable sections of that work are not derived from the Program, and can be reasonably considered independent and separate works in themselves, then this License, and its terms, do not apply to those sections when you distribute them as separate works. But when you distribute the same sections as part of a whole which is a work based

on the Program, the distribution of the whole must be on the terms of this License, whose permissions for other licensees extend to the entire whole, and thus to each and every part regardless of who wrote it.

Thus, it is not the intent of this section to claim rights or contest your rights to work written entirely by you; rather, the intent is to exercise the right to control the distribution of derivative or collective works based on the Program.

In addition, mere aggregation of another work not based on the Program with the Program (or with a work based on the Program) on a volume of a storage or distribution medium does not bring the other work under the scope of this License.

3. You may copy and distribute the Program (or a work based on it, under Section 2) in object code or executable form under the terms of Sections 1 and 2 above provided that you also do one of the following:

- a) Accompany it with the complete corresponding machine-readable source code, which must be distributed under the terms of Sections 1 and 2 above on a medium customarily used for software interchange; or,
- b) Accompany it with a written offer, valid for at least three years, to give any third party, for a charge no more than your cost of physically performing source distribution, a complete machine-readable copy of the corresponding source code, to be distributed under the terms of Sections 1 and 2 above on a medium customarily used for software interchange; or,
- c) Accompany it with the information you received as to the offer to distribute corresponding source code. (This alternative is allowed only for noncommercial distribution and only if you received the program in object code or executable form with such an offer, in accord with Subsection b above.)

The source code for a work means the preferred form of the work for making modifications to it. For an executable work, complete source code means all the source code for all modules it contains, plus any associated interface definition files, plus the scripts used to control compilation and installation of the executable. However, as a special exception, the source code distributed need not include anything that is normally distributed (in either source or binary form) with the major components (compiler, kernel, and so on) of the operating system on which the executable runs, unless that component itself accompanies the executable.

If distribution of executable or object code is made by offering access to copy from a designated place, then offering equivalent

access to copy the source code from the same place counts as distribution of the source code, even though third parties are not compelled to copy the source along with the object code.

4. You may not copy, modify, sublicense, or distribute the Program except as expressly provided under this License. Any attempt otherwise to copy, modify, sublicense or distribute the Program is void, and will automatically terminate your rights under this License. However, parties who have received copies, or rights, from you under this License will not have their licenses terminated so long as such parties remain in full compliance.

5. You are not required to accept this License, since you have not signed it. However, nothing else grants you permission to modify or distribute the Program or its derivative works. These actions are prohibited by law if you do not accept this License. Therefore, by modifying or distributing the Program (or any work based on the Program), you indicate your acceptance of this License to do so, and all its terms and conditions for copying, distributing or modifying the Program or works based on it.

6. Each time you redistribute the Program (or any work based on the Program), the recipient automatically receives a license from the original licensor to copy, distribute or modify the Program subject to these terms and conditions. You may not impose any further restrictions on the recipients' exercise of the rights granted herein. You are not responsible for enforcing compliance by third parties to this License.

7. If, as a consequence of a court judgment or allegation of patent infringement or for any other reason (not limited to patent issues), conditions are imposed on you (whether by court order, agreement or otherwise) that contradict the conditions of this License, they do not excuse you from the conditions of this License. If you cannot distribute so as to satisfy simultaneously your obligations under this License and any other pertinent obligations, then as a consequence you may not distribute the Program at all. For example, if a patent license would not permit royalty-free redistribution of the Program by all those who receive copies directly or indirectly through you, then the only way you could satisfy both it and this License would be to refrain entirely from distribution of the Program.

If any portion of this section is held invalid or unenforceable under any particular circumstance, the balance of the section is intended to apply and the section as a whole is intended to apply in other circumstances.

It is not the purpose of this section to induce you to infringe any

patents or other property right claims or to contest validity of any such claims; this section has the sole purpose of protecting the integrity of the free software distribution system, which is implemented by public license practices. Many people have made generous contributions to the wide range of software distributed through that system in reliance on consistent application of that system; it is up to the author/donor to decide if he or she is willing to distribute software through any other system and a licensee cannot impose that choice.

This section is intended to make thoroughly clear what is believed to be a consequence of the rest of this License.

8. If the distribution and/or use of the Program is restricted in certain countries either by patents or by copyrighted interfaces, the original copyright holder who places the Program under this License may add an explicit geographical distribution limitation excluding those countries, so that distribution is permitted only in or among countries not thus excluded. In such case, this License incorporates the limitation as if written in the body of this License.

9. The Free Software Foundation may publish revised and/or new versions of the General Public License from time to time. Such new versions will be similar in spirit to the present version, but may differ in detail to address new problems or concerns.

Each version is given a distinguishing version number. If the Program specifies a version number of this License which applies to it and "any later version", you have the option of following the terms and conditions either of that version or of any later version published by the Free Software Foundation. If the Program does not specify a version number of this License, you may choose any version ever published by the Free Software Foundation.

10. If you wish to incorporate parts of the Program into other free programs whose distribution conditions are different, write to the author to ask for permission. For software which is copyrighted by the Free Software Foundation, write to the Free Software Foundation; we sometimes make exceptions for this. Our decision will be guided by the two goals of preserving the free status of all derivatives of our free software and of promoting the sharing and reuse of software generally.

NO WARRANTY

11. BECAUSE THE PROGRAM IS LICENSED FREE OF CHARGE, THERE IS NO WARRANTY FOR THE PROGRAM, TO THE EXTENT PERMITTED BY APPLICABLE LAW. EXCEPT WHEN OTHERWISE STATED IN WRITING THE COPYRIGHT HOLDERS AND/OR OTHER PARTIES PROVIDE THE PROGRAM "AS IS" WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED

OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. THE ENTIRE RISK AS TO THE QUALITY AND PERFORMANCE OF THE PROGRAM IS WITH YOU. SHOULD THE PROGRAM PROVE DEFECTIVE, YOU ASSUME THE COST OF ALL NECESSARY SERVICING, REPAIR OR CORRECTION.

12. IN NO EVENT UNLESS REQUIRED BY APPLICABLE LAW OR AGREED TO IN WRITING WILL ANY COPYRIGHT HOLDER, OR ANY OTHER PARTY WHO MAY MODIFY AND/OR REDISTRIBUTE THE PROGRAM AS PERMITTED ABOVE, BE LIABLE TO YOU FOR DAMAGES, INCLUDING ANY GENERAL, SPECIAL, INCIDENTAL OR CONSEQUENTIAL DAMAGES ARISING OUT OF THE USE OR INABILITY TO USE THE PROGRAM (INCLUDING BUT NOT LIMITED TO LOSS OF DATA OR DATA BEING RENDERED INACCURATE OR LOSSES SUSTAINED BY YOU OR THIRD PARTIES OR A FAILURE OF THE PROGRAM TO OPERATE WITH ANY OTHER PROGRAMS), EVEN IF SUCH HOLDER OR OTHER PARTY HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

END OF TERMS AND CONDITIONS

How to Apply These Terms to Your New Programs

If you develop a new program, and you want it to be of the greatest possible use to the public, the best way to achieve this is to make it free software which everyone can redistribute and change under these terms.

To do so, attach the following notices to the program. It is safest to attach them to the start of each source file to most effectively convey the exclusion of warranty; and each file should have at least the "copyright" line and a pointer to where the full notice is found.

<one line to give the program's name and a brief idea of what it does.>
Copyright (C) <year> <name of author>

This program is free software; you can redistribute it and/or modify it under the terms of the GNU General Public License as published by the Free Software Foundation; either version 2 of the License, or (at your option) any later version.

This program is distributed in the hope that it will be useful, but WITHOUT ANY WARRANTY; without even the implied warranty of MERCHANTABILITY or FITNESS FOR A PARTICULAR PURPOSE. See the GNU General Public License for more details.

You should have received a copy of the GNU General Public License along with this program; if not, write to the Free Software Foundation, Inc., 59 Temple Place, Suite 330, Boston, MA 02111-1307 USA

Also add information on how to contact you by electronic and paper mail.

If the program is interactive, make it output a short notice like this when it starts in an interactive mode:

```
Gnomovision version 69, Copyright (C) year name of author
Gnomovision comes with ABSOLUTELY NO WARRANTY; for details type `show w'.
This is free software, and you are welcome to redistribute it
under certain conditions; type `show c' for details.
```

The hypothetical commands `show w' and `show c' should show the appropriate parts of the General Public License. Of course, the commands you use may be called something other than `show w' and `show c'; they could even be mouse-clicks or menu items--whatever suits your program.

You should also get your employer (if you work as a programmer) or your school, if any, to sign a "copyright disclaimer" for the program, if necessary. Here is a sample; alter the names:

```
Yoyodyne, Inc., hereby disclaims all copyright interest in the program
`Gnomovision' (which makes passes at compilers) written by James Hacker.
```

```
<signature of Ty Coon>, 1 April 1989
Ty Coon, President of Vice
```

This General Public License does not permit incorporating your program into proprietary programs. If your program is a subroutine library, you may consider it more useful to permit linking proprietary applications with the library. If this is what you want to do, use the GNU Library General Public License instead of this License.

License Mixing

=====

libcurl can be built to use a fair amount of various third party libraries, libraries that are written and provided by other parties that are distributed using their own licenses. Even libcurl itself contains code that may cause problems to some. This document attempts to describe what licenses libcurl and the other libraries use and what possible dilemmas linking and mixing them all can lead to for end users.

I am not a lawyer and this is not legal advice!

One common dilemma is that [GPL](<https://www.gnu.org/licenses/gpl.html>) licensed code is not allowed to be linked with code licensed under the [Original BSD license](<https://spdx.org/licenses/BSD-4-Clause.html>) (with the announcement clause). You may still build your own copies that use them all, but distributing them as binaries would be to violate the GPL license - unless you accompany your license with an [exception](<https://www.gnu.org/licenses/gpl-faq.html#GPLIncompatibleLibs>). This particular problem was addressed when the [Modified BSD license](<https://opensource.org/licenses/BSD-3-Clause>) was created, which does

not have the announcement clause that collides with GPL.

libcurl

Uses an [MIT style license](<https://curl.haxx.se/docs/copyright.html>) that is very liberal.

OpenSSL

(May be used for SSL/TLS support) Uses an Original BSD-style license with an announcement clause that makes it "incompatible" with GPL. You are not allowed to ship binaries that link with OpenSSL that includes GPL code (unless that specific GPL code includes an exception for OpenSSL - a habit that is growing more and more common). If OpenSSL's licensing is a problem for you, consider using another TLS library.

GnuTLS

(May be used for SSL/TLS support) Uses the [LGPL](<https://www.gnu.org/licenses/lgpl.html>) license. If this is a problem for you, consider using another TLS library. Also note that GnuTLS itself depends on and uses other libs (libgcrypt and libgpg-error) and they too are LGPL- or GPL-licensed.

WolfSSL

(May be used for SSL/TLS support) Uses the GPL license or a proprietary license. If this is a problem for you, consider using another TLS library.

NSS

(May be used for SSL/TLS support) Is covered by the [MPL](<https://www.mozilla.org/MPL/>) license, the GPL license and the LGPL license. You may choose to license the code under MPL terms, GPL terms, or LGPL terms. These licenses grant you different permissions and impose different obligations. You should select the license that best meets your needs.

axTLS

(May be used for SSL/TLS support) Uses a Modified BSD-style license.

mbedTLS

(May be used for SSL/TLS support) Uses the [Apache 2.0 license](<https://opensource.org/licenses/Apache-2.0>) or the GPL license. You may choose to license the code under Apache 2.0 terms or GPL terms. These licenses grant you different permissions and impose different

obligations. You should select the license that best meets your needs.

BoringSSL

(May be used for SSL/TLS support) As an OpenSSL fork, it has the same license as that.

libressl

(May be used for SSL/TLS support) As an OpenSSL fork, it has the same license as that.

c-ares

(Used for asynchronous name resolves) Uses an MIT license that is very liberal and imposes no restrictions on any other library or part you may link with.

zlib

(Used for compressed Transfer-Encoding support) Uses an MIT-style license that shouldn't collide with any other library.

MIT Kerberos

(May be used for GSS support) MIT licensed, that shouldn't collide with any other parts.

Heimdal

(May be used for GSS support) Heimdal is Original BSD licensed with the announcement clause.

GNU GSS

(May be used for GSS support) GNU GSS is GPL licensed. Note that you may not distribute binary curl packages that uses this if you build curl to also link and use any Original BSD licensed libraries!

libidn

(Used for IDNA support) Uses the GNU Lesser General Public License [3]. LGPL is a variation of GPL with slightly less aggressive "copyleft". This license requires more requirements to be met when distributing binaries, see the license for details. Also note that if you distribute a binary that includes this library, you must also include the full LGPL license text. Please properly point out what parts of the distributed package that the license addresses.

OpenLDAP

(Used for LDAP support) Uses a Modified BSD-style license. Since libcurl uses OpenLDAP as a shared library only, I have not heard of anyone that ships OpenLDAP linked with libcurl in an app.

libssh2

(Used for scp and sftp support) libssh2 uses a Modified BSD-style license.

To protect your rights, we need to make restrictions that forbid anyone to deny you these rights or to ask you to surrender the rights. These restrictions translate to certain responsibilities for you if you distribute copies of the software, or if you modify it.

For example, if you distribute copies of such a program, whether

gratis or for a fee, you must give the recipients all the rights that you have. You must make sure that they, too, receive or can get the source code. And you must show them these terms so they know their rights.

We protect your rights with two steps: (1) copyright the software, and (2) offer you this license which gives you legal permission to copy, distribute and/or modify the software.

Also, for each author's protection and ours, we want to make certain that everyone understands that there is no warranty for this free software. If the software is modified by someone else and passed on, we want its recipients to know that what they have is not the original, so that any problems introduced by others will not reflect on the original authors' reputations.

Finally, any free program is threatened constantly by software patents. We wish to avoid the danger that redistributors of a free program will individually obtain patent licenses, in effect making the program proprietary. To prevent this, we have made it clear that any patent must be licensed for everyone's free use or not licensed at all.

The precise terms and conditions for copying, distribution and modification follow.

GNU GENERAL PUBLIC LICENSE TERMS AND CONDITIONS FOR COPYING, DISTRIBUTION AND MODIFICATION

0. This License applies to any program or other work which contains a notice placed by the copyright holder saying it may be distributed under the terms of this General Public License. The "Program", below, refers to any such program or work, and a "work based on the Program" means either the Program or any derivative work under copyright law: that is to say, a work containing the Program or a portion of it, either verbatim or with modifications and/or translated into another language. (Hereinafter, translation is included without limitation in the term "modification".) Each licensee is addressed as "you".

Activities other than copying, distribution and modification are not covered by this License; they are outside its scope. The act of running the Program is not restricted, and the output from the Program is covered only if its contents constitute a work based on the Program (independent of having been made by running the Program). Whether that is true depends on what the Program does.

1. You may copy and distribute verbatim copies of the Program's source code as you receive it, in any medium, provided that you conspicuously and appropriately publish on each copy an appropriate

copyright notice and disclaimer of warranty; keep intact all the notices that refer to this License and to the absence of any warranty; and give any other recipients of the Program a copy of this License along with the Program.

You may charge a fee for the physical act of transferring a copy, and you may at your option offer warranty protection in exchange for a fee.

2. You may modify your copy or copies of the Program or any portion of it, thus forming a work based on the Program, and copy and distribute such modifications or work under the terms of Section 1 above, provided that you also meet all of these conditions:

- a) You must cause the modified files to carry prominent notices stating that you changed the files and the date of any change.
- b) You must cause any work that you distribute or publish, that in whole or in part contains or is derived from the Program or any part thereof, to be licensed as a whole at no charge to all third parties under the terms of this License.
- c) If the modified program normally reads commands interactively when run, you must cause it, when started running for such interactive use in the most ordinary way, to print or display an announcement including an appropriate copyright notice and a notice that there is no warranty (or else, saying that you provide a warranty) and that users may redistribute the program under these conditions, and telling the user how to view a copy of this License. (Exception: if the Program itself is interactive but does not normally print such an announcement, your work based on the Program is not required to print an announcement.)

These requirements apply to the modified work as a whole. If identifiable sections of that work are not derived from the Program, and can be reasonably considered independent and separate works in themselves, then this License, and its terms, do not apply to those sections when you distribute them as separate works. But when you distribute the same sections as part of a whole which is a work based on the Program, the distribution of the whole must be on the terms of this License, whose permissions for other licensees extend to the entire whole, and thus to each and every part regardless of who wrote it.

Thus, it is not the intent of this section to claim rights or contest your rights to work written entirely by you; rather, the intent is to exercise the right to control the distribution of derivative or collective works based on the Program.

In addition, mere aggregation of another work not based on the Program

with the Program (or with a work based on the Program) on a volume of a storage or distribution medium does not bring the other work under the scope of this License.

3. You may copy and distribute the Program (or a work based on it, under Section 2) in object code or executable form under the terms of Sections 1 and 2 above provided that you also do one of the following:

a) Accompany it with the complete corresponding machine-readable source code, which must be distributed under the terms of Sections 1 and 2 above on a medium customarily used for software interchange; or,

b) Accompany it with a written offer, valid for at least three years, to give any third party, for a charge no more than your cost of physically performing source distribution, a complete machine-readable copy of the corresponding source code, to be distributed under the terms of Sections 1 and 2 above on a medium customarily used for software interchange; or,

c) Accompany it with the information you received as to the offer to distribute corresponding source code. (This alternative is allowed only for noncommercial distribution and only if you received the program in object code or executable form with such an offer, in accord with Subsection b above.)

The source code for a work means the preferred form of the work for making modifications to it. For an executable work, complete source code means all the source code for all modules it contains, plus any associated interface definition files, plus the scripts used to control compilation and installation of the executable. However, as a special exception, the source code distributed need not include anything that is normally distributed (in either source or binary form) with the major components (compiler, kernel, and so on) of the operating system on which the executable runs, unless that component itself accompanies the executable.

If distribution of executable or object code is made by offering access to copy from a designated place, then offering equivalent access to copy the source code from the same place counts as distribution of the source code, even though third parties are not compelled to copy the source along with the object code.

4. You may not copy, modify, sublicense, or distribute the Program except as expressly provided under this License. Any attempt otherwise to copy, modify, sublicense or distribute the Program is void, and will automatically terminate your rights under this License. However, parties who have received copies, or rights, from you under this License will not have their licenses terminated so long as such

parties remain in full compliance.

5. You are not required to accept this License, since you have not signed it. However, nothing else grants you permission to modify or distribute the Program or its derivative works. These actions are prohibited by law if you do not accept this License. Therefore, by modifying or distributing the Program (or any work based on the Program), you indicate your acceptance of this License to do so, and all its terms and conditions for copying, distributing or modifying the Program or works based on it.

6. Each time you redistribute the Program (or any work based on the Program), the recipient automatically receives a license from the original licensor to copy, distribute or modify the Program subject to these terms and conditions. You may not impose any further restrictions on the recipients' exercise of the rights granted herein. You are not responsible for enforcing compliance by third parties to this License.

7. If, as a consequence of a court judgment or allegation of patent infringement or for any other reason (not limited to patent issues), conditions are imposed on you (whether by court order, agreement or otherwise) that contradict the conditions of this License, they do not excuse you from the conditions of this License. If you cannot distribute so as to satisfy simultaneously your obligations under this License and any other pertinent obligations, then as a consequence you may not distribute the Program at all. For example, if a patent license would not permit royalty-free redistribution of the Program by all those who receive copies directly or indirectly through you, then the only way you could satisfy both it and this License would be to refrain entirely from distribution of the Program.

If any portion of this section is held invalid or unenforceable under any particular circumstance, the balance of the section is intended to apply and the section as a whole is intended to apply in other circumstances.

It is not the purpose of this section to induce you to infringe any patents or other property right claims or to contest validity of any such claims; this section has the sole purpose of protecting the integrity of the free software distribution system, which is implemented by public license practices. Many people have made generous contributions to the wide range of software distributed through that system in reliance on consistent application of that system; it is up to the author/donor to decide if he or she is willing to distribute software through any other system and a licensee cannot impose that choice.

This section is intended to make thoroughly clear what is believed to be a consequence of the rest of this License.

8. If the distribution and/or use of the Program is restricted in certain countries either by patents or by copyrighted interfaces, the original copyright holder who places the Program under this License may add an explicit geographical distribution limitation excluding those countries, so that distribution is permitted only in or among countries not thus excluded. In such case, this License incorporates the limitation as if written in the body of this License.

9. The Free Software Foundation may publish revised and/or new versions of the General Public License from time to time. Such new versions will be similar in spirit to the present version, but may differ in detail to address new problems or concerns.

Each version is given a distinguishing version number. If the Program specifies a version number of this License which applies to it and "any later version", you have the option of following the terms and conditions either of that version or of any later version published by the Free Software Foundation. If the Program does not specify a version number of this License, you may choose any version ever published by the Free Software Foundation.

10. If you wish to incorporate parts of the Program into other free programs whose distribution conditions are different, write to the author to ask for permission. For software which is copyrighted by the Free Software Foundation, write to the Free Software Foundation; we sometimes make exceptions for this. Our decision will be guided by the two goals of preserving the free status of all derivatives of our free software and of promoting the sharing and reuse of software generally.

NO WARRANTY

11. BECAUSE THE PROGRAM IS LICENSED FREE OF CHARGE, THERE IS NO WARRANTY FOR THE PROGRAM, TO THE EXTENT PERMITTED BY APPLICABLE LAW. EXCEPT WHEN OTHERWISE STATED IN WRITING THE COPYRIGHT HOLDERS AND/OR OTHER PARTIES PROVIDE THE PROGRAM "AS IS" WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. THE ENTIRE RISK AS TO THE QUALITY AND PERFORMANCE OF THE PROGRAM IS WITH YOU. SHOULD THE PROGRAM PROVE DEFECTIVE, YOU ASSUME THE COST OF ALL NECESSARY SERVICING, REPAIR OR CORRECTION.

12. IN NO EVENT UNLESS REQUIRED BY APPLICABLE LAW OR AGREED TO IN WRITING WILL ANY COPYRIGHT HOLDER, OR ANY OTHER PARTY WHO MAY MODIFY AND/OR REDISTRIBUTE THE PROGRAM AS PERMITTED ABOVE, BE LIABLE TO YOU FOR DAMAGES, INCLUDING ANY GENERAL, SPECIAL, INCIDENTAL OR CONSEQUENTIAL DAMAGES ARISING

OUT OF THE USE OR INABILITY TO USE THE PROGRAM (INCLUDING BUT NOT LIMITED TO LOSS OF DATA OR DATA BEING RENDERED INACCURATE OR LOSSES SUSTAINED BY YOU OR THIRD PARTIES OR A FAILURE OF THE PROGRAM TO OPERATE WITH ANY OTHER PROGRAMS), EVEN IF SUCH HOLDER OR OTHER PARTY HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

END OF TERMS AND CONDITIONS

How to Apply These Terms to Your New Programs

If you develop a new program, and you want it to be of the greatest possible use to the public, the best way to achieve this is to make it free software which everyone can redistribute and change under these terms.

To do so, attach the following notices to the program. It is safest to attach them to the start of each source file to most effectively convey the exclusion of warranty; and each file should have at least the "copyright" line and a pointer to where the full notice is found.

<one line to give the program's name and a brief idea of what it does.>

Copyright (C) 19yy <name of author>

This program is free software; you can redistribute it and/or modify it under the terms of the GNU General Public License as published by the Free Software Foundation; either version 2 of the License, or (at your option) any later version.

This program is distributed in the hope that it will be useful, but WITHOUT ANY WARRANTY; without even the implied warranty of MERCHANTABILITY or FITNESS FOR A PARTICULAR PURPOSE. See the GNU General Public License for more details.

You should have received a copy of the GNU General Public License along with this program; if not, write to the Free Software Foundation, Inc., 59 Temple Place, Suite 330, Boston, MA 02111-1307 USA

Also add information on how to contact you by electronic and paper mail.

If the program is interactive, make it output a short notice like this when it starts in an interactive mode:

Gnomovision version 69, Copyright (C) 19yy name of author
Gnomovision comes with ABSOLUTELY NO WARRANTY; for details type 'show w'.
This is free software, and you are welcome to redistribute it under certain conditions; type 'show c' for details.

The hypothetical commands 'show w' and 'show c' should show the appropriate

parts of the General Public License. Of course, the commands you use may be called something other than 'show w' and 'show c'; they could even be mouse-clicks or menu items--whatever suits your program.

You should also get your employer (if you work as a programmer) or your school, if any, to sign a "copyright disclaimer" for the program, if necessary. Here is a sample; alter the names:

Yoyodyne, Inc., hereby disclaims all copyright interest in the program 'Gnomovision' (which makes passes at compilers) written by James Hacker.

<signature of Ty Coon>, 1 April 1989
Ty Coon, President of Vice

This General Public License does not permit incorporating your program into proprietary programs. If your program is a subroutine library, you may consider it more useful to permit linking proprietary applications with the library. If this is what you want to do, use the GNU Library General Public License instead of this License.

GNU GENERAL PUBLIC LICENSE
Version 3, 29 June 2007

Copyright (C) 2007 Free Software Foundation, Inc. <<http://fsf.org/>>
Everyone is permitted to copy and distribute verbatim copies of this license document, but changing it is not allowed.

Preamble

The GNU General Public License is a free, copyleft license for software and other kinds of works.

The licenses for most software and other practical works are designed to take away your freedom to share and change the works. By contrast, the GNU General Public License is intended to guarantee your freedom to share and change all versions of a program--to make sure it remains free software for all its users. We, the Free Software Foundation, use the GNU General Public License for most of our software; it applies also to any other work released this way by its authors. You can apply it to your programs, too.

When we speak of free software, we are referring to freedom, not price. Our General Public Licenses are designed to make sure that you have the freedom to distribute copies of free software (and charge for them if you wish), that you receive source code or can get it if you want it, that you can change the software or use pieces of it in new free programs, and that you know you can do these things.

To protect your rights, we need to prevent others from denying you

these rights or asking you to surrender the rights. Therefore, you have certain responsibilities if you distribute copies of the software, or if you modify it: responsibilities to respect the freedom of others.

For example, if you distribute copies of such a program, whether gratis or for a fee, you must pass on to the recipients the same freedoms that you received. You must make sure that they, too, receive or can get the source code. And you must show them these terms so they know their rights.

Developers that use the GNU GPL protect your rights with two steps: (1) assert copyright on the software, and (2) offer you this License giving you legal permission to copy, distribute and/or modify it.

For the developers' and authors' protection, the GPL clearly explains that there is no warranty for this free software. For both users' and authors' sake, the GPL requires that modified versions be marked as changed, so that their problems will not be attributed erroneously to authors of previous versions.

Some devices are designed to deny users access to install or run modified versions of the software inside them, although the manufacturer can do so. This is fundamentally incompatible with the aim of protecting users' freedom to change the software. The systematic pattern of such abuse occurs in the area of products for individuals to use, which is precisely where it is most unacceptable. Therefore, we have designed this version of the GPL to prohibit the practice for those products. If such problems arise substantially in other domains, we stand ready to extend this provision to those domains in future versions of the GPL, as needed to protect the freedom of users.

Finally, every program is threatened constantly by software patents. States should not allow patents to restrict development and use of software on general-purpose computers, but in those that do, we wish to avoid the special danger that patents applied to a free program could make it effectively proprietary. To prevent this, the GPL assures that patents cannot be used to render the program non-free.

The precise terms and conditions for copying, distribution and modification follow.

TERMS AND CONDITIONS

0. Definitions.

"This License" refers to version 3 of the GNU General Public License.

"Copyright" also means copyright-like laws that apply to other kinds of

works, such as semiconductor masks.

"The Program" refers to any copyrightable work licensed under this License. Each licensee is addressed as "you". "Licensees" and "recipients" may be individuals or organizations.

To "modify" a work means to copy from or adapt all or part of the work in a fashion requiring copyright permission, other than the making of an exact copy. The resulting work is called a "modified version" of the earlier work or a work "based on" the earlier work.

A "covered work" means either the unmodified Program or a work based on the Program.

To "propagate" a work means to do anything with it that, without permission, would make you directly or secondarily liable for infringement under applicable copyright law, except executing it on a computer or modifying a private copy. Propagation includes copying, distribution (with or without modification), making available to the public, and in some countries other activities as well.

To "convey" a work means any kind of propagation that enables other parties to make or receive copies. Mere interaction with a user through a computer network, with no transfer of a copy, is not conveying.

An interactive user interface displays "Appropriate Legal Notices" to the extent that it includes a convenient and prominently visible feature that (1) displays an appropriate copyright notice, and (2) tells the user that there is no warranty for the work (except to the extent that warranties are provided), that licensees may convey the work under this License, and how to view a copy of this License. If the interface presents a list of user commands or options, such as a menu, a prominent item in the list meets this criterion.

1. Source Code.

The "source code" for a work means the preferred form of the work for making modifications to it. "Object code" means any non-source form of a work.

A "Standard Interface" means an interface that either is an official standard defined by a recognized standards body, or, in the case of interfaces specified for a particular programming language, one that is widely used among developers working in that language.

The "System Libraries" of an executable work include anything, other than the work as a whole, that (a) is included in the normal form of packaging a Major Component, but which is not part of that Major

Component, and (b) serves only to enable use of the work with that Major Component, or to implement a Standard Interface for which an implementation is available to the public in source code form. A "Major Component", in this context, means a major essential component (kernel, window system, and so on) of the specific operating system (if any) on which the executable work runs, or a compiler used to produce the work, or an object code interpreter used to run it.

The "Corresponding Source" for a work in object code form means all the source code needed to generate, install, and (for an executable work) run the object code and to modify the work, including scripts to control those activities. However, it does not include the work's System Libraries, or general-purpose tools or generally available free programs which are used unmodified in performing those activities but which are not part of the work. For example, Corresponding Source includes interface definition files associated with source files for the work, and the source code for shared libraries and dynamically linked subprograms that the work is specifically designed to require, such as by intimate data communication or control flow between those subprograms and other parts of the work.

The Corresponding Source need not include anything that users can regenerate automatically from other parts of the Corresponding Source.

The Corresponding Source for a work in source code form is that same work.

2. Basic Permissions.

All rights granted under this License are granted for the term of copyright on the Program, and are irrevocable provided the stated conditions are met. This License explicitly affirms your unlimited permission to run the unmodified Program. The output from running a covered work is covered by this License only if the output, given its content, constitutes a covered work. This License acknowledges your rights of fair use or other equivalent, as provided by copyright law.

You may make, run and propagate covered works that you do not convey, without conditions so long as your license otherwise remains in force. You may convey covered works to others for the sole purpose of having them make modifications exclusively for you, or provide you with facilities for running those works, provided that you comply with the terms of this License in conveying all material for which you do not control copyright. Those thus making or running the covered works for you must do so exclusively on your behalf, under your direction and control, on terms that prohibit them from making any copies of your copyrighted material outside their relationship with you.

Conveying under any other circumstances is permitted solely under the conditions stated below. Sublicensing is not allowed; section 10 makes it unnecessary.

3. Protecting Users' Legal Rights From Anti-Circumvention Law.

No covered work shall be deemed part of an effective technological measure under any applicable law fulfilling obligations under article 11 of the WIPO copyright treaty adopted on 20 December 1996, or similar laws prohibiting or restricting circumvention of such measures.

When you convey a covered work, you waive any legal power to forbid circumvention of technological measures to the extent such circumvention is effected by exercising rights under this License with respect to the covered work, and you disclaim any intention to limit operation or modification of the work as a means of enforcing, against the work's users, your or third parties' legal rights to forbid circumvention of technological measures.

4. Conveying Verbatim Copies.

You may convey verbatim copies of the Program's source code as you receive it, in any medium, provided that you conspicuously and appropriately publish on each copy an appropriate copyright notice; keep intact all notices stating that this License and any non-permissive terms added in accord with section 7 apply to the code; keep intact all notices of the absence of any warranty; and give all recipients a copy of this License along with the Program.

You may charge any price or no price for each copy that you convey, and you may offer support or warranty protection for a fee.

5. Conveying Modified Source Versions.

You may convey a work based on the Program, or the modifications to produce it from the Program, in the form of source code under the terms of section 4, provided that you also meet all of these conditions:

- a) The work must carry prominent notices stating that you modified it, and giving a relevant date.
- b) The work must carry prominent notices stating that it is released under this License and any conditions added under section 7. This requirement modifies the requirement in section 4 to "keep intact all notices".

c) You must license the entire work, as a whole, under this License to anyone who comes into possession of a copy. This License will therefore apply, along with any applicable section 7 additional terms, to the whole of the work, and all its parts, regardless of how they are packaged. This License gives no permission to license the work in any other way, but it does not invalidate such permission if you have separately received it.

d) If the work has interactive user interfaces, each must display Appropriate Legal Notices; however, if the Program has interactive interfaces that do not display Appropriate Legal Notices, your work need not make them do so.

A compilation of a covered work with other separate and independent works, which are not by their nature extensions of the covered work, and which are not combined with it such as to form a larger program, in or on a volume of a storage or distribution medium, is called an "aggregate" if the compilation and its resulting copyright are not used to limit the access or legal rights of the compilation's users beyond what the individual works permit. Inclusion of a covered work in an aggregate does not cause this License to apply to the other parts of the aggregate.

6. Conveying Non-Source Forms.

You may convey a covered work in object code form under the terms of sections 4 and 5, provided that you also convey the machine-readable Corresponding Source under the terms of this License, in one of these ways:

a) Convey the object code in, or embodied in, a physical product (including a physical distribution medium), accompanied by the Corresponding Source fixed on a durable physical medium customarily used for software interchange.

b) Convey the object code in, or embodied in, a physical product (including a physical distribution medium), accompanied by a written offer, valid for at least three years and valid for as long as you offer spare parts or customer support for that product model, to give anyone who possesses the object code either (1) a copy of the Corresponding Source for all the software in the product that is covered by this License, on a durable physical medium customarily used for software interchange, for a price no more than your reasonable cost of physically performing this conveying of source, or (2) access to copy the Corresponding Source from a network server at no charge.

c) Convey individual copies of the object code with a copy of the

written offer to provide the Corresponding Source. This alternative is allowed only occasionally and noncommercially, and only if you received the object code with such an offer, in accord with subsection 6b.

d) Convey the object code by offering access from a designated place (gratis or for a charge), and offer equivalent access to the Corresponding Source in the same way through the same place at no further charge. You need not require recipients to copy the Corresponding Source along with the object code. If the place to copy the object code is a network server, the Corresponding Source may be on a different server (operated by you or a third party) that supports equivalent copying facilities, provided you maintain clear directions next to the object code saying where to find the Corresponding Source. Regardless of what server hosts the Corresponding Source, you remain obligated to ensure that it is available for as long as needed to satisfy these requirements.

e) Convey the object code using peer-to-peer transmission, provided you inform other peers where the object code and Corresponding Source of the work are being offered to the general public at no charge under subsection 6d.

A separable portion of the object code, whose source code is excluded from the Corresponding Source as a System Library, need not be included in conveying the object code work.

A "User Product" is either (1) a "consumer product", which means any tangible personal property which is normally used for personal, family, or household purposes, or (2) anything designed or sold for incorporation into a dwelling. In determining whether a product is a consumer product, doubtful cases shall be resolved in favor of coverage. For a particular product received by a particular user, "normally used" refers to a typical or common use of that class of product, regardless of the status of the particular user or of the way in which the particular user actually uses, or expects or is expected to use, the product. A product is a consumer product regardless of whether the product has substantial commercial, industrial or non-consumer uses, unless such uses represent the only significant mode of use of the product.

"Installation Information" for a User Product means any methods, procedures, authorization keys, or other information required to install and execute modified versions of a covered work in that User Product from a modified version of its Corresponding Source. The information must suffice to ensure that the continued functioning of the modified object code is in no case prevented or interfered with solely because modification has been made.

If you convey an object code work under this section in, or with, or specifically for use in, a User Product, and the conveying occurs as part of a transaction in which the right of possession and use of the User Product is transferred to the recipient in perpetuity or for a fixed term (regardless of how the transaction is characterized), the Corresponding Source conveyed under this section must be accompanied by the Installation Information. But this requirement does not apply if neither you nor any third party retains the ability to install modified object code on the User Product (for example, the work has been installed in ROM).

The requirement to provide Installation Information does not include a requirement to continue to provide support service, warranty, or updates for a work that has been modified or installed by the recipient, or for the User Product in which it has been modified or installed. Access to a network may be denied when the modification itself materially and adversely affects the operation of the network or violates the rules and protocols for communication across the network.

Corresponding Source conveyed, and Installation Information provided, in accord with this section must be in a format that is publicly documented (and with an implementation available to the public in source code form), and must require no special password or key for unpacking, reading or copying.

7. Additional Terms.

"Additional permissions" are terms that supplement the terms of this License by making exceptions from one or more of its conditions. Additional permissions that are applicable to the entire Program shall be treated as though they were included in this License, to the extent that they are valid under applicable law. If additional permissions apply only to part of the Program, that part may be used separately under those permissions, but the entire Program remains governed by this License without regard to the additional permissions.

When you convey a copy of a covered work, you may at your option remove any additional permissions from that copy, or from any part of it. (Additional permissions may be written to require their own removal in certain cases when you modify the work.) You may place additional permissions on material, added by you to a covered work, for which you have or can give appropriate copyright permission.

Notwithstanding any other provision of this License, for material you add to a covered work, you may (if authorized by the copyright holders of that material) supplement the terms of this License with terms:

- a) Disclaiming warranty or limiting liability differently from the

terms of sections 15 and 16 of this License; or

- b) Requiring preservation of specified reasonable legal notices or author attributions in that material or in the Appropriate Legal Notices displayed by works containing it; or
- c) Prohibiting misrepresentation of the origin of that material, or requiring that modified versions of such material be marked in reasonable ways as different from the original version; or
- d) Limiting the use for publicity purposes of names of licensors or authors of the material; or
- e) Declining to grant rights under trademark law for use of some trade names, trademarks, or service marks; or
- f) Requiring indemnification of licensors and authors of that material by anyone who conveys the material (or modified versions of it) with contractual assumptions of liability to the recipient, for any liability that these contractual assumptions directly impose on those licensors and authors.

All other non-permissive additional terms are considered "further restrictions" within the meaning of section 10. If the Program as you received it, or any part of it, contains a notice stating that it is governed by this License along with a term that is a further restriction, you may remove that term. If a license document contains a further restriction but permits relicensing or conveying under this License, you may add to a covered work material governed by the terms of that license document, provided that the further restriction does not survive such relicensing or conveying.

If you add terms to a covered work in accord with this section, you must place, in the relevant source files, a statement of the additional terms that apply to those files, or a notice indicating where to find the applicable terms.

Additional terms, permissive or non-permissive, may be stated in the form of a separately written license, or stated as exceptions; the above requirements apply either way.

8. Termination.

You may not propagate or modify a covered work except as expressly provided under this License. Any attempt otherwise to propagate or modify it is void, and will automatically terminate your rights under this License (including any patent licenses granted under the third paragraph of section 11).

However, if you cease all violation of this License, then your license from a particular copyright holder is reinstated (a) provisionally, unless and until the copyright holder explicitly and finally terminates your license, and (b) permanently, if the copyright holder fails to notify you of the violation by some reasonable means prior to 60 days after the cessation.

Moreover, your license from a particular copyright holder is reinstated permanently if the copyright holder notifies you of the violation by some reasonable means, this is the first time you have received notice of violation of this License (for any work) from that copyright holder, and you cure the violation prior to 30 days after your receipt of the notice.

Termination of your rights under this section does not terminate the licenses of parties who have received copies or rights from you under this License. If your rights have been terminated and not permanently reinstated, you do not qualify to receive new licenses for the same material under section 10.

9. Acceptance Not Required for Having Copies.

You are not required to accept this License in order to receive or run a copy of the Program. Ancillary propagation of a covered work occurring solely as a consequence of using peer-to-peer transmission to receive a copy likewise does not require acceptance. However, nothing other than this License grants you permission to propagate or modify any covered work. These actions infringe copyright if you do not accept this License. Therefore, by modifying or propagating a covered work, you indicate your acceptance of this License to do so.

10. Automatic Licensing of Downstream Recipients.

Each time you convey a covered work, the recipient automatically receives a license from the original licensors, to run, modify and propagate that work, subject to this License. You are not responsible for enforcing compliance by third parties with this License.

An "entity transaction" is a transaction transferring control of an organization, or substantially all assets of one, or subdividing an organization, or merging organizations. If propagation of a covered work results from an entity transaction, each party to that transaction who receives a copy of the work also receives whatever licenses to the work the party's predecessor in interest had or could give under the previous paragraph, plus a right to possession of the Corresponding Source of the work from the predecessor in interest, if the predecessor has it or can get it with reasonable efforts.

You may not impose any further restrictions on the exercise of the rights granted or affirmed under this License. For example, you may not impose a license fee, royalty, or other charge for exercise of rights granted under this License, and you may not initiate litigation (including a cross-claim or counterclaim in a lawsuit) alleging that any patent claim is infringed by making, using, selling, offering for sale, or importing the Program or any portion of it.

11. Patents.

A "contributor" is a copyright holder who authorizes use under this License of the Program or a work on which the Program is based. The work thus licensed is called the contributor's "contributor version".

A contributor's "essential patent claims" are all patent claims owned or controlled by the contributor, whether already acquired or hereafter acquired, that would be infringed by some manner, permitted by this License, of making, using, or selling its contributor version, but do not include claims that would be infringed only as a consequence of further modification of the contributor version. For purposes of this definition, "control" includes the right to grant patent sublicenses in a manner consistent with the requirements of this License.

Each contributor grants you a non-exclusive, worldwide, royalty-free patent license under the contributor's essential patent claims, to make, use, sell, offer for sale, import and otherwise run, modify and propagate the contents of its contributor version.

In the following three paragraphs, a "patent license" is any express agreement or commitment, however denominated, not to enforce a patent (such as an express permission to practice a patent or covenant not to sue for patent infringement). To "grant" such a patent license to a party means to make such an agreement or commitment not to enforce a patent against the party.

If you convey a covered work, knowingly relying on a patent license, and the Corresponding Source of the work is not available for anyone to copy, free of charge and under the terms of this License, through a publicly available network server or other readily accessible means, then you must either (1) cause the Corresponding Source to be so available, or (2) arrange to deprive yourself of the benefit of the patent license for this particular work, or (3) arrange, in a manner consistent with the requirements of this License, to extend the patent license to downstream recipients. "Knowingly relying" means you have actual knowledge that, but for the patent license, your conveying the covered work in a country, or your recipient's use of the covered work

in a country, would infringe one or more identifiable patents in that country that you have reason to believe are valid.

If, pursuant to or in connection with a single transaction or arrangement, you convey, or propagate by procuring conveyance of, a covered work, and grant a patent license to some of the parties receiving the covered work authorizing them to use, propagate, modify or convey a specific copy of the covered work, then the patent license you grant is automatically extended to all recipients of the covered work and works based on it.

A patent license is "discriminatory" if it does not include within the scope of its coverage, prohibits the exercise of, or is conditioned on the non-exercise of one or more of the rights that are specifically granted under this License. You may not convey a covered work if you are a party to an arrangement with a third party that is in the business of distributing software, under which you make payment to the third party based on the extent of your activity of conveying the work, and under which the third party grants, to any of the parties who would receive the covered work from you, a discriminatory patent license (a) in connection with copies of the covered work conveyed by you (or copies made from those copies), or (b) primarily for and in connection with specific products or compilations that contain the covered work, unless you entered into that arrangement, or that patent license was granted, prior to 28 March 2007.

Nothing in this License shall be construed as excluding or limiting any implied license or other defenses to infringement that may otherwise be available to you under applicable patent law.

12. No Surrender of Others' Freedom.

If conditions are imposed on you (whether by court order, agreement or otherwise) that contradict the conditions of this License, they do not excuse you from the conditions of this License. If you cannot convey a covered work so as to satisfy simultaneously your obligations under this License and any other pertinent obligations, then as a consequence you may not convey it at all. For example, if you agree to terms that obligate you to collect a royalty for further conveying from those to whom you convey the Program, the only way you could satisfy both those terms and this License would be to refrain entirely from conveying the Program.

13. Use with the GNU Affero General Public License.

Notwithstanding any other provision of this License, you have permission to link or combine any covered work with a work licensed under version 3 of the GNU Affero General Public License into a single combined work, and to convey the resulting work. The terms of this

License will continue to apply to the part which is the covered work, but the special requirements of the GNU Affero General Public License, section 13, concerning interaction through a network will apply to the combination as such.

14. Revised Versions of this License.

The Free Software Foundation may publish revised and/or new versions of the GNU General Public License from time to time. Such new versions will be similar in spirit to the present version, but may differ in detail to address new problems or concerns.

Each version is given a distinguishing version number. If the Program specifies that a certain numbered version of the GNU General Public License "or any later version" applies to it, you have the option of following the terms and conditions either of that numbered version or of any later version published by the Free Software Foundation. If the Program does not specify a version number of the GNU General Public License, you may choose any version ever published by the Free Software Foundation.

If the Program specifies that a proxy can decide which future versions of the GNU General Public License can be used, that proxy's public statement of acceptance of a version permanently authorizes you to choose that version for the Program.

Later license versions may give you additional or different permissions. However, no additional obligations are imposed on any author or copyright holder as a result of your choosing to follow a later version.

15. Disclaimer of Warranty.

THERE IS NO WARRANTY FOR THE PROGRAM, TO THE EXTENT PERMITTED BY APPLICABLE LAW. EXCEPT WHEN OTHERWISE STATED IN WRITING THE COPYRIGHT HOLDERS AND/OR OTHER PARTIES PROVIDE THE PROGRAM "AS IS" WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. THE ENTIRE RISK AS TO THE QUALITY AND PERFORMANCE OF THE PROGRAM IS WITH YOU. SHOULD THE PROGRAM PROVE DEFECTIVE, YOU ASSUME THE COST OF ALL NECESSARY SERVICING, REPAIR OR CORRECTION.

16. Limitation of Liability.

IN NO EVENT UNLESS REQUIRED BY APPLICABLE LAW OR AGREED TO IN WRITING WILL ANY COPYRIGHT HOLDER, OR ANY OTHER PARTY WHO MODIFIES AND/OR CONVEYS THE PROGRAM AS PERMITTED ABOVE, BE LIABLE TO YOU FOR DAMAGES, INCLUDING ANY GENERAL, SPECIAL, INCIDENTAL OR CONSEQUENTIAL DAMAGES ARISING OUT OF THE

USE OR INABILITY TO USE THE PROGRAM (INCLUDING BUT NOT LIMITED TO LOSS OF DATA OR DATA BEING RENDERED INACCURATE OR LOSSES SUSTAINED BY YOU OR THIRD PARTIES OR A FAILURE OF THE PROGRAM TO OPERATE WITH ANY OTHER PROGRAMS), EVEN IF SUCH HOLDER OR OTHER PARTY HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

17. Interpretation of Sections 15 and 16.

If the disclaimer of warranty and limitation of liability provided above cannot be given local legal effect according to their terms, reviewing courts shall apply local law that most closely approximates an absolute waiver of all civil liability in connection with the Program, unless a warranty or assumption of liability accompanies a copy of the Program in return for a fee.

END OF TERMS AND CONDITIONS

How to Apply These Terms to Your New Programs

If you develop a new program, and you want it to be of the greatest possible use to the public, the best way to achieve this is to make it free software which everyone can redistribute and change under these terms.

To do so, attach the following notices to the program. It is safest to attach them to the start of each source file to most effectively state the exclusion of warranty; and each file should have at least the "copyright" line and a pointer to where the full notice is found.

```
<one line to give the program's name and a brief idea of what it does.>  
Copyright (C) <year> <name of author>
```

```
This program is free software: you can redistribute it and/or modify  
it under the terms of the GNU General Public License as published by  
the Free Software Foundation, either version 3 of the License, or  
(at your option) any later version.
```

```
This program is distributed in the hope that it will be useful,  
but WITHOUT ANY WARRANTY; without even the implied warranty of  
MERCHANTABILITY or FITNESS FOR A PARTICULAR PURPOSE. See the  
GNU General Public License for more details.
```

```
You should have received a copy of the GNU General Public License  
along with this program. If not, see <http://www.gnu.org/licenses/>.
```

Also add information on how to contact you by electronic and paper mail.

If the program does terminal interaction, make it output a short notice like this when it starts in an interactive mode:

<program> Copyright (C) <year> <name of author>

This program comes with ABSOLUTELY NO WARRANTY; for details type 'show w'.

This is free software, and you are welcome to redistribute it
under certain conditions; type 'show c' for details.

The hypothetical commands 'show w' and 'show c' should show the appropriate parts of the General Public License. Of course, your program's commands might be different; for a GUI interface, you would use an "about box".

You should also get your employer (if you work as a programmer) or school, if any, to sign a "copyright disclaimer" for the program, if necessary.

For more information on this, and how to apply and follow the GNU GPL, see
<<http://www.gnu.org/licenses/>>.

The GNU General Public License does not permit incorporating your program into proprietary programs. If your program is a subroutine library, you may consider it more useful to permit linking proprietary applications with the library. If this is what you want to do, use the GNU Lesser General Public License instead of this License. But first, please read

<<http://www.gnu.org/philosophy/why-not-lgpl.html>>.

To: Damian Le Gresley (damlegre)

Subject: Re: dnsmasq licencing

Damian,

All the code in dnsmasq carries the following statement, so you elect to use the entire application under the terms of GPLv2.

This program is free software; you can redistribute it and/or modify
it under the terms of the GNU General Public License as published by
the Free Software Foundation; version 2 dated June, 1991, or
(at your option) version 3 dated 29 June, 2007.

BTW, what's a "small cell product"?

Cheers,

Simon.

1.11 ethtool 6.0

1.11.1 Available under license :

GNU GENERAL PUBLIC LICENSE
Version 2, June 1991

Copyright (C) 1989, 1991 Free Software Foundation, Inc.
59 Temple Place, Suite 330, Boston, MA 02111-1307 USA
Everyone is permitted to copy and distribute verbatim copies
of this license document, but changing it is not allowed.

Preamble

The licenses for most software are designed to take away your
freedom to share and change it. By contrast, the GNU General Public
License is intended to guarantee your freedom to share and change free
software--to make sure the software is free for all its users. This
General Public License applies to most of the Free Software

Foundation's software and to any other program whose authors commit to using it. (Some other Free Software Foundation software is covered by the GNU Library General Public License instead.) You can apply it to your programs, too.

When we speak of free software, we are referring to freedom, not price. Our General Public Licenses are designed to make sure that you have the freedom to distribute copies of free software (and charge for this service if you wish), that you receive source code or can get it if you want it, that you can change the software or use pieces of it in new free programs; and that you know you can do these things.

To protect your rights, we need to make restrictions that forbid anyone to deny you these rights or to ask you to surrender the rights. These restrictions translate to certain responsibilities for you if you distribute copies of the software, or if you modify it.

For example, if you distribute copies of such a program, whether gratis or for a fee, you must give the recipients all the rights that you have. You must make sure that they, too, receive or can get the source code. And you must show them these terms so they know their rights.

We protect your rights with two steps: (1) copyright the software, and (2) offer you this license which gives you legal permission to copy, distribute and/or modify the software.

Also, for each author's protection and ours, we want to make certain that everyone understands that there is no warranty for this free software. If the software is modified by someone else and passed on, we want its recipients to know that what they have is not the original, so that any problems introduced by others will not reflect on the original authors' reputations.

Finally, any free program is threatened constantly by software patents. We wish to avoid the danger that redistributors of a free program will individually obtain patent licenses, in effect making the program proprietary. To prevent this, we have made it clear that any patent must be licensed for everyone's free use or not licensed at all.

The precise terms and conditions for copying, distribution and modification follow.

GNU GENERAL PUBLIC LICENSE TERMS AND CONDITIONS FOR COPYING, DISTRIBUTION AND MODIFICATION

0. This License applies to any program or other work which contains a notice placed by the copyright holder saying it may be distributed

under the terms of this General Public License. The "Program", below, refers to any such program or work, and a "work based on the Program" means either the Program or any derivative work under copyright law: that is to say, a work containing the Program or a portion of it, either verbatim or with modifications and/or translated into another language. (Hereinafter, translation is included without limitation in the term "modification".) Each licensee is addressed as "you".

Activities other than copying, distribution and modification are not covered by this License; they are outside its scope. The act of running the Program is not restricted, and the output from the Program is covered only if its contents constitute a work based on the Program (independent of having been made by running the Program). Whether that is true depends on what the Program does.

1. You may copy and distribute verbatim copies of the Program's source code as you receive it, in any medium, provided that you conspicuously and appropriately publish on each copy an appropriate copyright notice and disclaimer of warranty; keep intact all the notices that refer to this License and to the absence of any warranty; and give any other recipients of the Program a copy of this License along with the Program.

You may charge a fee for the physical act of transferring a copy, and you may at your option offer warranty protection in exchange for a fee.

2. You may modify your copy or copies of the Program or any portion of it, thus forming a work based on the Program, and copy and distribute such modifications or work under the terms of Section 1 above, provided that you also meet all of these conditions:

- a) You must cause the modified files to carry prominent notices stating that you changed the files and the date of any change.
- b) You must cause any work that you distribute or publish, that in whole or in part contains or is derived from the Program or any part thereof, to be licensed as a whole at no charge to all third parties under the terms of this License.
- c) If the modified program normally reads commands interactively when run, you must cause it, when started running for such interactive use in the most ordinary way, to print or display an announcement including an appropriate copyright notice and a notice that there is no warranty (or else, saying that you provide a warranty) and that users may redistribute the program under these conditions, and telling the user how to view a copy of this License. (Exception: if the Program itself is interactive but does not normally print such an announcement, your work based on

the Program is not required to print an announcement.)

These requirements apply to the modified work as a whole. If identifiable sections of that work are not derived from the Program, and can be reasonably considered independent and separate works in themselves, then this License, and its terms, do not apply to those sections when you distribute them as separate works. But when you distribute the same sections as part of a whole which is a work based on the Program, the distribution of the whole must be on the terms of this License, whose permissions for other licensees extend to the entire whole, and thus to each and every part regardless of who wrote it.

Thus, it is not the intent of this section to claim rights or contest your rights to work written entirely by you; rather, the intent is to exercise the right to control the distribution of derivative or collective works based on the Program.

In addition, mere aggregation of another work not based on the Program with the Program (or with a work based on the Program) on a volume of a storage or distribution medium does not bring the other work under the scope of this License.

3. You may copy and distribute the Program (or a work based on it, under Section 2) in object code or executable form under the terms of Sections 1 and 2 above provided that you also do one of the following:

- a) Accompany it with the complete corresponding machine-readable source code, which must be distributed under the terms of Sections 1 and 2 above on a medium customarily used for software interchange; or,
- b) Accompany it with a written offer, valid for at least three years, to give any third party, for a charge no more than your cost of physically performing source distribution, a complete machine-readable copy of the corresponding source code, to be distributed under the terms of Sections 1 and 2 above on a medium customarily used for software interchange; or,
- c) Accompany it with the information you received as to the offer to distribute corresponding source code. (This alternative is allowed only for noncommercial distribution and only if you received the program in object code or executable form with such an offer, in accord with Subsection b above.)

The source code for a work means the preferred form of the work for making modifications to it. For an executable work, complete source code means all the source code for all modules it contains, plus any associated interface definition files, plus the scripts used to control compilation and installation of the executable. However, as a

special exception, the source code distributed need not include anything that is normally distributed (in either source or binary form) with the major components (compiler, kernel, and so on) of the operating system on which the executable runs, unless that component itself accompanies the executable.

If distribution of executable or object code is made by offering access to copy from a designated place, then offering equivalent access to copy the source code from the same place counts as distribution of the source code, even though third parties are not compelled to copy the source along with the object code.

4. You may not copy, modify, sublicense, or distribute the Program except as expressly provided under this License. Any attempt otherwise to copy, modify, sublicense or distribute the Program is void, and will automatically terminate your rights under this License. However, parties who have received copies, or rights, from you under this License will not have their licenses terminated so long as such parties remain in full compliance.

5. You are not required to accept this License, since you have not signed it. However, nothing else grants you permission to modify or distribute the Program or its derivative works. These actions are prohibited by law if you do not accept this License. Therefore, by modifying or distributing the Program (or any work based on the Program), you indicate your acceptance of this License to do so, and all its terms and conditions for copying, distributing or modifying the Program or works based on it.

6. Each time you redistribute the Program (or any work based on the Program), the recipient automatically receives a license from the original licensor to copy, distribute or modify the Program subject to these terms and conditions. You may not impose any further restrictions on the recipients' exercise of the rights granted herein. You are not responsible for enforcing compliance by third parties to this License.

7. If, as a consequence of a court judgment or allegation of patent infringement or for any other reason (not limited to patent issues), conditions are imposed on you (whether by court order, agreement or otherwise) that contradict the conditions of this License, they do not excuse you from the conditions of this License. If you cannot distribute so as to satisfy simultaneously your obligations under this License and any other pertinent obligations, then as a consequence you may not distribute the Program at all. For example, if a patent license would not permit royalty-free redistribution of the Program by all those who receive copies directly or indirectly through you, then the only way you could satisfy both it and this License would be to

refrain entirely from distribution of the Program.

If any portion of this section is held invalid or unenforceable under any particular circumstance, the balance of the section is intended to apply and the section as a whole is intended to apply in other circumstances.

It is not the purpose of this section to induce you to infringe any patents or other property right claims or to contest validity of any such claims; this section has the sole purpose of protecting the integrity of the free software distribution system, which is implemented by public license practices. Many people have made generous contributions to the wide range of software distributed through that system in reliance on consistent application of that system; it is up to the author/donor to decide if he or she is willing to distribute software through any other system and a licensee cannot impose that choice.

This section is intended to make thoroughly clear what is believed to be a consequence of the rest of this License.

8. If the distribution and/or use of the Program is restricted in certain countries either by patents or by copyrighted interfaces, the original copyright holder who places the Program under this License may add an explicit geographical distribution limitation excluding those countries, so that distribution is permitted only in or among countries not thus excluded. In such case, this License incorporates the limitation as if written in the body of this License.

9. The Free Software Foundation may publish revised and/or new versions of the General Public License from time to time. Such new versions will be similar in spirit to the present version, but may differ in detail to address new problems or concerns.

Each version is given a distinguishing version number. If the Program specifies a version number of this License which applies to it and "any later version", you have the option of following the terms and conditions either of that version or of any later version published by the Free Software Foundation. If the Program does not specify a version number of this License, you may choose any version ever published by the Free Software Foundation.

10. If you wish to incorporate parts of the Program into other free programs whose distribution conditions are different, write to the author to ask for permission. For software which is copyrighted by the Free Software Foundation, write to the Free Software Foundation; we sometimes make exceptions for this. Our decision will be guided by the two goals of preserving the free status of all derivatives of our free software and

of promoting the sharing and reuse of software generally.

NO WARRANTY

11. BECAUSE THE PROGRAM IS LICENSED FREE OF CHARGE, THERE IS NO WARRANTY FOR THE PROGRAM, TO THE EXTENT PERMITTED BY APPLICABLE LAW. EXCEPT WHEN OTHERWISE STATED IN WRITING THE COPYRIGHT HOLDERS AND/OR OTHER PARTIES PROVIDE THE PROGRAM "AS IS" WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. THE ENTIRE RISK AS TO THE QUALITY AND PERFORMANCE OF THE PROGRAM IS WITH YOU. SHOULD THE PROGRAM PROVE DEFECTIVE, YOU ASSUME THE COST OF ALL NECESSARY SERVICING, REPAIR OR CORRECTION.

12. IN NO EVENT UNLESS REQUIRED BY APPLICABLE LAW OR AGREED TO IN WRITING WILL ANY COPYRIGHT HOLDER, OR ANY OTHER PARTY WHO MAY MODIFY AND/OR REDISTRIBUTE THE PROGRAM AS PERMITTED ABOVE, BE LIABLE TO YOU FOR DAMAGES, INCLUDING ANY GENERAL, SPECIAL, INCIDENTAL OR CONSEQUENTIAL DAMAGES ARISING OUT OF THE USE OR INABILITY TO USE THE PROGRAM (INCLUDING BUT NOT LIMITED TO LOSS OF DATA OR DATA BEING RENDERED INACCURATE OR LOSSES SUSTAINED BY YOU OR THIRD PARTIES OR A FAILURE OF THE PROGRAM TO OPERATE WITH ANY OTHER PROGRAMS), EVEN IF SUCH HOLDER OR OTHER PARTY HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

END OF TERMS AND CONDITIONS

How to Apply These Terms to Your New Programs

If you develop a new program, and you want it to be of the greatest possible use to the public, the best way to achieve this is to make it free software which everyone can redistribute and change under these terms.

To do so, attach the following notices to the program. It is safest to attach them to the start of each source file to most effectively convey the exclusion of warranty; and each file should have at least the "copyright" line and a pointer to where the full notice is found.

<one line to give the program's name and a brief idea of what it does.>

Copyright (C) <year> <name of author>

This program is free software; you can redistribute it and/or modify it under the terms of the GNU General Public License as published by the Free Software Foundation; either version 2 of the License, or (at your option) any later version.

This program is distributed in the hope that it will be useful, but WITHOUT ANY WARRANTY; without even the implied warranty of MERCHANTABILITY or FITNESS FOR A PARTICULAR PURPOSE. See the

GNU General Public License for more details.

You should have received a copy of the GNU General Public License along with this program; if not, write to the Free Software Foundation, Inc., 59 Temple Place, Suite 330, Boston, MA 02111-1307 USA

Also add information on how to contact you by electronic and paper mail.

If the program is interactive, make it output a short notice like this when it starts in an interactive mode:

```
Gnomovision version 69, Copyright (C) year name of author
Gnomovision comes with ABSOLUTELY NO WARRANTY; for details type `show w'.
This is free software, and you are welcome to redistribute it
under certain conditions; type `show c' for details.
```

The hypothetical commands ``show w'` and ``show c'` should show the appropriate parts of the General Public License. Of course, the commands you use may be called something other than ``show w'` and ``show c'`; they could even be mouse-clicks or menu items--whatever suits your program.

You should also get your employer (if you work as a programmer) or your school, if any, to sign a "copyright disclaimer" for the program, if necessary. Here is a sample; alter the names:

```
Yoyodyne, Inc., hereby disclaims all copyright interest in the program
`Gnomovision' (which makes passes at compilers) written by James Hacker.
```

```
<signature of Ty Coon>, 1 April 1989
Ty Coon, President of Vice
```

This General Public License does not permit incorporating your program into proprietary programs. If your program is a subroutine library, you may consider it more useful to permit linking proprietary applications with the library. If this is what you want to do, use the GNU Library General Public License instead of this License.

1.12 gmp 4.2.1

1.12.1 Available under license :

GNU LESSER GENERAL PUBLIC LICENSE
Version 2.1, February 1999

Copyright (C) 1991, 1999 Free Software Foundation, Inc.
51 Franklin Street, Fifth Floor, Boston, MA 02110-1301 USA
Everyone is permitted to copy and distribute verbatim copies

of this license document, but changing it is not allowed.

[This is the first released version of the Lesser GPL. It also counts as the successor of the GNU Library Public License, version 2, hence the version number 2.1.]

Preamble

The licenses for most software are designed to take away your freedom to share and change it. By contrast, the GNU General Public Licenses are intended to guarantee your freedom to share and change free software--to make sure the software is free for all its users.

This license, the Lesser General Public License, applies to some specially designated software packages--typically libraries--of the Free Software Foundation and other authors who decide to use it. You can use it too, but we suggest you first think carefully about whether this license or the ordinary General Public License is the better strategy to use in any particular case, based on the explanations below.

When we speak of free software, we are referring to freedom of use, not price. Our General Public Licenses are designed to make sure that you have the freedom to distribute copies of free software (and charge for this service if you wish); that you receive source code or can get it if you want it; that you can change the software and use pieces of it in new free programs; and that you are informed that you can do these things.

To protect your rights, we need to make restrictions that forbid distributors to deny you these rights or to ask you to surrender these rights. These restrictions translate to certain responsibilities for you if you distribute copies of the library or if you modify it.

For example, if you distribute copies of the library, whether gratis or for a fee, you must give the recipients all the rights that we gave you. You must make sure that they, too, receive or can get the source code. If you link other code with the library, you must provide complete object files to the recipients, so that they can relink them with the library after making changes to the library and recompiling it. And you must show them these terms so they know their rights.

We protect your rights with a two-step method: (1) we copyright the library, and (2) we offer you this license, which gives you legal permission to copy, distribute and/or modify the library.

To protect each distributor, we want to make it very clear that there is no warranty for the free library. Also, if the library is modified by someone else and passed on, the recipients should know

that what they have is not the original version, so that the original author's reputation will not be affected by problems that might be introduced by others.

Finally, software patents pose a constant threat to the existence of any free program. We wish to make sure that a company cannot effectively restrict the users of a free program by obtaining a restrictive license from a patent holder. Therefore, we insist that any patent license obtained for a version of the library must be consistent with the full freedom of use specified in this license.

Most GNU software, including some libraries, is covered by the ordinary GNU General Public License. This license, the GNU Lesser General Public License, applies to certain designated libraries, and is quite different from the ordinary General Public License. We use this license for certain libraries in order to permit linking those libraries into non-free programs.

When a program is linked with a library, whether statically or using a shared library, the combination of the two is legally speaking a combined work, a derivative of the original library. The ordinary General Public License therefore permits such linking only if the entire combination fits its criteria of freedom. The Lesser General Public License permits more lax criteria for linking other code with the library.

We call this license the "Lesser" General Public License because it does Less to protect the user's freedom than the ordinary General Public License. It also provides other free software developers Less of an advantage over competing non-free programs. These disadvantages are the reason we use the ordinary General Public License for many libraries. However, the Lesser license provides advantages in certain special circumstances.

For example, on rare occasions, there may be a special need to encourage the widest possible use of a certain library, so that it becomes a de-facto standard. To achieve this, non-free programs must be allowed to use the library. A more frequent case is that a free library does the same job as widely used non-free libraries. In this case, there is little to gain by limiting the free library to free software only, so we use the Lesser General Public License.

In other cases, permission to use a particular library in non-free programs enables a greater number of people to use a large body of free software. For example, permission to use the GNU C Library in non-free programs enables many more people to use the whole GNU operating system, as well as its variant, the GNU/Linux operating system.

Although the Lesser General Public License is Less protective of the users' freedom, it does ensure that the user of a program that is linked with the Library has the freedom and the wherewithal to run that program using a modified version of the Library.

The precise terms and conditions for copying, distribution and modification follow. Pay close attention to the difference between a "work based on the library" and a "work that uses the library". The former contains code derived from the library, whereas the latter must be combined with the library in order to run.

GNU LESSER GENERAL PUBLIC LICENSE TERMS AND CONDITIONS FOR COPYING, DISTRIBUTION AND MODIFICATION

0. This License Agreement applies to any software library or other program which contains a notice placed by the copyright holder or other authorized party saying it may be distributed under the terms of this Lesser General Public License (also called "this License"). Each licensee is addressed as "you".

A "library" means a collection of software functions and/or data prepared so as to be conveniently linked with application programs (which use some of those functions and data) to form executables.

The "Library", below, refers to any such software library or work which has been distributed under these terms. A "work based on the Library" means either the Library or any derivative work under copyright law: that is to say, a work containing the Library or a portion of it, either verbatim or with modifications and/or translated straightforwardly into another language. (Hereinafter, translation is included without limitation in the term "modification".)

"Source code" for a work means the preferred form of the work for making modifications to it. For a library, complete source code means all the source code for all modules it contains, plus any associated interface definition files, plus the scripts used to control compilation and installation of the library.

Activities other than copying, distribution and modification are not covered by this License; they are outside its scope. The act of running a program using the Library is not restricted, and output from such a program is covered only if its contents constitute a work based on the Library (independent of the use of the Library in a tool for writing it). Whether that is true depends on what the Library does and what the program that uses the Library does.

1. You may copy and distribute verbatim copies of the Library's

complete source code as you receive it, in any medium, provided that you conspicuously and appropriately publish on each copy an appropriate copyright notice and disclaimer of warranty; keep intact all the notices that refer to this License and to the absence of any warranty; and distribute a copy of this License along with the Library.

You may charge a fee for the physical act of transferring a copy, and you may at your option offer warranty protection in exchange for a fee.

2. You may modify your copy or copies of the Library or any portion of it, thus forming a work based on the Library, and copy and distribute such modifications or work under the terms of Section 1 above, provided that you also meet all of these conditions:

- a) The modified work must itself be a software library.
- b) You must cause the files modified to carry prominent notices stating that you changed the files and the date of any change.
- c) You must cause the whole of the work to be licensed at no charge to all third parties under the terms of this License.
- d) If a facility in the modified Library refers to a function or a table of data to be supplied by an application program that uses the facility, other than as an argument passed when the facility is invoked, then you must make a good faith effort to ensure that, in the event an application does not supply such function or table, the facility still operates, and performs whatever part of its purpose remains meaningful.

(For example, a function in a library to compute square roots has a purpose that is entirely well-defined independent of the application. Therefore, Subsection 2d requires that any application-supplied function or table used by this function must be optional: if the application does not supply it, the square root function must still compute square roots.)

These requirements apply to the modified work as a whole. If identifiable sections of that work are not derived from the Library, and can be reasonably considered independent and separate works in themselves, then this License, and its terms, do not apply to those sections when you distribute them as separate works. But when you distribute the same sections as part of a whole which is a work based on the Library, the distribution of the whole must be on the terms of this License, whose permissions for other licensees extend to the entire whole, and thus to each and every part regardless of who wrote

it.

Thus, it is not the intent of this section to claim rights or contest your rights to work written entirely by you; rather, the intent is to exercise the right to control the distribution of derivative or collective works based on the Library.

In addition, mere aggregation of another work not based on the Library with the Library (or with a work based on the Library) on a volume of a storage or distribution medium does not bring the other work under the scope of this License.

3. You may opt to apply the terms of the ordinary GNU General Public License instead of this License to a given copy of the Library. To do this, you must alter all the notices that refer to this License, so that they refer to the ordinary GNU General Public License, version 2, instead of to this License. (If a newer version than version 2 of the ordinary GNU General Public License has appeared, then you can specify that version instead if you wish.) Do not make any other change in these notices.

Once this change is made in a given copy, it is irreversible for that copy, so the ordinary GNU General Public License applies to all subsequent copies and derivative works made from that copy.

This option is useful when you wish to copy part of the code of the Library into a program that is not a library.

4. You may copy and distribute the Library (or a portion or derivative of it, under Section 2) in object code or executable form under the terms of Sections 1 and 2 above provided that you accompany it with the complete corresponding machine-readable source code, which must be distributed under the terms of Sections 1 and 2 above on a medium customarily used for software interchange.

If distribution of object code is made by offering access to copy from a designated place, then offering equivalent access to copy the source code from the same place satisfies the requirement to distribute the source code, even though third parties are not compelled to copy the source along with the object code.

5. A program that contains no derivative of any portion of the Library, but is designed to work with the Library by being compiled or linked with it, is called a "work that uses the Library". Such a work, in isolation, is not a derivative work of the Library, and therefore falls outside the scope of this License.

However, linking a "work that uses the Library" with the Library

creates an executable that is a derivative of the Library (because it contains portions of the Library), rather than a "work that uses the library". The executable is therefore covered by this License. Section 6 states terms for distribution of such executables.

When a "work that uses the Library" uses material from a header file that is part of the Library, the object code for the work may be a derivative work of the Library even though the source code is not. Whether this is true is especially significant if the work can be linked without the Library, or if the work is itself a library. The threshold for this to be true is not precisely defined by law.

If such an object file uses only numerical parameters, data structure layouts and accessors, and small macros and small inline functions (ten lines or less in length), then the use of the object file is unrestricted, regardless of whether it is legally a derivative work. (Executables containing this object code plus portions of the Library will still fall under Section 6.)

Otherwise, if the work is a derivative of the Library, you may distribute the object code for the work under the terms of Section 6. Any executables containing that work also fall under Section 6, whether or not they are linked directly with the Library itself.

6. As an exception to the Sections above, you may also combine or link a "work that uses the Library" with the Library to produce a work containing portions of the Library, and distribute that work under terms of your choice, provided that the terms permit modification of the work for the customer's own use and reverse engineering for debugging such modifications.

You must give prominent notice with each copy of the work that the Library is used in it and that the Library and its use are covered by this License. You must supply a copy of this License. If the work during execution displays copyright notices, you must include the copyright notice for the Library among them, as well as a reference directing the user to the copy of this License. Also, you must do one of these things:

- a) Accompany the work with the complete corresponding machine-readable source code for the Library including whatever changes were used in the work (which must be distributed under Sections 1 and 2 above); and, if the work is an executable linked with the Library, with the complete machine-readable "work that uses the Library", as object code and/or source code, so that the user can modify the Library and then relink to produce a modified executable containing the modified Library. (It is understood that the user who changes the contents of definitions files in the

Library will not necessarily be able to recompile the application to use the modified definitions.)

b) Use a suitable shared library mechanism for linking with the Library. A suitable mechanism is one that (1) uses at run time a copy of the library already present on the user's computer system, rather than copying library functions into the executable, and (2) will operate properly with a modified version of the library, if the user installs one, as long as the modified version is interface-compatible with the version that the work was made with.

c) Accompany the work with a written offer, valid for at least three years, to give the same user the materials specified in Subsection 6a, above, for a charge no more than the cost of performing this distribution.

d) If distribution of the work is made by offering access to copy from a designated place, offer equivalent access to copy the above specified materials from the same place.

e) Verify that the user has already received a copy of these materials or that you have already sent this user a copy.

For an executable, the required form of the "work that uses the Library" must include any data and utility programs needed for reproducing the executable from it. However, as a special exception, the materials to be distributed need not include anything that is normally distributed (in either source or binary form) with the major components (compiler, kernel, and so on) of the operating system on which the executable runs, unless that component itself accompanies the executable.

It may happen that this requirement contradicts the license restrictions of other proprietary libraries that do not normally accompany the operating system. Such a contradiction means you cannot use both them and the Library together in an executable that you distribute.

7. You may place library facilities that are a work based on the Library side-by-side in a single library together with other library facilities not covered by this License, and distribute such a combined library, provided that the separate distribution of the work based on the Library and of the other library facilities is otherwise permitted, and provided that you do these two things:

a) Accompany the combined library with a copy of the same work based on the Library, uncombined with any other library facilities. This must be distributed under the terms of the

Sections above.

b) Give prominent notice with the combined library of the fact that part of it is a work based on the Library, and explaining where to find the accompanying uncombined form of the same work.

8. You may not copy, modify, sublicense, link with, or distribute the Library except as expressly provided under this License. Any attempt otherwise to copy, modify, sublicense, link with, or distribute the Library is void, and will automatically terminate your rights under this License. However, parties who have received copies, or rights, from you under this License will not have their licenses terminated so long as such parties remain in full compliance.

9. You are not required to accept this License, since you have not signed it. However, nothing else grants you permission to modify or distribute the Library or its derivative works. These actions are prohibited by law if you do not accept this License. Therefore, by modifying or distributing the Library (or any work based on the Library), you indicate your acceptance of this License to do so, and all its terms and conditions for copying, distributing or modifying the Library or works based on it.

10. Each time you redistribute the Library (or any work based on the Library), the recipient automatically receives a license from the original licensor to copy, distribute, link with or modify the Library subject to these terms and conditions. You may not impose any further restrictions on the recipients' exercise of the rights granted herein. You are not responsible for enforcing compliance by third parties with this License.

11. If, as a consequence of a court judgment or allegation of patent infringement or for any other reason (not limited to patent issues), conditions are imposed on you (whether by court order, agreement or otherwise) that contradict the conditions of this License, they do not excuse you from the conditions of this License. If you cannot distribute so as to satisfy simultaneously your obligations under this License and any other pertinent obligations, then as a consequence you may not distribute the Library at all. For example, if a patent license would not permit royalty-free redistribution of the Library by all those who receive copies directly or indirectly through you, then the only way you could satisfy both it and this License would be to refrain entirely from distribution of the Library.

If any portion of this section is held invalid or unenforceable under any particular circumstance, the balance of the section is intended to apply, and the section as a whole is intended to apply in other circumstances.

It is not the purpose of this section to induce you to infringe any patents or other property right claims or to contest validity of any such claims; this section has the sole purpose of protecting the integrity of the free software distribution system which is implemented by public license practices. Many people have made generous contributions to the wide range of software distributed through that system in reliance on consistent application of that system; it is up to the author/donor to decide if he or she is willing to distribute software through any other system and a licensee cannot impose that choice.

This section is intended to make thoroughly clear what is believed to be a consequence of the rest of this License.

12. If the distribution and/or use of the Library is restricted in certain countries either by patents or by copyrighted interfaces, the original copyright holder who places the Library under this License may add an explicit geographical distribution limitation excluding those countries, so that distribution is permitted only in or among countries not thus excluded. In such case, this License incorporates the limitation as if written in the body of this License.

13. The Free Software Foundation may publish revised and/or new versions of the Lesser General Public License from time to time. Such new versions will be similar in spirit to the present version, but may differ in detail to address new problems or concerns.

Each version is given a distinguishing version number. If the Library specifies a version number of this License which applies to it and "any later version", you have the option of following the terms and conditions either of that version or of any later version published by the Free Software Foundation. If the Library does not specify a license version number, you may choose any version ever published by the Free Software Foundation.

14. If you wish to incorporate parts of the Library into other free programs whose distribution conditions are incompatible with these, write to the author to ask for permission. For software which is copyrighted by the Free Software Foundation, write to the Free Software Foundation; we sometimes make exceptions for this. Our decision will be guided by the two goals of preserving the free status of all derivatives of our free software and of promoting the sharing and reuse of software generally.

NO WARRANTY

15. BECAUSE THE LIBRARY IS LICENSED FREE OF CHARGE, THERE IS NO WARRANTY FOR THE LIBRARY, TO THE EXTENT PERMITTED BY APPLICABLE LAW.

EXCEPT WHEN OTHERWISE STATED IN WRITING THE COPYRIGHT HOLDERS AND/OR OTHER PARTIES PROVIDE THE LIBRARY "AS IS" WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. THE ENTIRE RISK AS TO THE QUALITY AND PERFORMANCE OF THE LIBRARY IS WITH YOU. SHOULD THE LIBRARY PROVE DEFECTIVE, YOU ASSUME THE COST OF ALL NECESSARY SERVICING, REPAIR OR CORRECTION.

16. IN NO EVENT UNLESS REQUIRED BY APPLICABLE LAW OR AGREED TO IN WRITING WILL ANY COPYRIGHT HOLDER, OR ANY OTHER PARTY WHO MAY MODIFY AND/OR REDISTRIBUTE THE LIBRARY AS PERMITTED ABOVE, BE LIABLE TO YOU FOR DAMAGES, INCLUDING ANY GENERAL, SPECIAL, INCIDENTAL OR CONSEQUENTIAL DAMAGES ARISING OUT OF THE USE OR INABILITY TO USE THE LIBRARY (INCLUDING BUT NOT LIMITED TO LOSS OF DATA OR DATA BEING RENDERED INACCURATE OR LOSSES SUSTAINED BY YOU OR THIRD PARTIES OR A FAILURE OF THE LIBRARY TO OPERATE WITH ANY OTHER SOFTWARE), EVEN IF SUCH HOLDER OR OTHER PARTY HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

END OF TERMS AND CONDITIONS

How to Apply These Terms to Your New Libraries

If you develop a new library, and you want it to be of the greatest possible use to the public, we recommend making it free software that everyone can redistribute and change. You can do so by permitting redistribution under these terms (or, alternatively, under the terms of the ordinary General Public License).

To apply these terms, attach the following notices to the library. It is safest to attach them to the start of each source file to most effectively convey the exclusion of warranty; and each file should have at least the "copyright" line and a pointer to where the full notice is found.

<one line to give the library's name and a brief idea of what it does.>
Copyright (C) <year> <name of author>

This library is free software; you can redistribute it and/or modify it under the terms of the GNU Lesser General Public License as published by the Free Software Foundation; either version 2.1 of the License, or (at your option) any later version.

This library is distributed in the hope that it will be useful, but WITHOUT ANY WARRANTY; without even the implied warranty of MERCHANTABILITY or FITNESS FOR A PARTICULAR PURPOSE. See the GNU Lesser General Public License for more details.

You should have received a copy of the GNU Lesser General Public

License along with this library; if not, write to the Free Software Foundation, Inc., 51 Franklin Street, Fifth Floor, Boston, MA 02110-1301 USA

Also add information on how to contact you by electronic and paper mail.

You should also get your employer (if you work as a programmer) or your school, if any, to sign a "copyright disclaimer" for the library, if necessary. Here is a sample; alter the names:

Yoyodyne, Inc., hereby disclaims all copyright interest in the library `Frob' (a library for tweaking knobs) written by James Random Hacker.

<signature of Ty Coon>, 1 April 1990
Ty Coon, President of Vice

That's all there is to it!

1.13.1 Available under license :

GNU GENERAL PUBLIC LICENSE
Version 3, 29 June 2007

Copyright (C) 2007 Free Software Foundation, Inc. <<http://fsf.org/>>
Everyone is permitted to copy and distribute verbatim copies of this license document, but changing it is not allowed.

Preamble

The GNU General Public License is a free, copyleft license for software and other kinds of works.

The licenses for most software and other practical works are designed to take away your freedom to share and change the works. By contrast, the GNU General Public License is intended to guarantee your freedom to share and change all versions of a program--to make sure it remains free software for all its users. We, the Free Software Foundation, use the GNU General Public License for most of our software; it applies also to any other work released this way by its authors. You can apply it to your programs, too.

When we speak of free software, we are referring to freedom, not price. Our General Public Licenses are designed to make sure that you have the freedom to distribute copies of free software (and charge for them if you wish), that you receive source code or can get it if you want it, that you can change the software or use pieces of it in new free programs, and that you know you can do these things.

To protect your rights, we need to prevent others from denying you these rights or asking you to surrender the rights. Therefore, you have certain responsibilities if you distribute copies of the software, or if you modify it: responsibilities to respect the freedom of others.

For example, if you distribute copies of such a program, whether gratis or for a fee, you must pass on to the recipients the same freedoms that you received. You must make sure that they, too, receive or can get the source code. And you must show them these terms so they know their rights.

Developers that use the GNU GPL protect your rights with two steps: (1) assert copyright on the software, and (2) offer you this License giving you legal permission to copy, distribute and/or modify it.

For the developers' and authors' protection, the GPL clearly explains that there is no warranty for this free software. For both users' and authors' sake, the GPL requires that modified versions be marked as changed, so that their problems will not be attributed erroneously to authors of previous versions.

Some devices are designed to deny users access to install or run modified versions of the software inside them, although the manufacturer can do so. This is fundamentally incompatible with the aim of protecting users' freedom to change the software. The systematic pattern of such abuse occurs in the area of products for individuals to use, which is precisely where it is most unacceptable. Therefore, we have designed this version of the GPL to prohibit the practice for those products. If such problems arise substantially in other domains, we stand ready to extend this provision to those domains in future versions of the GPL, as needed to protect the freedom of users.

Finally, every program is threatened constantly by software patents. States should not allow patents to restrict development and use of software on general-purpose computers, but in those that do, we wish to avoid the special danger that patents applied to a free program could make it effectively proprietary. To prevent this, the GPL assures that patents cannot be used to render the program non-free.

The precise terms and conditions for copying, distribution and modification follow.

TERMS AND CONDITIONS

0. Definitions.

"This License" refers to version 3 of the GNU General Public License.

"Copyright" also means copyright-like laws that apply to other kinds of works, such as semiconductor masks.

"The Program" refers to any copyrightable work licensed under this License. Each licensee is addressed as "you". "Licensees" and "recipients" may be individuals or organizations.

To "modify" a work means to copy from or adapt all or part of the work in a fashion requiring copyright permission, other than the making of an exact copy. The resulting work is called a "modified version" of the earlier work or a work "based on" the earlier work.

A "covered work" means either the unmodified Program or a work based on the Program.

To "propagate" a work means to do anything with it that, without permission, would make you directly or secondarily liable for infringement under applicable copyright law, except executing it on a computer or modifying a private copy. Propagation includes copying, distribution (with or without modification), making available to the public, and in some countries other activities as well.

To "convey" a work means any kind of propagation that enables other parties to make or receive copies. Mere interaction with a user through a computer network, with no transfer of a copy, is not conveying.

An interactive user interface displays "Appropriate Legal Notices" to the extent that it includes a convenient and prominently visible feature that (1) displays an appropriate copyright notice, and (2) tells the user that there is no warranty for the work (except to the extent that warranties are provided), that licensees may convey the work under this License, and how to view a copy of this License. If the interface presents a list of user commands or options, such as a menu, a prominent item in the list meets this criterion.

1. Source Code.

The "source code" for a work means the preferred form of the work for making modifications to it. "Object code" means any non-source form of a work.

A "Standard Interface" means an interface that either is an official standard defined by a recognized standards body, or, in the case of interfaces specified for a particular programming language, one that is widely used among developers working in that language.

The "System Libraries" of an executable work include anything, other

than the work as a whole, that (a) is included in the normal form of packaging a Major Component, but which is not part of that Major Component, and (b) serves only to enable use of the work with that Major Component, or to implement a Standard Interface for which an implementation is available to the public in source code form. A "Major Component", in this context, means a major essential component (kernel, window system, and so on) of the specific operating system (if any) on which the executable work runs, or a compiler used to produce the work, or an object code interpreter used to run it.

The "Corresponding Source" for a work in object code form means all the source code needed to generate, install, and (for an executable work) run the object code and to modify the work, including scripts to control those activities. However, it does not include the work's System Libraries, or general-purpose tools or generally available free programs which are used unmodified in performing those activities but which are not part of the work. For example, Corresponding Source includes interface definition files associated with source files for the work, and the source code for shared libraries and dynamically linked subprograms that the work is specifically designed to require, such as by intimate data communication or control flow between those subprograms and other parts of the work.

The Corresponding Source need not include anything that users can regenerate automatically from other parts of the Corresponding Source.

The Corresponding Source for a work in source code form is that same work.

2. Basic Permissions.

All rights granted under this License are granted for the term of copyright on the Program, and are irrevocable provided the stated conditions are met. This License explicitly affirms your unlimited permission to run the unmodified Program. The output from running a covered work is covered by this License only if the output, given its content, constitutes a covered work. This License acknowledges your rights of fair use or other equivalent, as provided by copyright law.

You may make, run and propagate covered works that you do not convey, without conditions so long as your license otherwise remains in force. You may convey covered works to others for the sole purpose of having them make modifications exclusively for you, or provide you with facilities for running those works, provided that you comply with the terms of this License in conveying all material for which you do not control copyright. Those thus making or running the covered works for you must do so exclusively on your behalf, under your direction

and control, on terms that prohibit them from making any copies of your copyrighted material outside their relationship with you.

Conveying under any other circumstances is permitted solely under the conditions stated below. Sublicensing is not allowed; section 10 makes it unnecessary.

3. Protecting Users' Legal Rights From Anti-Circumvention Law.

No covered work shall be deemed part of an effective technological measure under any applicable law fulfilling obligations under article 11 of the WIPO copyright treaty adopted on 20 December 1996, or similar laws prohibiting or restricting circumvention of such measures.

When you convey a covered work, you waive any legal power to forbid circumvention of technological measures to the extent such circumvention is effected by exercising rights under this License with respect to the covered work, and you disclaim any intention to limit operation or modification of the work as a means of enforcing, against the work's users, your or third parties' legal rights to forbid circumvention of technological measures.

4. Conveying Verbatim Copies.

You may convey verbatim copies of the Program's source code as you receive it, in any medium, provided that you conspicuously and appropriately publish on each copy an appropriate copyright notice; keep intact all notices stating that this License and any non-permissive terms added in accord with section 7 apply to the code; keep intact all notices of the absence of any warranty; and give all recipients a copy of this License along with the Program.

You may charge any price or no price for each copy that you convey, and you may offer support or warranty protection for a fee.

5. Conveying Modified Source Versions.

You may convey a work based on the Program, or the modifications to produce it from the Program, in the form of source code under the terms of section 4, provided that you also meet all of these conditions:

- a) The work must carry prominent notices stating that you modified it, and giving a relevant date.
- b) The work must carry prominent notices stating that it is released under this License and any conditions added under section 7. This requirement modifies the requirement in section 4 to

"keep intact all notices".

c) You must license the entire work, as a whole, under this License to anyone who comes into possession of a copy. This License will therefore apply, along with any applicable section 7 additional terms, to the whole of the work, and all its parts, regardless of how they are packaged. This License gives no permission to license the work in any other way, but it does not invalidate such permission if you have separately received it.

d) If the work has interactive user interfaces, each must display Appropriate Legal Notices; however, if the Program has interactive interfaces that do not display Appropriate Legal Notices, your work need not make them do so.

A compilation of a covered work with other separate and independent works, which are not by their nature extensions of the covered work, and which are not combined with it such as to form a larger program, in or on a volume of a storage or distribution medium, is called an "aggregate" if the compilation and its resulting copyright are not used to limit the access or legal rights of the compilation's users beyond what the individual works permit. Inclusion of a covered work in an aggregate does not cause this License to apply to the other parts of the aggregate.

6. Conveying Non-Source Forms.

You may convey a covered work in object code form under the terms of sections 4 and 5, provided that you also convey the machine-readable Corresponding Source under the terms of this License, in one of these ways:

a) Convey the object code in, or embodied in, a physical product (including a physical distribution medium), accompanied by the Corresponding Source fixed on a durable physical medium customarily used for software interchange.

b) Convey the object code in, or embodied in, a physical product (including a physical distribution medium), accompanied by a written offer, valid for at least three years and valid for as long as you offer spare parts or customer support for that product model, to give anyone who possesses the object code either (1) a copy of the Corresponding Source for all the software in the product that is covered by this License, on a durable physical medium customarily used for software interchange, for a price no more than your reasonable cost of physically performing this conveying of source, or (2) access to copy the Corresponding Source from a network server at no charge.

c) Convey individual copies of the object code with a copy of the written offer to provide the Corresponding Source. This alternative is allowed only occasionally and noncommercially, and only if you received the object code with such an offer, in accord with subsection 6b.

d) Convey the object code by offering access from a designated place (gratis or for a charge), and offer equivalent access to the Corresponding Source in the same way through the same place at no further charge. You need not require recipients to copy the Corresponding Source along with the object code. If the place to copy the object code is a network server, the Corresponding Source may be on a different server (operated by you or a third party) that supports equivalent copying facilities, provided you maintain clear directions next to the object code saying where to find the Corresponding Source. Regardless of what server hosts the Corresponding Source, you remain obligated to ensure that it is available for as long as needed to satisfy these requirements.

e) Convey the object code using peer-to-peer transmission, provided you inform other peers where the object code and Corresponding Source of the work are being offered to the general public at no charge under subsection 6d.

A separable portion of the object code, whose source code is excluded from the Corresponding Source as a System Library, need not be included in conveying the object code work.

A "User Product" is either (1) a "consumer product", which means any tangible personal property which is normally used for personal, family, or household purposes, or (2) anything designed or sold for incorporation into a dwelling. In determining whether a product is a consumer product, doubtful cases shall be resolved in favor of coverage. For a particular product received by a particular user, "normally used" refers to a typical or common use of that class of product, regardless of the status of the particular user or of the way in which the particular user actually uses, or expects or is expected to use, the product. A product is a consumer product regardless of whether the product has substantial commercial, industrial or non-consumer uses, unless such uses represent the only significant mode of use of the product.

"Installation Information" for a User Product means any methods, procedures, authorization keys, or other information required to install and execute modified versions of a covered work in that User Product from a modified version of its Corresponding Source. The information must suffice to ensure that the continued functioning of the modified object code is in no case prevented or interfered with solely because

modification has been made.

If you convey an object code work under this section in, or with, or specifically for use in, a User Product, and the conveying occurs as part of a transaction in which the right of possession and use of the User Product is transferred to the recipient in perpetuity or for a fixed term (regardless of how the transaction is characterized), the Corresponding Source conveyed under this section must be accompanied by the Installation Information. But this requirement does not apply if neither you nor any third party retains the ability to install modified object code on the User Product (for example, the work has been installed in ROM).

The requirement to provide Installation Information does not include a requirement to continue to provide support service, warranty, or updates for a work that has been modified or installed by the recipient, or for the User Product in which it has been modified or installed. Access to a network may be denied when the modification itself materially and adversely affects the operation of the network or violates the rules and protocols for communication across the network.

Corresponding Source conveyed, and Installation Information provided, in accord with this section must be in a format that is publicly documented (and with an implementation available to the public in source code form), and must require no special password or key for unpacking, reading or copying.

7. Additional Terms.

"Additional permissions" are terms that supplement the terms of this License by making exceptions from one or more of its conditions. Additional permissions that are applicable to the entire Program shall be treated as though they were included in this License, to the extent that they are valid under applicable law. If additional permissions apply only to part of the Program, that part may be used separately under those permissions, but the entire Program remains governed by this License without regard to the additional permissions.

When you convey a copy of a covered work, you may at your option remove any additional permissions from that copy, or from any part of it. (Additional permissions may be written to require their own removal in certain cases when you modify the work.) You may place additional permissions on material, added by you to a covered work, for which you have or can give appropriate copyright permission.

Notwithstanding any other provision of this License, for material you add to a covered work, you may (if authorized by the copyright holders of that material) supplement the terms of this License with terms:

- a) Disclaiming warranty or limiting liability differently from the terms of sections 15 and 16 of this License; or
- b) Requiring preservation of specified reasonable legal notices or author attributions in that material or in the Appropriate Legal Notices displayed by works containing it; or
- c) Prohibiting misrepresentation of the origin of that material, or requiring that modified versions of such material be marked in reasonable ways as different from the original version; or
- d) Limiting the use for publicity purposes of names of licensors or authors of the material; or
- e) Declining to grant rights under trademark law for use of some trade names, trademarks, or service marks; or
- f) Requiring indemnification of licensors and authors of that material by anyone who conveys the material (or modified versions of it) with contractual assumptions of liability to the recipient, for any liability that these contractual assumptions directly impose on those licensors and authors.

All other non-permissive additional terms are considered "further restrictions" within the meaning of section 10. If the Program as you received it, or any part of it, contains a notice stating that it is governed by this License along with a term that is a further restriction, you may remove that term. If a license document contains a further restriction but permits relicensing or conveying under this License, you may add to a covered work material governed by the terms of that license document, provided that the further restriction does not survive such relicensing or conveying.

If you add terms to a covered work in accord with this section, you must place, in the relevant source files, a statement of the additional terms that apply to those files, or a notice indicating where to find the applicable terms.

Additional terms, permissive or non-permissive, may be stated in the form of a separately written license, or stated as exceptions; the above requirements apply either way.

8. Termination.

You may not propagate or modify a covered work except as expressly provided under this License. Any attempt otherwise to propagate or modify it is void, and will automatically terminate your rights under

this License (including any patent licenses granted under the third paragraph of section 11).

However, if you cease all violation of this License, then your license from a particular copyright holder is reinstated (a) provisionally, unless and until the copyright holder explicitly and finally terminates your license, and (b) permanently, if the copyright holder fails to notify you of the violation by some reasonable means prior to 60 days after the cessation.

Moreover, your license from a particular copyright holder is reinstated permanently if the copyright holder notifies you of the violation by some reasonable means, this is the first time you have received notice of violation of this License (for any work) from that copyright holder, and you cure the violation prior to 30 days after your receipt of the notice.

Termination of your rights under this section does not terminate the licenses of parties who have received copies or rights from you under this License. If your rights have been terminated and not permanently reinstated, you do not qualify to receive new licenses for the same material under section 10.

9. Acceptance Not Required for Having Copies.

You are not required to accept this License in order to receive or run a copy of the Program. Ancillary propagation of a covered work occurring solely as a consequence of using peer-to-peer transmission to receive a copy likewise does not require acceptance. However, nothing other than this License grants you permission to propagate or modify any covered work. These actions infringe copyright if you do not accept this License. Therefore, by modifying or propagating a covered work, you indicate your acceptance of this License to do so.

10. Automatic Licensing of Downstream Recipients.

Each time you convey a covered work, the recipient automatically receives a license from the original licensors, to run, modify and propagate that work, subject to this License. You are not responsible for enforcing compliance by third parties with this License.

An "entity transaction" is a transaction transferring control of an organization, or substantially all assets of one, or subdividing an organization, or merging organizations. If propagation of a covered work results from an entity transaction, each party to that transaction who receives a copy of the work also receives whatever licenses to the work the party's predecessor in interest had or could give under the previous paragraph, plus a right to possession of the

Corresponding Source of the work from the predecessor in interest, if the predecessor has it or can get it with reasonable efforts.

You may not impose any further restrictions on the exercise of the rights granted or affirmed under this License. For example, you may not impose a license fee, royalty, or other charge for exercise of rights granted under this License, and you may not initiate litigation (including a cross-claim or counterclaim in a lawsuit) alleging that any patent claim is infringed by making, using, selling, offering for sale, or importing the Program or any portion of it.

11. Patents.

A "contributor" is a copyright holder who authorizes use under this License of the Program or a work on which the Program is based. The work thus licensed is called the contributor's "contributor version".

A contributor's "essential patent claims" are all patent claims owned or controlled by the contributor, whether already acquired or hereafter acquired, that would be infringed by some manner, permitted by this License, of making, using, or selling its contributor version, but do not include claims that would be infringed only as a consequence of further modification of the contributor version. For purposes of this definition, "control" includes the right to grant patent sublicenses in a manner consistent with the requirements of this License.

Each contributor grants you a non-exclusive, worldwide, royalty-free patent license under the contributor's essential patent claims, to make, use, sell, offer for sale, import and otherwise run, modify and propagate the contents of its contributor version.

In the following three paragraphs, a "patent license" is any express agreement or commitment, however denominated, not to enforce a patent (such as an express permission to practice a patent or covenant not to sue for patent infringement). To "grant" such a patent license to a party means to make such an agreement or commitment not to enforce a patent against the party.

If you convey a covered work, knowingly relying on a patent license, and the Corresponding Source of the work is not available for anyone to copy, free of charge and under the terms of this License, through a publicly available network server or other readily accessible means, then you must either (1) cause the Corresponding Source to be so available, or (2) arrange to deprive yourself of the benefit of the patent license for this particular work, or (3) arrange, in a manner consistent with the requirements of this License, to extend the patent license to downstream recipients. "Knowingly relying" means you have

actual knowledge that, but for the patent license, your conveying the covered work in a country, or your recipient's use of the covered work in a country, would infringe one or more identifiable patents in that country that you have reason to believe are valid.

If, pursuant to or in connection with a single transaction or arrangement, you convey, or propagate by procuring conveyance of, a covered work, and grant a patent license to some of the parties receiving the covered work authorizing them to use, propagate, modify or convey a specific copy of the covered work, then the patent license you grant is automatically extended to all recipients of the covered work and works based on it.

A patent license is "discriminatory" if it does not include within the scope of its coverage, prohibits the exercise of, or is conditioned on the non-exercise of one or more of the rights that are specifically granted under this License. You may not convey a covered work if you are a party to an arrangement with a third party that is in the business of distributing software, under which you make payment to the third party based on the extent of your activity of conveying the work, and under which the third party grants, to any of the parties who would receive the covered work from you, a discriminatory patent license (a) in connection with copies of the covered work conveyed by you (or copies made from those copies), or (b) primarily for and in connection with specific products or compilations that contain the covered work, unless you entered into that arrangement, or that patent license was granted, prior to 28 March 2007.

Nothing in this License shall be construed as excluding or limiting any implied license or other defenses to infringement that may otherwise be available to you under applicable patent law.

12. No Surrender of Others' Freedom.

If conditions are imposed on you (whether by court order, agreement or otherwise) that contradict the conditions of this License, they do not excuse you from the conditions of this License. If you cannot convey a covered work so as to satisfy simultaneously your obligations under this License and any other pertinent obligations, then as a consequence you may not convey it at all. For example, if you agree to terms that obligate you to collect a royalty for further conveying from those to whom you convey the Program, the only way you could satisfy both those terms and this License would be to refrain entirely from conveying the Program.

13. Use with the GNU Affero General Public License.

Notwithstanding any other provision of this License, you have permission to link or combine any covered work with a work licensed

under version 3 of the GNU Affero General Public License into a single combined work, and to convey the resulting work. The terms of this License will continue to apply to the part which is the covered work, but the special requirements of the GNU Affero General Public License, section 13, concerning interaction through a network will apply to the combination as such.

14. Revised Versions of this License.

The Free Software Foundation may publish revised and/or new versions of the GNU General Public License from time to time. Such new versions will be similar in spirit to the present version, but may differ in detail to address new problems or concerns.

Each version is given a distinguishing version number. If the Program specifies that a certain numbered version of the GNU General Public License "or any later version" applies to it, you have the option of following the terms and conditions either of that numbered version or of any later version published by the Free Software Foundation. If the Program does not specify a version number of the GNU General Public License, you may choose any version ever published by the Free Software Foundation.

If the Program specifies that a proxy can decide which future versions of the GNU General Public License can be used, that proxy's public statement of acceptance of a version permanently authorizes you to choose that version for the Program.

Later license versions may give you additional or different permissions. However, no additional obligations are imposed on any author or copyright holder as a result of your choosing to follow a later version.

15. Disclaimer of Warranty.

THERE IS NO WARRANTY FOR THE PROGRAM, TO THE EXTENT PERMITTED BY APPLICABLE LAW. EXCEPT WHEN OTHERWISE STATED IN WRITING THE COPYRIGHT HOLDERS AND/OR OTHER PARTIES PROVIDE THE PROGRAM "AS IS" WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. THE ENTIRE RISK AS TO THE QUALITY AND PERFORMANCE OF THE PROGRAM IS WITH YOU. SHOULD THE PROGRAM PROVE DEFECTIVE, YOU ASSUME THE COST OF ALL NECESSARY SERVICING, REPAIR OR CORRECTION.

16. Limitation of Liability.

IN NO EVENT UNLESS REQUIRED BY APPLICABLE LAW OR AGREED TO IN WRITING WILL ANY COPYRIGHT HOLDER, OR ANY OTHER PARTY WHO MODIFIES AND/OR CONVEYS

THE PROGRAM AS PERMITTED ABOVE, BE LIABLE TO YOU FOR DAMAGES, INCLUDING ANY GENERAL, SPECIAL, INCIDENTAL OR CONSEQUENTIAL DAMAGES ARISING OUT OF THE USE OR INABILITY TO USE THE PROGRAM (INCLUDING BUT NOT LIMITED TO LOSS OF DATA OR DATA BEING RENDERED INACCURATE OR LOSSES SUSTAINED BY YOU OR THIRD PARTIES OR A FAILURE OF THE PROGRAM TO OPERATE WITH ANY OTHER PROGRAMS), EVEN IF SUCH HOLDER OR OTHER PARTY HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

17. Interpretation of Sections 15 and 16.

If the disclaimer of warranty and limitation of liability provided above cannot be given local legal effect according to their terms, reviewing courts shall apply local law that most closely approximates an absolute waiver of all civil liability in connection with the Program, unless a warranty or assumption of liability accompanies a copy of the Program in return for a fee.

END OF TERMS AND CONDITIONS

How to Apply These Terms to Your New Programs

If you develop a new program, and you want it to be of the greatest possible use to the public, the best way to achieve this is to make it free software which everyone can redistribute and change under these terms.

To do so, attach the following notices to the program. It is safest to attach them to the start of each source file to most effectively state the exclusion of warranty; and each file should have at least the "copyright" line and a pointer to where the full notice is found.

```
<one line to give the program's name and a brief idea of what it does.>  
Copyright (C) <year> <name of author>
```

```
This program is free software: you can redistribute it and/or modify  
it under the terms of the GNU General Public License as published by  
the Free Software Foundation, either version 3 of the License, or  
(at your option) any later version.
```

```
This program is distributed in the hope that it will be useful,  
but WITHOUT ANY WARRANTY; without even the implied warranty of  
MERCHANTABILITY or FITNESS FOR A PARTICULAR PURPOSE. See the  
GNU General Public License for more details.
```

```
You should have received a copy of the GNU General Public License  
along with this program. If not, see <http://www.gnu.org/licenses/>.
```

Also add information on how to contact you by electronic and paper mail.

If the program does terminal interaction, make it output a short notice like this when it starts in an interactive mode:

```
<program> Copyright (C) <year> <name of author>
This program comes with ABSOLUTELY NO WARRANTY; for details type `show w'.
This is free software, and you are welcome to redistribute it
under certain conditions; type `show c' for details.
```

The hypothetical commands `show w' and `show c' should show the appropriate parts of the General Public License. Of course, your program's commands might be different; for a GUI interface, you would use an "about box".

You should also get your employer (if you work as a programmer) or school, if any, to sign a "copyright disclaimer" for the program, if necessary. For more information on this, and how to apply and follow the GNU GPL, see <http://www.gnu.org/licenses/>.

The GNU General Public License does not permit incorporating your program into proprietary programs. If your program is a subroutine library, you may consider it more useful to permit linking proprietary applications with the library. If this is what you want to do, use the GNU Lesser General Public License instead of this License. But first, please read <http://www.gnu.org/philosophy/why-not-lgpl.html>.

```
@c The GNU Free Documentation License.
@center Version 1.3, 3 November 2008
```

```
@c This file is intended to be included within another document,
@c hence no sectioning command or @node.
```

```
@display

```
@enumerate 0
@item
PREAMBLE
```

The purpose of this License is to make a manual, textbook, or other functional and useful document @dfn{free} in the sense of freedom: to assure everyone the effective freedom to copy and redistribute it, with or without modifying it, either commercially or noncommercially. Secondly, this License preserves for the author and publisher a way to get credit for their work, while not being considered responsible for modifications made by others.

This License is a kind of "copyleft", which means that derivative works of the document must themselves be free in the same sense. It complements the GNU General Public License, which is a copyleft license designed for free software.

We have designed this License in order to use it for manuals for free software, because free software needs free documentation: a free program should come with manuals providing the same freedoms that the software does. But this License is not limited to software manuals; it can be used for any textual work, regardless of subject matter or whether it is published as a printed book. We recommend this License principally for works whose purpose is instruction or reference.

@item

APPLICABILITY AND DEFINITIONS

This License applies to any manual or other work, in any medium, that contains a notice placed by the copyright holder saying it can be distributed under the terms of this License. Such a notice grants a world-wide, royalty-free license, unlimited in duration, to use that work under the conditions stated herein. The "Document", below, refers to any such manual or work. Any member of the public is a licensee, and is addressed as "you". You accept the license if you copy, modify or distribute the work in a way requiring permission under copyright law.

A "Modified Version" of the Document means any work containing the Document or a portion of it, either copied verbatim, or with modifications and/or translated into another language.

A "Secondary Section" is a named appendix or a front-matter section of the Document that deals exclusively with the relationship of the publishers or authors of the Document to the Document's overall subject (or to related matters) and contains nothing that could fall directly within that overall subject. (Thus, if the Document is in part a textbook of mathematics, a Secondary Section may not explain any mathematics.) The relationship could be a matter of historical connection with the subject or with related matters, or of legal, commercial, philosophical, ethical or political position regarding them.

The "Invariant Sections" are certain Secondary Sections whose titles are designated, as being those of Invariant Sections, in the notice that says that the Document is released under this License. If a section does not fit the above definition of Secondary then it is not allowed to be designated as Invariant. The Document may contain zero Invariant Sections. If the Document does not identify any Invariant

Sections then there are none.

The ``Cover Texts" are certain short passages of text that are listed, as Front-Cover Texts or Back-Cover Texts, in the notice that says that the Document is released under this License. A Front-Cover Text may be at most 5 words, and a Back-Cover Text may be at most 25 words.

A ``Transparent" copy of the Document means a machine-readable copy, represented in a format whose specification is available to the general public, that is suitable for revising the document straightforwardly with generic text editors or (for images composed of pixels) generic paint programs or (for drawings) some widely available drawing editor, and that is suitable for input to text formatters or for automatic translation to a variety of formats suitable for input to text formatters. A copy made in an otherwise Transparent file format whose markup, or absence of markup, has been arranged to thwart or discourage subsequent modification by readers is not Transparent. An image format is not Transparent if used for any substantial amount of text. A copy that is not ``Transparent" is called ``Opaque".

Examples of suitable formats for Transparent copies include plain `@sc{ascii}` without markup, Texinfo input format, `La@TeX{}` input format, `@acronym{SGML}` or `@acronym{XML}` using a publicly available `@acronym{DTD}`, and standard-conforming simple `@acronym{HTML}`, PostScript or `@acronym{PDF}` designed for human modification. Examples of transparent image formats include `@acronym{PNG}`, `@acronym{XCF}` and `@acronym{JPG}`. Opaque formats include proprietary formats that can be read and edited only by proprietary word processors, `@acronym{SGML}` or `@acronym{XML}` for which the `@acronym{DTD}` and/or processing tools are not generally available, and the machine-generated `@acronym{HTML}`, PostScript or `@acronym{PDF}` produced by some word processors for output purposes only.

The ``Title Page" means, for a printed book, the title page itself, plus such following pages as are needed to hold, legibly, the material this License requires to appear in the title page. For works in formats which do not have any title page as such, ``Title Page" means the text near the most prominent appearance of the work's title, preceding the beginning of the body of the text.

The ``publisher" means any person or entity that distributes copies of the Document to the public.

A section ``Entitled XYZ" means a named subunit of the Document whose title either is precisely XYZ or contains XYZ in parentheses following text that translates XYZ in another language. (Here XYZ stands for a specific section name mentioned below, such as ``Acknowledgements", ``Dedications", ``Endorsements", or ``History".) To ``Preserve the Title"

of such a section when you modify the Document means that it remains a section ``Entitled XYZ" according to this definition.

The Document may include Warranty Disclaimers next to the notice which states that this License applies to the Document. These Warranty Disclaimers are considered to be included by reference in this License, but only as regards disclaiming warranties: any other implication that these Warranty Disclaimers may have is void and has no effect on the meaning of this License.

@item

VERBATIM COPYING

You may copy and distribute the Document in any medium, either commercially or noncommercially, provided that this License, the copyright notices, and the license notice saying this License applies to the Document are reproduced in all copies, and that you add no other conditions whatsoever to those of this License. You may not use technical measures to obstruct or control the reading or further copying of the copies you make or distribute. However, you may accept compensation in exchange for copies. If you distribute a large enough number of copies you must also follow the conditions in section 3.

You may also lend copies, under the same conditions stated above, and you may publicly display copies.

@item

COPYING IN QUANTITY

If you publish printed copies (or copies in media that commonly have printed covers) of the Document, numbering more than 100, and the Document's license notice requires Cover Texts, you must enclose the copies in covers that carry, clearly and legibly, all these Cover Texts: Front-Cover Texts on the front cover, and Back-Cover Texts on the back cover. Both covers must also clearly and legibly identify you as the publisher of these copies. The front cover must present the full title with all words of the title equally prominent and visible. You may add other material on the covers in addition. Copying with changes limited to the covers, as long as they preserve the title of the Document and satisfy these conditions, can be treated as verbatim copying in other respects.

If the required texts for either cover are too voluminous to fit legibly, you should put the first ones listed (as many as fit reasonably) on the actual cover, and continue the rest onto adjacent pages.

If you publish or distribute Opaque copies of the Document numbering

more than 100, you must either include a machine-readable Transparent copy along with each Opaque copy, or state in or with each Opaque copy a computer-network location from which the general network-using public has access to download using public-standard network protocols a complete Transparent copy of the Document, free of added material. If you use the latter option, you must take reasonably prudent steps, when you begin distribution of Opaque copies in quantity, to ensure that this Transparent copy will remain thus accessible at the stated location until at least one year after the last time you distribute an Opaque copy (directly or through your agents or retailers) of that edition to the public.

It is requested, but not required, that you contact the authors of the Document well before redistributing any large number of copies, to give them a chance to provide you with an updated version of the Document.

@item

MODIFICATIONS

You may copy and distribute a Modified Version of the Document under the conditions of sections 2 and 3 above, provided that you release the Modified Version under precisely this License, with the Modified Version filling the role of the Document, thus licensing distribution and modification of the Modified Version to whoever possesses a copy of it. In addition, you must do these things in the Modified Version:

@enumerate A

@item

Use in the Title Page (and on the covers, if any) a title distinct from that of the Document, and from those of previous versions (which should, if there were any, be listed in the History section of the Document). You may use the same title as a previous version if the original publisher of that version gives permission.

@item

List on the Title Page, as authors, one or more persons or entities responsible for authorship of the modifications in the Modified Version, together with at least five of the principal authors of the Document (all of its principal authors, if it has fewer than five), unless they release you from this requirement.

@item

State on the Title page the name of the publisher of the Modified Version, as the publisher.

@item

Preserve all the copyright notices of the Document.

@item

Add an appropriate copyright notice for your modifications adjacent to the other copyright notices.

@item

Include, immediately after the copyright notices, a license notice giving the public permission to use the Modified Version under the terms of this License, in the form shown in the Addendum below.

@item

Preserve in that license notice the full lists of Invariant Sections and required Cover Texts given in the Document's license notice.

@item

Include an unaltered copy of this License.

@item

Preserve the section Entitled ``History'', Preserve its Title, and add to it an item stating at least the title, year, new authors, and publisher of the Modified Version as given on the Title Page. If there is no section Entitled ``History'' in the Document, create one stating the title, year, authors, and publisher of the Document as given on its Title Page, then add an item describing the Modified Version as stated in the previous sentence.

@item

Preserve the network location, if any, given in the Document for public access to a Transparent copy of the Document, and likewise the network locations given in the Document for previous versions it was based on. These may be placed in the ``History'' section. You may omit a network location for a work that was published at least four years before the Document itself, or if the original publisher of the version it refers to gives permission.

@item

For any section Entitled ``Acknowledgements'' or ``Dedications'', Preserve the Title of the section, and preserve in the section all the substance and tone of each of the contributor acknowledgements and/or dedications given therein.

@item

Preserve all the Invariant Sections of the Document, unaltered in their text and in their titles. Section numbers or the equivalent are not considered part of the section titles.

@item

Delete any section Entitled ``Endorsements''. Such a section may not be included in the Modified Version.

@item

Do not retitle any existing section to be Entitled ``Endorsements" or to conflict in title with any Invariant Section.

@item

Preserve any Warranty Disclaimers.

@end enumerate

If the Modified Version includes new front-matter sections or appendices that qualify as Secondary Sections and contain no material copied from the Document, you may at your option designate some or all of these sections as invariant. To do this, add their titles to the list of Invariant Sections in the Modified Version's license notice. These titles must be distinct from any other section titles.

You may add a section Entitled ``Endorsements", provided it contains nothing but endorsements of your Modified Version by various parties---for example, statements of peer review or that the text has been approved by an organization as the authoritative definition of a standard.

You may add a passage of up to five words as a Front-Cover Text, and a passage of up to 25 words as a Back-Cover Text, to the end of the list of Cover Texts in the Modified Version. Only one passage of Front-Cover Text and one of Back-Cover Text may be added by (or through arrangements made by) any one entity. If the Document already includes a cover text for the same cover, previously added by you or by arrangement made by the same entity you are acting on behalf of, you may not add another; but you may replace the old one, on explicit permission from the previous publisher that added the old one.

The author(s) and publisher(s) of the Document do not by this License give permission to use their names for publicity for or to assert or imply endorsement of any Modified Version.

@item

COMBINING DOCUMENTS

You may combine the Document with other documents released under this License, under the terms defined in section 4 above for modified versions, provided that you include in the combination all of the Invariant Sections of all of the original documents, unmodified, and list them all as Invariant Sections of your combined work in its license notice, and that you preserve all their Warranty Disclaimers.

The combined work need only contain one copy of this License, and multiple identical Invariant Sections may be replaced with a single

copy. If there are multiple Invariant Sections with the same name but different contents, make the title of each such section unique by adding at the end of it, in parentheses, the name of the original author or publisher of that section if known, or else a unique number. Make the same adjustment to the section titles in the list of Invariant Sections in the license notice of the combined work.

In the combination, you must combine any sections Entitled ``History'' in the various original documents, forming one section Entitled ``History''; likewise combine any sections Entitled ``Acknowledgements'', and any sections Entitled ``Dedications''. You must delete all sections Entitled ``Endorsements.''

@item

COLLECTIONS OF DOCUMENTS

You may make a collection consisting of the Document and other documents released under this License, and replace the individual copies of this License in the various documents with a single copy that is included in the collection, provided that you follow the rules of this License for verbatim copying of each of the documents in all other respects.

You may extract a single document from such a collection, and distribute it individually under this License, provided you insert a copy of this License into the extracted document, and follow this License in all other respects regarding verbatim copying of that document.

@item

AGGREGATION WITH INDEPENDENT WORKS

A compilation of the Document or its derivatives with other separate and independent documents or works, in or on a volume of a storage or distribution medium, is called an ``aggregate'' if the copyright resulting from the compilation is not used to limit the legal rights of the compilation's users beyond what the individual works permit. When the Document is included in an aggregate, this License does not apply to the other works in the aggregate which are not themselves derivative works of the Document.

If the Cover Text requirement of section 3 is applicable to these copies of the Document, then if the Document is less than one half of the entire aggregate, the Document's Cover Texts may be placed on covers that bracket the Document within the aggregate, or the electronic equivalent of covers if the Document is in electronic form. Otherwise they must appear on printed covers that bracket the whole aggregate.

@item

TRANSLATION

Translation is considered a kind of modification, so you may distribute translations of the Document under the terms of section 4. Replacing Invariant Sections with translations requires special permission from their copyright holders, but you may include translations of some or all Invariant Sections in addition to the original versions of these Invariant Sections. You may include a translation of this License, and all the license notices in the Document, and any Warranty Disclaimers, provided that you also include the original English version of this License and the original versions of those notices and disclaimers. In case of a disagreement between the translation and the original version of this License or a notice or disclaimer, the original version will prevail.

If a section in the Document is Entitled ``Acknowledgements'', ``Dedications'', or ``History'', the requirement (section 4) to Preserve its Title (section 1) will typically require changing the actual title.

@item

TERMINATION

You may not copy, modify, sublicense, or distribute the Document except as expressly provided under this License. Any attempt otherwise to copy, modify, sublicense, or distribute it is void, and will automatically terminate your rights under this License.

However, if you cease all violation of this License, then your license from a particular copyright holder is reinstated (a) provisionally, unless and until the copyright holder explicitly and finally terminates your license, and (b) permanently, if the copyright holder fails to notify you of the violation by some reasonable means prior to 60 days after the cessation.

Moreover, your license from a particular copyright holder is reinstated permanently if the copyright holder notifies you of the violation by some reasonable means, this is the first time you have received notice of violation of this License (for any work) from that copyright holder, and you cure the violation prior to 30 days after your receipt of the notice.

Termination of your rights under this section does not terminate the licenses of parties who have received copies or rights from you under this License. If your rights have been terminated and not permanently reinstated, receipt of a copy of some or all of the same material does not give you any rights to use it.

@item

FUTURE REVISIONS OF THIS LICENSE

The Free Software Foundation may publish new, revised versions of the GNU Free Documentation License from time to time. Such new versions will be similar in spirit to the present version, but may differ in detail to address new problems or concerns. See [@uref{http://www.gnu.org/copyleft/}](http://www.gnu.org/copyleft/).

Each version of the License is given a distinguishing version number. If the Document specifies that a particular numbered version of this License "or any later version" applies to it, you have the option of following the terms and conditions either of that specified version or of any later version that has been published (not as a draft) by the Free Software Foundation. If the Document does not specify a version number of this License, you may choose any version ever published (not as a draft) by the Free Software Foundation. If the Document specifies that a proxy can decide which future versions of this License can be used, that proxy's public statement of acceptance of a version permanently authorizes you to choose that version for the Document.

@item

RELICENSING

"Massive Multiauthor Collaboration Site" (or "MMC Site") means any World Wide Web server that publishes copyrightable works and also provides prominent facilities for anybody to edit those works. A public wiki that anybody can edit is an example of such a server. A "Massive Multiauthor Collaboration" (or "MMC") contained in the site means any set of copyrightable works thus published on the MMC site.

"CC-BY-SA" means the Creative Commons Attribution-Share Alike 3.0 license published by Creative Commons Corporation, a not-for-profit corporation with a principal place of business in San Francisco, California, as well as future copyleft versions of that license published by that same organization.

"Incorporate" means to publish or republish a Document, in whole or in part, as part of another Document.

An MMC is "eligible for relicensing" if it is licensed under this License, and if all works that were first published under this License somewhere other than this MMC, and subsequently incorporated in whole or in part into the MMC, (1) had no cover texts or invariant sections, and (2) were thus incorporated prior to November 1, 2008.

The operator of an MMC Site may republish an MMC contained in the site under CC-BY-SA on the same site at any time before August 1, 2009, provided the MMC is eligible for relicensing.

@end enumerate

@page

@heading ADDENDUM: How to use this License for your documents

To use this License in a document you have written, include a copy of the License in the document and put the following copyright and license notices just after the title page:

@smallexample

@group

Copyright (C) @var{year} @var{your name}.

Permission is granted to copy, distribute and/or modify this document under the terms of the GNU Free Documentation License, Version 1.3 or any later version published by the Free Software Foundation; with no Invariant Sections, no Front-Cover Texts, and no Back-Cover Texts. A copy of the license is included in the section entitled ``GNU Free Documentation License''.

@end group

@end smallexample

If you have Invariant Sections, Front-Cover Texts and Back-Cover Texts, replace the ``with@dots{ }Texts." line with this:

@smallexample

@group

with the Invariant Sections being @var{list their titles}, with the Front-Cover Texts being @var{list}, and with the Back-Cover Texts being @var{list}.

@end group

@end smallexample

If you have Invariant Sections without Cover Texts, or some other combination of the three, merge those two alternatives to suit the situation.

If your document contains nontrivial examples of program code, we recommend releasing these examples in parallel under your choice of free software license, such as the GNU General Public License, to permit their use in free software.

@c Local Variables:

@end display

@heading Preamble

The GNU General Public License is a free, copyleft license for software and other kinds of works.

The licenses for most software and other practical works are designed to take away your freedom to share and change the works. By contrast, the GNU General Public License is intended to guarantee your freedom to share and change all versions of a program---to make sure it remains free software for all its users. We, the Free Software Foundation, use the GNU General Public License for most of our software; it applies also to any other work released this way by its authors. You can apply it to your programs, too.

When we speak of free software, we are referring to freedom, not price. Our General Public Licenses are designed to make sure that you have the freedom to distribute copies of free software (and charge for them if you wish), that you receive source code or can get it if you want it, that you can change the software or use pieces of it in new free programs, and that you know you can do these things.

To protect your rights, we need to prevent others from denying you these rights or asking you to surrender the rights. Therefore, you have certain responsibilities if you distribute copies of the software, or if you modify it: responsibilities to respect the freedom of others.

For example, if you distribute copies of such a program, whether gratis or for a fee, you must pass on to the recipients the same freedoms that you received. You must make sure that they, too, receive or can get the source code. And you must show them these terms so they know their rights.

Developers that use the GNU GPL protect your rights with two steps:

(1) assert copyright on the software, and (2) offer you this License

giving you legal permission to copy, distribute and/or modify it.

For the developers' and authors' protection, the GPL clearly explains that there is no warranty for this free software. For both users' and authors' sake, the GPL requires that modified versions be marked as changed, so that their problems will not be attributed erroneously to authors of previous versions.

Some devices are designed to deny users access to install or run modified versions of the software inside them, although the manufacturer can do so. This is fundamentally incompatible with the aim of protecting users' freedom to change the software. The systematic pattern of such abuse occurs in the area of products for individuals to use, which is precisely where it is most unacceptable. Therefore, we have designed this version of the GPL to prohibit the practice for those products. If such problems arise substantially in other domains, we stand ready to extend this provision to those domains in future versions of the GPL, as needed to protect the freedom of users.

Finally, every program is threatened constantly by software patents. States should not allow patents to restrict development and use of software on general-purpose computers, but in those that do, we wish to avoid the special danger that patents applied to a free program could make it effectively proprietary. To prevent this, the GPL assures that patents cannot be used to render the program non-free.

The precise terms and conditions for copying, distribution and modification follow.

@heading TERMS AND CONDITIONS

@enumerate 0

@item Definitions.

``This License" refers to version 3 of the GNU General Public License.

``Copyright" also means copyright-like laws that apply to other kinds of works, such as semiconductor masks.

``The Program" refers to any copyrightable work licensed under this License. Each licensee is addressed as ``you". ``Licensees" and ``recipients" may be individuals or organizations.

To ``modify" a work means to copy from or adapt all or part of the work in a fashion requiring copyright permission, other than the making of an exact copy. The resulting work is called a ``modified version" of the earlier work or a work ``based on" the earlier work.

A "covered work" means either the unmodified Program or a work based on the Program.

To "propagate" a work means to do anything with it that, without permission, would make you directly or secondarily liable for infringement under applicable copyright law, except executing it on a computer or modifying a private copy. Propagation includes copying, distribution (with or without modification), making available to the public, and in some countries other activities as well.

To "convey" a work means any kind of propagation that enables other parties to make or receive copies. Mere interaction with a user through a computer network, with no transfer of a copy, is not conveying.

An interactive user interface displays "Appropriate Legal Notices" to the extent that it includes a convenient and prominently visible feature that (1) displays an appropriate copyright notice, and (2) tells the user that there is no warranty for the work (except to the extent that warranties are provided), that licensees may convey the work under this License, and how to view a copy of this License. If the interface presents a list of user commands or options, such as a menu, a prominent item in the list meets this criterion.

@item Source Code.

The "source code" for a work means the preferred form of the work for making modifications to it. "Object code" means any non-source form of a work.

A "Standard Interface" means an interface that either is an official standard defined by a recognized standards body, or, in the case of interfaces specified for a particular programming language, one that is widely used among developers working in that language.

The "System Libraries" of an executable work include anything, other than the work as a whole, that (a) is included in the normal form of packaging a Major Component, but which is not part of that Major Component, and (b) serves only to enable use of the work with that Major Component, or to implement a Standard Interface for which an implementation is available to the public in source code form. A "Major Component", in this context, means a major essential component (kernel, window system, and so on) of the specific operating system (if any) on which the executable work runs, or a compiler used to produce the work, or an object code interpreter used to run it.

The "Corresponding Source" for a work in object code form means all

the source code needed to generate, install, and (for an executable work) run the object code and to modify the work, including scripts to control those activities. However, it does not include the work's System Libraries, or general-purpose tools or generally available free programs which are used unmodified in performing those activities but which are not part of the work. For example, Corresponding Source includes interface definition files associated with source files for the work, and the source code for shared libraries and dynamically linked subprograms that the work is specifically designed to require, such as by intimate data communication or control flow between those subprograms and other parts of the work.

The Corresponding Source need not include anything that users can regenerate automatically from other parts of the Corresponding Source.

The Corresponding Source for a work in source code form is that same work.

@item Basic Permissions.

All rights granted under this License are granted for the term of copyright on the Program, and are irrevocable provided the stated conditions are met. This License explicitly affirms your unlimited permission to run the unmodified Program. The output from running a covered work is covered by this License only if the output, given its content, constitutes a covered work. This License acknowledges your rights of fair use or other equivalent, as provided by copyright law.

You may make, run and propagate covered works that you do not convey, without conditions so long as your license otherwise remains in force. You may convey covered works to others for the sole purpose of having them make modifications exclusively for you, or provide you with facilities for running those works, provided that you comply with the terms of this License in conveying all material for which you do not control copyright. Those thus making or running the covered works for you must do so exclusively on your behalf, under your direction and control, on terms that prohibit them from making any copies of your copyrighted material outside their relationship with you.

Conveying under any other circumstances is permitted solely under the conditions stated below. Sublicensing is not allowed; section 10 makes it unnecessary.

@item Protecting Users' Legal Rights From Anti-Circumvention Law.

No covered work shall be deemed part of an effective technological measure under any applicable law fulfilling obligations under article 11 of the WIPO copyright treaty adopted on 20 December 1996, or

similar laws prohibiting or restricting circumvention of such measures.

When you convey a covered work, you waive any legal power to forbid circumvention of technological measures to the extent such circumvention is effected by exercising rights under this License with respect to the covered work, and you disclaim any intention to limit operation or modification of the work as a means of enforcing, against the work's users, your or third parties' legal rights to forbid circumvention of technological measures.

@item Conveying Verbatim Copies.

You may convey verbatim copies of the Program's source code as you receive it, in any medium, provided that you conspicuously and appropriately publish on each copy an appropriate copyright notice; keep intact all notices stating that this License and any non-permissive terms added in accord with section 7 apply to the code; keep intact all notices of the absence of any warranty; and give all recipients a copy of this License along with the Program.

You may charge any price or no price for each copy that you convey, and you may offer support or warranty protection for a fee.

@item Conveying Modified Source Versions.

You may convey a work based on the Program, or the modifications to produce it from the Program, in the form of source code under the terms of section 4, provided that you also meet all of these conditions:

@enumerate a

@item

The work must carry prominent notices stating that you modified it, and giving a relevant date.

@item

The work must carry prominent notices stating that it is released under this License and any conditions added under section 7. This requirement modifies the requirement in section 4 to ``keep intact all notices".

@item

You must license the entire work, as a whole, under this License to anyone who comes into possession of a copy. This License will therefore apply, along with any applicable section 7 additional terms, to the whole of the work, and all its parts, regardless of how they are packaged. This License gives no permission to license the work in

any other way, but it does not invalidate such permission if you have separately received it.

@item

If the work has interactive user interfaces, each must display Appropriate Legal Notices; however, if the Program has interactive interfaces that do not display Appropriate Legal Notices, your work need not make them do so.

@end enumerate

A compilation of a covered work with other separate and independent works, which are not by their nature extensions of the covered work, and which are not combined with it such as to form a larger program, in or on a volume of a storage or distribution medium, is called an "aggregate" if the compilation and its resulting copyright are not used to limit the access or legal rights of the compilation's users beyond what the individual works permit. Inclusion of a covered work in an aggregate does not cause this License to apply to the other parts of the aggregate.

@item Conveying Non-Source Forms.

You may convey a covered work in object code form under the terms of sections 4 and 5, provided that you also convey the machine-readable Corresponding Source under the terms of this License, in one of these ways:

@enumerate a

@item

Convey the object code in, or embodied in, a physical product (including a physical distribution medium), accompanied by the Corresponding Source fixed on a durable physical medium customarily used for software interchange.

@item

Convey the object code in, or embodied in, a physical product (including a physical distribution medium), accompanied by a written offer, valid for at least three years and valid for as long as you offer spare parts or customer support for that product model, to give anyone who possesses the object code either (1) a copy of the Corresponding Source for all the software in the product that is covered by this License, on a durable physical medium customarily used for software interchange, for a price no more than your reasonable cost of physically performing this conveying of source, or (2) access to copy the Corresponding Source from a network server at no charge.

@item

Convey individual copies of the object code with a copy of the written

offer to provide the Corresponding Source. This alternative is allowed only occasionally and noncommercially, and only if you received the object code with such an offer, in accord with subsection 6b.

@item

Convey the object code by offering access from a designated place (gratis or for a charge), and offer equivalent access to the Corresponding Source in the same way through the same place at no further charge. You need not require recipients to copy the Corresponding Source along with the object code. If the place to copy the object code is a network server, the Corresponding Source may be on a different server (operated by you or a third party) that supports equivalent copying facilities, provided you maintain clear directions next to the object code saying where to find the Corresponding Source. Regardless of what server hosts the Corresponding Source, you remain obligated to ensure that it is available for as long as needed to satisfy these requirements.

@item

Convey the object code using peer-to-peer transmission, provided you inform other peers where the object code and Corresponding Source of the work are being offered to the general public at no charge under subsection 6d.

@end enumerate

A separable portion of the object code, whose source code is excluded from the Corresponding Source as a System Library, need not be included in conveying the object code work.

A "User Product" is either (1) a "consumer product", which means any tangible personal property which is normally used for personal, family, or household purposes, or (2) anything designed or sold for incorporation into a dwelling. In determining whether a product is a consumer product, doubtful cases shall be resolved in favor of coverage. For a particular product received by a particular user, "normally used" refers to a typical or common use of that class of product, regardless of the status of the particular user or of the way in which the particular user actually uses, or expects or is expected to use, the product. A product is a consumer product regardless of whether the product has substantial commercial, industrial or non-consumer uses, unless such uses represent the only significant mode of use of the product.

"Installation Information" for a User Product means any methods, procedures, authorization keys, or other information required to install and execute modified versions of a covered work in that User

Product from a modified version of its Corresponding Source. The information must suffice to ensure that the continued functioning of the modified object code is in no case prevented or interfered with solely because modification has been made.

If you convey an object code work under this section in, or with, or specifically for use in, a User Product, and the conveying occurs as part of a transaction in which the right of possession and use of the User Product is transferred to the recipient in perpetuity or for a fixed term (regardless of how the transaction is characterized), the Corresponding Source conveyed under this section must be accompanied by the Installation Information. But this requirement does not apply if neither you nor any third party retains the ability to install modified object code on the User Product (for example, the work has been installed in ROM).

The requirement to provide Installation Information does not include a requirement to continue to provide support service, warranty, or updates for a work that has been modified or installed by the recipient, or for the User Product in which it has been modified or installed. Access to a network may be denied when the modification itself materially and adversely affects the operation of the network or violates the rules and protocols for communication across the network.

Corresponding Source conveyed, and Installation Information provided, in accord with this section must be in a format that is publicly documented (and with an implementation available to the public in source code form), and must require no special password or key for unpacking, reading or copying.

@item Additional Terms.

“Additional permissions” are terms that supplement the terms of this License by making exceptions from one or more of its conditions. Additional permissions that are applicable to the entire Program shall be treated as though they were included in this License, to the extent that they are valid under applicable law. If additional permissions apply only to part of the Program, that part may be used separately under those permissions, but the entire Program remains governed by this License without regard to the additional permissions.

When you convey a copy of a covered work, you may at your option remove any additional permissions from that copy, or from any part of it. (Additional permissions may be written to require their own removal in certain cases when you modify the work.) You may place additional permissions on material, added by you to a covered work, for which you have or can give appropriate copyright permission.

Notwithstanding any other provision of this License, for material you add to a covered work, you may (if authorized by the copyright holders of that material) supplement the terms of this License with terms:

@enumerate a

@item

Disclaiming warranty or limiting liability differently from the terms of sections 15 and 16 of this License; or

@item

Requiring preservation of specified reasonable legal notices or author attributions in that material or in the Appropriate Legal Notices displayed by works containing it; or

@item

Prohibiting misrepresentation of the origin of that material, or requiring that modified versions of such material be marked in reasonable ways as different from the original version; or

@item

Limiting the use for publicity purposes of names of licensors or authors of the material; or

@item

Declining to grant rights under trademark law for use of some trade names, trademarks, or service marks; or

@item

Requiring indemnification of licensors and authors of that material by anyone who conveys the material (or modified versions of it) with contractual assumptions of liability to the recipient, for any liability that these contractual assumptions directly impose on those licensors and authors.

@end enumerate

All other non-permissive additional terms are considered "further restrictions" within the meaning of section 10. If the Program as you received it, or any part of it, contains a notice stating that it is governed by this License along with a term that is a further restriction, you may remove that term. If a license document contains a further restriction but permits relicensing or conveying under this License, you may add to a covered work material governed by the terms of that license document, provided that the further restriction does not survive such relicensing or conveying.

If you add terms to a covered work in accord with this section, you must place, in the relevant source files, a statement of the

additional terms that apply to those files, or a notice indicating where to find the applicable terms.

Additional terms, permissive or non-permissive, may be stated in the form of a separately written license, or stated as exceptions; the above requirements apply either way.

@item Termination.

You may not propagate or modify a covered work except as expressly provided under this License. Any attempt otherwise to propagate or modify it is void, and will automatically terminate your rights under this License (including any patent licenses granted under the third paragraph of section 11).

However, if you cease all violation of this License, then your license from a particular copyright holder is reinstated (a) provisionally, unless and until the copyright holder explicitly and finally terminates your license, and (b) permanently, if the copyright holder fails to notify you of the violation by some reasonable means prior to 60 days after the cessation.

Moreover, your license from a particular copyright holder is reinstated permanently if the copyright holder notifies you of the violation by some reasonable means, this is the first time you have received notice of violation of this License (for any work) from that copyright holder, and you cure the violation prior to 30 days after your receipt of the notice.

Termination of your rights under this section does not terminate the licenses of parties who have received copies or rights from you under this License. If your rights have been terminated and not permanently reinstated, you do not qualify to receive new licenses for the same material under section 10.

@item Acceptance Not Required for Having Copies.

You are not required to accept this License in order to receive or run a copy of the Program. Ancillary propagation of a covered work occurring solely as a consequence of using peer-to-peer transmission to receive a copy likewise does not require acceptance. However, nothing other than this License grants you permission to propagate or modify any covered work. These actions infringe copyright if you do not accept this License. Therefore, by modifying or propagating a covered work, you indicate your acceptance of this License to do so.

@item Automatic Licensing of Downstream Recipients.

Each time you convey a covered work, the recipient automatically receives a license from the original licensors, to run, modify and propagate that work, subject to this License. You are not responsible for enforcing compliance by third parties with this License.

An "entity transaction" is a transaction transferring control of an organization, or substantially all assets of one, or subdividing an organization, or merging organizations. If propagation of a covered work results from an entity transaction, each party to that transaction who receives a copy of the work also receives whatever licenses to the work the party's predecessor in interest had or could give under the previous paragraph, plus a right to possession of the Corresponding Source of the work from the predecessor in interest, if the predecessor has it or can get it with reasonable efforts.

You may not impose any further restrictions on the exercise of the rights granted or affirmed under this License. For example, you may not impose a license fee, royalty, or other charge for exercise of rights granted under this License, and you may not initiate litigation (including a cross-claim or counterclaim in a lawsuit) alleging that any patent claim is infringed by making, using, selling, offering for sale, or importing the Program or any portion of it.

@item Patents.

A "contributor" is a copyright holder who authorizes use under this License of the Program or a work on which the Program is based. The work thus licensed is called the contributor's "contributor version".

A contributor's "essential patent claims" are all patent claims owned or controlled by the contributor, whether already acquired or hereafter acquired, that would be infringed by some manner, permitted by this License, of making, using, or selling its contributor version, but do not include claims that would be infringed only as a consequence of further modification of the contributor version. For purposes of this definition, "control" includes the right to grant patent sublicenses in a manner consistent with the requirements of this License.

Each contributor grants you a non-exclusive, worldwide, royalty-free patent license under the contributor's essential patent claims, to make, use, sell, offer for sale, import and otherwise run, modify and propagate the contents of its contributor version.

In the following three paragraphs, a "patent license" is any express agreement or commitment, however denominated, not to enforce a patent (such as an express permission to practice a patent or covenant not to sue for patent infringement). To "grant" such a patent license to a

party means to make such an agreement or commitment not to enforce a patent against the party.

If you convey a covered work, knowingly relying on a patent license, and the Corresponding Source of the work is not available for anyone to copy, free of charge and under the terms of this License, through a publicly available network server or other readily accessible means, then you must either (1) cause the Corresponding Source to be so available, or (2) arrange to deprive yourself of the benefit of the patent license for this particular work, or (3) arrange, in a manner consistent with the requirements of this License, to extend the patent license to downstream recipients. ``Knowingly relying" means you have actual knowledge that, but for the patent license, your conveying the covered work in a country, or your recipient's use of the covered work in a country, would infringe one or more identifiable patents in that country that you have reason to believe are valid.

If, pursuant to or in connection with a single transaction or arrangement, you convey, or propagate by procuring conveyance of, a covered work, and grant a patent license to some of the parties receiving the covered work authorizing them to use, propagate, modify or convey a specific copy of the covered work, then the patent license you grant is automatically extended to all recipients of the covered work and works based on it.

A patent license is ``discriminatory" if it does not include within the scope of its coverage, prohibits the exercise of, or is conditioned on the non-exercise of one or more of the rights that are specifically granted under this License. You may not convey a covered work if you are a party to an arrangement with a third party that is in the business of distributing software, under which you make payment to the third party based on the extent of your activity of conveying the work, and under which the third party grants, to any of the parties who would receive the covered work from you, a discriminatory patent license (a) in connection with copies of the covered work conveyed by you (or copies made from those copies), or (b) primarily for and in connection with specific products or compilations that contain the covered work, unless you entered into that arrangement, or that patent license was granted, prior to 28 March 2007.

Nothing in this License shall be construed as excluding or limiting any implied license or other defenses to infringement that may otherwise be available to you under applicable patent law.

@item No Surrender of Others' Freedom.

If conditions are imposed on you (whether by court order, agreement or otherwise) that contradict the conditions of this License, they do not

excuse you from the conditions of this License. If you cannot convey a covered work so as to satisfy simultaneously your obligations under this License and any other pertinent obligations, then as a consequence you may not convey it at all. For example, if you agree to terms that obligate you to collect a royalty for further conveying from those to whom you convey the Program, the only way you could satisfy both those terms and this License would be to refrain entirely from conveying the Program.

@item Use with the GNU Affero General Public License.

Notwithstanding any other provision of this License, you have permission to link or combine any covered work with a work licensed under version 3 of the GNU Affero General Public License into a single combined work, and to convey the resulting work. The terms of this License will continue to apply to the part which is the covered work, but the special requirements of the GNU Affero General Public License, section 13, concerning interaction through a network will apply to the combination as such.

@item Revised Versions of this License.

The Free Software Foundation may publish revised and/or new versions of the GNU General Public License from time to time. Such new versions will be similar in spirit to the present version, but may differ in detail to address new problems or concerns.

Each version is given a distinguishing version number. If the Program specifies that a certain numbered version of the GNU General Public License "or any later version" applies to it, you have the option of following the terms and conditions either of that numbered version or of any later version published by the Free Software Foundation. If the Program does not specify a version number of the GNU General Public License, you may choose any version ever published by the Free Software Foundation.

If the Program specifies that a proxy can decide which future versions of the GNU General Public License can be used, that proxy's public statement of acceptance of a version permanently authorizes you to choose that version for the Program.

Later license versions may give you additional or different permissions. However, no additional obligations are imposed on any author or copyright holder as a result of your choosing to follow a later version.

@item Disclaimer of Warranty.

THERE IS NO WARRANTY FOR THE PROGRAM, TO THE EXTENT PERMITTED BY APPLICABLE LAW. EXCEPT WHEN OTHERWISE STATED IN WRITING THE COPYRIGHT HOLDERS AND/OR OTHER PARTIES PROVIDE THE PROGRAM ``AS IS" WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. THE ENTIRE RISK AS TO THE QUALITY AND PERFORMANCE OF THE PROGRAM IS WITH YOU. SHOULD THE PROGRAM PROVE DEFECTIVE, YOU ASSUME THE COST OF ALL NECESSARY SERVICING, REPAIR OR CORRECTION.

@item Limitation of Liability.

IN NO EVENT UNLESS REQUIRED BY APPLICABLE LAW OR AGREED TO IN WRITING WILL ANY COPYRIGHT HOLDER, OR ANY OTHER PARTY WHO MODIFIES AND/OR CONVEYS THE PROGRAM AS PERMITTED ABOVE, BE LIABLE TO YOU FOR DAMAGES, INCLUDING ANY GENERAL, SPECIAL, INCIDENTAL OR CONSEQUENTIAL DAMAGES ARISING OUT OF THE USE OR INABILITY TO USE THE PROGRAM (INCLUDING BUT NOT LIMITED TO LOSS OF DATA OR DATA BEING RENDERED INACCURATE OR LOSSES SUSTAINED BY YOU OR THIRD PARTIES OR A FAILURE OF THE PROGRAM TO OPERATE WITH ANY OTHER PROGRAMS), EVEN IF SUCH HOLDER OR OTHER PARTY HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

@item Interpretation of Sections 15 and 16.

If the disclaimer of warranty and limitation of liability provided above cannot be given local legal effect according to their terms, reviewing courts shall apply local law that most closely approximates an absolute waiver of all civil liability in connection with the Program, unless a warranty or assumption of liability accompanies a copy of the Program in return for a fee.

@end enumerate

@heading END OF TERMS AND CONDITIONS

@heading How to Apply These Terms to Your New Programs

If you develop a new program, and you want it to be of the greatest possible use to the public, the best way to achieve this is to make it free software which everyone can redistribute and change under these terms.

To do so, attach the following notices to the program. It is safest to attach them to the start of each source file to most effectively state the exclusion of warranty; and each file should have at least the ``copyright" line and a pointer to where the full notice is found.

@smallexample

```
@var{one line to give the program's name and a brief idea of what it does.}
Copyright (C) @var{year} @var{name of author}
```

This program is free software: you can redistribute it and/or modify it under the terms of the GNU General Public License as published by the Free Software Foundation, either version 3 of the License, or (at your option) any later version.

This program is distributed in the hope that it will be useful, but WITHOUT ANY WARRANTY; without even the implied warranty of MERCHANTABILITY or FITNESS FOR A PARTICULAR PURPOSE. See the GNU General Public License for more details.

You should have received a copy of the GNU General Public License along with this program. If not, see [@url{http://www.gnu.org/licenses/}](http://www.gnu.org/licenses/).
@end smallexample

Also add information on how to contact you by electronic and paper mail.

If the program does terminal interaction, make it output a short notice like this when it starts in an interactive mode:

```
@smallexample
@var{program} Copyright (C) @var{year} @var{name of author}
This program comes with ABSOLUTELY NO WARRANTY; for details type @samp{show w}.
This is free software, and you are welcome to redistribute it
under certain conditions; type @samp{show c} for details.
@end smallexample
```

The hypothetical commands `@samp{show w}` and `@samp{show c}` should show the appropriate parts of the General Public License. Of course, your program's commands might be different; for a GUI interface, you would use an ```about box"`.

You should also get your employer (if you work as a programmer) or school, if any, to sign a ```copyright disclaimer"` for the program, if necessary. For more information on this, and how to apply and follow the GNU GPL, see [@url{http://www.gnu.org/licenses/}](http://www.gnu.org/licenses/).

The GNU General Public License does not permit incorporating your program into proprietary programs. If your program is a subroutine library, you may consider it more useful to permit linking proprietary applications with the library. If this is what you want to do, use the GNU Lesser General Public License instead of this License. But first, please read [@url{http://www.gnu.org/philosophy/why-not-lgpl.html}](http://www.gnu.org/philosophy/why-not-lgpl.html).
@c The GNU Lesser General Public License.
@center Version 2.1, February 1999

@c This file is intended to be included within another document,
@c hence no sectioning command or @node.

as the successor of the GNU Library Public License, version 2, hence the
version number 2.1.]

@end display

@subheading Preamble

The licenses for most software are designed to take away your
freedom to share and change it. By contrast, the GNU General Public
Licenses are intended to guarantee your freedom to share and change
free software---to make sure the software is free for all its users.

This license, the Lesser General Public License, applies to some
specially designated software---typically libraries---of the Free
Software Foundation and other authors who decide to use it. You can use
it too, but we suggest you first think carefully about whether this
license or the ordinary General Public License is the better strategy to
use in any particular case, based on the explanations below.

When we speak of free software, we are referring to freedom of use,
not price. Our General Public Licenses are designed to make sure that
you have the freedom to distribute copies of free software (and charge
for this service if you wish); that you receive source code or can get
it if you want it; that you can change the software and use pieces of it
in new free programs; and that you are informed that you can do these
things.

To protect your rights, we need to make restrictions that forbid
distributors to deny you these rights or to ask you to surrender these
rights. These restrictions translate to certain responsibilities for
you if you distribute copies of the library or if you modify it.

For example, if you distribute copies of the library, whether gratis
or for a fee, you must give the recipients all the rights that we gave
you. You must make sure that they, too, receive or can get the source
code. If you link other code with the library, you must provide
complete object files to the recipients, so that they can relink them
with the library after making changes to the library and recompiling

it. And you must show them these terms so they know their rights.

We protect your rights with a two-step method: (1) we copyright the library, and (2) we offer you this license, which gives you legal permission to copy, distribute and/or modify the library.

To protect each distributor, we want to make it very clear that there is no warranty for the free library. Also, if the library is modified by someone else and passed on, the recipients should know that what they have is not the original version, so that the original author's reputation will not be affected by problems that might be introduced by others.

Finally, software patents pose a constant threat to the existence of any free program. We wish to make sure that a company cannot effectively restrict the users of a free program by obtaining a restrictive license from a patent holder. Therefore, we insist that any patent license obtained for a version of the library must be consistent with the full freedom of use specified in this license.

Most GNU software, including some libraries, is covered by the ordinary GNU General Public License. This license, the GNU Lesser General Public License, applies to certain designated libraries, and is quite different from the ordinary General Public License. We use this license for certain libraries in order to permit linking those libraries into non-free programs.

When a program is linked with a library, whether statically or using a shared library, the combination of the two is legally speaking a combined work, a derivative of the original library. The ordinary General Public License therefore permits such linking only if the entire combination fits its criteria of freedom. The Lesser General Public License permits more lax criteria for linking other code with the library.

We call this license the `Lesser` General Public License because it does *Less* to protect the user's freedom than the ordinary General Public License. It also provides other free software developers *Less* of an advantage over competing non-free programs. These disadvantages are the reason we use the ordinary General Public License for many libraries. However, the Lesser license provides advantages in certain special circumstances.

For example, on rare occasions, there may be a special need to encourage the widest possible use of a certain library, so that it becomes a de-facto standard. To achieve this, non-free programs must be allowed to use the library. A more frequent case is that a free library does the same job as widely used non-free libraries. In this

case, there is little to gain by limiting the free library to free software only, so we use the Lesser General Public License.

In other cases, permission to use a particular library in non-free programs enables a greater number of people to use a large body of free software. For example, permission to use the GNU C Library in non-free programs enables many more people to use the whole GNU operating system, as well as its variant, the GNU/Linux operating system.

Although the Lesser General Public License is Less protective of the users' freedom, it does ensure that the user of a program that is linked with the Library has the freedom and the wherewithal to run that program using a modified version of the Library.

The precise terms and conditions for copying, distribution and modification follow. Pay close attention to the difference between a ``work based on the library" and a ``work that uses the library". The former contains code derived from the library, whereas the latter must be combined with the library in order to run.

@subheading TERMS AND CONDITIONS FOR COPYING, DISTRIBUTION AND MODIFICATION

@enumerate 0

@item

This License Agreement applies to any software library or other program which contains a notice placed by the copyright holder or other authorized party saying it may be distributed under the terms of this Lesser General Public License (also called ``this License"). Each licensee is addressed as ``you".

A ``library" means a collection of software functions and/or data prepared so as to be conveniently linked with application programs (which use some of those functions and data) to form executables.

The ``Library", below, refers to any such software library or work which has been distributed under these terms. A ``work based on the Library" means either the Library or any derivative work under copyright law: that is to say, a work containing the Library or a portion of it, either verbatim or with modifications and/or translated straightforwardly into another language. (Hereinafter, translation is included without limitation in the term ``modification".)

``Source code" for a work means the preferred form of the work for making modifications to it. For a library, complete source code means all the source code for all modules it contains, plus any associated interface definition files, plus the scripts used to control compilation and installation of the library.

Activities other than copying, distribution and modification are not covered by this License; they are outside its scope. The act of running a program using the Library is not restricted, and output from such a program is covered only if its contents constitute a work based on the Library (independent of the use of the Library in a tool for writing it). Whether that is true depends on what the Library does and what the program that uses the Library does.

@item

You may copy and distribute verbatim copies of the Library's complete source code as you receive it, in any medium, provided that you conspicuously and appropriately publish on each copy an appropriate copyright notice and disclaimer of warranty; keep intact all the notices that refer to this License and to the absence of any warranty; and distribute a copy of this License along with the Library.

You may charge a fee for the physical act of transferring a copy, and you may at your option offer warranty protection in exchange for a fee.

@item

You may modify your copy or copies of the Library or any portion of it, thus forming a work based on the Library, and copy and distribute such modifications or work under the terms of Section 1 above, provided that you also meet all of these conditions:

@enumerate a

@item

The modified work must itself be a software library.

@item

You must cause the files modified to carry prominent notices stating that you changed the files and the date of any change.

@item

You must cause the whole of the work to be licensed at no charge to all third parties under the terms of this License.

@item

If a facility in the modified Library refers to a function or a table of data to be supplied by an application program that uses the facility, other than as an argument passed when the facility is invoked, then you must make a good faith effort to ensure that, in the event an application does not supply such function or table, the facility still operates, and performs whatever part of its purpose remains meaningful.

(For example, a function in a library to compute square roots has a purpose that is entirely well-defined independent of the application. Therefore, Subsection 2d requires that any application-supplied function or table used by this function must be optional: if the application does not supply it, the square root function must still compute square roots.)

@end enumerate

These requirements apply to the modified work as a whole. If identifiable sections of that work are not derived from the Library, and can be reasonably considered independent and separate works in themselves, then this License, and its terms, do not apply to those sections when you distribute them as separate works. But when you distribute the same sections as part of a whole which is a work based on the Library, the distribution of the whole must be on the terms of this License, whose permissions for other licensees extend to the entire whole, and thus to each and every part regardless of who wrote it.

Thus, it is not the intent of this section to claim rights or contest your rights to work written entirely by you; rather, the intent is to exercise the right to control the distribution of derivative or collective works based on the Library.

In addition, mere aggregation of another work not based on the Library with the Library (or with a work based on the Library) on a volume of a storage or distribution medium does not bring the other work under the scope of this License.

@item

You may opt to apply the terms of the ordinary GNU General Public License instead of this License to a given copy of the Library. To do this, you must alter all the notices that refer to this License, so that they refer to the ordinary GNU General Public License, version 2, instead of to this License. (If a newer version than version 2 of the ordinary GNU General Public License has appeared, then you can specify that version instead if you wish.) Do not make any other change in these notices.

Once this change is made in a given copy, it is irreversible for that copy, so the ordinary GNU General Public License applies to all subsequent copies and derivative works made from that copy.

This option is useful when you wish to copy part of the code of the Library into a program that is not a library.

@item

You may copy and distribute the Library (or a portion or derivative of it, under Section 2) in object code or executable form under the terms of Sections 1 and 2 above provided that you accompany it with the complete corresponding machine-readable source code, which must be distributed under the terms of Sections 1 and 2 above on a medium customarily used for software interchange.

If distribution of object code is made by offering access to copy from a designated place, then offering equivalent access to copy the source code from the same place satisfies the requirement to distribute the source code, even though third parties are not compelled to copy the source along with the object code.

@item

A program that contains no derivative of any portion of the Library, but is designed to work with the Library by being compiled or linked with it, is called a ``work that uses the Library''. Such a work, in isolation, is not a derivative work of the Library, and therefore falls outside the scope of this License.

However, linking a ``work that uses the Library'' with the Library creates an executable that is a derivative of the Library (because it contains portions of the Library), rather than a ``work that uses the library''. The executable is therefore covered by this License. Section 6 states terms for distribution of such executables.

When a ``work that uses the Library'' uses material from a header file that is part of the Library, the object code for the work may be a derivative work of the Library even though the source code is not. Whether this is true is especially significant if the work can be linked without the Library, or if the work is itself a library. The threshold for this to be true is not precisely defined by law.

If such an object file uses only numerical parameters, data structure layouts and accessors, and small macros and small inline functions (ten lines or less in length), then the use of the object file is unrestricted, regardless of whether it is legally a derivative work. (Executables containing this object code plus portions of the Library will still fall under Section 6.)

Otherwise, if the work is a derivative of the Library, you may distribute the object code for the work under the terms of Section 6. Any executables containing that work also fall under Section 6, whether or not they are linked directly with the Library itself.

@item

As an exception to the Sections above, you may also combine or link a ``work that uses the Library'' with the Library to produce a

work containing portions of the Library, and distribute that work under terms of your choice, provided that the terms permit modification of the work for the customer's own use and reverse engineering for debugging such modifications.

You must give prominent notice with each copy of the work that the Library is used in it and that the Library and its use are covered by this License. You must supply a copy of this License. If the work during execution displays copyright notices, you must include the copyright notice for the Library among them, as well as a reference directing the user to the copy of this License. Also, you must do one of these things:

@enumerate a

@item

Accompany the work with the complete corresponding machine-readable source code for the Library including whatever changes were used in the work (which must be distributed under Sections 1 and 2 above); and, if the work is an executable linked with the Library, with the complete machine-readable ``work that uses the Library'', as object code and/or source code, so that the user can modify the Library and then relink to produce a modified executable containing the modified Library. (It is understood that the user who changes the contents of definitions files in the Library will not necessarily be able to recompile the application to use the modified definitions.)

@item

Use a suitable shared library mechanism for linking with the Library. A suitable mechanism is one that (1) uses at run time a copy of the library already present on the user's computer system, rather than copying library functions into the executable, and (2) will operate properly with a modified version of the library, if the user installs one, as long as the modified version is interface-compatible with the version that the work was made with.

@item

Accompany the work with a written offer, valid for at least three years, to give the same user the materials specified in Subsection 6a, above, for a charge no more than the cost of performing this distribution.

@item

If distribution of the work is made by offering access to copy from a designated place, offer equivalent access to copy the above specified materials from the same place.

@item

Verify that the user has already received a copy of these materials or that you have already sent this user a copy.

@end enumerate

For an executable, the required form of the "work that uses the Library" must include any data and utility programs needed for reproducing the executable from it. However, as a special exception, the materials to be distributed need not include anything that is normally distributed (in either source or binary form) with the major components (compiler, kernel, and so on) of the operating system on which the executable runs, unless that component itself accompanies the executable.

It may happen that this requirement contradicts the license restrictions of other proprietary libraries that do not normally accompany the operating system. Such a contradiction means you cannot use both them and the Library together in an executable that you distribute.

@item

You may place library facilities that are a work based on the Library side-by-side in a single library together with other library facilities not covered by this License, and distribute such a combined library, provided that the separate distribution of the work based on the Library and of the other library facilities is otherwise permitted, and provided that you do these two things:

@enumerate a

@item

Accompany the combined library with a copy of the same work based on the Library, uncombined with any other library facilities. This must be distributed under the terms of the Sections above.

@item

Give prominent notice with the combined library of the fact that part of it is a work based on the Library, and explaining where to find the accompanying uncombined form of the same work.

@end enumerate

@item

You may not copy, modify, sublicense, link with, or distribute the Library except as expressly provided under this License. Any attempt otherwise to copy, modify, sublicense, link with, or distribute the Library is void, and will automatically terminate your rights under this License. However, parties who have received copies, or rights, from you under this License will not have their licenses terminated so long as such parties remain in full compliance.

@item

You are not required to accept this License, since you have not signed it. However, nothing else grants you permission to modify or distribute the Library or its derivative works. These actions are prohibited by law if you do not accept this License. Therefore, by modifying or distributing the Library (or any work based on the Library), you indicate your acceptance of this License to do so, and all its terms and conditions for copying, distributing or modifying the Library or works based on it.

@item

Each time you redistribute the Library (or any work based on the Library), the recipient automatically receives a license from the original licensor to copy, distribute, link with or modify the Library subject to these terms and conditions. You may not impose any further restrictions on the recipients' exercise of the rights granted herein. You are not responsible for enforcing compliance by third parties with this License.

@item

If, as a consequence of a court judgment or allegation of patent infringement or for any other reason (not limited to patent issues), conditions are imposed on you (whether by court order, agreement or otherwise) that contradict the conditions of this License, they do not excuse you from the conditions of this License. If you cannot distribute so as to satisfy simultaneously your obligations under this License and any other pertinent obligations, then as a consequence you may not distribute the Library at all. For example, if a patent license would not permit royalty-free redistribution of the Library by all those who receive copies directly or indirectly through you, then the only way you could satisfy both it and this License would be to refrain entirely from distribution of the Library.

If any portion of this section is held invalid or unenforceable under any particular circumstance, the balance of the section is intended to apply, and the section as a whole is intended to apply in other circumstances.

It is not the purpose of this section to induce you to infringe any patents or other property right claims or to contest validity of any such claims; this section has the sole purpose of protecting the integrity of the free software distribution system which is implemented by public license practices. Many people have made generous contributions to the wide range of software distributed through that system in reliance on consistent application of that system; it is up to the author/donor to decide if he or she is willing to distribute software through any other system and a licensee cannot impose that choice.

This section is intended to make thoroughly clear what is believed to be a consequence of the rest of this License.

@item

If the distribution and/or use of the Library is restricted in certain countries either by patents or by copyrighted interfaces, the original copyright holder who places the Library under this License may add an explicit geographical distribution limitation excluding those countries, so that distribution is permitted only in or among countries not thus excluded. In such case, this License incorporates the limitation as if written in the body of this License.

@item

The Free Software Foundation may publish revised and/or new versions of the Lesser General Public License from time to time. Such new versions will be similar in spirit to the present version, but may differ in detail to address new problems or concerns.

Each version is given a distinguishing version number. If the Library specifies a version number of this License which applies to it and ``any later version'', you have the option of following the terms and conditions either of that version or of any later version published by the Free Software Foundation. If the Library does not specify a license version number, you may choose any version ever published by the Free Software Foundation.

@item

If you wish to incorporate parts of the Library into other free programs whose distribution conditions are incompatible with these, write to the author to ask for permission. For software which is copyrighted by the Free Software Foundation, write to the Free Software Foundation; we sometimes make exceptions for this. Our decision will be guided by the two goals of preserving the free status of all derivatives of our free software and of promoting the sharing and reuse of software generally.

@subheading How to Apply These Terms to Your New Libraries

If you develop a new library, and you want it to be of the greatest possible use to the public, we recommend making it free software that everyone can redistribute and change. You can do so by permitting redistribution under these terms (or, alternatively, under the terms of the ordinary General Public License).

To apply these terms, attach the following notices to the library. It is safest to attach them to the start of each source file to most effectively convey the exclusion of warranty; and each file should have at least the ``copyright" line and a pointer to where the full notice is found.

@smallexample

@var{one line to give the library's name and an idea of what it does.}

Copyright (C) @var{year} @var{name of author}

This library is free software; you can redistribute it and/or modify it

under the terms of the GNU Lesser General Public License as published by the Free Software Foundation; either version 2.1 of the License, or (at your option) any later version.

This library is distributed in the hope that it will be useful, but WITHOUT ANY WARRANTY; without even the implied warranty of MERCHANTABILITY or FITNESS FOR A PARTICULAR PURPOSE. See the GNU Lesser General Public License for more details.

You should have received a copy of the GNU Lesser General Public License along with this library; if not, write to the Free Software Foundation, Inc., 51 Franklin Street, Fifth Floor, Boston, MA 02110-1301, USA.

@end smallexample

Also add information on how to contact you by electronic and paper mail.

You should also get your employer (if you work as a programmer) or your school, if any, to sign a ``copyright disclaimer" for the library, if necessary. Here is a sample; alter the names:

@smallexample

Yoyodyne, Inc., hereby disclaims all copyright interest in the library `Frob' (a library for tweaking knobs) written by James Random Hacker.

@var{signature of Ty Coon}, 1 April 1990

Ty Coon, President of Vice

@end smallexample

That's all there is to it!

GNU LESSER GENERAL PUBLIC LICENSE

Version 2.1, February 1999

Copyright (C) 1991, 1999 Free Software Foundation, Inc.

51 Franklin St, Fifth Floor, Boston, MA 02110-1301 USA

Everyone is permitted to copy and distribute verbatim copies of this license document, but changing it is not allowed.

[This is the first released version of the Lesser GPL. It also counts as the successor of the GNU Library Public License, version 2, hence the version number 2.1.]

Preamble

The licenses for most software are designed to take away your freedom to share and change it. By contrast, the GNU General Public Licenses are intended to guarantee your freedom to share and change free software--to make sure the software is free for all its users.

This license, the Lesser General Public License, applies to some specially designated software packages--typically libraries--of the Free Software Foundation and other authors who decide to use it. You can use it too, but we suggest you first think carefully about whether this license or the ordinary General Public License is the better strategy to use in any particular case, based on the explanations below.

When we speak of free software, we are referring to freedom of use, not price. Our General Public Licenses are designed to make sure that you have the freedom to distribute copies of free software (and charge for this service if you wish); that you receive source code or can get it if you want it; that you can change the software and use pieces of it in new free programs; and that you are informed that you can do these things.

To protect your rights, we need to make restrictions that forbid distributors to deny you these rights or to ask you to surrender these rights. These restrictions translate to certain responsibilities for you if you distribute copies of the library or if you modify it.

For example, if you distribute copies of the library, whether gratis or for a fee, you must give the recipients all the rights that we gave you. You must make sure that they, too, receive or can get the source code. If you link other code with the library, you must provide complete object files to the recipients, so that they can relink them with the library after making changes to the library and recompiling it. And you must show them these terms so they know their rights.

We protect your rights with a two-step method: (1) we copyright the library, and (2) we offer you this license, which gives you legal permission to copy, distribute and/or modify the library.

To protect each distributor, we want to make it very clear that there is no warranty for the free library. Also, if the library is modified by someone else and passed on, the recipients should know that what they have is not the original version, so that the original author's reputation will not be affected by problems that might be introduced by others.

Finally, software patents pose a constant threat to the existence of any free program. We wish to make sure that a company cannot effectively restrict the users of a free program by obtaining a restrictive license from a patent holder. Therefore, we insist that any patent license obtained for a version of the library must be consistent with the full freedom of use specified in this license.

Most GNU software, including some libraries, is covered by the

ordinary GNU General Public License. This license, the GNU Lesser General Public License, applies to certain designated libraries, and is quite different from the ordinary General Public License. We use this license for certain libraries in order to permit linking those libraries into non-free programs.

When a program is linked with a library, whether statically or using a shared library, the combination of the two is legally speaking a combined work, a derivative of the original library. The ordinary General Public License therefore permits such linking only if the entire combination fits its criteria of freedom. The Lesser General Public License permits more lax criteria for linking other code with the library.

We call this license the "Lesser" General Public License because it does Less to protect the user's freedom than the ordinary General Public License. It also provides other free software developers Less of an advantage over competing non-free programs. These disadvantages are the reason we use the ordinary General Public License for many libraries. However, the Lesser license provides advantages in certain special circumstances.

For example, on rare occasions, there may be a special need to encourage the widest possible use of a certain library, so that it becomes a de-facto standard. To achieve this, non-free programs must be allowed to use the library. A more frequent case is that a free library does the same job as widely used non-free libraries. In this case, there is little to gain by limiting the free library to free software only, so we use the Lesser General Public License.

In other cases, permission to use a particular library in non-free programs enables a greater number of people to use a large body of free software. For example, permission to use the GNU C Library in non-free programs enables many more people to use the whole GNU operating system, as well as its variant, the GNU/Linux operating system.

Although the Lesser General Public License is Less protective of the users' freedom, it does ensure that the user of a program that is linked with the Library has the freedom and the wherewithal to run that program using a modified version of the Library.

The precise terms and conditions for copying, distribution and modification follow. Pay close attention to the difference between a "work based on the library" and a "work that uses the library". The former contains code derived from the library, whereas the latter must be combined with the library in order to run.

GNU LESSER GENERAL PUBLIC LICENSE
TERMS AND CONDITIONS FOR COPYING, DISTRIBUTION AND MODIFICATION

0. This License Agreement applies to any software library or other program which contains a notice placed by the copyright holder or other authorized party saying it may be distributed under the terms of this Lesser General Public License (also called "this License"). Each licensee is addressed as "you".

A "library" means a collection of software functions and/or data prepared so as to be conveniently linked with application programs (which use some of those functions and data) to form executables.

The "Library", below, refers to any such software library or work which has been distributed under these terms. A "work based on the Library" means either the Library or any derivative work under copyright law: that is to say, a work containing the Library or a portion of it, either verbatim or with modifications and/or translated straightforwardly into another language. (Hereinafter, translation is included without limitation in the term "modification".)

"Source code" for a work means the preferred form of the work for making modifications to it. For a library, complete source code means all the source code for all modules it contains, plus any associated interface definition files, plus the scripts used to control compilation and installation of the library.

Activities other than copying, distribution and modification are not covered by this License; they are outside its scope. The act of running a program using the Library is not restricted, and output from such a program is covered only if its contents constitute a work based on the Library (independent of the use of the Library in a tool for writing it). Whether that is true depends on what the Library does and what the program that uses the Library does.

1. You may copy and distribute verbatim copies of the Library's complete source code as you receive it, in any medium, provided that you conspicuously and appropriately publish on each copy an appropriate copyright notice and disclaimer of warranty; keep intact all the notices that refer to this License and to the absence of any warranty; and distribute a copy of this License along with the Library.

You may charge a fee for the physical act of transferring a copy, and you may at your option offer warranty protection in exchange for a fee.

2. You may modify your copy or copies of the Library or any portion

of it, thus forming a work based on the Library, and copy and distribute such modifications or work under the terms of Section 1 above, provided that you also meet all of these conditions:

- a) The modified work must itself be a software library.
- b) You must cause the files modified to carry prominent notices stating that you changed the files and the date of any change.
- c) You must cause the whole of the work to be licensed at no charge to all third parties under the terms of this License.
- d) If a facility in the modified Library refers to a function or a table of data to be supplied by an application program that uses the facility, other than as an argument passed when the facility is invoked, then you must make a good faith effort to ensure that, in the event an application does not supply such function or table, the facility still operates, and performs whatever part of its purpose remains meaningful.

(For example, a function in a library to compute square roots has a purpose that is entirely well-defined independent of the application. Therefore, Subsection 2d requires that any application-supplied function or table used by this function must be optional: if the application does not supply it, the square root function must still compute square roots.)

These requirements apply to the modified work as a whole. If identifiable sections of that work are not derived from the Library, and can be reasonably considered independent and separate works in themselves, then this License, and its terms, do not apply to those sections when you distribute them as separate works. But when you distribute the same sections as part of a whole which is a work based on the Library, the distribution of the whole must be on the terms of this License, whose permissions for other licensees extend to the entire whole, and thus to each and every part regardless of who wrote it.

Thus, it is not the intent of this section to claim rights or contest your rights to work written entirely by you; rather, the intent is to exercise the right to control the distribution of derivative or collective works based on the Library.

In addition, mere aggregation of another work not based on the Library with the Library (or with a work based on the Library) on a volume of a storage or distribution medium does not bring the other work under the scope of this License.

3. You may opt to apply the terms of the ordinary GNU General Public License instead of this License to a given copy of the Library. To do this, you must alter all the notices that refer to this License, so that they refer to the ordinary GNU General Public License, version 2, instead of to this License. (If a newer version than version 2 of the ordinary GNU General Public License has appeared, then you can specify that version instead if you wish.) Do not make any other change in these notices.

Once this change is made in a given copy, it is irreversible for that copy, so the ordinary GNU General Public License applies to all subsequent copies and derivative works made from that copy.

This option is useful when you wish to copy part of the code of the Library into a program that is not a library.

4. You may copy and distribute the Library (or a portion or derivative of it, under Section 2) in object code or executable form under the terms of Sections 1 and 2 above provided that you accompany it with the complete corresponding machine-readable source code, which must be distributed under the terms of Sections 1 and 2 above on a medium customarily used for software interchange.

If distribution of object code is made by offering access to copy from a designated place, then offering equivalent access to copy the source code from the same place satisfies the requirement to distribute the source code, even though third parties are not compelled to copy the source along with the object code.

5. A program that contains no derivative of any portion of the Library, but is designed to work with the Library by being compiled or linked with it, is called a "work that uses the Library". Such a work, in isolation, is not a derivative work of the Library, and therefore falls outside the scope of this License.

However, linking a "work that uses the Library" with the Library creates an executable that is a derivative of the Library (because it contains portions of the Library), rather than a "work that uses the library". The executable is therefore covered by this License. Section 6 states terms for distribution of such executables.

When a "work that uses the Library" uses material from a header file that is part of the Library, the object code for the work may be a derivative work of the Library even though the source code is not. Whether this is true is especially significant if the work can be linked without the Library, or if the work is itself a library. The threshold for this to be true is not precisely defined by law.

If such an object file uses only numerical parameters, data structure layouts and accessors, and small macros and small inline functions (ten lines or less in length), then the use of the object file is unrestricted, regardless of whether it is legally a derivative work. (Executables containing this object code plus portions of the Library will still fall under Section 6.)

Otherwise, if the work is a derivative of the Library, you may distribute the object code for the work under the terms of Section 6. Any executables containing that work also fall under Section 6, whether or not they are linked directly with the Library itself.

6. As an exception to the Sections above, you may also combine or link a "work that uses the Library" with the Library to produce a work containing portions of the Library, and distribute that work under terms of your choice, provided that the terms permit modification of the work for the customer's own use and reverse engineering for debugging such modifications.

You must give prominent notice with each copy of the work that the Library is used in it and that the Library and its use are covered by this License. You must supply a copy of this License. If the work during execution displays copyright notices, you must include the copyright notice for the Library among them, as well as a reference directing the user to the copy of this License. Also, you must do one of these things:

a) Accompany the work with the complete corresponding machine-readable source code for the Library including whatever changes were used in the work (which must be distributed under Sections 1 and 2 above); and, if the work is an executable linked with the Library, with the complete machine-readable "work that uses the Library", as object code and/or source code, so that the user can modify the Library and then relink to produce a modified executable containing the modified Library. (It is understood that the user who changes the contents of definitions files in the Library will not necessarily be able to recompile the application to use the modified definitions.)

b) Use a suitable shared library mechanism for linking with the Library. A suitable mechanism is one that (1) uses at run time a copy of the library already present on the user's computer system, rather than copying library functions into the executable, and (2) will operate properly with a modified version of the library, if the user installs one, as long as the modified version is interface-compatible with the version that the work was made with.

c) Accompany the work with a written offer, valid for at

least three years, to give the same user the materials specified in Subsection 6a, above, for a charge no more than the cost of performing this distribution.

d) If distribution of the work is made by offering access to copy from a designated place, offer equivalent access to copy the above specified materials from the same place.

e) Verify that the user has already received a copy of these materials or that you have already sent this user a copy.

For an executable, the required form of the "work that uses the Library" must include any data and utility programs needed for reproducing the executable from it. However, as a special exception, the materials to be distributed need not include anything that is normally distributed (in either source or binary form) with the major components (compiler, kernel, and so on) of the operating system on which the executable runs, unless that component itself accompanies the executable.

It may happen that this requirement contradicts the license restrictions of other proprietary libraries that do not normally accompany the operating system. Such a contradiction means you cannot use both them and the Library together in an executable that you distribute.

7. You may place library facilities that are a work based on the Library side-by-side in a single library together with other library facilities not covered by this License, and distribute such a combined library, provided that the separate distribution of the work based on the Library and of the other library facilities is otherwise permitted, and provided that you do these two things:

a) Accompany the combined library with a copy of the same work based on the Library, uncombined with any other library facilities. This must be distributed under the terms of the Sections above.

b) Give prominent notice with the combined library of the fact that part of it is a work based on the Library, and explaining where to find the accompanying uncombined form of the same work.

8. You may not copy, modify, sublicense, link with, or distribute the Library except as expressly provided under this License. Any attempt otherwise to copy, modify, sublicense, link with, or distribute the Library is void, and will automatically terminate your rights under this License. However, parties who have received copies, or rights, from you under this License will not have their licenses

terminated so long as such parties remain in full compliance.

9. You are not required to accept this License, since you have not signed it. However, nothing else grants you permission to modify or distribute the Library or its derivative works. These actions are prohibited by law if you do not accept this License. Therefore, by modifying or distributing the Library (or any work based on the Library), you indicate your acceptance of this License to do so, and all its terms and conditions for copying, distributing or modifying the Library or works based on it.

10. Each time you redistribute the Library (or any work based on the Library), the recipient automatically receives a license from the original licensor to copy, distribute, link with or modify the Library subject to these terms and conditions. You may not impose any further restrictions on the recipients' exercise of the rights granted herein. You are not responsible for enforcing compliance by third parties with this License.

11. If, as a consequence of a court judgment or allegation of patent infringement or for any other reason (not limited to patent issues), conditions are imposed on you (whether by court order, agreement or otherwise) that contradict the conditions of this License, they do not excuse you from the conditions of this License. If you cannot distribute so as to satisfy simultaneously your obligations under this License and any other pertinent obligations, then as a consequence you may not distribute the Library at all. For example, if a patent license would not permit royalty-free redistribution of the Library by all those who receive copies directly or indirectly through you, then the only way you could satisfy both it and this License would be to refrain entirely from distribution of the Library.

If any portion of this section is held invalid or unenforceable under any particular circumstance, the balance of the section is intended to apply, and the section as a whole is intended to apply in other circumstances.

It is not the purpose of this section to induce you to infringe any patents or other property right claims or to contest validity of any such claims; this section has the sole purpose of protecting the integrity of the free software distribution system which is implemented by public license practices. Many people have made generous contributions to the wide range of software distributed through that system in reliance on consistent application of that system; it is up to the author/donor to decide if he or she is willing to distribute software through any other system and a licensee cannot impose that choice.

This section is intended to make thoroughly clear what is believed to

be a consequence of the rest of this License.

12. If the distribution and/or use of the Library is restricted in certain countries either by patents or by copyrighted interfaces, the original copyright holder who places the Library under this License may add an explicit geographical distribution limitation excluding those countries, so that distribution is permitted only in or among countries not thus excluded. In such case, this License incorporates the limitation as if written in the body of this License.

13. The Free Software Foundation may publish revised and/or new versions of the Lesser General Public License from time to time. Such new versions will be similar in spirit to the present version, but may differ in detail to address new problems or concerns.

Each version is given a distinguishing version number. If the Library specifies a version number of this License which applies to it and "any later version", you have the option of following the terms and conditions either of that version or of any later version published by the Free Software Foundation. If the Library does not specify a license version number, you may choose any version ever published by the Free Software Foundation.

14. If you wish to incorporate parts of the Library into other free programs whose distribution conditions are incompatible with these, write to the author to ask for permission. For software which is copyrighted by the Free Software Foundation, write to the Free Software Foundation; we sometimes make exceptions for this. Our decision will be guided by the two goals of preserving the free status of all derivatives of our free software and of promoting the sharing and reuse of software generally.

NO WARRANTY

15. BECAUSE THE LIBRARY IS LICENSED FREE OF CHARGE, THERE IS NO WARRANTY FOR THE LIBRARY, TO THE EXTENT PERMITTED BY APPLICABLE LAW. EXCEPT WHEN OTHERWISE STATED IN WRITING THE COPYRIGHT HOLDERS AND/OR OTHER PARTIES PROVIDE THE LIBRARY "AS IS" WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. THE ENTIRE RISK AS TO THE QUALITY AND PERFORMANCE OF THE LIBRARY IS WITH YOU. SHOULD THE LIBRARY PROVE DEFECTIVE, YOU ASSUME THE COST OF ALL NECESSARY SERVICING, REPAIR OR CORRECTION.

16. IN NO EVENT UNLESS REQUIRED BY APPLICABLE LAW OR AGREED TO IN WRITING WILL ANY COPYRIGHT HOLDER, OR ANY OTHER PARTY WHO MAY MODIFY AND/OR REDISTRIBUTE THE LIBRARY AS PERMITTED ABOVE, BE LIABLE TO YOU FOR DAMAGES, INCLUDING ANY GENERAL, SPECIAL, INCIDENTAL OR

CONSEQUENTIAL DAMAGES ARISING OUT OF THE USE OR INABILITY TO USE THE LIBRARY (INCLUDING BUT NOT LIMITED TO LOSS OF DATA OR DATA BEING RENDERED INACCURATE OR LOSSES SUSTAINED BY YOU OR THIRD PARTIES OR A FAILURE OF THE LIBRARY TO OPERATE WITH ANY OTHER SOFTWARE), EVEN IF SUCH HOLDER OR OTHER PARTY HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

END OF TERMS AND CONDITIONS

How to Apply These Terms to Your New Libraries

If you develop a new library, and you want it to be of the greatest possible use to the public, we recommend making it free software that everyone can redistribute and change. You can do so by permitting redistribution under these terms (or, alternatively, under the terms of the ordinary General Public License).

To apply these terms, attach the following notices to the library. It is safest to attach them to the start of each source file to most effectively convey the exclusion of warranty; and each file should have at least the "copyright" line and a pointer to where the full notice is found.

<one line to give the library's name and a brief idea of what it does.>
Copyright (C) <year> <name of author>

This library is free software; you can redistribute it and/or modify it under the terms of the GNU Lesser General Public License as published by the Free Software Foundation; either version 2.1 of the License, or (at your option) any later version.

This library is distributed in the hope that it will be useful, but WITHOUT ANY WARRANTY; without even the implied warranty of MERCHANTABILITY or FITNESS FOR A PARTICULAR PURPOSE. See the GNU Lesser General Public License for more details.

You should have received a copy of the GNU Lesser General Public License along with this library; if not, write to the Free Software Foundation, Inc., 51 Franklin St, Fifth Floor, Boston, MA 02110-1301 USA

Also add information on how to contact you by electronic and paper mail.

You should also get your employer (if you work as a programmer) or your school, if any, to sign a "copyright disclaimer" for the library, if necessary. Here is a sample; alter the names:

Yoyodyne, Inc., hereby disclaims all copyright interest in the library `Frob' (a library for tweaking knobs) written by James Random Hacker.

<signature of Ty Coon>, 1 April 1990

Ty Coon, President of Vice

That's all there is to it!

/**
 * gnutls_ia_enable - Indicate willingness for TLS/IA application phases
 * @session: is a #gnutls_session_t structure.
 * @allow_skip_on_resume: non-zero if local party allows to skip the
 *   TLS/IA application phases for a resumed session.
 *
 * Specify whether we must advertise support for the TLS/IA extension
 * during the handshake.
 *
 * At the client side, we always advertise TLS/IA if gnutls_ia_enable
 * was called before the handshake; at the server side, we also
 * require that the client has advertised that it wants to run TLS/IA
 * before including the advertisement, as required by the protocol.
 *
 * Similarly, at the client side we always advertise that we allow

```

```

* TLS/IA to be skipped for resumed sessions if @allow_skip_on_resume
* is non-zero; at the server side, we also require that the session
* is indeed resumable and that the client has also advertised that it
* allows TLS/IA to be skipped for resumed sessions.
*
* After the TLS handshake, call gnutls_ia_handshake_p() to find out
* whether both parties agreed to do a TLS/IA handshake, before
* calling gnutls_ia_handshake() or one of the lower level gnutls_ia_*
* functions.

<h2 class="chapter">1 Preface</h2>

<p>This document tries to demonstrate and explain the <acronym>GnuTLS</acronym> library API. A brief introduction to the protocols and the technology involved, is also included so that an application programmer can better understand the <acronym>GnuTLS</acronym> purpose and actual offerings. Even if <acronym>GnuTLS</acronym> is a typical library software, it operates over several security and cryptographic protocols, which require the programmer to make careful and correct usage of them, otherwise he risks to offer just a false sense of security. Security and the

network security terms are very general terms even for computer software thus cannot be easily restricted to a single cryptographic library. For that reason, do not consider a program secure just because it uses `<acronym>GnuTLS</acronym>`; there are several ways to compromise a program or a communication line and `<acronym>GnuTLS</acronym>` only helps with some of them.

`<p>`Although this document tries to be self contained, basic network programming and PKI knowlegde is assumed in most of it. A good introduction to networking can be found in [STEVENS] (see `Bibliography`) and for Public Key Infrastructure in [GUTPKI] (see `Bibliography`).

`<p>```Updated versions of the `<acronym>GnuTLS</acronym>` software and this document will be available from `http://www.gnutls.org/` and `http://www.gnu.org/software/gnutls/`.

1.2 Commercial Support</h3>

<p>Commercial support is available for users of GnuTLS. The kind of support that can be purchased may include:

Implement new features.

Such as a new TLS extension.

Port GnuTLS to new platforms.

This could include porting to an embedded platforms that may need memory or size optimization.

Integrating TLS as a security environment in your existing project.

System design of components related to TLS.

<p>If you are interested, please write to:

<pre class="verbatim">Simon Josefsson Datakonsult

Hagagatan 24

113 47 Stockholm

Sweden

E-mail: simon@josefsson.org

</pre>

<p>If your company provide support related to GnuTLS and would like to be mentioned here, contact the author (see Bug Reports).

<div class="node">

<p><hr>

Next: Bug Reports,&br/>Previous: Commercial Support,&br/>Up: Preface

</div>

1.3 Downloading and Installing

GnuTLS is available for download from the following URL:

<http://www.gnutls.org/download.html>

The latest version is stored in a file, e.g., `gnutls-2.8.5.tar.gz`; where the `2.8.5` value is the highest version number in the directory.

GnuTLS uses a Linux-like development cycle: even minor version numbers indicate a stable release and a odd minor version number indicates a development release. For example, GnuTLS 1.6.3 denote a stable release since 6 is even, and GnuTLS 1.7.11 denote a development release since 7 is odd.

GnuTLS depends on Libgcrypt, and you will need to install Libgcrypt before installing GnuTLS. Libgcrypt is available from <ftp://ftp.gnupg.org/gcrypt/libgcrypt>. Libgcrypt needs another library, libpgp-error, and you need to install libpgp-error before installing Libgcrypt. Libpgp-error is available from <ftp://ftp.gnupg.org/gcrypt/libpgp-error>.

Don't forget to verify the cryptographic signature after downloading source code packages.

The package is then extracted, configured and built like many other packages that use Autoconf. For detailed information on configuring and building it, refer to the `INSTALL` file that is part of the distribution archive. Typically you invoke `./configure` and then `make check install`. There are a number of compile-time parameters, as discussed below.

The compression libraries (libz and lzo) are optional dependencies. You can get libz from <http://www.zlib.net/>. You can get lzo from <http://www.oberhumer.com/opensource/lzo/>.

The X.509 part of GnuTLS needs ASN.1 functionality, from a library called libtasn1. A copy of libtasn1 is included in GnuTLS. If you want to install it separately (e.g., to make it possibly to use libtasn1 in other programs), you can get it from <http://www.gnu.org/software/gnutls/download.html>.

The OpenPGP part of GnuTLS uses a stripped down version of OpenCDK for parsing OpenPGP packets. It is included in GnuTLS. Use the parameter `--disable-openpgp-authentication` to disable the OpenPGP functionality in GnuTLS. Unfortunately, we didn't have resources to maintain the code in a separate library.

Regarding the Guile bindings, there are additional installation considerations, see [Guile Preparations](#Guile-Preparations).

A few `configure` options may be relevant, summarized in the table.

<code>--disable-srp-authentication</code>	<code>--disable-psk-authentication</code>	<code>--disable-anon-authentication</code>	<code>--disable-extra-pki</code>	<code>--disable-openpgp-authentication</code>	<code>--disable-openssl-compatibility</code>
Disable or enable particular features. Generally not recommended.					

For the complete list, refer to the output from `configure --help`.

1.4 Bug Reports

[index-Reporting-Bugs-3](#)

If you think you have found a bug in GnuTLS, please investigate it and report it.

-

- Please make sure that the bug is really in GnuTLS, and preferably also check that it hasn't already been fixed in the latest version.
- You have to send us a test case that makes it possible for us to reproduce the bug.

You also have to explain what is wrong; if you get a crash, or if the results printed are not good and in that case, in what way. Make sure that the bug report includes all information you would need to fix this kind of bug for someone else.

<p>Please make an effort to produce a self-contained report, with something definite that can be tested or debugged. Vague queries or piecemeal messages are difficult to act on and don't help the development effort.

<p>If your bug report is good, we will do our best to help you to get a corrected version of the software; if the bug report is poor, we won't do anything about it (apart from asking you to send better bug reports).

<p>If you think something in this manual is unclear, or downright incorrect, or if the language needs to be improved, please also send a note.

<p>Send your bug report to:

<div align="center">‘<samp>bug-gnutls@gnu.org</samp>’</div>

<div class="node">

<p><hr>

Previous: Bug Reports,&

Up: Preface

</div>

<h3 class="section">1.5 Contributing</h3>

<p>

If you want to submit a patch for inclusion – from solve a typo you discovered, up to adding support for a new feature – you should submit it as a bug report (see Bug Reports). There are some things that you can do to increase the chances for it to be included in the official package.

<p>Unless your patch is very small (say, under 10 lines) we require that you assign the copyright of your work to the Free Software Foundation. This is to protect the freedom of the project. If you have not already signed papers, we will send you the necessary information when you submit your contribution.

<p>For contributions that doesn't consist of actual programming code, the only guidelines are common sense. Use it.

<p>For code contributions, a number of style guides will help you:

Coding Style.

Follow the GNU Standards document (see GNU Coding Standards).

<p>If you normally code using another coding standard, there is no problem, but you should use ‘<samp>indent</samp>’ to reformat the code

(see GNU Indent) before submitting your work.

Use the unified diff format ‘<samp>diff -u</samp>’.

Return errors.

No reason whatsoever should abort the execution of the library. Even memory allocation errors, e.g. when malloc return NULL, should work although result in an error code.

Design with thread safety in mind.

Don't use global variables. Don't even write to per-handle global variables unless the documented behaviour of the function you write is to write to the per-handle global variable.

Avoid using the C math library.

It causes problems for embedded implementations, and in most situations it is very easy to avoid using it.

Document your functions.

Use comments before each function headers, that, if properly formatted, are extracted into Texinfo manuals and GTK-DOC web pages.

Supply a ChangeLog and NEWS entries, where appropriate.

<div class="node">

<p><hr>

Next: Introduction to TLS,&br/>Previous: Preface,&br/>Up: Top

</div>

<h2 class="chapter">2 The Library</h2>

In brief `GnuTLS` can be described as a library which offers an API to access secure communication protocols. These protocols provide privacy over insecure lines, and were designed to prevent eavesdropping, tampering, or message forgery.

Technically `GnuTLS` is a portable ANSI C based library which implements the TLS 1.1 and SSL 3.0 protocols (See [Introduction to TLS](#Introduction-to-TLS), for a more detailed description of the protocols), accompanied with the required framework for authentication and public key infrastructure. Important features of the `GnuTLS` library include:

- Support for TLS 1.0, TLS 1.1, and SSL 3.0 protocols.
- Support for both `X.509` and `OpenPGP` certificates.
- Support for handling and verification of certificates.
- Support for `SRP` for TLS authentication.
- Support for `PSK` for TLS authentication.
- Support for TLS Extension mechanism.
- Support for TLS Compression Methods.

Additionally `GnuTLS` provides a limited emulation API for the widely used `OpenSSL` ¹ library, to ease integration with existing applications.

`GnuTLS` consists of three independent parts, namely the 'TLS protocol part', the 'Certificate part', and the 'Cryptographic backend' part. The 'TLS protocol part' is the actual protocol implementation, and is entirely implemented within the `GnuTLS` library. The 'Certificate part' consists of the certificate parsing, and verification functions which is partially implemented in the `GnuTLS` library. The `Libtasn1` ², a library which offers `ASN.1` parsing capabilities, is used for the `X.509` certificate parsing functions. A smaller version of `OpenCDK` ³ is used for the `OpenPGP` key support in `GnuTLS`. The 'Cryptographic backend' is provided by the `Libgcrypt` ⁴

library⁵.

<p>In order to ease integration in embedded systems, parts of the <acronym>GnuTLS</acronym> library can be disabled at compile time. That way a small library, with the required features, can be generated.

- General Idea
- Error handling
- Memory handling
- Callback functions

<div class="node">

<p><hr>
Next: Error handling,
Up: The Library

</div>

<h3 class="section">2.1 General Idea</h3>

<p>A brief description of how <acronym>GnuTLS</acronym> works internally is shown at the figure below. This section may be easier to understand after having seen the examples (see examples).

<div class="block-image"></div>

<p>As shown in the figure, there is a read-only global state that is initialized once by the global initialization function. This global structure, among others, contains the memory allocation functions used, and some structures needed for the <acronym>ASN.1</acronym> parser. This structure is never modified by any <acronym>GnuTLS</acronym> function, except for the deinitialization function which frees all memory allocated in the global structure and is called after the program has permanently finished using <acronym>GnuTLS</acronym>.

<p>The credentials structure is used by some authentication methods, such as certificate authentication (see Certificate Authentication). A credentials structure may contain certificates, private keys, temporary parameters for Diffie-Hellman or RSA key exchange, and other stuff that may be shared between several TLS sessions.

<p>This structure should be initialized using the appropriate initialization functions. For example an application which uses certificate authentication would probably initialize the credentials, using the appropriate functions, and put its trusted certificates in

this structure. The next step is to associate the credentials structure with each `TLS` session.

A `GnuTLS` session contains all the required stuff for a session to handle one secure connection. This session calls directly to the transport layer functions, in order to communicate with the peer. Every session has a unique session ID shared with the peer.

Since TLS sessions can be resumed, servers would probably need a database backend to hold the session's parameters. Every `GnuTLS` session after a successful handshake calls the appropriate backend function (See [resume](#resume), for information on initialization) to store the newly negotiated session. The session database is examined by the server just after having received the client hello and if the session ID sent by the client, matches a stored session, the stored session will be retrieved, and the new session will be a resumed one, and will share the same session ID with the previous one.

`<div class="node">`

``

`<p><hr>`

`Next: Memory handling`,

`Previous: General Idea`,

`Up: The Library`

`</div>`

`<h3 class="section">2.2 Error Handling</h3>`

In `GnuTLS` most functions return an integer type as a result. In almost all cases a zero or a positive number means success, and a negative number indicates failure, or a situation that some action has to be taken. Thus negative error codes may be fatal or not.

Fatal errors terminate the connection immediately and further sends and receives will be disallowed. An example of a fatal error code is `GNUTLS_E_DECRYPTION_FAILED`. Non-fatal errors may warn about something, i.e., a warning alert was received, or indicate the some action has to be taken. This is the case with the error code `GNUTLS_E_REHANDSHAKE` returned by [gnutls_record_recv](#gnutls_005frecord_005frecv). This error code indicates that the server requests a re-handshake. The client may ignore this request, or may reply with an alert. You can test if an error code is a fatal one by using the [gnutls_error_is_fatal](#gnutls_005ferror_005fis_005ffatal).

If any non fatal errors, that require an action, are to be returned by

a function, these error codes will be documented in the function's reference. See [Error Codes](#Error-Codes), for all the error codes.

```

```

```
</div>
```

2.3 Memory Handling

[GnuTLS](#) internally handles heap allocated objects differently, depending on the sensitivity of the data they contain. However for performance reasons, the default memory functions do not overwrite sensitive data from memory, nor protect such objects from being written to the swap. In order to change the default behavior the [gnutls_global_set_mem_functions](#) function is available which can be used to set other memory handlers than the defaults.

The [Libgcrypt](#) library on which [GnuTLS](#) depends, has such secure memory allocation functions available. These should be used in cases where even the system's swap memory is not considered secure. See the documentation of [Libgcrypt](#) for more information.

Up:&nbsp;<a rel="up" accesskey="u" href="#The-Library">The Library</a>
```

```
</div>
```

2.4 Callback Functions

[index-Callback-functions-6](#)
There are several cases where [GnuTLS](#) may need some out of band input from your program. This is now implemented using some callback functions, which your program is expected to register.

An example of this type of functions are the push and pull callbacks which are used to specify the functions that will retrieve and send data to the transport layer.

- gnutls_transport_set_push_function
- gnutls_transport_set_pull_function

<p>Other callback functions such as the one set by gnutls_srp_set_server_credentials_function, may require more complicated input, including data to be allocated. These callbacks should allocate and free memory using the functions shown below.

- gnutls_malloc
- gnutls_free

Next: Authentication methods, Previous: The Library, Up: Top

>3 Introduction to <acronym>TLS</acronym></h2>

<p><acronym>TLS</acronym> stands for “Transport Layer Security” and is the successor of SSL, the Secure Sockets Layer protocol [SSL3] (see Bibliography) designed by Netscape. <acronym>TLS</acronym> is an Internet protocol, defined by <acronym>IETF</acronym>⁷, described in <acronym>RFC</acronym> 4346 and also in [RESCORLA] (see Bibliography). The protocol provides confidentiality, and authentication layers over any reliable transport layer. The description, below, refers to <acronym>TLS</acronym> 1.0 but also applies to <acronym>TLS</acronym> 1.1 [RFC4346] (see Bibliography) and <acronym>SSL</acronym> 3.0, since the differences of these protocols are minor. Older protocols such as <acronym>SSL</acronym> 2.0 are not discussed nor implemented in <acronym>GnuTLS</acronym> since they are not considered secure today. GnuTLS also supports <acronym>X.509</acronym> and <acronym>OpenPGP</acronym> [RFC4880] (see Bibliography).

Up:&nbsp;<a rel="up" accesskey="u" href="#Introduction-to-TLS">Introduction to TLS</a>

</div>
```

<h3 class="section">3.1 TLS Layers</h3>

```
<p><a name="index-TLS-Layers-7"></a>
<acronym>TLS</acronym> is a layered protocol, and consists of the Record
Protocol, the Handshake Protocol and the Alert Protocol. The Record
Protocol is to serve all other protocols and is above the transport
layer. The Record protocol offers symmetric encryption, data
authenticity, and optionally compression.
```

```
<p>The Alert protocol offers some signaling to the other protocols. It
can help informing the peer for the cause of failures and other error
conditions. See <a href="#The-Alert-Protocol">The Alert Protocol</a>, for more information. The
alert protocol is above the record protocol.
```

```
<p>The Handshake protocol is responsible for the security parameters'
negotiation, the initial key exchange and authentication. See <a href="#The-Handshake-Protocol">The Handshake
Protocol</a>, for more information about the handshake
protocol. The protocol layering in TLS is shown in the figure below.
```

```
<div class="block-image"></div>
```

```
<div class="node">
<a name="The-transport-layer"></a>
<p><hr>
Next:&nbsp;<a rel="next" accesskey="n" href="#The-TLS-record-protocol">The TLS record protocol</a>,
Previous:&nbsp;<a rel="previous" accesskey="p" href="#TLS-layers">TLS layers</a>,
Up:&nbsp;<a rel="up" accesskey="u" href="#Introduction-to-TLS">Introduction to TLS</a>
```

</div>

<h3 class="section">3.2 The Transport Layer</h3>

<p>

<acronym>TLS</acronym> is not limited to one transport layer, it can be used above any transport layer, as long as it is a reliable one. A set of functions is provided and their purpose is to load to <acronym>GnuTLS</acronym> the required callbacks to access the transport layer.

gnutls_transport_set_push_function

gnutls_transport_set_pull_function

gnutls_transport_set_ptr

gnutls_transport_set_lowat

gnutls_transport_set_errno

<p>These functions accept a callback function as a parameter. The callback functions should return the number of bytes written, or -1 on error and should set <code>errno</code> appropriately.

<p>In some environments, setting <code>errno</code> is unreliable, for example Windows have several errno variables in different CRTs, or it may be that errno is not a thread-local variable. If this is a concern to you, call <code>gnutls_transport_set_errno</code> with the intended errno value instead of setting <code>errno</code> directly.

<p><acronym>GnuTLS</acronym> currently only interprets the EINTR and EAGAIN errno values and returns the corresponding <acronym>GnuTLS</acronym> error codes <code>GNUTLS_E_INTERRUPTED</code> and <code>GNUTLS_E_AGAIN</code>. These values are usually returned by interrupted system calls, or when non blocking IO is used. All <acronym>GnuTLS</acronym> functions can be resumed (called again), if any of these error codes is returned. The error codes above refer to the system call, not the <acronym>GnuTLS</acronym> function, since signals do not interrupt <acronym>GnuTLS</acronym>' functions.

<p>For non blocking sockets or other custom made pull/push functions the gnutls_transport_set_lowat must be called, with a zero low water mark value.

<p>By default, if the transport functions are not set, <acronym>GnuTLS</acronym> will use the Berkeley Sockets functions. In this case <acronym>GnuTLS</acronym> will use some hacks in order for <code>select</code> to work, thus making it easy to add <acronym>TLS</acronym> support to existing TCP/IP servers.

```
<div class="node">
<a name="The-TLS-record-protocol"></a>
<p><hr>
Next:&nbsp;<a rel="next" accesskey="n" href="#The-TLS-Alert-Protocol">The TLS Alert Protocol</a>,
Previous:&nbsp;<a rel="previous" accesskey="p" href="#The-transport-layer">The transport layer</a>,
Up:&nbsp;<a rel="up" accesskey="u" href="#Introduction-to-TLS">Introduction to TLS</a>

</div>
```

<h3 class="section">3.3 The TLS Record Protocol</h3>

```
<p><a name="index-Record-protocol-9"></a>
The Record protocol is the secure communications provider. Its purpose
is to encrypt, authenticate and &mdash;optionally&mdash; compress packets.
The following functions are available:
```

```
<dl>
<dt><a href="#gnutls_005frecord_005frecord_005frecord_005fsend">gnutls_record_send</a>:<dd>To send a record packet (with
application data).

<br><dt><a href="#gnutls_005frecord_005frecord_005frecord_005frecv">gnutls_record_recv</a>:<dd>To receive a record packet (with
application data).

<br><dt><a href="#gnutls_005frecord_005frecord_005frecord_005fdirection">gnutls_record_get_direction</a>:<dd>To get the
direction of the last interrupted function call.
</dl>
```

```
<p>As you may have already noticed, the functions which access the Record
protocol, are quite limited, given the importance of this protocol in
<acronym>TLS</acronym>. This is because the Record protocol's parameters are
all set by the Handshake protocol.
```

```
<p>The Record protocol initially starts with NULL parameters, which means
no encryption, and no MAC is used. Encryption and authentication begin
just after the handshake protocol has finished.
```

```
<ul class="menu">

```

algorithms used in the record layer

Up: [The TLS record protocol](#)

3.3.1 Encryption Algorithms Used in the Record Layer

Confidentiality in the record layer is achieved by using symmetric block encryption algorithms like `3DES`, `AES`, or stream algorithms like `ARCFOUR_128`. Ciphers are encryption algorithms that use a single, secret, key to encrypt and decrypt data. Block algorithms in TLS also provide protection against statistical analysis of the data. Thus, if you're using the `TLS` protocol, a random number of blocks will be appended to data, to prevent eavesdroppers from guessing the actual data size.

Supported cipher algorithms:

- `3DES_CBC` is the DES block cipher algorithm used with triple encryption (EDE). Has 64 bits block size and is used in CBC mode.
- `ARCFOUR_128` is a fast stream cipher.
- `ARCFOUR_40` This is the ARCFOUR cipher that is fed with a 40 bit key, which is considered weak.
- `AES_CBC` AES or RIJNDAEL is the block cipher algorithm that replaces the old DES algorithm. Has 128 bits block size and is used in CBC mode. This is not officially supported in TLS.

Supported MAC algorithms:

- `MAC_MD5` MD5 is a cryptographic hash algorithm designed by Ron Rivest. Outputs 128 bits of data.
- `MAC_SHA` SHA is a cryptographic hash algorithm designed by NSA. Outputs 160 bits of data.

[Compression algorithms used in the record layer](#)

<p><hr>
Next: Weaknesses and countermeasures,
Previous: Encryption algorithms used in the record layer,
Up: The TLS record protocol

</div>

3.3.2 Compression Algorithms Used in the Record Layer</h4>

<p>
The TLS record layer also supports compression. The algorithms implemented in <acronym>GnuTLS</acronym> can be found in the table below. All the algorithms except for DEFLATE which is referenced in [RFC3749] (see Bibliography), should be considered as <acronym>GnuTLS</acronym>' extensions¹⁰, and should be advertised only when the peer is known to have a compliant client, to avoid interoperability problems.

<p>The included algorithms perform really good when text, or other compressible data are to be transferred, but offer nothing on already compressed data, such as compressed images, zipped archives etc. These compression algorithms, may be useful in high bandwidth TLS tunnels, and in cases where network usage has to be minimized. As a drawback, compression increases latency.

<p>The record layer compression in <acronym>GnuTLS</acronym> is implemented based on the proposal [RFC3749] (see Bibliography). The supported compression algorithms are:

<dl>
<dt><code>DEFLATE</code><dd>Zlib compression, using the deflate algorithm.

<dt><code>LZO</code><dd>LZO is a very fast compression algorithm. This algorithm is only available if the <acronym>GnuTLS-extra</acronym> library has been initialized and the private extensions are enabled, and if GnuTLS was built with LZO support.

</dl>

<div class="node">

<p><hr>
Previous: Compression algorithms used in the record layer,
Up: The TLS record protocol

</div>

<h4 class="subsection">3.3.3 Weaknesses and Countermeasures</h4>

<p>Some weaknesses that may affect the security of the Record layer have been found in <acronym>TLS</acronym> 1.0 protocol. These weaknesses can be exploited by active attackers, and exploit the facts that

<ol type=1 start=1>

<acronym>TLS</acronym> has separate alerts for “decryption_failed” and “bad_record_mac”;

The decryption failure reason can be detected by timing the response time.

The IV for CBC encrypted packets is the last block of the previous encrypted packet.

<p>Those weaknesses were solved in <acronym>TLS</acronym> 1.1 [RFC4346] (see Bibliography) which is implemented in <acronym>GnuTLS</acronym>. For a detailed discussion see the archives of the TLS Working Group mailing list and the paper [CBCATT] (see Bibliography).

<div class="node">

<p><hr>

Next: The TLS Handshake Protocol,&br/>Previous: The TLS record protocol,&br/>Up: Introduction to TLS

</div>

<h3 class="section">3.4 The TLS Alert Protocol</h3>

<p>

The Alert protocol is there to allow signals to be sent between peers. These signals are mostly used to inform the peer about the cause of a protocol failure. Some of these signals are used internally by the protocol and the application protocol does not have to cope with them (see <code>GNUTLS_A_CLOSE_NOTIFY</code>), and others refer to the application protocol solely (see <code>GNUTLS_A_USER_CANCELLED</code>). An alert signal includes a level indication which may be either fatal or warning. Fatal alerts always terminate the current connection, and prevent future renegotiations using the current session ID.

The alert messages are protected by the record protocol, thus the information that is included does not leak. You must take extreme care for the alert information not to leak to a possible attacker, via public log files etc.

[gnutls_alert_send](#): To send an alert signal.

[gnutls_error_to_alert](#): To map a gnutls error number to an alert signal.

[gnutls_alert_get](#): Returns the last received alert.

[gnutls_alert_get_name](#): Returns the name, in a character array, of the given alert.

[The-TLS-Handshake-Protocol](#)

Next: [TLS Extensions](#),
Previous: [The-TLS-Alert-Protocol](#),
Up: [Introduction to TLS](#)

3.5 The TLS Handshake Protocol

[The-Handshake-Protocol](#) [index-Handshake-protocol-13](#)

The Handshake protocol is responsible for the ciphersuite negotiation, the initial key exchange, and the authentication of the two peers. This is fully controlled by the application layer, thus your program has to set up the required parameters. Available functions to control the handshake protocol include:

[gnutls_priority_init](#): To initialize a priority set of ciphers.

[gnutls_priority_deinit](#): To deinitialize a priority set of ciphers.

[gnutls_priority_set](#): To associate a priority set with a [TLS](#) session.

[gnutls_priority_set_direct](#): To directly associate a session with a given priority string.

[gnutls_credentials_set](#): To set the appropriate credentials structures.

[gnutls_certificate_server_set_request](#): To set whether client certificate is required or not.

[gnutls_handshake](#): To initiate the handshake.

3.5.1 TLS Cipher Suites

The Handshake Protocol of [TLS](#) negotiates cipher suites of the form `TLS_DHE_RSA_WITH_3DES_CBC_SHA`. The usual cipher suites contain these parameters:

- The key exchange algorithm.
`DHE_RSA` in the example.
- The Symmetric encryption algorithm and mode.
`3DES_CBC` in this example.
- The MAC [11](#) algorithm used for authentication.
`MAC_SHA` is used in the above example.

The cipher suite negotiated in the handshake protocol will affect the Record Protocol, by enabling encryption and data authentication. Note that you should not over rely on [TLS](#) to negotiate the strongest available cipher suite. Do not enable ciphers and algorithms that you consider weak.

The priority functions, discussed above, allow the application layer to enable and set priorities on the individual ciphers. It may imply that all combinations of ciphersuites are allowed, but this is not true. For several reasons, not discussed here, some combinations were not defined in the [TLS](#) protocol. The supported ciphersuites are shown in [ciphersuites](#).

3.5.2 Client Authentication

[index-Client-Certificate-authentication-14](#)
In the case of ciphersuites that use certificate authentication, the authentication of the client is optional in [TLS](#). A server

may request a certificate from the client — using the

[gnutls_certificate_server_set_request](#) function. If a

certificate is to be requested from the client during the handshake,

the server will send a certificate request message that contains a

list of acceptable certificate signers. In [GnuTLS](#) the certificate

signers list is constructed using the trusted Certificate Authorities by the

server. That is the ones set using

- [gnutls_certificate_set_x509_trust_file](#)
- [gnutls_certificate_set_x509_trust_mem](#)

Sending of the names of the CAs can be controlled using

[gnutls_certificate_send_x509_rdn_sequence](#). The client, then,

may send a certificate, signed by one of the server's acceptable signers.

3.5.3 Resuming Sessions

[gnutls_handshake](#) function, is expensive since a lot of

calculations are performed. In order to support many fast connections

to the same server a client may use session resuming. **Session**

resuming is a feature of the [TLS](#) protocol which allows a

client to connect to a server, after a successful handshake, without

the expensive calculations. This is achieved by using the previously

established keys. [GnuTLS](#) supports this feature, and the

example (see [ex:resume-client](#)) illustrates a typical use of it.

Keep in mind that sessions are expired after some time, for security

reasons, thus it may be normal for a server not to resume a session

even if you requested that. Also note that you must enable, using the

priority functions, at least the algorithms used in the last session.

3.5.4 Resuming Internals

The resuming capability, mostly in the server side, is one of the

problems of a thread-safe TLS implementations. The problem is that all

threads must share information in order to be able to resume

sessions. The gnutls approach is, in case of a client, to leave all

the burden of resuming to the client. I.e., copy and keep the necessary

parameters. See the functions:

```

<ul>
<li><a href="#gnutls_005fsession_005fget_005fdata">gnutls_session_get_data</a>

    <li><a href="#gnutls_005fsession_005fget_005fid">gnutls_session_get_id</a>

    <li><a href="#gnutls_005fsession_005fset_005fdata">gnutls_session_set_data</a>

</ul>

```

<p>The server side is different. A server has to specify some callback functions which store, retrieve and delete session data. These can be registered with:

```

<ul>
<li><a href="#gnutls_005fdb_005fset_005fremove_005ffunction">gnutls_db_set_remove_function</a>

    <li><a href="#gnutls_005fdb_005fset_005fstore_005ffunction">gnutls_db_set_store_function</a>

    <li><a href="#gnutls_005fdb_005fset_005fretrieve_005ffunction">gnutls_db_set_retrieve_function</a>

    <li><a href="#gnutls_005fdb_005fset_005fptr">gnutls_db_set_ptr</a>

</ul>

```

<p>It might also be useful to be able to check for expired sessions in order to remove them, and save space. The function gnutls_db_check_entry is provided for that reason.

```

<div class="node">

```

<h3 class="section">3.6 TLS Extensions</h3>

<p>
A number of extensions to the <acronym>TLS</acronym> protocol have been proposed mainly in [TLSEXT] (see Bibliography). The extensions supported in <acronym>GnuTLS</acronym> are:

```

<ul>
<li>Maximum fragment length negotiation

```

Server name indication

<p>and they will be discussed in the subsections that follow.

<h4 class="subsection">3.6.1 Maximum Fragment Length Negotiation</h4>

<p>
This extension allows a <acronym>TLS</acronym> implementation to negotiate a smaller value for record packet maximum length. This extension may be useful to clients with constrained capabilities. See the gnutls_record_set_max_size and the gnutls_record_get_max_size functions.

<h4 class="subsection">3.6.2 Server Name Indication</h4>

<p>

A common problem in <acronym>HTTPS</acronym> servers is the fact that the <acronym>TLS</acronym> protocol is not aware of the hostname that a client connects to, when the handshake procedure begins. For that reason the <acronym>TLS</acronym> server has no way to know which certificate to send.

<p>This extension solves that problem within the <acronym>TLS</acronym> protocol, and allows a client to send the HTTP hostname before the handshake begins within the first handshake packet. The functions gnutls_server_name_set and gnutls_server_name_get can be used to enable this extension, or to retrieve the name sent by a client.

<h3 class="section">3.7 Selecting Cryptographic Key Sizes</h3>

<p>

In TLS, since a lot of algorithms are involved, it is not easy to set a consistent security level. For this reason this section will present some correspondance between key sizes of symmetric algorithms and public key algorithms based on the most conservative values of [SELKEY] (see Bibliography).

Those can be used to generate certificates with appropriate key sizes as well as parameters for Diffie-Hellman and SRP authentication.

```

<p><table summary="">
<tr align="left"><td valign="top" width="15%">Year
</td><td valign="top" width="20%">Symmetric key size
</td><td valign="top" width="20%">RSA key size, DH and SRP prime size

</td><td valign="top" width="20%">272

<br></td></tr></table>

```

The first column provides an estimation of the year until these parameters are considered safe and the rest of the columns list the parameters for the

various algorithms.

Note however that the values suggested here are nothing more than an educated guess that is valid today. There are no guarantees that an algorithm will remain unbreakable or that these values will remain constant in time. There could be scientific breakthroughs that cannot be predicted or total failure of the current public key systems by quantum computers. On the other hand though the cryptosystems used in TLS are selected in a conservative way and such catastrophic breakthroughs or failures are believed to be unlikely.

NIST publication SP 800-57 [NISTSP80057] (see [Bibliography](#Bibliography)) contains a similar table that extends beyond the key sizes given above.

Bits of security	Symmetric key algorithms	RSA key size, DSA, DH and SRP prime size	ECC key size
------------------	--------------------------	--	--------------

80	2TDEA	1024	160-223
----	-------	------	---------

112	3DES	2048	224-255
-----	------	------	---------

128	AES-128	3072	256-383
-----	---------	------	---------

192	AES-192	7680	384-511
-----	---------	------	---------

256	AES-256	15360	512+
-----	---------	-------	------

The recommendations are fairly consistent.

```

<h3 class="section">3.8 On SSL 2 and Older Protocols</h3>

```
<p><a name="index-SSL-2-22"></a>
```

One of the initial decisions in the <acronym>GnuTLS</acronym> development was to implement the known security protocols for the transport layer. Initially <acronym>TLS</acronym> 1.0 was implemented since it was the latest at that time, and was considered to be the most advanced in security properties. Later the <acronym>SSL</acronym> 3.0 protocol was implemented since it is still the only protocol supported by several servers and there are no serious security vulnerabilities known.

<p>One question that may arise is why we didn't implement <acronym>SSL</acronym> 2.0 in the library. There are several reasons, most important being that it has serious security flaws, unacceptable for a modern security library. Other than that, this protocol is barely used by anyone these days since it has been deprecated since 1996. The security problems in <acronym>SSL</acronym> 2.0 include:

-
Message integrity compromised.
The <acronym>SSLv2</acronym> message authentication uses the MD5 function, and is insecure.

There is no protection of the handshake in <acronym>SSLv2</acronym>, which permits a man-in-the-middle attack.
<acronym>SSLv2</acronym> relies on TCP FIN to close the session, so the attacker can forge a TCP FIN, and the peer cannot tell if it was a legitimate end of data or not.
The cryptographic keys in <acronym>SSLv2</acronym> are used for both message authentication and encryption, so if weak encryption schemes are negotiated (say 40-bit keys) the message authentication code use the same weak key, which isn't necessary.

<p>Other protocols such as Microsoft's <acronym>PCT</acronym> 1 and <acronym>PCT</acronym> 2 were not implemented because they were also abandoned and deprecated by <acronym>SSL</acronym> 3.0 and later <acronym>TLS</acronym> 1.0.

Up: Introduction to TLS

</div>

<h3 class="section">3.9 On Record Padding</h3>

<p>

The TLS protocol allows for random padding of records, to make it more difficult to perform analysis on the length of exchanged messages. (In RFC 4346 this is specified in section 6.2.3.2.) GnuTLS appears to be one of few implementation that take advantage of this text, and pad records by a random length.

<p>The TLS implementation in the Symbian operating system, frequently used by Nokia and Sony-Ericsson mobile phones, cannot handle non-minimal record padding. What happens when one of these clients handshake with a GnuTLS server is that the client will fail to compute the correct MAC for the record. The client sends a TLS alert (<code>bad_record_mac</code>) and disconnects. Typically this will result in error messages such as 'A TLS fatal alert has been received', 'Bad record MAC', or both, on the GnuTLS server side.

<p>GnuTLS implements a work around for this problem. However, it has to be enabled specifically. It can be enabled by using gnutls_record_disable_padding, or gnutls_priority_set with the <code>%COMPAT</code> priority string.

<p>If you implement an application that have a configuration file, we recommend that you make it possible for users or administrators to specify a GnuTLS protocol priority string, which is used by your application via gnutls_priority_set. To allow the best flexibility, make it possible to have a different priority string for different incoming IP addresses.

<p>To enable the workaround in the <code>gnutls-cli</code> client or the

`gnutls-serv` server, for testing of other implementations, use the following parameter: `--priority "%COMPAT"`.

This problem has been discussed on mailing lists and in bug reports. This section tries to collect all pieces of information that we know about the problem. If you wish to go back to the old discussions, here are some links:

4.1 Certificate Authentication</h3>

4.1.1 Authentication Using <acronym>X.509</acronym> Certificates</h4>

<p>

<acronym>X.509</acronym> certificates contain the public parameters, of a public key algorithm, and an authority's signature, which proves the authenticity of the parameters. See The X.509 trust model, for more information on <acronym>X.509</acronym> protocols.

4.1.2 Authentication Using <acronym>OpenPGP</acronym> Keys</h4>

<p>

<acronym>OpenPGP</acronym> keys also contain public parameters of a public key algorithm, and signatures from several other parties. Depending on whether a signer is trusted the key is considered trusted or not. <acronym>GnuTLS</acronym>'s <acronym>OpenPGP</acronym> authentication implementation is based on the [TLSPGP] (see Bibliography) proposal.

<p>See The OpenPGP trust model, for more information about the <acronym>OpenPGP</acronym> trust model. For a more detailed introduction to <acronym>OpenPGP</acronym> and <acronym>GnuPG</acronym> see [GPGH] (see Bibliography).

4.1.3 Using Certificate Authentication</h4>

<p>In <acronym>GnuTLS</acronym> both the <acronym>OpenPGP</acronym> and <acronym>X.509</acronym> certificates are part of the certificate authentication and thus are handled using a common API.

<p>When using certificates the server is required to have at least one certificate and private key pair. A client may or may not have such a pair. The certificate and key pair should be loaded, before any <acronym>TLS</acronym> session is initialized, in a certificate credentials

structure. This should be done by using

[gnutls_certificate_set_x509_key_file](#)

or

[gnutls_certificate_set_openpgp_key_file](#)

depending on the

certificate type. In the X.509 case, the functions will

also accept and use a certificate list that leads to a trusted

authority. The certificate list must be ordered in such way that every

certificate certifies the one before it. The trusted authority's

certificate need not to be included, since the peer should possess it

already.

As an alternative, a callback may be used so the server or the client

specify the certificate and the key at the handshake time. That

callback can be set using the functions:

-

- [gnutls_certificate_server_set_retrieve_function](#)
- [gnutls_certificate_client_set_retrieve_function](#)

Certificate verification is possible by loading the trusted

authorities into the credentials structure by using

[gnutls_certificate_set_x509_trust_file](#)

or

[gnutls_certificate_set_openpgp_keyring_file](#)

for openpgp

keys. Note however that the peer's certificate is not automatically

verified, you should call [gnutls_certificate_verify_peers2](#),

after a successful handshake, to verify the signatures of the

certificate. An alternative way, which reports a more detailed

verification output, is to use [gnutls_certificate_get_peers](#)

to

obtain the raw certificate of the peer and verify it using the

functions discussed in [The X.509 trust model](#).

In a handshake, the negotiated cipher suite depends on the

certificate's parameters, so not all key exchange methods will be

available with some certificates. GnuTLS will disable

ciphersuites that are not compatible with the key, or the enabled authentication methods. For example keys marked as sign-only, will not be able to access the plain RSA ciphersuites, but only the `DHE_RSA` ones. It is recommended not to use RSA keys for both signing and encryption. If possible use the same key for the `DHE_RSA` and `RSA_EXPORT` ciphersuites, which use signing, and a different key for the plain RSA ciphersuites, which use encryption. All the key exchange methods shown below are available in certificate authentication.

Note that the DHE key exchange methods are generally slower¹² than plain RSA and require Diffie Hellman parameters to be generated and associated with a credentials structure, by the server. The `RSA-EXPORT` method also requires 512 bit RSA parameters, that should also be generated and associated with the credentials structure. See the functions:

- [gnutls_dh_params_generate2](#)
- [gnutls_certificate_set_dh_params](#)
- [gnutls_rsa_params_generate2](#)
- [gnutls_certificate_set_rsa_export_params](#)

Sometimes in order to avoid bottlenecks in programs it is useful to store and read parameters from formats that can be generated by external programs such as `certtool`. This is possible with `GnuTLS` by using the following functions:

- [gnutls_dh_params_import_pkcs3](#)
- [gnutls_rsa_params_import_pkcs1](#)
- [gnutls_dh_params_export_pkcs3](#)
- [gnutls_rsa_params_export_pkcs1](#)

Key exchange algorithms for `OpenPGP` and `X.509` certificates:

<dl>
<dt><code>RSA:</code><dd>The RSA algorithm is used to encrypt a key and send it to the peer.
The certificate must allow the key to be used for encryption.

<dt><code>RSA_EXPORT:</code><dd>The RSA algorithm is used to encrypt a key and send it to the peer.

In the EXPORT algorithm, the server signs temporary RSA parameters of 512 bits — which are considered weak — and sends them to the client.

<dt><code>DHE_RSA:</code><dd>The RSA algorithm is used to sign Ephemeral Diffie-Hellman parameters which are sent to the peer. The key in the certificate must allow the key to be used for signing. Note that key exchange algorithms which use Ephemeral Diffie-Hellman parameters, offer perfect forward secrecy. That means that even if the private key used for signing is compromised, it cannot be used to reveal past session data.

<dt><code>DHE_DSS:</code><dd>The DSS algorithm is used to sign Ephemeral Diffie-Hellman parameters which are sent to the peer. The certificate must contain DSA parameters to use this key exchange algorithm. DSS stands for Digital Signature Standard.

</dl>

<div class="node">

<p><hr>

Next: Authentication using SRP,
Previous: Certificate authentication,
Up: Authentication methods

</div>

<h3 class="section">4.2 Anonymous Authentication</h3>

<p>

The anonymous key exchange performs encryption but there is no indication of the identity of the peer. This kind of authentication is vulnerable to a man in the middle attack, but this protocol can be used even if there is no prior communication and trusted parties with the peer, or when full anonymity is required. Unless really required, do not use anonymous authentication. Available key exchange methods are shown below.

<p>Note that the key exchange methods for anonymous authentication require Diffie-Hellman parameters to be generated by the server and associated with

an anonymous credentials structure.

Supported anonymous key exchange algorithms:

```
<dl>
<dt><code>ANON_DH:</code><dd>This algorithm exchanges Diffie-Hellman parameters.
</dl>
```

```
<div class="node">
<a name="Authentication-using-SRP"></a>
<p><hr>

Previous:&nbsp;<a rel="previous" accesskey="p" href="#Anonymous-authentication">Anonymous
authentication</a>,
Up:&nbsp;<a rel="up" accesskey="u" href="#Authentication-methods">Authentication methods</a>
</div>
```

4.3 Authentication using SRP

Authentication via the Secure Remote Password protocol, SRP¹³, is supported. The SRP key exchange is an extension to the TLS protocol, and it is a password based authentication (unlike X.509 or OpenPGP that use certificates). The two peers can be identified using a single password, or there can be combinations where the client is authenticated using SRP and the server using a certificate.

The advantage of SRP authentication, over other proposed secure password authentication schemes, is that SRP does not require the server to hold the user's password. This kind of protection is similar to the one used traditionally in the `UNIX` `/etc/passwd` file, where the contents of this file did not cause harm to the system security if they were revealed. The SRP needs instead of the plain password something called a verifier, which is calculated using the user's password, and if stolen cannot be used to impersonate the user. Check [TOMSRP] (see Bibliography) for a detailed description of the SRP protocol and the Stanford SRP libraries, which includes a PAM module that synchronizes the system's users passwords with the SRP password files. That way SRP authentication could be used for all the system's users.

The implementation in GnuTLS is based on paper [TLSSRP] (see Bibliography). The supported SRP key

exchange methods are:

- <dl>
 - <dt><code>SRP:</code><dd>Authentication using the <acronym>SRP</acronym> protocol.
 -
<dt><code>SRP_DSS:</code><dd>Client authentication using the <acronym>SRP</acronym> protocol.
Server is authenticated using a certificate with DSA parameters.
 -
<dt><code>SRP_RSA:</code><dd>Client authentication using the <acronym>SRP</acronym> protocol.
Server is authenticated using a certificate with RSA parameters.</dl>

<p>If clients supporting <acronym>SRP</acronym> know the username and password before the connection, should initialize the client credentials and call the function gnutls_srp_set_client_credentials. Alternatively they could specify a callback function by using the function gnutls_srp_set_client_credentials_function. This has the advantage that allows probing the server for <acronym>SRP</acronym> support. In that case the callback function will be called twice per handshake. The first time is before the ciphersuite is negotiated, and if the callback returns a negative error code, the callback will be called again if <acronym>SRP</acronym> has been negotiated. This uses a special <acronym>TLS</acronym>-<acronym>SRP</acronym> handshake idiom in order to avoid, in interactive applications, to ask the user for <acronym>SRP</acronym> password and username if the server does not negotiate an <acronym>SRP</acronym> ciphersuite.

<p>In server side the default behaviour of <acronym>GnuTLS</acronym> is to read the usernames and <acronym>SRP</acronym> verifiers from password files. These password files are the ones used by the Stanford srp libraries and can be specified using the gnutls_srp_set_server_credentials_file. If a different password file format is to be used, then the function gnutls_srp_set_server_credentials_function, should be called, in order to set an appropriate callback.

<p>Some helper functions such as

```
<ul>
<li><a href="#gnutls_005fsrp_005fverifier">gnutls_srp_verifier</a>

<li><a href="#gnutls_005fsrp_005fbase64_005fencode">gnutls_srp_base64_encode</a>

<li><a href="#gnutls_005fsrp_005fbase64_005fdecode">gnutls_srp_base64_decode</a>

</ul>
```

are included in `GnuTLS`, and can be used to generate and maintain `SRP` verifiers and password files. A program to manipulate the required parameters for `SRP` authentication is also included. See `srptool`, for more information.

```
<div class="node">
<a name="Authentication-using-PSK"></a>
<p><hr>
Next:&nbsp;<a rel="next" accesskey="n" href="#Authentication-and-credentials">Authentication and
credentials</a>,
Previous:&nbsp;<a rel="previous" accesskey="p" href="#Authentication-using-SRP">Authentication using
SRP</a>,
Up:&nbsp;<a rel="up" accesskey="u" href="#Authentication-methods">Authentication methods</a>

</div>
```

4.4 Authentication using `PSK`

`index-g_t_0040acronym_007bPSK_007d-authentication-30`

Authentication using Pre-shared keys is a method to authenticate using usernames and binary keys. This protocol avoids making use of public key infrastructure and expensive calculations, thus it is suitable for constraint clients.

The implementation in `GnuTLS` is based on paper [TLSPSK] (see `Bibliography`). The supported `PSK` key exchange methods are:

```
<dl>
<dt><code>PSK:</code><dd>Authentication using the <acronym>PSK</acronym> protocol.

<br><dt><code>DHE-PSK:</code><dd>Authentication using the <acronym>PSK</acronym> protocol and
Diffie-Hellman key exchange.
This method offers perfect forward secrecy.

</dl>
```

Clients supporting `PSK` should supply the username and key before the connection to the client credentials by calling the function `gnutls_psk_set_client_credentials`.

Alternatively they could specify a callback function by using the function [gnutls_psk_set_client_credentials_function](#).

This has the advantage that the callback will be called only if [PSK](#) has been negotiated.

In server side the default behaviour of [GnuTLS](#) is to read the usernames and [PSK](#) keys from a password file. The password file should contain usernames and keys in hexadecimal format. The name of the password file can be stored to the credentials structure by calling

[gnutls_psk_set_server_credentials_file](#).

If a different

password file format is to be used, then the function

[gnutls_psk_set_server_credentials_function](#), should be used instead.

The server can help the client chose a suitable username and password, by sending a hint. In the server, specify the hint by calling

[gnutls_psk_set_server_credentials_hint](#).

The client can retrieve

the hint, for example in the callback function, using

[gnutls_psk_client_get_hint](#).

There is no standard mechanism to derive a PSK key from a password specified by the TLS PSK document. However, [GnuTLS](#) provides

[gnutls_psk_netconf_derive_key](#) which follows the algorithm

specified in [draft-ietf-netconf-tls-02.txt](#).

Some helper functions such as:

- [gnutls_hex_encode](#)
- [gnutls_hex_decode](#)

are included in [GnuTLS](#), and may be used to generate and maintain [PSK](#) keys.

<p><hr>
Next: Parameters stored in credentials,

Up: Authentication methods

</div>

4.5 Authentication and Credentials

In <acronym>GnuTLS</acronym> every key exchange method is associated with a credentials type. So in order to enable to enable a specific method, the corresponding credentials type should be initialized and set using gnutls_credentials_set. A mapping is shown below.

Key exchange algorithms and the corresponding credential types:

Key exchange	Client credentials	Server credentials
<code>KX_RSA</code>	<code>CRD_CERTIFICATE</code>	<code>CRD_CERTIFICATE</code>
<code>KX_DHE_RSA</code>	<code>CRD_CERTIFICATE</code>	<code>CRD_CERTIFICATE</code>
<code>KX_DHE_DSS</code>	<code>CRD_CERTIFICATE</code>	<code>CRD_CERTIFICATE</code>

4.6 Parameters Stored in Credentials

Several parameters such as the ones used for Diffie-Hellman authentication are stored within the credentials structures, so all sessions can access them. Those parameters are stored in structures such as `gnutls_dh_params_t` and `gnutls_rsa_params_t`, and functions like [gnutls_certificate_set_dh_params](#gnutls_005fcertificate_005fset_005fdh_005fparams) and [gnutls_certificate_set_rsa_export_params](#gnutls_005fcertificate_005fset_005frsa_005fexport_005fparams) can be used to associate those parameters with the given credentials structure.

Since those parameters need to be renewed from time to time and a global structure such as the credentials, may not be easy to modify since it is accessible by all sessions, an alternative interface is available using a callback function. This can be set using the [gnutls_certificate_set_params_function](#gnutls_005fcertificate_005fset_005fparams_005ffunction). An example is shown below.

```
<pre class="example"> #include <gnutls.h>
```

```
    gnutls_rsa_params_t rsa_params;  
    gnutls_dh_params_t dh_params;
```

```
/* This function will be called once a session requests DH  
 * or RSA parameters. The parameters returned (if any) will  
 * be used for the first handshake only.  
 */
```

```
static int get_params( gnutls_session_t session,  
                      gnutls_params_type_t type,  
                      gnutls_params_st *st)  
{  
    if (type == GNUTLS_PARAMS_RSA_EXPORT)  
        st->params.rsa_export = rsa_params;  
    else if (type == GNUTLS_PARAMS_DH)
```

```

    st-&gt;params.dh = dh_params;
else return -1;

st-&gt;type = type;
/* do not deinitialize those parameters.
*/
st-&gt;deinit = 0;

return 0;
}

int main()
{
    gnutls_certificate_credentials_t cert_cred;

    initialize_params();

    /* ...
    */

    gnutls_certificate_set_params_function( cert_cred, get_params);
}

```

</div>

5.1 The X.509 Trust Model

X.509 certificates</p>

The X.509 protocols rely on a hierarchical trust model. In this trust model Certification Authorities (CAs) are used to certify entities. Usually more than one certification authorities exist, and certification authorities may certify other authorities to issue certificates as well, following a hierarchical model.

One needs to trust one or more CAs for his secure communications. In that case only the certificates issued by the trusted authorities are acceptable. See the figure above for a typical example. The API for handling X.509 certificates is described at section [sec:x509api](#). Some examples are listed below.

<ul class="menu">

X.509 certificates

X.509 certificates</p>

X.509 certificates</p>

<p><hr>

Next: [Verifying X.509 certificate paths](#),

Up: [The X.509 trust model](#)

</div>

5.1.1 X.509 Certificates

An X.509 certificate usually contains information about the certificate holder, the signer, a unique serial number, expiration dates and some other fields [RFC3280] (see [Bibliography](#)) as shown in the table below.

<dl>

<dt><code>version:</code><dd>The field that indicates the version of the certificate.

<dt><code>serialNumber:</code></dd>This field holds a unique serial number per certificate.

<dt><code>issuer:</code></dd>Holds the issuer's distinguished name.

<dt><code>validity:</code></dd>The activation and expiration dates.

<dt><code>subject:</code></dd>The subject's distinguished name of the certificate.

<dt><code>extensions:</code></dd>The extensions are fields only present in version 3 certificates.

</dl>

<p>The certificate's subject or issuer name is not just a single string. It is a Distinguished name and in the <acronym>ASN.1</acronym> notation is a sequence of several object IDs with their corresponding values. Some of available OIDs to be used in an <acronym>X.509</acronym> distinguished name are defined in <samp>gnutls/x509.h</samp>.

<p>The Version field in a certificate has values either 1 or 3 for version 3 certificates. Version 1 certificates do not support the extensions field so it is not possible to distinguish a CA from a person, thus their usage should be avoided.

<p>The validity dates are there to indicate the date that the specific certificate was activated and the date the certificate's key would be considered invalid.

<p>Certificate extensions are there to include information about the certificate's subject that did not fit in the typical certificate fields. Those may be e-mail addresses, flags that indicate whether the belongs to a CA etc. All the supported <acronym>X.509</acronym> version 3 extensions are shown in the table below.

<dl>

<dt><code>subject key id (2.5.29.14):</code></dd>An identifier of the key of the subject.

<dt><code>authority key id (2.5.29.35):</code></dd>An identifier of the authority's key used to sign the certificate.

<dt><code>subject alternative name (2.5.29.17):</code></dd>Alternative names to subject's distinguished name.

<dt><code>key usage (2.5.29.15):</code></dd>Constraints the key's usage of the certificate.

<dt><code>extended key usage (2.5.29.37):</code></dd>Constraints the purpose of the certificate.

<dt><code>basic constraints (2.5.29.19):</code></dd>Indicates whether this is a CA certificate or not, and

specify the maximum path lengths of certificate chains.

`CRL distribution points (2.5.29.31):` This extension is set by the CA, in order to inform about the issued CRLs.

`Proxy Certification Information (1.3.6.1.5.5.7.1.14):` Proxy Certificates includes this extension that contains the OID of the proxy policy language used, and can specify limits on the maximum lengths of proxy chains. Proxy Certificates are specified in [RFC3820] (see [Bibliography](#)).

In `GnuTLS` the `X.509` certificate structures are handled using the `gnutls_x509_cert_t` type and the corresponding private keys with the `gnutls_x509_privkey_t` type. All the available functions for `X.509` certificate handling have their prototypes in `gnutls/x509.h`. An example program to demonstrate the `X.509` parsing capabilities can be found at section [ex:x509-info](#).

[Verifying X.509 certificate paths](#)

[Verifying X.509 certificate paths](#)

Next: [PKCS #10 certificate requests](#),

Previous: [X.509 certificates](#),

Up: [The X.509 trust model](#)

5.1.2 Verifying `X.509` Certificate Paths

[index-Verifying-certificate-paths-33](#)

Verifying certificate paths is important in `X.509` authentication. For this purpose the function `gnutls_x509_cert_verify` is provided. The output of this function is the bitwise OR of the elements of the `gnutls_certificate_status_t` enumeration. A detailed description of these elements can be found in figure below.

The function `gnutls_certificate_verify_peers2` is equivalent to the previous one, and will verify the peer's certificate in a TLS session.

`CERT_INVALID:` The certificate is not signed by one of the known authorities, or

the signature is invalid.

`CERT_REVOKED:` The certificate has been revoked by its CA.

`CERT_SIGNER_NOT_FOUND:` The certificate's issuer is not known. This is the case when the issuer is not in the trusted certificates list.

`GNUTLS_CERT_SIGNER_NOT_CA:` The certificate's signer was not a CA. This may happen if this was a version 1 certificate, which is common with some CAs, or a version 3 certificate without the basic constraints extension.

`GNUTLS_CERT_INSECURE_ALGORITHM:` The certificate was signed using an insecure algorithm such as MD2 or MD5. These algorithms have been broken and should not be trusted.

There is also a possibility to pass some input to the verification functions in the form of flags. For `gnutls_x509 crt_verify` the flags are passed straightforward, but `gnutls_certificate_verify_peers2` depends on the flags set by calling `gnutls_certificate_set_verify_flags`. All the available flags are part of the enumeration `gnutls_certificate_verify_flags` and are explained in the table below.

`gnutls_certificate_verify_flags` `index-gnutls_certificate_verify_flags-34`

`GNUTLS_VERIFY_DISABLE_CA_SIGN:` If set a signer does not have to be a certificate authority. This flag should normally be disabled, unless you know what this means.

`GNUTLS_VERIFY_ALLOW_X509_V1_CA_CRT:` Allow only trusted CA certificates that have version 1. This is safer than `GNUTLS_VERIFY_ALLOW_ANY_X509_V1_CA_CRT`, and should be used instead. That way only signers in your trusted list will be allowed to have certificates of version 1.

`GNUTLS_VERIFY_ALLOW_ANY_X509_V1_CA_CRT:` Allow CA certificates that have version 1 (both root and intermediate). This is dangerous since those haven't the

basicConstraints extension. Must be used in combination with
GNUTLS_VERIFY_ALLOW_X509_V1_CA_CERT.

`GNUTLS_VERIFY_DO_NOT_ALLOW_SAME:` If a certificate is not signed by anyone trusted but exists in the trusted CA list do not treat it as trusted.

`GNUTLS_VERIFY_ALLOW_SIGN_RSA_MD2:` Allow certificates to be signed using the old MD2 algorithm.

`GNUTLS_VERIFY_ALLOW_SIGN_RSA_MD5:` Allow certificates to be signed using the broken MD5 algorithm.

Although the verification of a certificate path indicates that the certificate is signed by trusted authority, does not reveal anything about the peer's identity. It is required to verify if the certificate's owner is the one you expect. For more information consult [RFC2818] (see [Bibliography](#)) and section [ex.verify](#) for an example.

Up: [The X.509 trust model](#)

5.1.3 [PKCS](#) #10 Certificate Requests

[index-Certificate-requests-35](#) [index-g_t_0040acronym_007bPKCS_007d-_002310-36](#)

A certificate request is a structure, which contain information about an applicant of a certificate service. It usually contains a private key, a distinguished name and secondary data such as a challenge password. [GnuTLS](#) supports the requests defined in [PKCS](#) #10 [RFC2986] (see [Bibliography](#)). Other certificate request's format such as PKIX's [RFC4211] (see [Bibliography](#)) are not currently supported.

In [GnuTLS](#) the [PKCS](#) #10 structures are handled using the `gnutls_x509_crq_t` type. An example of a certificate request generation can be found at section [ex.crq](#).

<div class="node">

<p><hr>

certificate requests,
Up: The X.509 trust model
</div>

5.1.4 <acronym>PKCS</acronym> #12 Structures</h4>

<p>
A <acronym>PKCS</acronym> #12 structure [PKCS12] (see Bibliography) usually
contains a user's
private keys and certificates. It is commonly used in browsers to
export and import the user's identities.

<p>In <acronym>GnuTLS</acronym> the <acronym>PKCS</acronym> #12 structures are handled
using the <code>gnutls_pkcs12_t</code> type. This is an abstract type that
may hold several <code>gnutls_pkcs12_bag_t</code> types. The Bag types are
the holders of the actual data, which may be certificates, private
keys or encrypted data. An Bag of type encrypted should be decrypted
in order for its data to be accessed.

<p>An example of a <acronym>PKCS</acronym> #12 structure generation can be found
at section ex:pkcs12.

authentication
</div>

5.2 The <acronym>OpenPGP</acronym> Trust Model</h3>

<p>
The <acronym>OpenPGP</acronym> key authentication relies on a distributed trust
model, called the “web of trust”. The “web of trust” uses a
decentralized system of trusted introducers, which are the same as a
CA. <acronym>OpenPGP</acronym> allows anyone to sign anyone's else public
key. When Alice signs Bob's key, she is introducing Bob's key to
anyone who trusts Alice. If someone trusts Alice to introduce keys,

then Alice is a trusted introducer in the mind of that observer.

<div class="block-image"></div>

<p>For example: If David trusts Alice to be an introducer, and Alice signed Bob's key, Dave also trusts Bob's key to be the real one.

<p>There are some key points that are important in that model. In the example Alice has to sign Bob's key, only if she is sure that the key belongs to Bob. Otherwise she may also make Dave falsely believe that this is Bob's key. Dave has also the responsibility to know who to trust. This model is similar to real life relations.

<p>Just see how Charlie behaves in the previous example. Although he has signed Bob's key - because he knows, somehow, that it belongs to Bob - he does not trust Bob to be an introducer. Charlie decided to trust only Kevin, for some reason. A reason could be that Bob is lazy enough, and signs other people's keys without being sure that they belong to the actual owner.

<h4 class="subsection">5.2.1 <acronym>OpenPGP</acronym> Keys</h4>

<p>In <acronym>GnuTLS</acronym> the <acronym>OpenPGP</acronym> key structures [RFC2440] (see Bibliography) are handled using the <code>gnutls_openpgp_cert_t</code> type and the corresponding private keys with the <code>gnutls_openpgp_privkey_t</code> type. All the prototypes for the key handling functions can be found at <samp>gnutls/openpgp.h</samp>.

<h4 class="subsection">5.2.2 Verifying an <acronym>OpenPGP</acronym> Key</h4>

<p>The verification functions of <acronym>OpenPGP</acronym> keys, included in <acronym>GnuTLS</acronym>, are simple ones, and do not use the features of the “web of trust”. For that reason, if the verification needs are complex, the assistance of external tools like <acronym>GnuPG</acronym> and GPGME (http://www.gnupg.org/related_software/gpgme/) is recommended.

<p>There is one verification function in <acronym>GnuTLS</acronym>, the gnutls_openpgp_cert_verify_ring. This checks an <acronym>OpenPGP</acronym> key against a given set of public keys (keyring) and returns the key status. The key verification status is the same as in <acronym>X.509</acronym> certificates, although the meaning and interpretation are different. For example an <acronym>OpenPGP</acronym> key may be valid, if the self signature is ok, even if no signers were found. The meaning of verification status is shown in the figure below.

<dl>
<dt><code>CERT_INVALID:</code><dd>A signature on the key is invalid. That means that the key was modified by somebody, or corrupted during transport.

<dt><code>CERT_REVOKED:</code><dd>The key has been revoked by its owner.

<dt><code>CERT_SIGNER_NOT_FOUND:</code><dd>The key was not signed by a known signer.

<dt><code>GNUTLS_CERT_INSECURE_ALGORITHM:</code><dd>The certificate was signed using an insecure algorithm such as MD2 or MD5.
These algorithms have been broken and should not be trusted.

</dl>

<div class="node">

<p><hr>
Previous: The OpenPGP trust model,
Up: More on certificate authentication

</div>

<h3 class="section">5.3 Digital Signatures</h3>

<p>
In this section we will provide some information about digital signatures, how they work, and give the rationale for disabling some of the algorithms used.

<p>Digital signatures work by using somebody's secret key to sign some arbitrary data. Then anybody else could use the public key of that person to verify the signature. Since the data may be arbitrary it is not suitable input to a cryptographic digital signature algorithm. For this reason and also for performance cryptographic hash algorithms are used to preprocess the input to the signature algorithm. This works as long as it is difficult enough to generate two different messages with the same hash algorithm output. In that case the same signature could be used as a proof for both messages. Nobody wants to sign an innocent message of donating 1 € to Greenpeace and find out that he donated 1.000.000 € to Bad Inc.

<p>For a hash algorithm to be called cryptographic the following three requirements must hold:

- <ol type=1 start=1>
Preimage resistance.

That means the algorithm must be one way and given the output of the hash function $H(x)$, it is impossible to calculate x .

- 2nd preimage resistance.

That means that given a pair x, y with $y=H(x)$ it is impossible to calculate an x' such that $y=H(x')$.

- Collision resistance.

That means that it is impossible to calculate random x and x' such $H(x')=H(x)$.

The last two requirements in the list are the most important in digital signatures. These protect against somebody who would like to generate two messages with the same hash output. When an algorithm is considered broken usually it means that the Collision resistance of the algorithm is less than brute force. Using the birthday paradox the brute force attack takes $2^{(hash\ size) / 2}$ operations. Today colliding certificates using the MD5 hash algorithm have been generated as shown in [WEGER] (see [Bibliography](#)).

There has been cryptographic results for the SHA-1 hash algorithms as well, although they are not yet critical. Before 2004, MD5 had a presumed collision strength of 2^{64} , but it has been showed to have a collision strength well under 2^{50} . As of November 2005, it is believed that SHA-1's collision strength is around 2^{63} . We consider this sufficiently hard so that we still support SHA-1. We anticipate that SHA-256/386/512 will be used in publicly-distributed certificates in the future. When 2^{63} can be considered too weak compared to the computer power available sometime in the future, SHA-1 will be disabled as well. The collision attacks on SHA-1 may also get better, given the new interest in tools for creating them.

5.3.1 Trading Security for Interoperability

If you connect to a server and use GnuTLS' functions to verify the certificate chain, and get a `GNUTLS_CERT_INSECURE_ALGORITHM` validation error (see [Verifying X.509 certificate paths](#)), it means that somewhere in the certificate chain there is a certificate signed using `RSA-MD2` or `RSA-MD5`. These two digital signature algorithms are considered broken, so GnuTLS fail when attempting to verify the certificate. In some situations, it may be useful to be able to verify the certificate chain anyway, assuming an attacker did

not utilize the fact that these signatures algorithms are broken.

This section will give help on how to achieve that.

First, it is important to know that you do not have to enable any of the flags discussed here to be able to use trusted root CA certificates signed using `RSA-MD2` or `RSA-MD5`. The only attack today is that it is possible to generate certificates with colliding signatures (collision resistance); you cannot generate a certificate that has the same signature as an already existing signature (2nd preimage resistance).

If you are using [gnutls_certificate_verify_peers2](#) to verify the

certificate chain, you can call

[gnutls_certificate_set_verify_flags](#) with the `GNUTLS_VERIFY_ALLOW_SIGN_RSA_MD2` or `GNUTLS_VERIFY_ALLOW_SIGN_RSA_MD5` flag, as in:

```
gnutls_certificate_set_verify_flags(x509cred,
GNUTLS_VERIFY_ALLOW_SIGN_RSA_MD5);
```

This will tell the verifier algorithm to enable `RSA-MD5` when verifying the certificates.

If you are using [gnutls_x509 crt_verify](#) or [gnutls_x509 crt_list_verify](#), you can pass the `GNUTLS_VERIFY_ALLOW_SIGN_RSA_MD5` parameter directly in the `flags` parameter.

If you are using these flags, it may also be a good idea to warn the user when verification failure occur for this reason. The simplest is to not use the flags by default, and only fall back to using them after warning the user. If you wish to inspect the certificate chain yourself, you can use [gnutls_certificate_get_peers](#) to extract

the raw server's certificate chain, then use

[gnutls_x509 crt_import](#) to parse each of the certificates, and then use [gnutls_x509 crt_get_signature_algorithm](#)

to find out the

signing algorithm used for each certificate. If any of the

intermediary certificates are using `GNUTLS_SIGN_RSA_MD2` or

`GNUTLS_SIGN_RSA_MD5`, you could present a warning.

6 How To Use [TLS](#) in Application Protocols

This chapter is intended to provide some hints on how to use the [TLS](#) over simple custom made application protocols. The discussion below mainly refers to the [TCP/IP](#) transport layer but may be extended to other ones too.

-

- [Separate ports](#)

- [Upward negotiation](#)

[Separate ports](#)

Next: [Upward negotiation](#),

Up: [How to use TLS in application protocols](#)

6.1 Separate Ports

Traditionally [SSL](#) was used in application protocols by assigning a new port number for the secure services. That way two separate ports were assigned, one for the non secure sessions, and one for the secured ones. This has the benefit that if a user requests a secure session then the client will try to connect to the secure port and fail otherwise. The only possible attack with this method is a denial of service one. The most famous example of this method is the famous ["HTTP over TLS"](#) or [HTTPS](#) protocol [RFC2818] (see [Bibliography](#)).

Despite its wide use, this method is not as good as it seems. This approach starts the [TLS](#) Handshake procedure just after the client connects on the [secure port](#). That way the [TLS](#) protocol does not know anything about the client, and popular methods like the host advertising in HTTP do not work [¹⁴](#). There is no way for the client to say [I](#)

connected to [YYY server](#), before the Handshake starts, so the server

cannot possibly know which certificate to use.

Other than that it requires two separate ports to run a single service, which is unnecessary complication. Due to the fact that there is a limitation on the available privileged ports, this approach was soon obsolete.

<div class="node">

<p><hr>

Previous: Separate ports,&

Up: How to use TLS in application protocols

</div>

6.2 Upward Negotiation</h3>

Other application protocols¹⁵ use a different approach to enable the secure layer. They use something called the “TLS upgrade” method. This method is quite tricky but it is more flexible. The idea is to extend the application protocol to have a “STARTTLS” request, whose purpose it to start the TLS protocols just after the client requests it. This is a really neat idea and does not require an extra port.

This method is used by almost all modern protocols and there is even the [RFC2817] (see Bibliography) paper which proposes extensions to HTTP to support it.

The tricky part, in this method, is that the “STARTTLS” request is sent in the clear, thus is vulnerable to modifications. A typical attack is to modify the messages in a way that the client is fooled and thinks that the server does not have the “STARTTLS” capability. See a typical conversation of a hypothetical protocol:

<blockquote>

(client connects to the server)

<p>CLIENT: HELLO I'M MR. XXX

<p>SERVER: NICE TO MEET YOU XXX

<p>CLIENT: PLEASE START TLS

<p>SERVER: OK

<p>*** TLS STARTS

<p>CLIENT: HERE ARE SOME CONFIDENTIAL DATA
</blockquote>

<p>And see an example of a conversation where someone is acting in between:

<blockquote>
(client connects to the server)

<p>CLIENT: HELLO I'M MR. XXX

<p>SERVER: NICE TO MEET YOU XXX

<p>CLIENT: PLEASE START TLS

<p>(here someone inserts this message)

<p>SERVER: SORRY I DON'T HAVE THIS CAPABILITY

<p>CLIENT: HERE ARE SOME CONFIDENTIAL DATA
</blockquote>

<p>As you can see above the client was fooled, and was dummy enough to send the confidential data in the clear.

<p>How to avoid the above attack? As you may have already thought this one is easy to avoid. The client has to ask the user before it connects whether the user requests <acronym>TLS</acronym> or not. If the user answered that he certainly wants the secure layer the last conversation should be:

<blockquote>
(client connects to the server)

<p>CLIENT: HELLO I'M MR. XXX

<p>SERVER: NICE TO MEET YOU XXX

<p>CLIENT: PLEASE START TLS

<p>(here someone inserts this message)

<p>SERVER: SORRY I DON'T HAVE THIS CAPABILITY

<p>CLIENT: BYE

<p>(the client notifies the user that the secure connection was not possible)
</blockquote>

<p>This method, if implemented properly, is far better than the traditional method, and the security properties remain the same, since only denial of service is possible. The benefit is that the server may request additional data before the <acronym>TLS</acronym> Handshake protocol starts, in order to send the correct certificate, use the correct password file¹⁶, or anything else!

Up:&nbsp;<a rel="up" accesskey="u" href="#Preparation">Preparation</a>
```

```
</div>
```

<h4 class="subsection">7.1.2 Initialization</h4>

<p>GnuTLS must be initialized before it can be used. The library is initialized by calling gnutls_global_init. The resources allocated by the initialization process can be released if the application no longer has a need to call GnuTLS functions, this is done by calling gnutls_global_deinit.

<p>The extra functionality of the <acronym>GnuTLS-extra</acronym> library is available after calling gnutls_global_init_extra.

<p>In order to take advantage of the internationalisation features in GnuTLS, such as translated error messages, the application must set the current locale using <code>setlocale</code> before initializing GnuTLS.

Up:&nbsp;<a rel="up" accesskey="u" href="#Preparation">Preparation</a>

</div>
```

<h4 class="subsection">7.1.3 Version Check</h4>

<p>It is often desirable to check that the version of `gnutls' used is indeed one which fits all requirements. Even with binary compatibility new features may have been introduced but due to problem with the dynamic linker an old version is actually used. So you may want to check that the version is okay right after program startup. See the function gnutls_check_version.

</div>
```

<h4 class="subsection">7.1.4 Debugging</h4>

<p>In many cases things may not go as expected and further information, to assist debugging, from <acronym>GnuTLS</acronym> is desired. Those are the case where the gnutls_global_set_log_level and gnutls_global_set_log_function are to be used. Those will print verbose information on the <acronym>GnuTLS</acronym> functions internal flow.

Up: [Preparation](#Preparation)

7.1.5 Building the Source

If you want to compile a source file including the `gnutls/gnutls.h` header file, you must make sure that the compiler can find it in the directory hierarchy. This is accomplished by adding the path to the directory in which the header file is located to the compilers include file search path (via the `-I` option).

However, the path to the include file is determined at the time the source is configured. To solve this problem, the library uses the external package `pkg-config` that knows the path to the include file and other configuration options. The options that need to be added to the compiler invocation at compile time are output by the `--cflags` option to `pkg-config libgnutls`. The following example shows how it can be used at the command line:

```
gcc -c foo.c `pkg-config libgnutls --cflags`
```

Adding the output of `pkg-config libgnutls --cflags` to the compilers command line will ensure that the compiler can find the `gnutls/gnutls.h` header file.

A similar problem occurs when linking the program with the library. Again, the compiler has to find the library files. For this to work, the path to the library files has to be added to the library search path (via the `-L` option). For this, the option `--libs` to `pkg-config libgnutls` can be used. For convenience, this option also outputs all other options that are required to link the program with the library (for instance, the `-lgnutls` option). The example shows how to link `foo.o` with the library to a program `foo`.

```
gcc -o foo foo.o `pkg-config libgnutls --libs`
```

Of course you can also combine both examples to a single command by specifying both options to `pkg-config`:

```
gcc -o foo foo.c `pkg-config libgnutls --cflags --libs`
```

```

</div>

```

7.2 Multi-Threaded Applications

Although the `GnuTLS` library is thread safe by design, some parts of `Libgcrypt`, such as the random generator, are not. Applications have to register callback functions to ensure proper locking in the sensitive parts of `libgcrypt`.

There are helper macros to help you properly initialize the libraries. Examples are shown below.

```

<ul>
<li>POSIX threads
<pre class="example">    #include <gnutls.h>
    #include <gcrypt.h>
    #include <errno.h>
    #include <pthread.h>
    GCRY_THREAD_OPTION_PTHREAD_IMPL;

    int main()
    {
        /* The order matters.
        */
        gcry_control (GCRYCTL_SET_THREAD_CBS, &gcry_threads_pthread);
        gnutls_global_init();
    }
</pre>
<li>GNU PTH threads
<pre class="example">    #include <gnutls.h>
    #include <gcrypt.h>
    #include <errno.h>
    #include <pth.h>
    GCRY_THREAD_OPTION_PTH_IMPL;

    int main()
    {
        gcry_control (GCRYCTL_SET_THREAD_CBS, &gcry_threads_pth);
        gnutls_global_init();
    }

```

```

    }
</pre>
<li>Other thread packages
<pre class="example">    /* The gcry_thread_cbs structure must have been
    * initialized.
    */
    static struct gcry_thread_cbs gcry_threads_other = { ... };

    int main()
    {
        gcry_control (GCRYCTL_SET_THREAD_CBS, &gcry_threads_other);
    }
</pre>
</ul>

```

7.3 Client Examples

This section contains examples of [TLS](#) and [SSL](#) clients, using [GnuTLS](#). Note that these examples contain little or no error checking. Some of the examples require functions implemented by another example.

- Simple client example with anonymous authentication
- Simple client example with X.509 certificate support
- Obtaining session information
- Verifying peer's certificate
- Using a callback to select the certificate to use
- Client with Resume capability example
- Simple client example with SRP authentication
- Simple client example with TLS/IA support

7.4.3 Echo Server with OpenPGP Authentication

<p>

The following example is an echo server which supports

OpenPGP key authentication. You can easily combine this functionality —that is have a server that supports both

X.509 and OpenPGP certificates— but we separated them to keep these examples as simple as possible.

```
<pre class="verbatim">/* This example code is placed in the public domain. */
```

```
#ifdef HAVE_CONFIG_H
```

```
# include <config.h>
```

```
#endif
```

```
#include <stdio.h>
```

```
#include <stdlib.h>
```

```
#include <errno.h>
```

```
#include <sys/types.h>
```

```
#include <sys/socket.h>
```

```
#include <arpa/inet.h>
```

```
#include <netinet/in.h>
```

```
#include <string.h>
```

```
#include <unistd.h>
```

```
#include <gnutls/gnutls.h>
```

```

#include <gnutls/openpgp.h>

#define KEYFILE "secret.asc"
#define CERTFILE "public.asc"
#define RINGFILE "ring.gpg"

/* This is a sample TLS 1.0-OpenPGP echo server.
*/

#define SA struct sockaddr
#define SOCKET_ERR(err,s) if(err==-1) { perror(s);return(1);}
#define MAX_BUF 1024
#define PORT 5556 /* listen to 5556 port */
#define DH_BITS 1024

/* These are global */
gnutls_certificate_credentials_t cred;

7.5.2 X.509 Certificate Parsing Example

To demonstrate the X.509 parsing capabilities an example program is listed below. That program reads the peer's certificate, and prints information about it.

```
<pre class="verbatim">/* This example code is placed in the public domain. */
```

```

#ifdef HAVE_CONFIG_H
# include <config.h>
#endif

#include <stdio.h>
#include <stdlib.h>
#include <gnutls/gnutls.h>
#include <gnutls/x509.h>

#include "examples.h"

static const char *
bin2hex (const void *bin, size_t bin_size)
{
    static char printable[110];
    const unsigned char *_bin = bin;
    char *print;
    size_t i;

    if (bin_size > 50)
        bin_size = 50;

    print = printable;
    for (i = 0; i < bin_size; i++)
    {
        sprintf (print, "%.2x ", _bin[i]);
        print += 2;
    }
}

```

```

    }

    return printable;
}

/* This function will print information about this session's peer
 * certificate.
 */
void
print_x509_certificate_info (gnutls_session_t session)
{
    char serial[40];
    char dn[128];
    size_t size;
    unsigned int algo, bits;
    time_t expiration_time, activation_time;
    const gnutls_datum_t *cert_list;
    unsigned int cert_list_size = 0;
    gnutls_x509_crt_t cert;

    /* This function only works for X.509 certificates.
     */
    if (gnutls_certificate_type_get (session) != GNUTLS_CERT_X509)
        return;

    cert_list = gnutls_certificate_get_peers (session, &cert_list_size);

    printf ("Peer provided %d certificates.\n", cert_list_size);

    if (cert_list_size > 0)
    {

Extension

Previous: [Miscellaneous examples](#),
Up: [How to use GnuTLS in applications](#)

7.6 Compatibility with the OpenSSL Library

To ease GnuTLS' integration with existing applications, a compatibility layer with the widely used OpenSSL library is included in the `gnutls-openssl` library. This compatibility layer is not complete and it is not intended to completely reimplement the OpenSSL API with GnuTLS. It only provides source-level compatibility. There is currently no attempt to make it binary-compatible with OpenSSL.

The prototypes for the compatibility functions are in the `gnutls/openssl.h` header file.

Current limitations imposed by the compatibility layer include:

- Error handling is not thread safe.

Next: [Keying Material Exporters](#),
Previous: [Compatibility with the OpenSSL library](#),
Up: [How to use GnuTLS in applications](#)

7.7 Opaque PRF Input TLS Extension

GnuTLS supports the Opaque PRF Input TLS extension (`draft-rescorla-tls-opaque-prf-input-00.txt`). The API consists of one API for use in the client, `gnutls_oprfi_enable_client`, and one API for use in the server, `gnutls_oprfi_enable_server`.

You must invoke both functions before calling [gnutls_handshake](#gnutls_005fhandshake). The server utilizes a callback function into the application. The callback can look at the random string provided by the client, and also set the server string. The string lengths must be equal according to the protocol.

```
<div class="node">
<a name="Keying-Material-Exporters"></a>
<p><hr>
Previous:&nbsp;<a rel="previous" accesskey="p" href="#Opaque-PRF-Input-TLS-Extension">Opaque PRF Input
TLS Extension</a>,
Up:&nbsp;<a rel="up" accesskey="u" href="#How-to-use-GnuTLS-in-applications">How to use GnuTLS in
applications</a>

</div>
```

7.8 Keying Material Exporters

```
<p><a name="index-Keying-Material-Exporters-44"></a><a name="index-Exporting-Keying-Material-45"></a>
The TLS PRF can be used by other protocols to derive data. The API to
use is gnutls\_prf. The function needs to be provided with the
label in the parameter label, and the extra data to mix in the
extra parameter. Depending on whether you want to mix in the
client or server random data first, you can set the
server_random_first parameter.
```

For example, after establishing a TLS session using [gnutls_handshake](#gnutls_005fhandshake), you can invoke the TLS PRF with this call:

```
<pre class="smallexample"> #define MYLABEL "EXPORTER-FOO"
#define MYCONTEXT "some context data"
char out[32];
rc = gnutls_prf (session, strlen (MYLABEL), MYLABEL, 0,
                strlen (MYCONTEXT), MYCONTEXT, 32, out);
</pre>
```

If you don't want to mix in the client/server random, there is a more low-level TLS PRF interface called [gnutls_prf_raw](#gnutls_005fprf_005fraw).

```

<h3 class="section">8.1 Invoking certtool</h3>

<p>
This is a program to generate <acronym>X.509</acronym> certificates, certificate requests, CRLs and private keys.

```
<pre class="verbatim">Certtool help
Usage: certtool [options]
  -s, --generate-self-signed
           Generate a self-signed certificate.
  -c, --generate-certificate
           Generate a signed certificate.
  --generate-proxy      Generate a proxy certificate.
  --generate-crl        Generate a CRL.
  -u, --update-certificate
           Update a signed certificate.
  -p, --generate-privkey  Generate a private key.
  -q, --generate-request  Generate a PKCS #10 certificate
                           request.
  -e, --verify-chain     Verify a PEM encoded certificate chain.
                           The last certificate in the chain must
                           be a self signed one.
  --verify-crl          Verify a CRL.
  --generate-dh-params   Generate PKCS #3 encoded Diffie-Hellman
                           parameters.
```

```

--get-dh-params      Get the included PKCS #3 encoded Diffie
                    Hellman parameters.
--load-privkey FILE  Private key file to use.
--load-request FILE  Certificate request file to use.
--load-certificate FILE
                    Certificate file to use.
--load-ca-privkey FILE Certificate authority's private key
                    file to use.
--load-ca-certificate FILE
                    Certificate authority's certificate
                    file to use.
--password PASSWORD Password to use.
-i, --certificate-info Print information on a certificate.
-l, --crl-info        Print information on a CRL.
--p12-info            Print information on a PKCS #12
                    structure.
--p7-info             Print information on a PKCS #7
                    structure.
--smime-to-p7        Convert S/MIME to PKCS #7 structure.
-k, --key-info        Print information on a private key.
--fix-key            Regenerate the parameters in a private
                    key.
--to-p12             Generate a PKCS #12 structure.
-8, --pkcs8          Use PKCS #8 format for private keys.
--dsa                Use DSA keys.
--hash STR           Hash algorithm to use for signing
                    (MD5,SHA1,RMD160).
--export-ciphers     Use weak encryption algorithms.
--indef              Use DER format for input certificates
                    and private keys.
--outdef             Use DER format for output certificates
                    and private keys.
--bits BITS          specify the number of bits for key
                    generation.
--outfile FILE       Output file.
--infile FILE        Input file.
--template FILE      Template file to use for non
                    interactive operation.
-d, --debug LEVEL    specify the debug level. Default is 1.
-h, --help           shows this help text
-v, --version        shows the program's version

```

</pre>

<p>The program can be used interactively or non interactively by specifying the <code>--template</code> command line option. See below for an example of a template file.

<p>How to use certtool interactively:

- To generate parameters for Diffie-Hellman key exchange, use the command:
<pre class="example"> \$ certtool --generate-dh-params --outfile dh.pem</pre>

To generate parameters for the RSA-EXPORT key exchange, use the command:
<pre class="example"> \$ certtool --generate-privkey --bits 512 --outfile rsa.pem</pre>

- To create a self signed certificate, use the command:
<pre class="example"> \$ certtool --generate-privkey --outfile ca-key.pem
\$ certtool --generate-self-signed --load-privkey ca-key.pem \
--outfile ca-cert.pem</pre>
<p>Note that a self-signed certificate usually belongs to a certificate authority, that signs other certificates.

- To create a private key (RSA by default), run:

<pre class="example"> \$ certtool --generate-privkey --outfile key.pem</pre>
<p>To create a DSA private key, run:

<pre class="example"> \$ certtool --dsa --generate-privkey --outfile key-dsa.pem</pre>
To generate a certificate using the private key, use the command:

- <pre class="example"> \$ certtool --generate-certificate --load-privkey key.pem \
--outfile cert.pem --load-ca-certificate ca-cert.pem \
--load-ca-privkey ca-key.pem</pre>
To create a certificate request (needed when the certificate is issued by another party), run:

- <pre class="example"> \$ certtool --generate-request --load-privkey key.pem \
--outfile request.pem</pre>

- To generate a certificate using the previous request, use the command:

<pre class="example"> \$ certtool --generate-certificate --load-request request.pem \
--outfile cert.pem \
--load-ca-certificate ca-cert.pem --load-ca-privkey ca-key.pem</pre>
To view the certificate information, use:

- <pre class="example"> \$ certtool --certificate-info --infile cert.pem</pre>

</pre>

To generate a <acronym>PKCS</acronym> #12 structure using the previous key and certificate, use the command:

```
<pre class="example">    $ certtool --load-certificate cert.pem --load-privkey key.pem \
    --to-p12 --outder --outfile key.p12
```

</pre>

Proxy certificate can be used to delegate your credential to a temporary, typically short-lived, certificate. To create one from the previously created certificate, first create a temporary key and then generate a proxy certificate for it, using the commands:

```
<pre class="example">    $ certtool --generate-privkey &gt; proxy-key.pem
    $ certtool --generate-proxy --load-ca-privkey key.pem \
    --load-privkey proxy-key.pem --load-certificate cert.pem \
    --outfile proxy-cert.pem
```

</pre>

To create an empty Certificate Revocation List (CRL) do:

```
<pre class="example">    $ certtool --generate-crl --load-ca-privkey x509-ca-key.pem --load-ca-certificate
x509-ca.pem
```

</pre>

<p>To create a CRL that contains some revoked certificates, place the certificates in a file and use <code>--load-certificate</code> as follows:

```
<pre class="example">    $ certtool --generate-crl --load-ca-privkey x509-ca-key.pem --load-ca-certificate
x509-ca.pem --load-certificate revoked-certs.pem
```

</pre>

To verify a Certificate Revocation List (CRL) do:

```
<pre class="example">    $ certtool --verify-crl --load-ca-certificate x509-ca.pem &lt; crl.pem
```

</pre>

<p>Certtool's template file format:

Firstly create a file named 'cert.cfg' that contains the information about the certificate. An example file is listed below.

Then execute:

```
<pre class="example">    $ certtool --generate-certificate cert.pem --load-privkey key.pem \
    --template cert.cfg \
    --load-ca-certificate ca-cert.pem --load-ca-privkey ca-key.pem
```

</pre>

<p>An example certtool template file:

```
<pre class="example"> # X.509 Certificate options
#
# DN options

# The organization of the subject.
organization = "Koko inc."

# The organizational unit of the subject.
unit = "sleeping dept."

# The locality of the subject.
# locality =

# The state of the certificate owner.
state = "Attiki"

# The country of the subject. Two letter code.
country = GR

# The common name of the certificate owner.
cn = "Cindy Lauper"

# A user id of the certificate owner.
#uid = "clauper"

# If the supported DN OIDs are not adequate you can set
# any OID here.
# For example set the X.520 Title and the X.520 Pseudonym
# by using OID and string pairs.
#dn_oid = "2.5.4.12" "Dr." "2.5.4.65" "jackal"

# This is deprecated and should not be used in new
# certificates.
# pkcs9_email = "none@none.org"

# The serial number of the certificate
serial = 007

# In how many days, counting from today, this certificate will expire.
expiration_days = 700

# X.509 v3 extensions

# A dnsname in case of a WWW server.
#dns_name = "www.none.org"
#dns_name = "www.morethanone.org"
```

```
# An IP address in case of a server.

--x509certfile FILE     X.509 Certificate file to use.
--srpusername NAME      SRP username to use.
--srppasswd PASSWD      SRP password to use.
--pskusername NAME      PSK username to use.
--pskkey KEY            PSK key (in hex) to use.
--opaque-prf-input DATA
                        Use Opaque PRF Input DATA.
-p, --port PORT         The port to connect to.
--insecure              Don't abort program if server
                        certificate can't be validated.
-l, --list              Print a list of the supported
                        algorithms and modes.
-h, --help              prints this help
-v, --version           prints the program's version number
</pre>

```

<p>To connect to a server using PSK authentication, you may use something like:

```

<pre class="smallexample"> $ gnutls-cli -p 5556 test.gnutls.org --pskusername jas --pskkey
9e32cf7786321a828ef7668f09fb35db --priority NORMAL:+PSK:-RSA:-DHE-RSA -d 4711
</pre>

```

<ul class="menu">

Example client PSK connection

<div class="node">

<p><hr>

Up: Invoking gnutls-cli

</div>

<h4 class="subsection">8.2.1 Example client PSK connection</h4>

<p>

If your server only supports the PSK ciphersuite, connecting to it should be as simple as connecting to the server:

```

<pre class="smallexample"> $ ./gnutls-cli -p 5556 localhost
Resolving 'localhost'...
Connecting to '127.0.0.1:5556'...
- PSK client callback. PSK hint 'psk_identity_hint'
Enter PSK identity: psk_identity
Enter password:

```

```
- PSK authentication. PSK hint 'psk_identity_hint'
- Version: TLS1.1
- Key Exchange: PSK
- Cipher: AES-128-CBC
- MAC: SHA1
- Compression: NULL
- Handshake was completed
```

- Simple Client Mode:

</pre>

<p>If the server supports several cipher suites, you may need to force it to chose PSK by using a cipher priority parameter such as

<code>--priority NORMAL:+PSK:-RSA:-DHE-RSA:-DHE-PSK</code>.

<p>Instead of using the Netconf-way to derive the PSK key from a password, you can also give the PSK username and key directly on the command line:

```
<pre class="smallexample"> $ ./gnutls-cli -p 5556 localhost --pskusername psk_identity --pskkey
88f3824b3e5659f52d00e959bacab954b6540344
```

```
Resolving 'localhost'...
```

```
Connecting to '127.0.0.1:5556'...
```

```
- PSK authentication. PSK hint 'psk_identity_hint'
```

```
- Version: TLS1.1
```

```
- Key Exchange: PSK
```

```
- Cipher: AES-128-CBC
```

```
- MAC: SHA1
```

```
- Compression: NULL
```

```
- Handshake was completed
```

- Simple Client Mode:

</pre>

<p>By keeping the <code>--pskusername</code> parameter and removing the <code>--pskkey</code> parameter, it will query only for the password during the handshake.

8.4 Invoking gnutls-serv

[index-gnutls_002dserv-51](#)

Simple server program that listens to incoming TLS connections.

```
GNU TLS test server
```

```
Usage: gnutls-serv [options]
```

```
-d, --debug integer    Enable debugging
-g, --generate          Generate Diffie-Hellman Parameters.
-p, --port integer     The port to connect to.
-q, --quiet            Suppress some messages.
--nodb                 Does not use the resume database.
--http                 Act as an HTTP Server.
--echo                 Act as an Echo Server.
--dhparams FILE        DH params file to use.
--x509fmtder           Use DER format for certificates
--x509cafile FILE      Certificate file to use.
--x509crlfile FILE     CRL file to use.
--pgpkeyring FILE      PGP Key ring file to use.
--pgpkeyfile FILE      PGP Key file to use.
--pgpcertfile FILE     PGP Public Key (certificate) file to
                        use.
--pgpsubkey HEX[auto] PGP subkey to use.
--x509keyfile FILE     X.509 key file to use.
--x509certfile FILE    X.509 Certificate file to use.
--x509dsafile FILE     Alternative X.509 key file to use.
--x509dsacertfile FILE Alternative X.509 certificate file to
                        use.
-r, --require-cert     Require a valid certificate.
-a, --disable-client-cert
                        Disable request for a client
                        certificate.
--pskpasswd FILE       PSK password file to use.
--pskhint HINT         PSK identity hint to use.
--srpasswd FILE        SRP password file to use.
--srpasswdconf FILE    SRP password conf file to use.
--opaque-prf-input DATA
                        Use Opaque PRF Input DATA.
--ciphers cipher1 cipher2...
                        Ciphers to enable.
--protocols protocol1 protocol2...
```

```

                Protocols to enable.
--comp comp1 comp2...  Compression methods to enable.
--macs mac1 mac2...   MACs to enable.
--kx kx1 kx2...      Key exchange methods to enable.
--ctypes certType1 certType2...
                Certificate types to enable.
--priority PRIORITY STRING
                Priorities string.
-l, --list           Print a list of the supported
                    algorithms and modes.
-h, --help          prints this help
-v, --version       prints the program's version number
</pre>

```

8.4.1 Setting Up a Test HTTPS Server

Running your own TLS server based on GnuTLS can be useful when debugging clients and/or GnuTLS itself. This section describes how to use `gnutls-serv` as a simple HTTPS server.

The most basic server can be started as:

```

<pre class="example">  gnutls-serv --http
</pre>

```

It will only support anonymous ciphersuites, which many TLS clients refuse to use.

The next step is to add support for X.509. First we generate a CA:

```

<pre class="example">  certtool --generate-privkey &gt; x509-ca-key.pem
                    echo 'cn = GnuTLS test CA' &gt; ca.tmpl
                    echo 'ca' &gt;&gt; ca.tmpl
                    echo 'cert_signing_key' &gt;&gt; ca.tmpl
                    certtool --generate-self-signed --load-privkey x509-ca-key.pem \
                    --template ca.tmpl --outfile x509-ca.pem
                    ...
</pre>

```

Then generate a server certificate. Remember to change the `dns_name` value to the name of your server host, or skip that command to avoid the field.

```

<pre class="example">  certtool --generate-privkey &gt; x509-server-key.pem
                    echo 'organization = GnuTLS test server' &gt; server.tmpl
                    echo 'cn = test.gnutls.org' &gt;&gt; server.tmpl
                    echo 'tls_www_server' &gt;&gt; server.tmpl
                    echo 'encryption_key' &gt;&gt; server.tmpl
                    echo 'signing_key' &gt;&gt; server.tmpl

```

```
echo 'dns_name = test.gnutls.org' &gt;&gt; server.tpl
certtool --generate-certificate --load-privkey x509-server-key.pem \
  --load-ca-certificate x509-ca.pem --load-ca-privkey x509-ca-key.pem \
  --template server.tpl --outfile x509-server.pem
```

...

</pre>

<p>For use in the client, you may want to generate a client certificate as well.

```
<pre class="example"> certtool --generate-privkey &gt; x509-client-key.pem
echo 'cn = GnuTLS test client' &gt;&gt; client.tpl
echo 'tls_www_client' &gt;&gt; client.tpl
echo 'encryption_key' &gt;&gt; client.tpl
echo 'signing_key' &gt;&gt; client.tpl
certtool --generate-certificate --load-privkey x509-client-key.pem \
  --load-ca-certificate x509-ca.pem --load-ca-privkey x509-ca-key.pem \
  --template client.tpl --outfile x509-client.pem
```

...

</pre>

<p>To be able to import the client key/certificate into some applications, you will need to convert them into a PKCS#12 structure. This also encrypts the security sensitive key with a password.

```
<pre class="example"> certtool --to-p12 --load-privkey x509-client-key.pem --load-certificate x509-client.pem --
outder --outfile x509-client.p12
```

</pre>

<p>For icing, we'll create a proxy certificate for the client too.

```
<pre class="example"> certtool --generate-privkey &gt; x509-proxy-key.pem
echo 'cn = GnuTLS test client proxy' &gt;&gt; proxy.tpl
certtool --generate-proxy --load-privkey x509-proxy-key.pem \
  --load-ca-certificate x509-client.pem --load-ca-privkey x509-client-key.pem \
  --load-certificate x509-client.pem --template proxy.tpl \
  --outfile x509-proxy.pem
```

...

</pre>

<p>Then start the server again:

```
<pre class="example"> gnutls-serv --http \
  --x509cafile x509-ca.pem \
  --x509keyfile x509-server-key.pem \
  --x509certfile x509-server.pem
```

</pre>

<p>Try connecting to the server using your web browser. Note that the server listens to port 5556 by default.

<p>While you are at it, to allow connections using DSA, you can also create a DSA key and certificate for the server. These credentials

will be used in the final example below.

```
<pre class="example"> certtool --generate-privkey --dsa &gt; x509-server-key-dsa.pem
certtool --generate-certificate --load-privkey x509-server-key-dsa.pem \
--load-ca-certificate x509-ca.pem --load-ca-privkey x509-ca-key.pem \
--template server.tmpl --outfile x509-server-dsa.pem
```

...

```
</pre>
```

<p>The next step is to create OpenPGP credentials for the server.

```
<pre class="example"> gpg --gen-key
...enter whatever details you want, use 'test.gnutls.org' as name...
```

```
</pre>
```

<p>Make a note of the OpenPGP key identifier of the newly generated key, here it was `5D1D14D8`. You will need to export the key for GnuTLS to be able to use it.

```
<pre class="example"> gpg -a --export 5D1D14D8 &gt; openpgp-server.txt
gpg --export 5D1D14D8 &gt; openpgp-server.bin
gpg --export-secret-keys 5D1D14D8 &gt; openpgp-server-key.bin
gpg -a --export-secret-keys 5D1D14D8 &gt; openpgp-server-key.txt
```

```
</pre>
```

<p>Let's start the server with support for OpenPGP credentials:

```
<pre class="example"> gnutls-serv --http \
--pgpkeyfile openpgp-server-key.txt \
--pgpcertfile openpgp-server.txt
```

```
</pre>
```

<p>The next step is to add support for SRP authentication.

```
<pre class="example"> srptool --create-conf srp-tpasswd.conf
srptool --passwd-conf srp-tpasswd.conf --username jas --passwd srp-passwd.txt
Enter password: [TYPE "foo"]
```

```
</pre>
```

<p>Start the server with SRP support:

```
<pre class="example"> gnutls-serv --http \
--srppasswdconf srp-tpasswd.conf \
--srppasswd srp-passwd.txt
```

```
</pre>
```

<p>Let's also add support for PSK.

```
<pre class="example"> $ psktool --passwd psk-passwd.txt
```

```
</pre>
```

<p>Start the server with PSK support:

```
<pre class="example"> gnutls-serv --http \
--pskpasswd psk-passwd.txt
```

</pre>

<p>Finally, we start the server with all the earlier parameters and you get this command:

```
<pre class="example">  gnutls-serv --http \  
    --x509cafile x509-ca.pem \  
    --x509keyfile x509-server-key.pem \  
    --x509certfile x509-server.pem \  
    --x509dsafile x509-server-key-dsa.pem \  
    --x509dsacertfile x509-server-dsa.pem \  
    --pgpkeyfile openpgp-server-key.txt \  
    --pgpcertfile openpgp-server.txt \  
    --srppasswdconf srp-tpasswd.conf \  
    --srppasswd srp-passwd.txt \  
    --pskpasswd psk-passwd.txt
```

</pre>

<ul class="menu">

Example server PSK connection

<div class="node">

<p><hr>

Up: Invoking gnutls-serv

</div>

<h4 class="subsection">8.4.2 Example server PSK connection</h4>

<p>

To set up a PSK server with <code>gnutls-serv</code> you need to create PSK password file (see Invoking psktool). In the example below, I type <code>password</code> at the prompt.

```
<pre class="smallexample">  $ ./psktool -u psk_identity -p psks.txt -n psk_identity_hint  
  Enter password:  
  Key stored to psks.txt  
  $ cat psks.txt  
  psk_identity:88f3824b3e5659f52d00e959bacab954b6540344  
  $
```

</pre>

<p>After this, start the server pointing to the password file. We disable DHE-PSK.

```
<pre class="smallexample">  $ ./gnutls-serv --pskpasswd psks.txt --pskhint psk_identity_hint --priority  
NORMAL:-DHE-PSK
```

Set static Diffie-Hellman parameters, consider --dhparams.

Echo Server ready. Listening to port '5556'.

```

</pre>
<p>You can now connect to the server using a PSK client (see <a href="#Example-client-PSK-connection">Example client PSK connection</a>).

<div class="node">
<a name="Invoking-psktool"></a>
<p><hr>
Next:&nbsp;<a rel="next" accesskey="n" href="#Invoking-srptool">Invoking srptool</a>,

Up:&nbsp;<a rel="up" accesskey="u" href="#Included-programs">Included programs</a>

</div>

```

8.5 Invoking psktool

<p>
This is a program to manage <acronym>PSK</acronym> username and keys.

```

<pre class="verbatim">PSKtool help
Usage : psktool [options]
  -u, --username username
           specify username.
  -p, --passwd FILE    specify a password file.
  -n, --netconf-hint HINT
           derive key from Netconf password, using
           HINT as the psk_identity_hint.
  -s, --keysize SIZE   specify the key size in bytes.
  -v, --version         prints the program's version number
  -h, --help           shows this help text
</pre>

```

<p>Normally the file will generate random keys for the indicate username. You may also derive PSK keys from passwords, using the algorithm specified in <samp>draft-ietf-netconf-tls-02.txt</samp>. The algorithm needs a PSK identity hint, which you specify using <code>--netconf-hint</code>. To derive a PSK key from a password with an empty PSK identity hint, using <code>--netconf-hint ""</code>.

```

<div class="node">
<a name="Invoking-srptool"></a>
<p><hr>
Previous:&nbsp;<a rel="previous" accesskey="p" href="#Invoking-psktool">Invoking psktool</a>,
Up:&nbsp;<a rel="up" accesskey="u" href="#Included-programs">Included programs</a>

</div>

```

8.6 Invoking srptool

<p>

The <samp>srptool</samp> is a very simple program that emulates the programs in the Stanford SRP libraries, see http://srp.stanford.edu/. It is intended for use in places where you don't expect <acronym>SRP</acronym> authentication to be the used for system users.

<p>Traditionally libsrp used two files. One called <code>tpasswd</code> which holds usernames and verifiers, and <code>tpasswd.conf</code> which holds generators and primes.

<p>How to use srptool:

To create tpasswd.conf which holds the g and n values for <acronym>SRP</acronym> protocol (generator and a large prime), run:

```
<pre class="example">    $ srptool --create-conf /etc/tpasswd.conf</pre>
```

This command will create /etc/tpasswd and will add user 'test' (you will also be prompted for a password). Verifiers are stored by default in the way libsrp expects.

```
<pre class="example">    $ srptool --passwd /etc/tpasswd \  
    --passwd-conf /etc/tpasswd.conf -u test</pre>
```

This command will check against a password. If the password matches the one in /etc/tpasswd you will get an ok.

```
<pre class="example">    $ srptool --passwd /etc/tpasswd \  
    --passwd-conf /etc/tpasswd.conf --verify -u test</pre>
```

9.1 Core Functions

The prototypes for the following functions lie in `gnutls/gnutls.h`.

`gnutls_alert_get_name`

`gnutls_alert_get_name`

Function: `const char * gnutls_alert_get_name` (`gnutls_alert_description_t alert`)
`gnutls_alert_get_name` returns a string describing the given alert number.

This function will return a string that describes the given alert number, or `NULL`. See `gnutls_alert_get`.

Returns: string corresponding to `gnutls_alert_description_t` value.

`gnutls_alert_get`

`gnutls_alert_get`

Function: `gnutls_alert_description_t gnutls_alert_get` (`gnutls_session_t session`)
`gnutls_alert_get` returns a `gnutls_alert_description_t` structure.

<p>This function will return the last alert number received. This function should be called if <code>GNUTLS_E_WARNING_ALERT_RECEIVED</code> or <code>GNUTLS_E_FATAL_ALERT_RECEIVED</code> has been returned by a gnutls function. The peer may send alerts if he thinks some things were not right. Check gnutls.h for the available alert descriptions.

<p>If no alert has been received the returned value is undefined.

<p>Returns: returns the last alert received, a <code>gnutls_alert_description_t</code> value.
</p></blockquote></div>

<p> <div class="defun"> — Function: int gnutls_alert_send_appropriate (<var>gnutls_session_t session, int err</var>)<var></var>
<blockquote><p><var>session</var>: is a <code>gnutls_session_t</code> structure. <p><var>err</var>: is an integer <p>Sends an alert to the peer depending on the error code returned by a gnutls function. This function will call <code>gnutls_error_to_alert()</code> to determine the appropriate alert to send. <p>This function may also return <code>GNUTLS_E_AGAIN</code>, or <code>GNUTLS_E_INTERRUPTED</code>. <p>If the return value is <code>GNUTLS_E_INVALID_REQUEST</code>, then no alert has been sent to the peer. <p>Returns: On success, <code>GNUTLS_E_SUCCESS</code> (0) is returned, otherwise an error code is returned. </p></blockquote></div> <p> <div class="defun"> — Function: int gnutls_alert_send (<var>gnutls_session_t session, gnutls_alert_level_t level, gnutls_alert_description_t desc</var>)<var></var>
<blockquote><p><var>session</var>: is a <code>gnutls_session_t</code> structure. <p><var>level</var>: is the level of the alert --- Open Source Used In USC GAN R2.10 Application Software R2.10.34.9 382

<p><var>desc</var>: is the alert description

<p>This function will send an alert to the peer in order to inform him of something important (eg. his Certificate could not be verified). If the alert level is Fatal then the peer is expected to close the connection, otherwise he may ignore the alert and continue.

<p>The error code of the underlying record send function will be returned, so you may also receive <code>GNUTLS_E_INTERRUPTED</code> or <code>GNUTLS_E_AGAIN</code> as well.

<p>Returns: On success, <code>GNUTLS_E_SUCCESS</code> (0) is returned, otherwise an error code is returned.

</p></blockquote></div>

<h4 class="subheading">gnutls_anon_allocate_client_credentials</h4>

<p>

<div class="defun">

— Function: int gnutls_anon_allocate_client_credentials (<var>gnutls_anon_client_credentials_t * sc</var>)<var></var>
<blockquote><p><var>sc</var>: is a pointer to a <code>gnutls_anon_client_credentials_t</code> structure.

<p>This structure is complex enough to manipulate directly thus this helper function is provided in order to allocate it.

<p>Returns: <code>GNUTLS_E_SUCCESS</code> on success, or an error code.

<h4 class="subheading">gnutls_anon_allocate_server_credentials</h4>

<p>

<div class="defun">

— Function: int gnutls_anon_allocate_server_credentials (<var>gnutls_anon_server_credentials_t * sc</var>)<var></var>
<blockquote><p><var>sc</var>: is a pointer to a <code>gnutls_anon_server_credentials_t</code> structure.

<p>This structure is complex enough to manipulate directly thus this helper function is provided in order to allocate it.

<p>Returns: <code>GNUTLS_E_SUCCESS</code> on success, or an error code.

<h4 class="subheading">gnutls_anon_free_client_credentials</h4>

<p>

— Function: void **gnutls_anon_free_client_credentials** (`gnutls_anon_client_credentials_t sc`)
`gnutls_anon_free_client_credentials`: is a `gnutls_anon_client_credentials_t` structure.

This structure is complex enough to manipulate directly thus this helper function is provided in order to free (deallocate) it.

gnutls_anon_free_server_credentials

[gnutls_anon_free_server_credentials](#)

— Function: void **gnutls_anon_free_server_credentials** (`gnutls_anon_server_credentials_t sc`)
`gnutls_anon_free_server_credentials`: is a `gnutls_anon_server_credentials_t` structure.

This structure is complex enough to manipulate directly thus this helper function is provided in order to free (deallocate) it.

gnutls_anon_set_params_function

[gnutls_anon_set_params_function](#)

— Function: void **gnutls_anon_set_params_function** (`gnutls_anon_server_credentials_t res`, `gnutls_params_function * func`)
`gnutls_anon_set_params_function`: is a `gnutls_anon_server_credentials_t` structure

`func`: is the function to be called

This function will set a callback in order for the server to get the Diffie-Hellman or RSA parameters for anonymous authentication. The callback should return zero on success.

gnutls_anon_set_server_dh_params

[gnutls_anon_set_server_dh_params](#)

— Function: void **gnutls_anon_set_server_dh_params** (`gnutls_anon_server_credentials_t res`, `gnutls_dh_params_t dh_params`)
`gnutls_anon_set_server_dh_params`: is a `gnutls_anon_server_credentials_t` structure

`res`: is a `gnutls_anon_server_credentials_t` structure

`dh_params`: is a structure that holds Diffie-Hellman parameters.

This function will set the Diffie-Hellman parameters for an anonymous server to use. These parameters will be used in Anonymous Diffie-Hellman cipher suites.

gnutls_anon_set_server_params_function

Function: void `gnutls_anon_set_server_params_function` (`gnutls_anon_server_credentials_t res`, `gnutls_params_function * func`)
`index-gnutls_005fanon_005fset_005fserver_005fparams_005ffunction-68`

`res`: is a `gnutls_certificate_credentials_t` structure

`func`: is the function to be called

This function will set a callback in order for the server to get the Diffie-Hellman parameters for anonymous authentication. The callback should return zero on success.

gnutls_auth_client_get_type

Function: `gnutls_credentials_type_t` `gnutls_auth_client_get_type` (`gnutls_session_t session`)
`index-gnutls_005fauth_005fclient_005fget_005ftype-69`

`session`: is a `gnutls_session_t` structure.

Returns the type of credentials that were used for client authentication. The returned information is to be used to distinguish the function used to access authentication data.

Returns: The type of credentials for the client authentication schema, a `gnutls_credentials_type_t` type.

gnutls_auth_get_type

— Function: `gnutls_credentials_type_t` `gnutls_auth_get_type` (`gnutls_session_t session`)
<var></var>

<blockquote><p><var>session</var>: is a `gnutls_session_t` structure.

<p>Returns type of credentials for the current authentication schema.
The returned information is to be used to distinguish the function used to access authentication data.

<p>Eg. for CERTIFICATE ciphersuites (key exchange algorithms: `GNUTLS_KX_RSA`, `GNUTLS_KX_DHE_RSA`), the same function are to be used to access the authentication data.

<p>Returns: The type of credentials for the current authentication schema, a `gnutls_credentials_type_t` type.
</p></blockquote></div>

gnutls_auth_server_get_type

<p>

<div class="defun">

— Function: `gnutls_credentials_type_t` `gnutls_auth_server_get_type` (`gnutls_session_t session`)
<var></var>

<blockquote><p><var>session</var>: is a `gnutls_session_t` structure.

<p>Returns the type of credentials that were used for server authentication.
The returned information is to be used to distinguish the function used to access authentication data.

<p>Returns: The type of credentials for the server authentication schema, a `gnutls_credentials_type_t` type.
</p></blockquote></div>

gnutls_bye

<p>

<div class="defun">

— Function: `int` `gnutls_bye` (`gnutls_session_t session`, `gnutls_close_request_t how`)
<var></var>

<blockquote><p><var>session</var>: is a `gnutls_session_t` structure.

<p><var>how</var>: is an integer

<p>Terminates the current TLS/SSL connection. The connection should have been initiated using `gnutls_handshake()`. `how` should be one of `GNUTLS_SHUT_RDWR`, `GNUTLS_SHUT_WR`.

In case of `GNUTLS_SHUT_RDWR` then the TLS connection gets terminated and further receives and sends will be disallowed. If the return value is zero you may continue using the connection. `GNUTLS_SHUT_RDWR` actually sends an alert containing a close request and waits for the peer to reply with the same message.

In case of `GNUTLS_SHUT_WR` then the TLS connection gets terminated and further sends will be disallowed. In order to reuse the connection you should wait for an EOF from the peer. `GNUTLS_SHUT_WR` sends an alert containing a close request.

Note that not all implementations will properly terminate a TLS connection. Some of them, usually for performance reasons, will terminate only the underlying transport layer, thus causing a transmission error to the peer. This error cannot be distinguished from a malicious party prematurely terminating the session, thus this behavior is not recommended.

This function may also return `GNUTLS_E_AGAIN` or `GNUTLS_E_INTERRUPTED`; cf. `gnutls_record_get_direction()`.

Returns: `GNUTLS_E_SUCCESS` on success, or an error code, see function documentation for entire semantics.

gnutls_certificate_activation_time_peers

[gnutls_certificate_activation_time_peers](#)

Function: `time_t gnutls_certificate_activation_time_peers(gnutls_session_t session)`

`gnutls_session_t session` is a gnutls session

`session`: is a gnutls session

This function will return the peer's certificate activation time. This is the creation time for openpgp keys.

Returns: (time_t)-1 on error.

Deprecated: `gnutls_certificate_verify_peers2()` now verifies activation times.

gnutls_certificate_allocate_credentials

[gnutls_certificate_allocate_credentials](#)

<div class="defun">

— Function: int gnutls_certificate_allocate_credentials (<var>gnutls_certificate_credentials_t *res</var>)<var></var>
<blockquote><p><var>res</var>: is a pointer to a <code>gnutls_certificate_credentials_t</code> structure.

<p>This structure is complex enough to manipulate directly thus this helper function is provided in order to allocate it.

<p>Returns: <code>GNUTLS_E_SUCCESS</code> on success, or an error code.</p></blockquote></div>

<h4 class="subheading">gnutls_certificate_client_get_request_status</h4>

<p>

<div class="defun">

— Function: int gnutls_certificate_client_get_request_status (<var>gnutls_session_t session</var>)<var></var>

<blockquote><p><var>session</var>: is a gnutls session

<p>Get whether client certificate is requested or not.

<p>Returns: 0 if the peer (server) did not request client authentication or 1 otherwise, or a negative value in case of error.

</p></blockquote></div>

<h4 class="subheading">gnutls_certificate_client_set_retrieve_function</h4>

<p>

<div class="defun">

— Function: void gnutls_certificate_client_set_retrieve_function

(<var>gnutls_certificate_credentials_t cred, gnutls_certificate_client_retrieve_function * func</var>)<var></var>

<blockquote><p><var>cred</var>: is a <code>gnutls_certificate_credentials_t</code> structure.

<p><var>func</var>: is the callback function

<p>This function sets a callback to be called in order to retrieve the certificate to be used in the handshake.

The callback's function prototype is:

```
int (*callback)(gnutls_session_t, const gnutls_datum_t* req_ca_dn, int nreqs,
const gnutls_pk_algorithm_t* pk_algos, int pk_algos_length, gnutls_retr_st* st);
```

<p><code>req_ca_cert</code> is only used in X.509 certificates.

Contains a list with the CA names that the server considers trusted.

Normally we should send a certificate that is signed by one of these CAs. These names are DER encoded. To get a more meaningful value use the function `gnutls_x509_rdn_get()`.

`pk_algos` contains a list with server's acceptable signature algorithms. The certificate returned should support the server's given algorithms.

`st` should contain the certificates and private keys.

If the callback function is provided then gnutls will call it, in the handshake, after the certificate request message has been received.

The callback function should set the certificate list to be sent, and return 0 on success. If no certificate was selected then the number of certificates should be set to zero. The value (-1) indicates error and the handshake will be terminated.

gnutls_certificate_expiration_time_peers

[gnutls_certificate_expiration_time_peers](#)

Function:

`gnutls_certificate_expiration_time_peers` (`gnutls_session_t session`)
[index-gnutls_certificate_expiration_time_peers-77](#)

`session`: is a gnutls session

This function will return the peer's certificate expiration time.

Returns: (time_t)-1 on error.

Deprecated: `gnutls_certificate_verify_peers2()` now verifies expiration times.

gnutls_certificate_free_ca_names

[gnutls_certificate_free_ca_names](#)

Function:

`gnutls_certificate_free_ca_names` (`gnutls_certificate_credentials_t sc`)
[index-gnutls_certificate_free_ca_names-78](#)

`sc`: is a `gnutls_certificate_credentials_t` structure.

This function will delete all the CA name in the given credentials. Clients may call this to save some memory since in client side the CA names are not used.

<p>CA names are used by servers to advertize the CAs they support to clients.
</p></blockquote></div>

<h4 class="subheading">gnutls_certificate_free_cas</h4>

<p>

<div class="defun">

— Function: void gnutls_certificate_free_cas (<var>gnutls_certificate_credentials_t sc</var>)<var></var>
<blockquote><p><var>sc</var>: is a <code>gnutls_certificate_credentials_t</code> structure.

<p>This function will delete all the CAs associated with the given credentials. Servers that do not use <code>gnutls_certificate_verify_peers2()</code> may call this to save some memory.
</p></blockquote></div>

— Function: const gnutls_datum_t * gnutls_certificate_get_ours (<var>gnutls_session_t session</var><var></var>
<blockquote><p><var>session</var>: is a gnutls session

<p>Get the certificate as sent to the peer, in the last handshake. These certificates are in raw format. In X.509 this is a certificate list. In OpenPGP this is a single certificate.

<p>Returns: return a pointer to a <code>gnutls_datum_t</code> containing our

certificates, or `NULL` in case of an error or if no certificate was used.

gnutls_certificate_get_peers

— Function: `const gnutls_datum_t * gnutls_certificate_get_peers` (`gnutls_session_t session`, `unsigned int * list_size`)
Returns: `gnutls_certificate_get_peers` returns a pointer to a `gnutls_datum_t` containing our certificates, or `NULL` in case of an error or if no certificate was used.

`session`: is a `gnutls_session`

`list_size`: is the length of the certificate list

Get the peer's raw certificate (chain) as sent by the peer. These certificates are in raw format (DER encoded for X.509). In case of a X.509 then a certificate list may be present. The first certificate in the list is the peer's certificate, following the issuer's certificate, then the issuer's issuer etc.

In case of OpenPGP keys a single key will be returned in raw format.

Returns: return a pointer to a `gnutls_datum_t` containing our certificates, or `NULL` in case of an error or if no certificate was used.

gnutls_certificate_get_x509_cas

— Function: `void gnutls_certificate_get_x509_cas` (`gnutls_certificate_credentials_t sc`, `gnutls_x509_cert_t ** x509_ca_list`, `unsigned int * ncas`)
Returns: `gnutls_certificate_get_x509_cas` returns a pointer to a `gnutls_certificate_credentials_t` structure.

`sc`: is a `gnutls_certificate_credentials_t` structure.

`x509_ca_list`: will point to the CA list. Should be treated as constant

`ncas`: the number of CAs

This function will export all the CAs associated with the given credentials.

Since: 2.4.0

</p></blockquote></div>

<h4 class="subheading">gnutls_certificate_get_x509_crls</h4>

<p>

<div class="defun">

gnutls_certificate_set_verify_flags

[gnutls_005fcertificate_005fset_005fverify_005fflags](#)

Function: void `gnutls_certificate_set_verify_flags` (`gnutls_certificate_credentials_t` res, unsigned int flags)

`gnutls_certificate_set_verify_flags` enumerations.

`res`: is a `gnutls_certificate_credentials_t` structure

`flags`: are the flags

This function will set the flags to be used at verification of the certificates. Flags must be OR of the `gnutls_certificate_verify_flags` enumerations.

gnutls_certificate_set_verify_limits

[gnutls_005fcertificate_005fset_005fverify_005flimits](#)

Function: void `gnutls_certificate_set_verify_limits` (`gnutls_certificate_credentials_t` res, unsigned int max_bits, unsigned int max_depth)

`gnutls_certificate_set_verify_limits` structure

`res`: is a `gnutls_certificate_credentials` structure

`max_bits`: is the number of bits of an acceptable certificate (default 8200)

`max_depth`: is maximum depth of the verification of a certificate chain (default 5)

This function will set some upper limits for the default verification function, `gnutls_certificate_verify_peers2()`, to avoid denial of service attacks. You can set them to zero to disable limits.

gnutls_certificate_set_x509_crl_file

[gnutls_005fcertificate_005fset_005fx509_005fcrl_005ffile](#)

Function: int `gnutls_certificate_set_x509_crl_file` (`gnutls_certificate_credentials_t` res, const char * crlfile, `gnutls_x509_crt_fmt_t` type)

`gnutls_certificate_set_x509_crl_file` structure

`res`: is a `gnutls_certificate_credentials_t` structure.

<p><var>crlfile</var>: is a file containing the list of verified CRLs (DER or PEM list)

<p><var>type</var>: is PEM or DER

<p>This function adds the trusted CRLs in order to verify client or server certificates. In case of a client this is not required to be called if the certificates are not verified using <code>gnutls_certificate_verify_peers2()</code>. This function may be called multiple times.

<p>Returns: number of CRLs processed or a negative value on error.</p></blockquote></div>

gnutls_certificate_set_x509_crl_mem</h4>

<p>

<div class="defun">

— Function: int gnutls_certificate_set_x509_crl_mem (<var>gnutls_certificate_credentials_t res, const gnutls_datum_t * CRL, gnutls_x509_crt_fmt_t type</var>)<var></var>

<blockquote><p><var>res</var>: is a `gnutls_certificate_credentials_t` structure.

<p><var>cert</var>: contains a certificate list (path) for the specified private key

<p><var>key</var>: is the private key, or `NULL`

<p><var>type</var>: is PEM or DER

<p>This function sets a certificate/private key pair in the `gnutls_certificate_credentials_t` structure. This function may be called more than once (in case multiple keys/certificates exist for the server).

<p>Currently are supported: RSA PKCS-1 encoded private keys, DSA private keys.

<p>DSA private keys are encoded the OpenSSL way, which is an ASN.1 DER sequence of 6 INTEGERS - version, p, q, g, pub, priv.

<p>Note that the keyUsage (2.5.29.15) PKIX extension in X.509 certificates is supported. This means that certificates intended for signing cannot be used for ciphersuites that require encryption.

<p>If the certificate and the private key are given in PEM encoding then the strings that hold their values must be null terminated.

<p>The `key` may be `NULL` if you are using a sign callback, see `gnutls_sign_callback_set()`.

<p>Returns: `GNUTLS_E_SUCCESS` on success, or an error code.
</p></blockquote></div>

gnutls_certificate_set_x509_key

<p>

<div class="defun">

— Function: int `gnutls_certificate_set_x509_key` (`gnutls_certificate_credentials_t res`, `gnutls_x509_crt_t * cert_list`, `int cert_list_size`, `gnutls_x509_privkey_t key`)<var></var>

<blockquote><p><var>res</var>: is a `gnutls_certificate_credentials_t` structure.

<p><var>cert_list</var>: contains a certificate list (path) for the specified private key

<p><var>cert_list_size</var>: holds the size of the certificate list

<p><var>key</var>: is a `gnutls_x509_privkey_t` key

This function sets a certificate/private key pair in the `gnutls_certificate_credentials_t` structure. This function may be called more than once (in case multiple keys/certificates exist for the server).

Returns: `GNUTLS_E_SUCCESS` on success, or an error code.

Since: 2.4.0

gnutls_certificate_set_x509_simple_pkcs12_file

[gnutls_005fcertificate_005fset_005fx509_005fsimple_005fpkcs12_005ffile](#)

Function: int `gnutls_certificate_set_x509_simple_pkcs12_file`

(`gnutls_certificate_credentials_t` res, const char * pkcs12file, `gnutls_x509 crt_fmt_t` type, const char * password)

[index-gnutls_005fcertificate_005fset_005fx509_005fsimple_005fpkcs12_005ffile-102](#)

`res`: is a `gnutls_certificate_credentials_t` structure.

`pkcs12file`: filename of file containing PKCS12 blob.

`type`: is PEM or DER of the `pkcs12file`.

`password`: optional password used to decrypt PKCS12 file, bags and keys.

This function sets a certificate/private key pair and/or a CRL in the `gnutls_certificate_credentials_t` structure. This function may be called more than once (in case multiple keys/certificates exist for the server).

MAC: ed PKCS12 files are supported. Encrypted PKCS12 bags are supported. Encrypted PKCS8 private keys are supported. However, only password based security, and the same password for all operations, are supported.

The private keys may be RSA PKCS1 or DSA private keys encoded in the OpenSSL way.

PKCS12 file may contain many keys and/or certificates, and there is no way to identify which key/certificate pair you want. You should make sure the PKCS12 file only contain one key/certificate pair and/or one CRL.

It is believed that the limitations of this function is acceptable

for most usage, and that any more flexibility would introduce complexity that would make it harder to use this functionality at all.

Returns: `GNUTLS_E_SUCCESS` on success, or an error code.

gnutls_certificate_set_x509_simple_pkcs12_mem

[gnutls_005fcertificate_005fset_005fx509_005fsimple_005fpkcs12_005fmem](#)

Function:

int `gnutls_certificate_set_x509_simple_pkcs12_mem`

(`gnutls_certificate_credentials_t` res, const `gnutls_datum_t` * p12blob, `gnutls_x509_cert_fmt_t` type, const char * password)

`res` is a `gnutls_certificate_credentials_t` structure.

`p12blob`: the PKCS12 blob.

`type`: is PEM or DER of the `pkcs12file`.

`password`: optional password used to decrypt PKCS12 file, bags and keys.

This function sets a certificate/private key pair and/or a CRL in the `gnutls_certificate_credentials_t` structure. This function may be called more than once (in case multiple keys/certificates exist for the server).

MAC: Encrypted PKCS12 files are supported. Encrypted PKCS12 bags are supported. Encrypted PKCS8 private keys are supported. However, only password based security, and the same password for all operations, are supported.

The private keys may be RSA PKCS1 or DSA private keys encoded in the OpenSSL way.

PKCS12 file may contain many keys and/or certificates, and there is no way to identify which key/certificate pair you want. You should make sure the PKCS12 file only contain one key/certificate pair and/or one CRL.

It is believed that the limitations of this function is acceptable for most usage, and that any more flexibility would introduce complexity that would make it harder to use this functionality at all.

Returns: `GNUTLS_E_SUCCESS` on success, or an error code.

Since: 2.8.0

gnutls_certificate_set_x509_trust_file

Function: int `gnutls_certificate_set_x509_trust_file` (`gnutls_certificate_credentials_t` res, const char * cafile, `gnutls_x509 crt_fmt_t` type) `index-gnutls_005fcertificate_005fset_005fx509_005ftrust_005ffile-104`

`res`: is a `gnutls_certificate_credentials_t` structure.

`cafile`: is a file containing the list of trusted CAs (DER or PEM list)

`type`: is PEM or DER

This function adds the trusted CAs in order to verify client or server certificates. In case of a client this is not required to be called if the certificates are not verified using `gnutls_certificate_verify_peers2()`. This function may be called multiple times.

In case of a server the names of the CAs set here will be sent to the client if a certificate request is sent. This can be disabled using `gnutls_certificate_send_x509_rdn_sequence()`.

Returns: number of certificates processed, or a negative value on error.

gnutls_certificate_set_x509_trust_mem

Function: int `gnutls_certificate_set_x509_trust_mem` (`gnutls_certificate_credentials_t` res, const `gnutls_datum_t` * ca, `gnutls_x509 crt_fmt_t` type) `index-gnutls_005fcertificate_005fset_005fx509_005ftrust_005fmem-105`

`res`: is a `gnutls_certificate_credentials_t` structure.

`ca`: is a list of trusted CAs or a DER certificate

`type`: is DER or PEM

This function adds the trusted CAs in order to verify client or

server certificates. In case of a client this is not required to be called if the certificates are not verified using `gnutls_certificate_verify_peers2()`. This function may be called multiple times.

In case of a server the CAs set here will be sent to the client if a certificate request is sent. This can be disabled using `gnutls_certificate_send_x509_rdn_sequence()`.

Returns: the number of certificates processed or a negative value on error.

gnutls_certificate_set_x509_trust

[gnutls_005fcertificate_005fset_005fx509_005ftrust](#)

Function: int `gnutls_certificate_set_x509_trust` (`gnutls_certificate_credentials_t res,`

`gnutls_x509 crt_t * ca_list,` int `ca_list_size`)
[gnutls_005fcertificate_005fset_005fx509_005ftrust-106](#)

`res`: is a `gnutls_certificate_credentials_t` structure.

`ca_list`: is a list of trusted CAs

`ca_list_size`: holds the size of the CA list

This function adds the trusted CAs in order to verify client or server certificates. In case of a client this is not required to be called if the certificates are not verified using `gnutls_certificate_verify_peers2()`. This function may be called multiple times.

In case of a server the CAs set here will be sent to the client if a certificate request is sent. This can be disabled using `gnutls_certificate_send_x509_rdn_sequence()`.

Returns: `GNUTLS_E_SUCCESS` on success, or an error code.

Since: 2.4.0

gnutls_certificate_type_get_id

[gnutls_005fcertificate_005ftype_005fget_005fid](#)

Function: `gnutls_certificate_type_t` `gnutls_certificate_type_get_id` (`const char *`

name

[index-gnutls_005fcertificate_005ftype_005fget_005fid-107](#)

`name`: is a certificate type name

The names are compared in a case insensitive way.

Returns: a `gnutls_certificate_type_t` for the specified in a string certificate type, or `GNUTLS_CERT_UNKNOWN` on error.

gnutls_certificate_type_get_name

[gnutls_005fcertificate_005ftype_005fget_005fname](#)

Function: const char * `gnutls_certificate_type_get_name` (`gnutls_certificate_type_t`

`type`) `type`: is a certificate type

Convert a `gnutls_certificate_type_t` type to a string.

Returns: a string that contains the name of the specified certificate type, or `NULL` in case of unknown types.

gnutls_certificate_type_get

[gnutls_005fcertificate_005ftype_005fget](#)

Function: `gnutls_certificate_type_t` `gnutls_certificate_type_get` (`gnutls_session_t`

`session`) `session`: is a `gnutls_session_t` structure.

The certificate type is by default X.509, unless it is negotiated as a TLS extension.

Returns: the currently used `gnutls_certificate_type_t` certificate type.

gnutls_certificate_type_list

[gnutls_005fcertificate_005ftype_005flist](#)

Function: const `gnutls_certificate_type_t` * `gnutls_certificate_type_list` (`void`

)

<p>Get a list of certificate types. Note that to be able to use OpenPGP certificates, you must link to libgnutls-extra and call <code>gnutls_global_init_extra()</code>.

<p>Returns: a zero-terminated list of <code>gnutls_certificate_type_t</code> integers indicating the available certificate types.

</p></blockquote></div>

gnutls_certificate_type_set_priority</h4>

<p>

<div class="defun">

— Function: int gnutls_certificate_type_set_priority (<var>gnutls_session_t session, const int * list</var>)<var></var>
<blockquote><p><var>session</var>: is a <code>gnutls_session_t</code> structure.

<p><var>list</var>: is a 0 terminated list of gnutls_certificate_type_t elements.

<p>Sets the priority on the certificate types supported by gnutls.

Priority is higher for elements specified before others.

After specifying the types you want, you must append a 0.

Note that the certificate type priority is set on the client.

The server does not use the cert type priority except for disabling types that were not specified.

<p>Returns: <code>GNUTLS_E_SUCCESS</code> on success, or an error code.

</p></blockquote></div>

gnutls_certificate_verify_peers2</h4>

<p>

<div class="defun">

— Function: int gnutls_certificate_verify_peers2 (<var>gnutls_session_t session, unsigned int * status</var>)<var></var>
<blockquote><p><var>session</var>: is a gnutls session

<p><var>status</var>: is the output of the verification

<p>This function will try to verify the peer's certificate and return its status (trusted, invalid etc.). The value of <code>status</code> should be one or more of the gnutls_certificate_status_t enumerated elements bitwise or'd. To avoid denial of service attacks some default upper limits regarding the certificate key size and chain size are set. To override them use <code>gnutls_certificate_set_verify_limits()</code>.

<p>Note that you must also check the peer's name in order to check if the verified certificate belongs to the actual peer.

<p>This function uses <code>gnutls_x509_cert_list_verify()</code> with the CAs in the credentials as trusted CAs.

<p>Note that some commonly used X.509 Certificate Authorities are still using Version 1 certificates. If you want to accept them, you need to call <code>gnutls_certificate_set_verify_flags()</code> with, e.g., <code>GNUTLS_VERIFY_ALLOW_X509_V1_CA_CRT</code> parameter.

<p>Returns: a negative error code on error and zero on success.</p></blockquote></div>

>gnutls_certificate_verify_peers</h4>

<p>

— Function: int gnutls_certificate_verify_peers (<var>gnutls_session_t session</var>)<var></var>
<blockquote><p><var>session</var>: is a gnutls session

<p>This function will try to verify the peer's certificate and return its status (trusted, invalid etc.). However you must also check the peer's name in order to check if the verified certificate belongs to the actual peer.

<p>This function uses <code>gnutls_x509_cert_list_verify()</code>.

<p>Returns: one or more of the <code>gnutls_certificate_status_t</code> enumerated elements bitwise or'd, or a negative value on error.

<p>Deprecated: Use <code>gnutls_certificate_verify_peers2()</code> instead.</p></blockquote></div>

>gnutls_check_version</h4>

<p>

<div class="defun">

— Function: const char * gnutls_check_version (<var>const char * req_version</var>)<var></var>
<blockquote><p><var>req_version</var>: version string to compare with, or <code>NULL</code>.

<p>Check GnuTLS Library version.

<p>See <code>GNUTLS_VERSION</code> for a suitable <code>req_version</code> string.

Return value: Check that the version of the library is at minimum the one given as a string in `req_version` and return the actual version string of the library; return `NULL` if the condition is not met. If `NULL` is passed to this function no check is done and only the version string is returned.

gnutls_cipher_get_id

— Function: `gnutls_cipher_algorithm_t gnutls_cipher_get_id` (`const char * name`)
: is a MAC algorithm name

The names are compared in a case insensitive way.

Returns: return a `gnutls_cipher_algorithm_t` value corresponding to the specified cipher, or `GNUTLS_CIPHER_UNKNOWN` on error.

gnutls_cipher_get_key_size

— Function: `size_t gnutls_cipher_get_key_size` (`gnutls_cipher_algorithm_t algorithm`)
: is an encryption algorithm

Get key size for cipher.

Returns: length (in bytes) of the given cipher's key size, or 0 if the given cipher is invalid.

gnutls_cipher_get_name

— Function: `const char * gnutls_cipher_get_name` (`gnutls_cipher_algorithm_t algorithm`)
: is an encryption algorithm

Convert a `gnutls_cipher_algorithm_t` type to a string.

Returns: a pointer to a string that contains the name of the specified cipher, or `NULL`.

gnutls_cipher_get

[gnutls_005fcipher_005fget](#)

Function:

`gnutls_cipher_algorithm_t` **gnutls_cipher_get** (`gnutls_session_t session`)
`session`: is a `gnutls_session_t` structure.

Get currently used cipher.

Returns: the currently used cipher, a `gnutls_cipher_algorithm_t` type.

gnutls_cipher_list

[gnutls_005fcipher_005flist](#)

Function:

`const gnutls_cipher_algorithm_t *` **gnutls_cipher_list** (`void`)
`name="index-gnutls_005fcipher_005flist-119"`

Get a list of supported cipher algorithms. Note that not necessarily all ciphers are supported as TLS cipher suites. For example, DES is not supported as a cipher suite, but is supported for other purposes (e.g., PKCS#8 or similar).

Returns: a zero-terminated list of `gnutls_cipher_algorithm_t` integers indicating the available ciphers.

gnutls_cipher_set_priority

[gnutls_005fcipher_005fset_005fpriority](#)

Function:

`int` **gnutls_cipher_set_priority** (`gnutls_session_t session, const int * list`)
`session`: is a `gnutls_session_t` structure.

`list`: is a 0 terminated list of `gnutls_cipher_algorithm_t` elements.

<p>Sets the priority on the ciphers supported by gnutls.
Priority is higher for elements specified before others.
After specifying the ciphers you want, you must append a 0.
Note that the priority is set on the client. The server does
not use the algorithm's priority except for disabling
algorithms that were not specified.

<p>Returns: <code>GNUTLS_E_SUCCESS</code> on success, or an error code.
</p></blockquote></div>

<blockquote><p><var>name</var>: is a compression method name

<p>The names are compared in a case insensitive way.

<p>Returns: an id of the specified in a string compression method, or <code>GNUTLS_COMP_UNKNOWN</code> on error.

</p></blockquote></div>

<h4 class="subheading">gnutls_compression_get_name</h4>

<p>

<div class="defun">

— Function: const char * gnutls_compression_get_name (<var>gnutls_compression_method_t algorithm</var><var></var>

<blockquote><p><var>algorithm</var>: is a Compression algorithm

<p>Convert a <code>gnutls_compression_method_t</code> value to a string.

<p>Returns: a pointer to a string that contains the name of the specified compression algorithm, or <code>NULL</code>.

</p></blockquote></div>

<h4 class="subheading">gnutls_compression_get</h4>

<p>

<div class="defun">

— Function: `gnutls_compression_method_t` **gnutls_compression_get** (`gnutls_session_t session`)
`gnutls_compression_get` (`gnutls_session_t session`): is a `gnutls_session_t` structure.

Get currently used compression algorithm.

Returns: the currently used compression method, a `gnutls_compression_method_t` value.

gnutls_compression_list

`gnutls_compression_list`

— Function: `const gnutls_compression_method_t *` **gnutls_compression_list** (`gnutls_session_t session`)
`gnutls_compression_list` (`gnutls_session_t session`): is a `gnutls_session_t` structure.

Get a list of compression methods. Note that to be able to use LZO compression, you must link to libgnutls-extra and call `gnutls_global_init_extra`.

Returns: a zero-terminated list of `gnutls_compression_method_t` integers indicating the available compression methods.

gnutls_compression_set_priority

`gnutls_compression_set_priority`

— Function: `int` **gnutls_compression_set_priority** (`gnutls_session_t session`, `const int *list`)
`gnutls_compression_set_priority` (`gnutls_session_t session`, `const int *list`): is a `gnutls_session_t` structure.

`session`: is a `gnutls_session_t` structure.

`list`: is a 0 terminated list of `gnutls_compression_method_t` elements.

Sets the priority on the compression algorithms supported by gnutls.

Priority is higher for elements specified before others.

After specifying the algorithms you want, you must append a 0.

Note that the priority is set on the client. The server does

not use the algorithm's priority except for disabling

algorithms that were not specified.

TLS 1.0 does not define any compression algorithms except NULL. Other compression algorithms are to be considered as gnutls extensions.

Returns: `GNUTLS_E_SUCCESS` on success, or an error code.

gnutls_credentials_clear

[gnutls_credentials_clear](#)

Function:

void `gnutls_credentials_clear` (`gnutls_session_t session`)

`session`: is a `gnutls_session_t` structure.

Clears all the credentials previously set in this session.

gnutls_credentials_set

[gnutls_credentials_set](#)

Function:

int `gnutls_credentials_set` (`gnutls_session_t session`, `gnutls_credentials_type_t type`, void * `cred`)

`session`: is a `gnutls_session_t` structure.

`type`: is the type of the credentials

`cred`: is a pointer to a structure.

Sets the needed credentials for the specified type. Eg username, password - or public and private keys etc. The `cred` parameter is a structure that depends on the specified type and on the current session (client or server).

In order to minimize memory usage, and share credentials between several threads gnutls keeps a pointer to cred, and not the whole cred structure. Thus you will have to keep the structure allocated until you call `gnutls_deinit()`.

For `GNUTLS_CRD_ANON`, `cred` should be `gnutls_anon_client_credentials_t` in case of a client. In case of a server it should be `gnutls_anon_server_credentials_t`.

For `GNUTLS_CRD_SRP`, `cred` should be `gnutls_srp_client_credentials_t` in case of a client, and `gnutls_srp_server_credentials_t`, in case of a server.

For `GNUTLS_CRD_CERTIFICATE`, `cred` should be

`gnutls_certificate_credentials_t`.

Returns: On success, `GNUTLS_E_SUCCESS` (zero) is returned, otherwise an error code is returned.

gnutls_crypto_bigint_register2

[gnutls_005fcrypto_005fbigint_005fregister2](#)

Function: int `gnutls_crypto_bigint_register2` (`int` priority, `int` version,

`gnutls_crypto_bigint_st * s`)
[index-gnutls_005fcrypto_005fbigint_005fregister2-130](#)

`priority`: is the priority of the interface

`version`: should be set to `GNUTLS_CRYPT_API_VERSION`

`s`: is a structure holding new interface's data

This function will register an interface for gnutls to operate on big integers. Any interface registered will override the included interface. The interface with the lowest priority will be used by gnutls.

Note that the bigint interface must interoperate with the public key interface. Thus if this interface is updated the `gnutls_crypto_pk_register()` should also be used.

This function should be called before `gnutls_global_init()`.

For simplicity you can use the convenience `gnutls_crypto_bigint_register()` macro.

Returns: `GNUTLS_E_SUCCESS` on success, otherwise an error.

Since: 2.6.0

gnutls_crypto_cipher_register2

[gnutls_005fcrypto_005fcipher_005fregister2](#)

— Function: int gnutls_dh_params_import_pkcs3 (<var>gnutls_dh_params_t params, const gnutls_datum_t * pkcs3_params, gnutls_x509_crt_fmt_t format</var>)<var></var>

<blockquote><p><var>params</var>: A structure where the parameters will be copied to

<p><var>pkcs3_params</var>: should contain a PKCS3 DHParams structure PEM or DER encoded

<p><var>format</var>: the format of params. PEM or DER.

<p>This function will extract the DHParams found in a PKCS3 formatted structure. This is the format generated by "openssl dhparam" tool.

<p>If the structure is PEM encoded, it should have a header of "BEGIN DH PARAMETERS".

<p>Returns: On success, <code>GNUTLS_E_SUCCESS</code> (zero) is returned, otherwise an error code is returned.

</p></blockquote></div>

gnutls_dh_params_import_raw

[gnutls_005fdh_005fparams_005fimport_005fraw](#)

Function:

int **gnutls_dh_params_import_raw** (`gnutls_dh_params_t` dh_params, const `gnutls_datum_t` * prime, const `gnutls_datum_t` * generator)

`dh_params`: Is a structure that will hold the prime numbers

`prime`: holds the new prime

`generator`: holds the new generator

This function will replace the pair of prime and generator for use in the Diffie-Hellman key exchange. The new parameters should be stored in the appropriate `gnutls_datum`.

Returns: On success, `GNUTLS_E_SUCCESS` (zero) is returned, otherwise an error code is returned.

gnutls_dh_params_init

[gnutls_005fdh_005fparams_005finit](#)

Function:

int **gnutls_dh_params_init** (`gnutls_dh_params_t` * dh_params)

`dh_params`: Is a structure that will hold the prime numbers

This function will initialize the DH parameters structure.

Returns: On success, `GNUTLS_E_SUCCESS` (zero) is returned, otherwise an error code is returned.

gnutls_dh_set_prime_bits

[gnutls_005fdh_005fset_005fprime_005fbits](#)

Function:

void **gnutls_dh_set_prime_bits** (`gnutls_session_t` session, unsigned int bits)

`session`: is a `gnutls_session_t` structure.

`bits`: is the number of bits

<p>This function sets the number of bits, for use in an Diffie-Hellman key exchange. This is used both in DH ephemeral and DH anonymous cipher suites. This will set the minimum size of the prime that will be used for the handshake.

<p>In the client side it sets the minimum accepted number of bits. If a server sends a prime with less bits than that <code>GNUTLS_E_DH_PRIME_UNACCEPTABLE</code> will be returned by the handshake.

<p>This function has no effect in server side.
</p></blockquote></div>

<p> <div class="defun"> — Function: int gnutls_error_is_fatal (<var>int error</var>)<var></var>
 <blockquote><p><var>error</var>: is a GnuTLS error code, a negative value

<p>If a GnuTLS function returns a negative value you may feed that value to this function to see if the error condition is fatal.

<p>Note that you may want to check the error code manually, since some non-fatal errors to the protocol may be fatal for you program.

<p>This function is only useful if you are dealing with errors from the record layer or the handshake layer.

<p>Returns: 1 if the error code is fatal, for positive <code>error</code> values, 0 is returned. For unknown <code>error</code> values, -1 is returned.
</p></blockquote></div>

<p> <div class="defun"> — Function: int gnutls_error_to_alert (<var>int err, int * level</var>)<var></var>
 <blockquote><p><var>err</var>: is a negative integer

<p><var>level</var>: the alert level will be stored there

<p>Get an alert depending on the error code returned by a gnutls function. All alerts sent by this function should be considered fatal. The only exception is when <code>err</code> is <code>GNUTLS_E_REHANDSHAKE</code>,</p>

where a warning alert should be sent to the peer indicating that no renegotiation will be performed.

If there is no mapping to a valid alert the alert to indicate internal error is returned.

Returns: the alert code to use for a particular error code.

gnutls_ext_register

[gnutls_005fext_005fregister](#)

Function:

int **gnutls_ext_register** (int type, const char * name, gnutls_ext_parse_type_t parse_type, gnutls_ext_recv_func_t recv_func, gnutls_ext_send_func_t send_func)

type: the 16-bit integer referring to the extension type

name: human printable name of the extension used for debugging

parse_type: either `GNUTLS_EXT_TLS` or `GNUTLS_EXT_APPLICATION`.

recv_func: a function to receive extension data

send_func: a function to send extension data

This function is used to register a new TLS extension handler.

Returns: `GNUTLS_E_SUCCESS` on success, or an error code.

Since: 2.6.0

gnutls_fingerprint

[gnutls_005ffingerprint](#)

Function:

int **gnutls_fingerprint** (gnutls_digest_algorithm_t algo, const gnutls_datum_t * data, void * result, size_t * result_size)

algo: is a digest algorithm

data: is the data

result: is the place where the result will be copied (may be null).

`result_size`: should hold the size of the result. The actual size of the returned result will also be copied there.

This function will calculate a fingerprint (actually a hash), of the given data. The result is not printable data. You should convert it to hex, or to something else printable.

This is the usual way to calculate a fingerprint of an X.509 DER encoded certificate. Note however that the fingerprint of an OpenPGP is not just a hash and cannot be calculated with this function.

Returns: On success, `GNUTLS_E_SUCCESS` (0) is returned, otherwise an error code is returned.

gnutls_free

[gnutls_005ffree](#)

Function:

`void gnutls_free(void * ptr)`

This function will free data pointed by ptr.

The deallocation function used is the one set by `gnutls_global_set_mem_functions()`.

gnutls_global_deinit

[gnutls_005fglobal_005fdeinit](#)

Function:

`void gnutls_global_deinit(void)`

This function deinitializes the global data, that were initialized using `gnutls_global_init()`.

Note! This function is not thread safe. See the discussion for `gnutls_global_init()` for more information.

gnutls_global_init

[gnutls_005fglobal_005finit](#)

Function:

– Function: `int gnutls_global_init` (`void`)
[index-gnutls_005fglobal_005finit-168](#)

This function initializes the global data to defaults. Every gnutls application has a global data which holds common parameters shared by gnutls session structures. You should call `gnutls_global_deinit` when gnutls usage is no longer needed

Note that this function will also initialize libcrypto, if it has not been initialized before. Thus if you want to manually initialize libcrypto you must do it before calling this function. This is useful in cases you want to disable libcrypto's internal lockings etc.

This function increment a global counter, so that `gnutls_global_deinit` only releases resources when it has been called as many times as `gnutls_global_init`. This is useful when GnuTLS is used by more than one library in an application. This function can be called many times, but will only do something the first time.

Note! This function is not thread safe. If two threads call this function simultaneously, they can cause a race between checking the global counter and incrementing it, causing both threads to execute the library initialization code. That would lead to a memory leak. To handle this, your application could invoke this function after acquiring a thread mutex. To ignore the potential memory leak is also an option.

Returns: On success, `GNUTLS_E_SUCCESS` (zero) is returned, otherwise an error code is returned.

gnutls_global_set_log_function

[index-gnutls_005fglobal_005fset_005flog_005ffunction](#)

– Function: `void gnutls_global_set_log_function` (`gnutls_log_func log_func`)
[index-gnutls_005fglobal_005fset_005flog_005ffunction-169](#)

`log_func`: it's a log function

This is the function where you set the logging function gnutls is going to use. This function only accepts a character array. Normally you may not use this function since it is only used for debugging purposes.

`gnutls_log_func` is of the form,

```
void (*gnutls_log_func)( int level, const char*);
```

```
</p></blockquote></div>
```

gnutls_global_set_log_level

```
<p><a name="gnutls_005fglobal_005fset_005flog_005flevel"></a>
```

```
<div class="defun">
```

```
&mdash; Function: void <b>gnutls_global_set_log_level</b> (<var>int level</var><var><a name="index-gnutls_005fglobal_005fset_005flog_005flevel-170"></a></var><br>
```

```
<blockquote><p><var>level</var>: it's an integer from 0 to 9.
```

This is the function that allows you to set the log level. The level is an integer between 0 and 9. Higher values mean more verbosity. The default value is 0. Larger values should only be used with care, since they may reveal sensitive information.

Use a log level over 10 to enable all debugging options.

gnutls_global_set_mem_functions

```
<p><a name="gnutls_005fglobal_005fset_005fmem_005ffunctions"></a>
```

```
<div class="defun">
```

```
&mdash; Function: void <b>gnutls_global_set_mem_functions</b> (<var>gnutls_alloc_function alloc_func, gnutls_alloc_function secure_alloc_func, gnutls_is_secure_function is_secure_func, gnutls_realloc_function realloc_func, gnutls_free_function free_func</var><var><a name="index-gnutls_005fglobal_005fset_005fmem_005ffunctions-171"></a></var><br>
```

```
<blockquote><p><var>alloc_func</var>: it's the default memory allocation function. Like malloc().
```

<var>secure_alloc_func</var>: This is the memory allocation function that will be used for sensitive data.

<var>is_secure_func</var>: a function that returns 0 if the memory given is not secure. May be NULL.

<var>realloc_func</var>: A realloc function

<var>free_func</var>: The function that frees allocated data. Must accept a NULL pointer.

This is the function were you set the memory allocation functions gnutls is going to use. By default the libc's allocation functions (`malloc()`, `free()`), are used by gnutls, to allocate both sensitive and not sensitive data. This function is provided to set the memory allocation functions to something other than the defaults (ie the gcrypt allocation functions).

This function must be called before `gnutls_global_init()` is called. This function is not thread safe.

</p></blockquote></div>

<h4 class="subheading">gnutls_handshake_get_last_in</h4>

<p>

<div class="defun">

— Function: `gnutls_handshake_description_t` **gnutls_handshake_get_last_in** (`gnutls_session_t session`)<var></var>
<blockquote><p><var>session</var>: is a `gnutls_session_t` structure.

<p>This function is only useful to check where the last performed handshake failed. If the previous handshake succeed or was not performed at all then no meaningful value will be returned.

<p>Check `gnutls_handshake_description_t` in `gnutls.h` for the available handshake descriptions.

<p>Returns: the last handshake message type received, a `gnutls_handshake_description_t`.

</p></blockquote></div>

<h4 class="subheading">gnutls_handshake_set_max_packet_length</h4>

<p>

<div class="defun">

— Function: void `gnutls_handshake_set_max_packet_length` (`gnutls_session_t session`, `size_t max`)
`gnutls_handshake_set_max_packet_length` is a `gnutls_session_t` structure.

`max`: is the maximum number.

This function will set the maximum size of all handshake messages. Handshakes over this size are rejected with `GNUTLS_E_HANDSHAKE_TOO_LARGE` error code. The default value is 48kb which is typically large enough. Set this to 0 if you do not want to set an upper limit.

The reason for restricting the handshake message sizes are to limit Denial of Service attacks.

gnutls_handshake_set_post_client_hello_function

`gnutls_handshake_set_post_client_hello_function`

`gnutls_handshake_set_post_client_hello_function`

— Function: void `gnutls_handshake_set_post_client_hello_function` (`gnutls_session_t session`, `gnutls_handshake_post_client_hello_func func`)
`gnutls_handshake_set_post_client_hello_function` is a `gnutls_session_t` structure.

`func`: is the function to be called

This function will set a callback to be called after the client hello has been received (callback valid in server side only). This allows the server to adjust settings based on received extensions.

Those settings could be ciphersuites, requesting certificate, or anything else except for version negotiation (this is done before the hello message is parsed).

This callback must return 0 on success or a gnutls error code to terminate the handshake.

Warning: You should not use this function to terminate the handshake based on client input unless you know what you are doing. Before the handshake is finished there is no way to know if there is a man-in-the-middle attack being performed.

gnutls_handshake_set_private_extensions

<p>

<div class="defun">

— Function: void gnutls_handshake_set_private_extensions (<var>gnutls_session_t session, int allow</var>)<var></var>

<blockquote><p><var>session</var>: is a <code>gnutls_session_t</code> structure.

<p><var>allow</var>: is an integer (0 or 1)

<p>This function will enable or disable the use of private cipher suites (the ones that start with 0xFF). By default or if <code>allow</code> is 0 then these cipher suites will not be advertised nor used.

<p>Unless this function is called with the option to allow (1), then no compression algorithms, like LZO. That is because these algorithms are not yet defined in any RFC or even internet draft.

<p>Enabling the private ciphersuites when talking to other than gnutls servers and clients may cause interoperability problems.

</p></blockquote></div>

<h4 class="subheading">gnutls_handshake</h4>

<p>

<div class="defun">

— Function: int gnutls_handshake (<var>gnutls_session_t session</var>)<var></var>

<blockquote><p><var>session</var>: is a <code>gnutls_session_t</code> structure.

<p>This function does the handshake of the TLS/SSL protocol, and initializes the TLS connection.

<p>This function will fail if any problem is encountered, and will return a negative error code. In case of a client, if the client has asked to resume a session, but the server couldn't, then a full handshake will be performed.

<p>The non-fatal errors such as <code>GNUTLS_E_AGAIN</code> and <code>GNUTLS_E_INTERRUPTED</code> interrupt the handshake procedure, which should be later be resumed. Call this function again, until it returns 0; cf. <code>gnutls_record_get_direction()</code> and <code>gnutls_error_is_fatal()</code>.

<p>If this function is called by a server after a rehandshake request then <code>GNUTLS_E_GOT_APPLICATION_DATA</code> or <code>GNUTLS_E_WARNING_ALERT_RECEIVED</code> may be returned. Note that these

are non fatal errors, only in the specific case of a rehandshake.
Their meaning is that the client rejected the rehandshake request.

<p>Returns: <code>GNUTLS_E_SUCCESS</code> on success, otherwise an error.</p></blockquote></div>

<p> <div class="defun"> — Function: int gnutls_hex2bin (<var>const char * hex_data, size_t hex_size, char * bin_data, size_t * bin_size</var><var></var>
 <blockquote><p><var>hex_data</var>: string with data in hex format <p><var>hex_size</var>: size of hex data <p><var>bin_data</var>: output array with binary data <p><var>bin_size</var>: when calling *<code>bin_size</code> should hold size of <code>bin_data</code>, on return will hold actual size of <code>bin_data</code>. <p>Convert a buffer with hex data to binary data. <p>Returns: <code>GNUTLS_E_SUCCESS</code> on success, otherwise an error. <p>Since: 2.4.0 </p></blockquote></div> <p> <div class="defun"> — Function: int gnutls_hex_decode (<var>const gnutls_datum_t * hex_data, char * result, size_t * result_size</var><var></var>

not

long enough, or 0 on success.

gnutls_hex_encode

– Function: int **gnutls_hex_encode** (`const gnutls_datum_t * data, char * result, size_t * result_size`)

`data`: contain the raw data

`result`: the place where hex data will be copied

`result_size`: holds the size of the result

This function will convert the given data to printable data, using the hex encoding, as used in the PSK password files.

Returns: `GNUTLS_E_SHORT_MEMORY_BUFFER` if the buffer given is not

long enough, or 0 on success.

gnutls_init

– Function: int **gnutls_init** (`gnutls_session_t * session, gnutls_connection_end_t con_end`)

`session`: is a pointer to a `gnutls_session_t` structure.

`con_end`: indicate if this session is to be used for server or client.

This function initializes the current session to null. Every session must be initialized before use, so internal structures can be allocated. This function allocates structures which can only be free'd by calling `gnutls_deinit()`. Returns zero on success.

`con_end` can be one of `GNUTLS_CLIENT` and `GNUTLS_SERVER`.

Returns: `GNUTLS_E_SUCCESS` on success, or an error code.

gnutls_kx_get_id

<p>

<div class="defun">

</p></blockquote></div>

gnutls_mac_get_key_size

[gnutls_005fmac_005fget_005fkey_005fsize](#)

Function:

`size_t gnutls_mac_get_key_size` (`gnutls_mac_algorithm_t algorithm`): is an encryption algorithm

Get size of MAC key.

Returns: length (in bytes) of the given MAC key size, or 0 if the given MAC algorithm is invalid.

gnutls_mac_get_name

[gnutls_005fmac_005fget_005fname](#)

Function:

`const char * gnutls_mac_get_name` (`gnutls_mac_algorithm_t algorithm`): is a MAC algorithm

Convert a `gnutls_mac_algorithm_t` value to a string.

Returns: a string that contains the name of the specified MAC algorithm, or `NULL`.

gnutls_mac_get

[gnutls_005fmac_005fget](#)

Function:

`gnutls_mac_algorithm_t gnutls_mac_get` (`gnutls_session_t session`): is a `gnutls_session_t` structure.

Get currently used MAC algorithm.

Returns: the currently used mac algorithm, a `gnutls_mac_algorithm_t` value.

gnutls_mac_list

[gnutls_005fmac_005flist](#)

Function: `const gnutls_mac_algorithm_t *` `gnutls_mac_list` (`void`)

`gnutls_mac_list` is a zero-terminated list of `gnutls_mac_algorithm_t` elements.

Blockquote:

Get a list of hash algorithms for use as MACs. Note that not necessarily all MACs are supported in TLS cipher suites. For example, MD2 is not supported as a cipher suite, but is supported for other purposes (e.g., X.509 signature verification or similar).

Returns: Return a zero-terminated list of `gnutls_mac_algorithm_t` integers indicating the available MACs.

Blockquote:

gnutls_mac_set_priority

[gnutls_005fmac_005fset_005fpriority](#)

Function: `int` `gnutls_mac_set_priority` (`gnutls_session_t` session, `int *` list)

`gnutls_mac_set_priority` sets the priority of the MAC algorithms supported by gnutls. Priority is higher for elements specified before others.

`session`: is a `gnutls_session_t` structure.

`list`: is a 0 terminated list of `gnutls_mac_algorithm_t` elements.

Sets the priority on the mac algorithms supported by gnutls. Priority is higher for elements specified before others. After specifying the algorithms you want, you must append a 0. Note that the priority is set on the client. The server does not use the algorithm's priority except for disabling algorithms that were not specified.

Returns: `GNUTLS_E_SUCCESS` on success, or an error code.

Blockquote:

gnutls_malloc

[gnutls_005fmalloc](#)

Function: `void *` `gnutls_malloc` (`size_t` s)

`gnutls_malloc` will allocate 's' bytes data, and return a pointer to memory. This function is supposed to be used by callbacks.

Blockquote:

This function will allocate 's' bytes data, and return a pointer to memory. This function is supposed to be used by callbacks.

<p>The allocation function used is the one set by <code>gnutls_global_set_mem_functions()</code>.</p></blockquote></div>

<h4 class="subheading">gnutls_openpgp_send_cert</h4>

`<blockquote><p><code>msg</code>`: is a message to be put in the encoded header

`<p><code>data</code>`: contains the raw data

`<p><code>result</code>`: will hold the newly allocated encoded data

`<p>`This function will convert the given data to printable data, using the base64 encoding. This is the encoding used in PEM messages. This function will allocate the required memory to hold the encoded data.

`<p>`You should use `gnutls_free()` to free the returned data.

Returns: On success, `GNUTLS_E_SUCCESS` (0) is returned, otherwise an error code is returned.

gnutls_pem_base64_encode

Function: int `gnutls_pem_base64_encode` (`const char * msg, const gnutls_datum_t * data, char * result, size_t * result_size`)
`index-gnutls_005fpem_005fbase64_005fencode-200`

`msg`: is a message to be put in the header

`data`: contain the raw data

`result`: the place where base64 data will be copied

`result_size`: holds the size of the result

This function will convert the given data to printable data, using the base64 encoding. This is the encoding used in PEM messages.

The output string will be null terminated, although the size will not include the terminating null.

Returns: On success `GNUTLS_E_SUCCESS` (0) is returned, `GNUTLS_E_SHORT_MEMORY_BUFFER` is returned if the buffer given is not long enough, or 0 on success.

gnutls_perror

Function: void `gnutls_perror` (`int error`)
`index-gnutls_005fperror-201`

`error`: is a GnuTLS error code, a negative value

This function is like `perror()`. The only difference is that it accepts an error number returned by a gnutls function.

gnutls_pk_algorithm_get_name

<div class="defun">

<h4 class="subheading">gnutls_prf_raw</h4>

<p>

<div class="defun">

— Function: int gnutls_prf_raw (<var>gnutls_session_t session, size_t label_size, const char * label, size_t seed_size, const char * seed, size_t outsize, char * out</var>)<var></var>

<blockquote><p><var>session</var>: is a <code>gnutls_session_t</code> structure.

<p><var>label_size</var>: length of the <code>label</code> variable.

<p><var>label</var>: label used in PRF computation, typically a short string.

<p><var>seed_size</var>: length of the <code>seed</code> variable.

<p><var>seed</var>: optional extra data to seed the PRF with.

<p><var>outsize</var>: size of pre-allocated output buffer to hold the output.

<p><var>out</var>: pre-allocate buffer to hold the generated data.

<p>Apply the TLS Pseudo-Random-Function (PRF) using the master secret on some data.

<p>The <code>label</code> variable usually contain a string denoting the purpose for the generated data. The <code>seed</code> usually contain data such as the client and server random, perhaps together with some additional data that is added to guarantee uniqueness of the output for a particular purpose.

<p>Because the output is not guaranteed to be unique for a particular session unless <code>seed</code> include the client random and server random

fields (the PRF would output the same data on another connection resumed from the first one), it is not recommended to use this function directly. The `gnutls_prf()` function seed the PRF with the client and server random fields directly, and is recommended if you want to generate pseudo random data unique for each session.

Returns: `GNUTLS_E_SUCCESS` on success, or an error code.

gnutls_prf

[gnutls_005fprf](#)

Function:

`int gnutls_prf(gnutls_session_t session, size_t label_size, const char * label, int server_random_first, size_t extra_size, const char * extra, size_t outsize, char * out)`

`session`: is a `gnutls_session_t` structure.

`label_size`: length of the `label` variable.

`label`: label used in PRF computation, typically a short string.

`server_random_first`: non-0 if server random field should be first in seed

`extra_size`: length of the `extra` variable.

`extra`: optional extra data to seed the PRF with.

`outsize`: size of pre-allocated output buffer to hold the output.

`out`: pre-allocate buffer to hold the generated data.

Apply the TLS Pseudo-Random-Function (PRF) using the master secret on some data, seeded with the client and server random fields.

The `label` variable usually contain a string denoting the purpose for the generated data. The `server_random_first` indicate whether the client random field or the server random field should be first in the seed. Non-0 indicate that the server random field is first, 0 that the client random field is first.

The `extra` variable can be used to add more data to the seed, after the random variables. It can be used to tie make sure the generated output is strongly connected to some additional data (e.g., a string used in user authentication).

The output is placed in `*OUT`, which must be pre-allocated.

Returns: `GNUTLS_E_SUCCESS` on success, or an error code.

gnutls_priority_deinit

[gnutls_005fpriority_005fdeinit](#)

Function:

void `gnutls_priority_deinit` (`gnutls_priority_t` priority_cache) `index-gnutls_005fpriority_005fdeinit-208`

`priority_cache`: is a `gnutls_priority_t` structure.

Deinitializes the priority cache.

gnutls_priority_init

[gnutls_005fpriority_005finit](#)

Function:

int `gnutls_priority_init` (`gnutls_priority_t` * priority_cache, const char * priorities, const char ** err_pos) `index-gnutls_005fpriority_005finit-209`

`priority_cache`: is a `gnutls_priority_t` structure.

`priorities`: is a string describing priorities

`err_pos`: In case of an error this will have the position in the string the error occurred

Sets priorities for the ciphers, key exchange methods, macs and compression methods. This is to avoid using the `gnutls_*_priority()` functions.

The `priorities` option allows you to specify a semi-colon separated list of the cipher priorities to enable.

Unless the first keyword is "NONE" the defaults (in preference order) are for TLS protocols TLS1.1, TLS1.0, SSL3.0; for compression NULL; for certificate types X.509, OpenPGP.

For key exchange algorithms when in NORMAL or SECURE levels the perfect forward secrecy algorithms take precedence of the other protocols. In all cases all the supported key exchange algorithms are enabled (except for the RSA-EXPORT which is only enabled in EXPORT level).

Note that although one can select very long key sizes (such as 256 bits) for symmetric algorithms, to actually increase security the public key

algorithms have to use longer key sizes as well.

<p>For all the current available algorithms and protocols use "gnutls-cli -l" to get a listing.

<p>Common keywords: Some keywords are defined to provide quick access to common preferences.

<p>"PERFORMANCE" means all the "secure" ciphersuites are enabled, limited to 128 bit ciphers and sorted by terms of speed performance.

<p>"NORMAL" means all "secure" ciphersuites. The 256-bit ciphers are included as a fallback only. The ciphers are sorted by security margin.

<p>"SECURE128" means all "secure" ciphersuites with ciphers up to 128 bits, sorted by security margin.

<p>"SECURE256" means all "secure" ciphersuites including the 256 bit ciphers, sorted by security margin.

<p>"EXPORT" means all ciphersuites are enabled, including the low-security 40 bit ciphers.

<p>"NONE" means nothing is enabled. This disables even protocols and compression methods.

<p>Special keywords: "!" or "-" appended with an algorithm will remove this algorithm.

<p>"+" appended with an algorithm will add this algorithm.

<p>"%COMPAT" will enable compatibility features for a server.

<p>"%SSL3_RECORD_VERSION" will use SSL3.0 record version in client hello.

<p>"%VERIFY_ALLOW_SIGN_RSA_MD5" will allow RSA-MD5 signatures in certificate chains.

<p>"%VERIFY_ALLOW_X509_V1_CA_CRT" will allow V1 CAs in chains.

<p>Namespace concern: To avoid collisions in order to specify a compression algorithm in this string you have to prefix it with "COMP-", protocol versions with "VERS-" and certificate types with "CTYPE-". All other algorithms don't need a prefix.

<p>Examples: "NORMAL:!AES-128-CBC" means normal ciphers except for AES-128.

<p>"EXPORT:!VERS-TLS1.0:+COMP-DEFLATE" means that export ciphers are enabled, TLS 1.0 is disabled, and libz compression enabled.

<p>"NONE:+VERS-TLS1.0:+AES-128-CBC:+RSA:+SHA1:+COMP-NULL", "NORMAL", "%COMPAT".

<p>Returns: On syntax error <code>GNUTLS_E_INVALID_REQUEST</code> is returned, <code>GNUTLS_E_SUCCESS</code> on success, or an error code.

</p></blockquote></div>

<p> <div class="defun"> — Function: int gnutls_priority_set_direct (<var>gnutls_session_t session, const char * priorities, const char ** err_pos</var>)<var></var>

gnutls_psk_netconf_derive_key

`gnutls_psk_netconf_derive_key`

Function:

`int gnutls_psk_netconf_derive_key` (`const char * password, const char * psk_identity, const char * psk_identity_hint, gnutls_datum_t * output_key`)

`password`: zero terminated string containing password.

`psk_identity`: zero terminated string with PSK identity.

`psk_identity_hint`: zero terminated string with PSK identity hint.

`output_key`: output variable, contains newly allocated *data pointer.

This function will derive a PSK key from a password, for use with the Netconf protocol.

Returns: `GNUTLS_E_SUCCESS` on success, or an error code.

Since: 2.4.0

gnutls_psk_server_get_username

`gnutls_psk_server_get_username`

Function:

`const char * gnutls_psk_server_get_username` (`gnutls_session_t session`)

This should only be called in case of PSK authentication and in case of a server.

Returns: the username of the peer, or `NULL` in case of an error.

gnutls_psk_set_client_credentials_function

<p>

<div class="defun">

<blockquote><p><var>session</var>: is a `gnutls_session_t` structure.

<p>This function checks if there are any data to receive in the gnutls buffers.

<p>Notice that you may also use `select()` to check for data in a TCP connection, instead of this function. GnuTLS leaves some data in the tcp buffer in order for select to work.

<p>Returns: the size of that data or 0.

</p></blockquote></div>

gnutls_record_disable_padding

<p>

<div class="defun">

— Function: void gnutls_record_disable_padding (<var>gnutls_session_t session</var>)<var></var>

<blockquote><p><var>session</var>: is a <code>gnutls_session_t</code> structure.

<p>Used to disabled padding in TLS 1.0 and above. Normally you do not need to use this function, but there are buggy clients that complain if a server pads the encrypted data. This of course will disable protection against statistical attacks on the data.

<p>Normally only servers that require maximum compatibility with everything out there, need to call this function.

</p></blockquote></div>

<h4 class="subheading">gnutls_record_get_direction</h4>

<p>

<div class="defun">

— Function: int gnutls_record_get_direction (<var>gnutls_session_t session</var>)<var></var>

<blockquote><p><var>session</var>: is a <code>gnutls_session_t</code> structure.

<p>This function provides information about the internals of the record protocol and is only useful if a prior gnutls function call (e.g. <code>gnutls_handshake()</code>) was interrupted for some reason, that is, if a function returned <code>GNUTLS_E_INTERRUPTED</code> or <code>GNUTLS_E_AGAIN</code>. In such a case, you might want to call <code>select()</code> or <code>poll()</code> before calling the interrupted gnutls function again. To tell you whether a file descriptor should be selected for either reading or writing, <code>gnutls_record_get_direction()</code> returns 0 if the interrupted function was trying to read data, and 1 if it was trying to write data.

<p>Returns: 0 if trying to read data, 1 if trying to write data.
</p></blockquote></div>

<h4 class="subheading">gnutls_record_get_max_size</h4>

<p>

<div class="defun">

— Function: size_t gnutls_record_get_max_size (<var>gnutls_session_t session</var>)<var></var>

<blockquote><p><var>session</var>: is a <code>gnutls_session_t</code> structure.

<p>Get the record size. The maximum record size is negotiated by the client after the first handshake message.

<p>Returns: The maximum record packet size in this connection.</p></blockquote></div>

<p> <div class="defun"> — Function: ssize_t gnutls_record_recv (<var>gnutls_session_t session, void * data, size_t sizeofdata</var><var></var>
<blockquote><p><var>session</var>: is a <code>gnutls_session_t</code> structure. <p><var>data</var>: the buffer that the data will be read into <p><var>sizeofdata</var>: the number of requested bytes <p>This function has the similar semantics with <code>recv()</code>. The only difference is that it accepts a GnuTLS session, and uses different error codes. <p>In the special case that a server requests a renegotiation, the client may receive an error code of <code>GNUTLS_E_REHANDSHAKE</code>. This message may be simply ignored, replied with an alert <code>GNUTLS_A_NO_RENEGOTIATION</code>, or replied with a new handshake, depending on the client's will. <p>If <code>EINTR</code> is returned by the internal push function (the default is <code>recv()</code>) then <code>GNUTLS_E_INTERRUPTED</code> will be returned. If <code>GNUTLS_E_INTERRUPTED</code> or <code>GNUTLS_E_AGAIN</code> is returned, you must call this function again to get the data. See also <code>gnutls_record_get_direction()</code>. <p>A server may also receive <code>GNUTLS_E_REHANDSHAKE</code> when a client has initiated a handshake. In that case the server can only initiate a handshake or terminate the connection. <p>Returns: the number of bytes received and zero on EOF. A negative error code is returned in case of an error. The number of bytes received might be less than <code>sizeofdata</code>. </p></blockquote></div> <p> --- Open Source Used In USC GAN R2.10 Application Software R2.10.34.9 461

<div class="defun">

— Function: ssize_t **gnutls_record_send** (<var>gnutls_session_t session, const void * data, size_t sizeofdata</var><var></var>
<blockquote><p><var>session</var>: is a <code>gnutls_session_t</code> structure.

<p><var>data</var>: contains the data to send

<p><var>sizeofdata</var>: is the length of the data

<p>This function has the similar semantics with <code>send()</code>. The only difference is that it accepts a GnuTLS session, and uses different error codes.

<p>Note that if the send buffer is full, <code>send()</code> will block this function. See the <code>send()</code> documentation for full information. You can replace the default push function by using <code>gnutls_transport_set_ptr2()</code> with a call to <code>send()</code> with a MSG_DONTWAIT flag if blocking is a problem.

<p>If the EINTR is returned by the internal push function (the default is <code>send()</code> } then <code>GNUTLS_E_INTERRUPTED</code> will be returned. If <code>GNUTLS_E_INTERRUPTED</code> or <code>GNUTLS_E_AGAIN</code> is returned, you must call this function again, with the same parameters; alternatively you could provide a <code>NULL</code> pointer for data, and 0 for size. cf. <code>gnutls_record_get_direction()</code>.

<p>Returns: the number of bytes sent, or a negative error code. The number of bytes sent might be less than <code>sizeofdata</code>. The maximum number of bytes this function can send in a single call depends on the negotiated maximum record size.

</p></blockquote></div>

gnutls_record_set_max_size

<p>

<div class="defun">

— Function: ssize_t **gnutls_record_set_max_size** (<var>gnutls_session_t session, size_t size</var><var></var>
<blockquote><p><var>session</var>: is a <code>gnutls_session_t</code> structure.

<p><var>size</var>: is the new size

<p>This function sets the maximum record packet size in this connection. This property can only be set to clients. The server may choose not to accept the requested size.

<p>Acceptable values are 512(=2⁹), 1024(=2¹⁰), 2048(=2¹¹) and

4096(=2¹²). The requested record size does get in effect immediately only while sending data. The receive part will take effect after a successful handshake.

<p>This function uses a TLS extension called 'max record size'. Not all TLS implementations use or even understand this extension.

<p>Returns: On success, <code>GNUTLS_E_SUCCESS</code> (zero) is returned, otherwise an error code is returned.

</p></blockquote></div>

<h4 class="subheading">gnutls_rehandshake</h4>

<p>

<p><var>q</var>: will hold the second prime (q)

<p><var>u</var>: will hold the coefficient

<p><var>bits</var>: if non null will hold the prime's number of bits

<p>This function will export the RSA parameters found in the given structure. The new parameters will be allocated using <code>gnutls_malloc()</code> and will be stored in the appropriate datum.

<p>Returns: <code>GNUTLS_E_SUCCESS</code> on success, or an negative error code.</p></blockquote></div>

<h4 class="subheading">gnutls_rsa_params_generate2</h4>

<p>

<div class="defun">

— Function: int gnutls_rsa_params_generate2 (<var>gnutls_rsa_params_t params, unsigned int bits</var><var></var>

<blockquote><p><var>params</var>: The structure where the parameters will be stored

<p><var>bits</var>: is the prime's number of bits

<p>This function will generate new temporary RSA parameters for use in RSA-EXPORT ciphersuites. This function is normally slow.

<p>Note that if the parameters are to be used in export cipher suites the bits value should be 512 or less.

Also note that the generation of new RSA parameters is only useful to servers. Clients use the parameters sent by the server, thus it's no use calling this in client side.

<p>Returns: <code>GNUTLS_E_SUCCESS</code> on success, or an negative error code.</p></blockquote></div>

<h4 class="subheading">gnutls_rsa_params_import_pkcs1</h4>

<p>

<div class="defun">

— Function: int gnutls_rsa_params_import_pkcs1 (<var>gnutls_rsa_params_t params, const

`gnutls_datum_t * pkcs1_params, gnutls_x509_crt_fmt_t format` (index-gnutls_005frsa_005fparams_005fimport_005fpkcs1-247)

`params`: A structure where the parameters will be copied to

`pkcs1_params`: should contain a PKCS1 RSAPublicKey structure PEM or DER encoded

`format`: the format of params. PEM or DER.

This function will extract the RSAPublicKey found in a PKCS1 formatted structure.

If the structure is PEM encoded, it should have a header of "BEGIN RSA PRIVATE KEY".

Returns: `GNUTLS_E_SUCCESS` on success, or a negative error code.

gnutls_rsa_params_import_raw

(index-gnutls_005frsa_005fparams_005fimport_005fraw)

`—` Function: `int gnutls_rsa_params_import_raw` (`gnutls_rsa_params_t rsa_params, const gnutls_datum_t * m, const gnutls_datum_t * e, const gnutls_datum_t * d, const gnutls_datum_t * p, const gnutls_datum_t * q, const gnutls_datum_t * u` (index-gnutls_005frsa_005fparams_005fimport_005fraw-248))

`rsa_params`: Is a structure will hold the parameters

`m`: holds the modulus

`e`: holds the public exponent

`d`: holds the private exponent

`p`: holds the first prime (p)

`q`: holds the second prime (q)

`u`: holds the coefficient

This function will replace the parameters in the given structure. The new parameters should be stored in the appropriate `gnutls_datum`.

Returns: `GNUTLS_E_SUCCESS` on success, or a negative error code.

gnutls_rsa_params_init

<p>

<div class="defun">

— Function: int gnutls_rsa_params_init (<var>gnutls_rsa_params_t * rsa_params</var>)<var></var>

<blockquote><p><var>rsa_params</var>: Is a structure that will hold the parameters

<p>This function will initialize the temporary RSA parameters structure.

<p>Returns: <code>GNUTLS_E_SUCCESS</code> on success, or a negative error code.
</p></blockquote></div>

<h4 class="subheading">gnutls_server_name_get</h4>

<p>

<div class="defun">

— Function: int gnutls_server_name_get (<var>gnutls_session_t session, void * data, size_t * data_length, unsigned int * type, unsigned int indx</var>)<var></var>

<blockquote><p><var>session</var>: is a <code>gnutls_session_t</code> structure.

<p><var>data</var>: will hold the data

<p><var>data_length</var>: will hold the data length. Must hold the maximum size of data.

<p><var>type</var>: will hold the server name indicator type

<p><var>indx</var>: is the index of the server_name

<p>This function will allow you to get the name indication (if any), a client has sent. The name indication may be any of the enumeration gnutls_server_name_type_t.

<p>If <code>type</code> is GNUTLS_NAME_DNS, then this function is to be used by servers that support virtual hosting, and the data will be a null terminated UTF-8 string.

<p>If <code>data</code> has not enough size to hold the server name GNUTLS_E_SHORT_MEMORY_BUFFER is returned, and <code>data_length</code> will hold the required size.

<p><code>index</code> is used to retrieve more than one server names (if sent by the client). The first server name has an index of 0, the second 1 and so on. If no name with the given index exists GNUTLS_E_REQUESTED_DATA_NOT_AVAILABLE is returned.

Returns: On success, `GNUTLS_E_SUCCESS` (zero) is returned, otherwise an error code is returned.

gnutls_server_name_set

Function: `int gnutls_server_name_set` (`gnutls_session_t session`, `gnutls_server_name_type_t type`, `const void * name`, `size_t name_length`)

`session`: is a `gnutls_session_t` structure.

`type`: specifies the indicator type

`name`: is a string that contains the server name.

`name_length`: holds the length of name

This function is to be used by clients that want to inform (via a TLS extension mechanism) the server of the name they connected to. This should be used by clients that connect to servers that do virtual hosting.

The value of `name` depends on the `ind` type. In case of `GNUTLS_NAME_DNS`, an ASCII or UTF-8 null terminated string, without the trailing dot, is expected. IPv4 or IPv6 addresses are not permitted.

Returns: On success, `GNUTLS_E_SUCCESS` (zero) is returned, otherwise an error code is returned.

gnutls_session_enable_compatibility_mode

Function: `void gnutls_session_enable_compatibility_mode` (`gnutls_session_t session`)

`session`: is a `gnutls_session_t` structure.

This function can be used to disable certain (security) features in TLS in order to maintain maximum compatibility with buggy clients. It is equivalent to calling:

`gnutls_record_disable_padding()`

Normally only servers that require maximum compatibility with everything out there, need to call this function.

gnutls_session_get_client_random

[gnutls_005fsession_005fget_005fclient_005frandom](#)

Function:

const void * **gnutls_session_get_client_random** (`gnutls_session_t session`)
`session`: is a `gnutls_session_t` structure.

Return a pointer to the 32-byte client random field used in the session. The pointer must not be modified or deallocated.

If a client random value has not yet been established, the output will be garbage; in particular, a `NULL` return value should not be expected.

Returns: pointer to client random data.

gnutls_session_get_data2

[gnutls_005fsession_005fget_005fdata2](#)

Function:

int **gnutls_session_get_data2** (`gnutls_session_t session`, `gnutls_datum_t * data`)
`session`: is a `gnutls_session_t` structure.

`data`: is a pointer to a datum that will hold the session.

Returns all session parameters, in order to support resuming. The client should call this, and keep the returned session, if he wants to resume that current version later by calling `gnutls_session_set_data()`. This function must be called after a successful handshake. The returned datum must be freed with `gnutls_free()`.

Resuming sessions is really useful and speeds up connections after a successful one.

Returns: On success, `GNUTLS_E_SUCCESS` (0) is returned, otherwise an error code is returned.

gnutls_session_get_data

[gnutls_005fsession_005fget_005fdata](#)

Function: int `gnutls_session_get_data` (`gnutls_session_t session, void * session_data, size_t`

`session_data_size`)
[index-gnutls_005fsession_005fget_005fdata-255](#)

`session`: is a `gnutls_session_t` structure.

`session_data`: is a pointer to space to hold the session.

`session_data_size`: is the `session_data`'s size, or it will be set by the function.

Returns all session parameters, in order to support resuming. The client should call this, and keep the returned session, if he wants to resume that current version later by calling `gnutls_session_set_data()` This function must be called after a successful handshake.

Resuming sessions is really useful and speedups connections after a succesful one.

Returns: On success, `GNUTLS_E_SUCCESS` (0) is returned, otherwise an error code is returned.

gnutls_session_get_id

[gnutls_005fsession_005fget_005fid](#)

Function: int `gnutls_session_get_id` (`gnutls_session_t session, void * session_id, size_t *`

`session_id_size`)
[index-gnutls_005fsession_005fget_005fid-256](#)

`session`: is a `gnutls_session_t` structure.

`session_id`: is a pointer to space to hold the session id.

`session_id_size`: is the session id's size, or it will be set by the function.

Returns the current session id. This can be used if you want to check if the next session you tried to resume was actually resumed. This is because resumed sessions have the same sessionID with the original session.

Session id is some data set by the server, that identify the current session. In TLS 1.0 and SSL 3.0 session id is always less than 32 bytes.

Returns: On success, `GNUTLS_E_SUCCESS` (0) is returned, otherwise an error code is returned.

gnutls_session_get_master_secret

[gnutls_005fsession_005fget_005fmaster_005fsecret](#)

Function:

`const void * gnutls_session_get_master_secret(gnutls_session_t session)`
`session`: is a `gnutls_session_t` structure.

Return a pointer to the 48-byte master secret in the session. The pointer must not be modified or deallocated.

If a master secret value has not yet been established, the output will be garbage; in particular, a `NULL` return value should not be expected.

Consider using `gnutls_prf()` rather than extracting the master secret and use it to derive further data.

Returns: pointer to master secret data.

gnutls_session_get_ptr

[gnutls_005fsession_005fget_005fptr](#)

Function:

`void * gnutls_session_get_ptr(gnutls_session_t session)`
`session`: is a `gnutls_session_t` structure.

Get user pointer for session. Useful in callbacks. This is the pointer set with `gnutls_session_set_ptr()`.

Returns: the user given pointer from the session structure, or `NULL` if it was never set.

gnutls_session_get_server_random

[gnutls_005fsession_005fget_005fserver_005frandom](#)

Function:

— Function: `const void * gnutls_session_get_server_random` (`gnutls_session_t session`)
Returns: `gnutls_session_t` structure.

Return a pointer to the 32-byte server random field used in the session. The pointer must not be modified or deallocated.

If a server random value has not yet been established, the output will be garbage; in particular, a `NULL` return value should not be expected.

Returns: pointer to server random data.

gnutls_session_is_resumed

`gnutls_session_is_resumed`

`gnutls_session_is_resumed`

— Function: `int gnutls_session_is_resumed` (`gnutls_session_t session`)
Returns: non zero if this session is resumed, or a zero if this is a new session.

Check whether session is resumed or not.

Returns: non zero if this session is resumed, or a zero if this is a new session.

gnutls_session_set_data

`gnutls_session_set_data`

`gnutls_session_set_data`

— Function: `int gnutls_session_set_data` (`gnutls_session_t session`, `const void * session_data`, `size_t session_data_size`)
Returns: `gnutls_session_t` structure.

`session_data`: is a pointer to space to hold the session.

`session_data_size`: is the session's size

Sets all session parameters, in order to resume a previously established session. The session data given must be the one returned by `gnutls_session_get_data`. This function should be called before `gnutls_handshake`.

Keep in mind that session resuming is advisory. The server may

choose not to resume the session, thus a full handshake will be performed.

Returns: On success, `GNUTLS_E_SUCCESS` (0) is returned, otherwise an error code is returned.

gnutls_session_set_finished_function

– Function: void `gnutls_session_set_finished_function` (`gnutls_session_t session`, `gnutls_finished_callback_func func`)

`gnutls_session`: is a `gnutls_session_t` structure.

`func`: a `gnutls_finished_callback_func` callback.

Register a callback function for the session that will be called when a TLS Finished message has been generated. The function is typically used to copy away the TLS finished message for later use as a channel binding or similar purpose.

The callback should follow this prototype:

```
void callback (gnutls_session_t session, const void *finished, size_t len);
```

The `finished` parameter will contain the binary TLS finished message, and `len` will contain its length. For SSLv3 connections, the `len` parameter will be 36 and for TLS connections it will be 12.

It is recommended that the function returns quickly in order to not delay the handshake. Use the function to store a copy of the TLS finished message for later use.

Since: 2.6.0

gnutls_session_set_ptr

– Function: void `gnutls_session_set_ptr` (`gnutls_session_t session`, void * `ptr`)

`session`: is a `gnutls_session_t` structure.

<p><var>ptr</var>: is the user pointer

<p>This function will set (associate) the user given pointer <code>ptr</code> to the session structure. This is pointer can be accessed with <code>gnutls_session_get_ptr()</code>.

gnutls_set_default_export_priority

<p>

<div class="defun">

— Function: int gnutls_set_default_export_priority (<var>gnutls_session_t session</var>)<var></var>
<blockquote><p><var>session</var>: is a <code>gnutls_session_t</code> structure.

<p>Sets some default priority on the ciphers, key exchange methods, macs and compression methods. This function also includes weak algorithms.

<p>This is the same as calling:
gnutls_priority_set_direct (session, "EXPORT", NULL);

<p>This function is kept around for backwards compatibility, but because of its wide use it is still fully supported. If you wish to allow users to provide a string that specify which ciphers to use (which is recommended), you should use <code>gnutls_priority_set_direct()</code> or <code>gnutls_priority_set()</code> instead.

<p>Returns: <code>GNUTLS_E_SUCCESS</code> on success, or an error code.

gnutls_set_default_priority

<p>

<div class="defun">

— Function: int gnutls_set_default_priority (<var>gnutls_session_t session</var>)<var></var>
<blockquote><p><var>session</var>: is a <code>gnutls_session_t</code> structure.

<p>Sets some default priority on the ciphers, key exchange methods, macs and compression methods.

<p>This is the same as calling:
gnutls_priority_set_direct (session, "NORMAL", NULL);

<p>This function is kept around for backwards compatibility, but

because of its wide use it is still fully supported. If you wish to allow users to provide a string that specify which ciphers to use (which is recommended), you should use `gnutls_priority_set_direct()` or `gnutls_priority_set()` instead.

Returns: `GNUTLS_E_SUCCESS` on success, or an error code.

gnutls_sign_algorithm_get_name

[gnutls_005fsign_005falgorithm_005fget_005fname](#)

Function: `const char * gnutls_sign_algorithm_get_name` (`gnutls_sign_algorithm_t sign`)

`sign`: is a sign algorithm

Convert a `gnutls_sign_algorithm_t` value to a string.

Returns: a string that contains the name of the specified sign algorithm, or `NULL`.

gnutls_sign_callback_get

[gnutls_005fsign_005fcallback_005fget](#)

Function: `gnutls_sign_func gnutls_sign_callback_get` (`gnutls_session_t session`, `void ** userdata`)

`session`: is a gnutls session

`userdata`: if non-`NULL`, will be set to abstract callback pointer.

Retrieve the callback function, and its userdata pointer.

Returns: The function pointer set by `gnutls_sign_callback_set()`, or if not set, `NULL`.

gnutls_sign_callback_set

[gnutls_005fsign_005fcallback_005fset](#)

Function: `void gnutls_sign_callback_set` (`gnutls_session_t session`, `gnutls_sign_func sign_func`, `void * userdata`)

`session`, `sign_func`, `userdata`

<blockquote><p><var>session</var>: is a gnutls session

<p><var>sign_func</var>: function pointer to application's sign callback.

<p><var>userdata</var>: void pointer that will be passed to sign callback.

<p>Set the callback function. The function must have this prototype:

```
<p>typedef int (*gnutls_sign_func) (gnutls_session_t session,
void *userdata,
gnutls_certificate_type_t cert_type,
const gnutls_datum_t * cert,
const gnutls_datum_t * hash,
gnutls_datum_t * signature);
```

<p>The <code>userdata</code> parameter is passed to the <code>sign_func</code> verbatim, and can be used to store application-specific data needed in the callback function. See also <code>gnutls_sign_callback_get()</code>.

`cred`: is a `gnutls_srp_server_credentials_t` structure.

`func`: is the callback function

This function can be used to set a callback to retrieve the username and password for client SRP authentication.

The callback's function form is:

```
int (*callback)(gnutls_session_t, char** username, char**password);
```

The `username` and `password` must be allocated using `gnutls_malloc()`. `username` and `password` should be ASCII strings or UTF-8 strings prepared using the "SASLprep" profile of "stringprep".

The callback function will be called once per handshake before the initial hello message is sent.

The callback should not return a negative error code the second time called, since the handshake procedure will be aborted.

The callback function should return 0 on success.
-1 indicates an error.

gnutls_srp_set_client_credentials

[gnutls_005fsrp_005fset_005fclient_005fcredentials](#)

<div class="defun">

<p><var>bits</var>: is the number of bits

<p>This function sets the minimum accepted number of bits, for use in an SRP key exchange. If zero, the default 2048 bits will be used.

<p>In the client side it sets the minimum accepted number of bits. If a server sends a prime with less bits than that <code>GNUTLS_E_RECEIVED_ILLEGAL_PARAMETER</code> will be returned by the handshake.

<p>This function has no effect in server side.

<p>Since: 2.6.0
</p></blockquote></div>

<h4 class="subheading">gnutls_srp_set_server_credentials_file</h4>

<p>

<div class="defun">

— Function: int gnutls_srp_set_server_credentials_file (<var>gnutls_srp_server_credentials_t res, const char * password_file, const char * password_conf_file</var>)<var></var>
<blockquote><p><var>res</var>: is a <code>gnutls_srp_server_credentials_t</code> structure.

<p><var>password_file</var>: is the SRP password file (tpasswd)

<p><var>password_conf_file</var>: is the SRP password conf file (tpasswd.conf)

This function sets the password files, in a `gnutls_srp_server_credentials_t` structure. Those password files hold usernames and verifiers and will be used for SRP authentication.

Returns: On success, `GNUTLS_E_SUCCESS` (0) is returned, or an error code.

gnutls_srp_set_server_credentials_function

[gnutls_005fsrp_005fset_005fserver_005fcredentials_005ffunction](#)

Function: void `gnutls_srp_set_server_credentials_function` (`gnutls_srp_server_credentials_t cred, gnutls_srp_server_credentials_function * func`)

`cred`: is a `gnutls_srp_server_credentials_t` structure.

`func`: is the callback function

This function can be used to set a callback to retrieve the user's SRP credentials.

The callback's function form is:

```
int (*callback)(gnutls_session_t, const char* username,
gnutls_datum_t* salt, gnutls_datum_t *verifier, gnutls_datum_t* g,
gnutls_datum_t* n);
```

`username` contains the actual username.

The `salt`, `verifier`, `generator` and `prime` must be filled in using the `gnutls_malloc()`. For convenience `prime` and `generator` may also be one of the static parameters defined in `extra.h`.

In case the callback returned a negative number then gnutls will assume that the username does not exist.

In order to prevent attackers from guessing valid usernames, if a user does not exist, `g` and `n` values should be filled in using a random user's parameters. In that case the callback must return the special value (1).

The callback function will only be called once per handshake.

The callback function should return 0 on success, while

-1 indicates an error.

gnutls_srp_verifier

<p>

<div class="defun">

— Function: int gnutls_srp_verifier (<var>const char * username, const char * password, const gnutls_datum_t * salt, const gnutls_datum_t * generator, const gnutls_datum_t * prime, gnutls_datum_t * res</var>)<var></var>

<blockquote><p><var>username</var>: is the user's name

<p><var>password</var>: is the user's password

<p><var>salt</var>: should be some randomly generated bytes

<p><var>generator</var>: is the generator of the group

<p><var>prime</var>: is the group's prime

<p><var>res</var>: where the verifier will be stored.

<p>This function will create an SRP verifier, as specified in RFC2945. The <code>prime</code> and <code>generator</code> should be one of the static parameters defined in gnutls/extra.h or may be generated using the libgcrypt functions <code>gcry_prime_generate()</code> and <code>gcry_prime_group_generator()</code>.

<p>The verifier will be allocated with <code>malloc</code> and will be stored in <code>res</code> using binary format.

<p>Returns: On success, <code>GNUTLS_E_SUCCESS</code> (0) is returned, or an error code.

</p></blockquote></div>

<h4 class="subheading">gnutls_strerror_name</h4>

<p>

<div class="defun">

<blockquote><p><var>session</var>: is a <code>gnutls_session_t</code> structure.

<p>Used to get the first argument of the transport function (like PUSH and PULL). This must have been set using <code>gnutls_transport_set_ptr()</code>.

<p>Returns: first argument of the transport function.</p></blockquote></div>

<h4 class="subheading">gnutls_transport_set_errno</h4>

<p>

<div class="defun">

— Function: void gnutls_transport_set_errno (<var>gnutls_session_t session, int err</var>)<var></var>

<blockquote><p><var>session</var>: is a <code>gnutls_session_t</code> structure.

<p><var>err</var>: error value to store in session-specific errno variable.

<p>Store <code>err</code> in the session-specific errno variable. Useful values for <code>err</code> is EAGAIN and EINTR, other values are treated will be treated as real errors in the push/pull function.

<p>This function is useful in replacement push/pull functions set by gnutls_transport_set_push_function and gnutls_transport_set_pullpush_function under Windows, where the replacement push/pull may not have access to the same <code>errno</code> variable that is used by GnuTLS (e.g., the application is linked to msvcrt71.dll and gnutls is linked to msvcrt.dll).

<p>If you don't have the <code>session</code> variable easily accessible from the push/pull function, and don't worry about thread conflicts, you can also use <code>gnutls_transport_set_global_errno()</code>.

</p></blockquote></div>

<h4 class="subheading">gnutls_transport_set_global_errno</h4>

<p>

<div class="defun">

— Function: void gnutls_transport_set_global_errno (<var>int err</var>)<var></var>

<blockquote><p><var>err</var>: error value to store in global errno variable.

<p>Store <code>err</code> in the global errno variable. Useful values for <code>err</code> is EAGAIN and EINTR, other values are treated will be treated as real errors in the push/pull function.

<p>This function is useful in replacement push/pull functions set by

`gnutls_transport_set_push_function` and `gnutls_transport_set_pullpush_function` under Windows, where the replacement push/pull may not have access to the same `errno` variable that is used by GnuTLS (e.g., the application is linked to `msvcr71.dll` and `gnutls` is linked to `msvcrt.dll`).

Whether this function is thread safe or not depends on whether the global variable `errno` is thread safe, some system libraries make it a thread-local variable. When feasible, using the guaranteed thread-safe `gnutls_transport_set_errno()` may be better.

gnutls_transport_set_lowat

[gnutls_transport_set_lowat](#)

Function:

`void gnutls_transport_set_lowat(gnutls_session_t session, int num)`
`session`: is a `gnutls_session_t` structure.

`num`: is the low water value.

Used to set the lowat value in order for select to check if there are pending data to socket buffer. Used only if you have changed the default low water value (default is 1). Normally you will not need that function. This function is only useful if using Berkeley style sockets. Otherwise it must be called and set lowat to zero.

gnutls_transport_set_ptr2

[gnutls_transport_set_ptr2](#)

Function:

`void gnutls_transport_set_ptr2(gnutls_session_t session, gnutls_transport_ptr_t recv_ptr, gnutls_transport_ptr_t send_ptr)`
`session`: is a `gnutls_session_t` structure.

`recv_ptr`: is the value for the pull function

`send_ptr`: is the value for the push function

Used to set the first argument of the transport function (like PUSH and PULL). In Berkeley style sockets this function will set the connection handle. With this function you can use two

different pointers for receiving and sending.

gnutls_transport_set_ptr

– Function: void **gnutls_transport_set_ptr** (`gnutls_session_t session, gnutls_transport_ptr_t ptr`)

`session`: is a `gnutls_session_t` structure.

`ptr`: is the value.

Used to set the first argument of the transport function (like PUSH and PULL). In Berkeley style sockets this function will set the connection handle.

gnutls_transport_set_pull_function

– Function: void **gnutls_transport_set_pull_function** (`gnutls_session_t session, gnutls_pull_func pull_func`)

`session`: gnutls session

`pull_func`: a callback function similar to `read()`

This is the function where you set a function for gnutls to receive data. Normally, if you use Berkeley style sockets, do not need to use this function since the default (`recv(2)`) will probably be ok.

PULL_FUNC is of the form,
`ssize_t (*gnutls_pull_func)(gnutls_transport_ptr_t, void*, size_t);`

gnutls_transport_set_push_function

– Function: void **gnutls_transport_set_push_function** (`gnutls_session_t session, gnutls_push_func push_func`)

`session`: gnutls session

<p><var>push_func</var>: a callback function similar to <code>write()</code>

<p>This is the function where you set a push function for gnutls to use in order to send data. If you are going to use berkeley style sockets, you do not need to use this function since the default (send(2)) will probably be ok. Otherwise you should specify this function for gnutls to be able to send data.

<p>PUSH_FUNC is of the form,
ssize_t (*gnutls_push_func)(gnutls_transport_ptr_t, const void*, size_t);
</p></blockquote></div>

<p><var>name</var>: the name

<p>This function will add the given key friendly name, to the specified, by the index, bag element. The name will be encoded as a 'Friendly name' bag attribute, which is usually used to set a user name to the local private key and the certificate pair.

<p>Returns: On success, <code>GNUTLS_E_SUCCESS</code> is returned, otherwise a negative error value. or a negative value on error.

</p></blockquote></div>

<p>

<div class="defun">

— Function: int gnutls_pkcs12_bag_set_key_id (<var>gnutls_pkcs12_bag_t bag, int indx, const gnutls_datum_t * id</var>)<var></var>

<blockquote><p><var>bag</var>: The bag

<p><var>indx</var>: The bag's element to add the id

<p><var>id</var>: the ID

<p>This function will add the given key ID, to the specified, by the index, bag element. The key ID will be encoded as a 'Local key identifier' bag attribute, which is usually used to distinguish the local private key and the certificate pair.

Returns: On success, `GNUTLS_E_SUCCESS` is returned, otherwise a negative error value. or a negative value on error.

gnutls_pkcs12_deinit

Function: void `gnutls_pkcs12_deinit` (`gnutls_pkcs12_t pkcs12`)
`index-gnutls_005fpkcs12_005fdeinit-313`

`pkcs12`: The structure to be initialized

This function will deinitialize a PKCS12 structure.

gnutls_pkcs12_export

Function: int `gnutls_pkcs12_export` (`gnutls_pkcs12_t pkcs12`, `gnutls_x509_crt_fmt_t format`, void * `output_data`, `size_t * output_data_size`)
`index-gnutls_005fpkcs12_005fexport-314`

`pkcs12`: Holds the pkcs12 structure

`format`: the format of output params. One of PEM or DER.

`output_data`: will contain a structure PEM or DER encoded

`output_data_size`: holds the size of `output_data` (and will be replaced by the actual size of parameters)

This function will export the `pkcs12` structure to DER or PEM format.

If the buffer provided is not long enough to hold the output, then `*output_data_size` will be updated and `GNUTLS_E_SHORT_MEMORY_BUFFER` will be returned.

If the structure is PEM encoded, it will have a header of "BEGIN PKCS12".

Return value: In case of failure a negative value will be returned, and 0 on success.

gnutls_pkcs12_generate_mac

<p>

— Function: int gnutls_x509_crl_get_issuer_dn_by_oid (<var>gnutls_x509_crl_t crl, const char *
oid, int indx, unsigned int raw_flag, void * buf, size_t * sizeof_buf</var>)<var><a name="index-
gnutls_005fx509_005fcr1_005fget_005fissuer_005fdn_005fby_005foid-345"></var>

<blockquote><p><var>crl</var>: should contain a gnutls_x509_crl_t structure

<p><var>oid</var>: holds an Object Identified in null terminated string

<p><var>indx</var>: In case multiple same OIDs exist in the RDN, this specifies which to send. Use zero to get
the first one.

<p><var>raw_flag</var>: If non zero returns the raw DER data of the DN part.

<p><var>buf</var>: a pointer to a structure to hold the peer's name (may be null)

<p><var>sizeof_buf</var>: initially holds the size of <code>buf</code>

<p>This function will extract the part of the name of the CRL issuer
specified by the given OID. The output will be encoded as described
in RFC2253. The output string will be ASCII or UTF-8 encoded,
depending on the certificate data.

<p>Some helper macros with popular OIDs can be found in gnutls/x509.h
If raw flag is zero, this function will only return known OIDs as
text. Other OIDs will be DER encoded, as described in RFC2253 – in
hex format with a '#' prefix. You can check about known OIDs
using <code>gnutls_x509_dn_oid_known</code>.

<p>If buf is null then only the size will be filled.

Returns: `GNUTLS_E_SHORT_MEMORY_BUFFER` if the provided buffer is not long enough, and in that case the `sizeof_buf` will be updated with the required size, and 0 on success.

gnutls_x509_crl_get_issuer_dn

[gnutls_005fx509_005fcrl_005fget_005fissuer_005fdn](#)

Function:

int **gnutls_x509_crl_get_issuer_dn** (const gnutls_x509_crl_t crl, char * buf, size_t * sizeof_buf)

`crl`: should contain a `gnutls_x509_crl_t` structure

`buf`: a pointer to a structure to hold the peer's name (may be null)

`sizeof_buf`: initially holds the size of `buf`

This function will copy the name of the CRL issuer in the provided buffer. The name will be in the form "C=xxxx,O=yyyy,CN=zzzz" as described in RFC2253. The output string will be ASCII or UTF-8 encoded, depending on the certificate data.

If `buf` is `NULL` then only the size will be filled.

Returns: `GNUTLS_E_SHORT_MEMORY_BUFFER` if the provided buffer is not long enough, and in that case the `sizeof_buf` will be updated with the required size, and 0 on success.

gnutls_x509_crl_get_next_update

[gnutls_005fx509_005fcrl_005fget_005fnext_005fupdate](#)

Function:

time_t **gnutls_x509_crl_get_next_update** (gnutls_x509_crl_t crl)

`crl`: should contain a `gnutls_x509_crl_t` structure

This function will return the time the next CRL will be issued. This field is optional in a CRL so it might be normal to get an error instead.

Returns: when the next CRL will be issued, or (time_t)-1 on error.

</p></blockquote></div>

<p><var>sizeof_oid</var>: initially holds the size of <code>oid</code>

<p>This function will extract the requested OID of the name of the Certificate request subject, specified by the given index.

<p>If oid is null then only the size will be filled.

<p>Returns: GNUTLS_E_SHORT_MEMORY_BUFFER if the provided buffer is not long enough, and in that case the *sizeof_oid will be updated with

the required size. On success 0 is returned.

gnutls_x509_crq_get_dn

– Function: int **gnutls_x509_crq_get_dn** (`gnutls_x509_crq_t crq, char * buf, size_t * sizeof_buf`)
`crq`: should contain a `gnutls_x509_crq_t` structure

`buf`: a pointer to a structure to hold the name (may be null)

`sizeof_buf`: initially holds the size of `buf`

This function will copy the name of the Certificate request subject in the provided buffer. The name will be in the form "C=xxxx,O=yyyy,CN=zzzz" as described in RFC2253. The output string will be ASCII or UTF-8 encoded, depending on the certificate data.

If `buf` is null then only the size will be filled.

Returns: `GNUTLS_E_SHORT_MEMORY_BUFFER` if the provided buffer is not long enough, and in that case the `*sizeof_buf` will be updated with the required size. On success 0 is returned.

gnutls_x509_crq_get_extension_by_oid

– Function: int **gnutls_x509_crq_get_extension_by_oid** (`gnutls_x509_crq_t cert, const char * oid, int indx, void * buf, size_t * sizeof_buf, unsigned int * critical`)
`cert`: should contain a `gnutls_x509_crq_t` structure

`oid`: holds an Object Identified in null terminated string

`indx`: In case multiple same OIDs exist in the extensions, this specifies which to send. Use zero to get the first one.

`buf`: a pointer to a structure to hold the name (may be null)

`sizeof_buf`: initially holds the size of `buf`

`critical`: will be non zero if the extension is marked as critical

This function will return the extension specified by the OID in the certificate. The extensions will be returned as binary data DER encoded, in the provided buffer.

Returns: On success, `GNUTLS_E_SUCCESS` is returned, otherwise a negative value in case of an error. If the certificate does not contain the specified extension `GNUTLS_E_REQUESTED_DATA_NOT_AVAILABLE` will be returned.

Since: 2.8.0

gnutls_x509_crq_get_extension_data

`gnutls_x509_crq_get_extension_data`

`gnutls_x509_crq_get_extension_data`

Function: `int gnutls_x509_crq_get_extension_data(gnutls_x509_crq_t cert, int indx, void * data, size_t * sizeof_data)` (`gnutls_x509_crq_t cert`, `int indx`, `void * data`, `size_t * sizeof_data`)
`index-gnutls_x509_crq_get_extension_data-377`
`cert`: should contain a `gnutls_x509_crq_t` structure

`indx`: Specifies which extension OID to send. Use zero to get the first one.

`data`: a pointer to a structure to hold the data (may be null)

`sizeof_data`: initially holds the size of `oid`

This function will return the requested extension data in the certificate. The extension data will be stored as a string in the provided buffer.

Use `gnutls_x509_crq_get_extension_info()` to extract the OID and critical flag. Use `gnutls_x509_crq_get_extension_by_oid()` instead, if you want to get data indexed by the extension OID rather than sequence.

Returns: On success, `GNUTLS_E_SUCCESS` is returned, otherwise a negative value in case of an error. If your have reached the last extension available `GNUTLS_E_REQUESTED_DATA_NOT_AVAILABLE` will be returned.

Since: 2.8.0

<p><var>key_usage</var>: where the key usage bits will be stored

<p><var>critical</var>: will be non zero if the extension is marked as critical

<p>This function will return certificate's key usage, by reading the keyUsage X.509 extension (2.5.29.15). The key usage value will

<p>ORed values of the: <code>GNUTLS_KEY_DIGITAL_SIGNATURE</code>,
<code>GNUTLS_KEY_NON_REPUDIATION</code>,
<code>GNUTLS_KEY_KEY_ENCIPHERMENT</code>,
<code>GNUTLS_KEY_DATA_ENCIPHERMENT</code>,</p>

`GNUTLS_KEY_KEY_AGREEMENT`,
`GNUTLS_KEY_KEY_CERT_SIGN`, `GNUTLS_KEY_CRL_SIGN`,
`GNUTLS_KEY_ENCIPHER_ONLY`, `GNUTLS_KEY_DECIPHER_ONLY`.

Returns: the certificate key usage, or a negative value in case of parsing error. If the certificate does not contain the keyUsage extension `GNUTLS_E_REQUESTED_DATA_NOT_AVAILABLE` will be returned.

Since: 2.8.0

gnutls_x509_crq_get_pk_algorithm

[gnutls_x509_crq_get_pk_algorithm](#)

`defun`

Function: int `gnutls_x509_crq_get_pk_algorithm` (`gnutls_x509_crq_t crq`, unsigned int * bits) [index-gnutls_x509_crq_get_pk_algorithm-383](#)
`crq`: should contain a `gnutls_x509_crq_t` structure

`bits`: if bits is non null it will hold the size of the parameters' in bits

This function will return the public key algorithm of a PKCS #10 certificate request.

If bits is non null, it should have enough size to hold the parameters size in bits. For RSA the bits returned is the modulus. For DSA the bits returned are of the public exponent.

Returns: a member of the `gnutls_pk_algorithm_t` enumeration on success, or a negative value on error.

gnutls_x509_crq_get_subject_alt_name

[gnutls_x509_crq_get_subject_alt_name](#)

`defun`

Function: int `gnutls_x509_crq_get_subject_alt_name` (`gnutls_x509_crq_t cert`, unsigned int seq, void * ret, size_t * ret_size, unsigned int * ret_type, unsigned int * critical) [index-gnutls_x509_crq_get_subject_alt_name-384](#)
`cert`: should contain a `gnutls_x509_crq_t` structure

`seq`: specifies the sequence number of the alt name, 0 for the first one, 1 for the second etc.

<p><var>ret</var>: is the place where the alternative name will be copied to

<p><var>ret_size</var>: holds the size of ret.

<p><var>ret_type</var>: holds the <code>gnutls_x509_subject_alt_name_t</code> name type

<p><var>critical</var>: will be non zero if the extension is marked as critical
(may be null)

<p>This function will return the alternative names, contained in the given certificate. It is the same as <code>gnutls_x509_crq_get_subject_alt_name()</code> except for the fact that it will return the type of the alternative name in <code>ret_type</code> even if the function fails for some reason (i.e. the buffer provided is not enough).

<p>Returns: the alternative subject name type on success, one of the enumerated <code>gnutls_x509_subject_alt_name_t</code>. It will return <code>GNUTLS_E_SHORT_MEMORY_BUFFER</code> if <code>ret_size</code> is not large enough to hold the value. In that case <code>ret_size</code> will be updated with the required size. If the certificate request does not have an Alternative name with the specified sequence number then <code>GNUTLS_E_REQUESTED_DATA_NOT_AVAILABLE</code> is returned.

<p>Since: 2.8.0
</p></blockquote></div>

gnutls_x509_crq_get_subject_alt_othername_oid

<p>

<div class="defun">

— Function: int gnutls_x509_crq_get_subject_alt_othername_oid (<var>gnutls_x509_crq_t cert, unsigned int seq, void * ret, size_t * ret_size</var>)<var></var>
<blockquote><p><var>cert</var>: should contain a <code>gnutls_x509_crq_t</code> structure

<p><var>seq</var>: specifies the sequence number of the alt name (0 for the first one, 1 for the second etc.)

<p><var>ret</var>: is the place where the otherName OID will be copied to

<p><var>ret_size</var>: holds the size of ret.

<p>This function will extract the type OID of an otherName Subject Alternative Name, contained in the given certificate, and return the type as an enumerated element.

<p>This function is only useful if

`gnutls_x509_crq_get_subject_alt_name()` returned
`GNUTLS_SAN_OTHERNAME`.

Returns: the alternative subject name type on success, one of the enumerated `gnutls_x509_subject_alt_name_t`. For supported OIDs, it will return one of the virtual (`GNUTLS_SAN_OTHERNAME_*`) types, e.g. `GNUTLS_SAN_OTHERNAME_XMPP`, and `GNUTLS_SAN_OTHERNAME` for unknown OIDs. It will return `GNUTLS_E_SHORT_MEMORY_BUFFER` if `ret_size` is not large enough to hold the value. In that case `ret_size` will be updated with the required size. If the certificate does not have an Alternative name with the specified sequence number and with the `otherName` type then `GNUTLS_E_REQUESTED_DATA_NOT_AVAILABLE` is returned.

Since: 2.8.0

gnutls_x509_crq_get_version

[gnutls_005fx509_005fcrq_005fget_005fversion](#)

`defun`

`crq`: should contain a `gnutls_x509_crq_t` structure

This function will return the version of the specified Certificate request.

Returns: version of certificate request, or a negative value on error.

gnutls_x509_crq_import

[gnutls_005fx509_005fcrq_005fimport](#)

`defun`

– Function: int `gnutls_x509_crq_import` (`gnutls_x509_crq_t crq`, `const gnutls_datum_t * data`, `gnutls_x509 crt_fmt_t format`)
[index-gnutls_005fx509_005fcrq_005fimport-387](#)
`crq`: The structure to store the parsed certificate request.

`data`: The DER or PEM encoded certificate.

`format`: One of DER or PEM

This function will convert the given DER or PEM encoded Certificate

to the native `gnutls_x509_crq_t` format. The output will be stored in `cert`.

If the Certificate is PEM encoded it should have a header of "NEW CERTIFICATE REQUEST".

Returns: On success, `GNUTLS_E_SUCCESS` is returned, otherwise a negative error value.

gnutls_x509_crq_init

[gnutls_005fx509_005fcrq_005finit](#)

– Function: int `gnutls_x509_crq_init` (`gnutls_x509_crq_t * crq`)
[index-gnutls_005fx509_005fcrq_005finit-388](#)

`crq`: The structure to be initialized

This function will initialize a PKCS10 certificate request structure.

Returns: On success, `GNUTLS_E_SUCCESS` is returned, otherwise a negative error value.

gnutls_x509_crq_print

[gnutls_005fx509_005fcrq_005fprint](#)

– Function: int `gnutls_x509_crq_print` (`gnutls_x509_crq_t crq`,
`gnutls_certificate_print_formats_t format`, `gnutls_datum_t * out`)
[index-gnutls_005fx509_005fcrq_005fprint-389](#)

`crq`: The structure to be printed

`format`: Indicate the format to use

`out`: Newly allocated datum with zero terminated string.

This function will pretty print a certificate request, suitable for display to a human.

The output `out` needs to be deallocate using `gnutls_free()`.

Returns: On success, `GNUTLS_E_SUCCESS` is returned, otherwise a negative error value.

<p>Use <code>gnutls_x509_cert_get_basic_constraints()</code> if you want to read the pathLenConstraint field too.

<p>Returns: A negative value may be returned in case of parsing error. If the certificate does not contain the basicConstraints extension <code>GNUTLS_E_REQUESTED_DATA_NOT_AVAILABLE</code> will be returned.</p></blockquote></div>

<h4 class="subheading">gnutls_x509_cert_get_crl_dist_points</h4>

<p>

<div class="defun">

— Function: int gnutls_x509_cert_get_crl_dist_points (<var>gnutls_x509_cert_t cert, unsigned int seq, void * ret, size_t * ret_size, unsigned int * reason_flags, unsigned int * critical</var>)<var></var>
<blockquote><p><var>cert</var>: should contain a <code>gnutls_x509_cert_t</code> structure

<p><var>seq</var>: specifies the sequence number of the distribution point (0 for the first one, 1 for the second etc.)

<p><var>ret</var>: is the place where the distribution point will be copied to

<p><var>ret_size</var>: holds the size of ret.

<p><var>reason_flags</var>: Revocation reasons flags.

<p><var>critical</var>: will be non zero if the extension is marked as critical (may be null)

<p>This function will return the CRL distribution points (2.5.29.31), contained in the given certificate.

`reason_flags` should be an ORed sequence of GNUTLS_CRL_REASON_UNUSED, GNUTLS_CRL_REASON_KEY_COMPROMISE, GNUTLS_CRL_REASON_CA_COMPROMISE, GNUTLS_CRL_REASON_AFFILIATION_CHANGED, GNUTLS_CRL_REASON_SUPERSEDED, GNUTLS_CRL_REASON_CESSATION_OF_OPERATION, GNUTLS_CRL_REASON_CERTIFICATE_HOLD, GNUTLS_CRL_REASON_PRIVILEGE_WITHDRAWN, GNUTLS_CRL_REASON_AA_COMPROMISE, or zero for all possible reasons.

This is specified in X509v3 Certificate Extensions. GNUTLS will return the distribution point type, or a negative error code on error.

Returns: `GNUTLS_E_SHORT_MEMORY_BUFFER` and updates `ret_size` if `ret_size` is not enough to hold the distribution point, or the type of the distribution point if everything was ok. The type is one of the enumerated `gnutls_x509_subject_alt_name_t`. If the certificate does not have an Alternative name with the specified sequence number then `GNUTLS_E_REQUESTED_DATA_NOT_AVAILABLE` is returned.

gnutls_x509_cert_get_dn_by_oid

[gnutls_005fx509_005fcrt_005fget_005fdn_005fby_005foid](#)

`defun`

Function: int `gnutls_x509_cert_get_dn_by_oid` (`gnutls_x509_cert_t cert`, `const char * oid`, `int indx`, `unsigned int raw_flag`, `void * buf`, `size_t * sizeof_buf`)

`cert`: should contain a `gnutls_x509_cert_t` structure

`oid`: holds an Object Identified in null terminated string

`indx`: In case multiple same OIDs exist in the RDN, this specifies which to send. Use zero to get the first one.

`raw_flag`: If non zero returns the raw DER data of the DN part.

`buf`: a pointer where the DN part will be copied (may be null).

`sizeof_buf`: initially holds the size of `buf`

This function will extract the part of the name of the Certificate subject specified by the given OID. The output, if the raw flag is not used, will be encoded as described in RFC2253. Thus a string that is

ASCII or UTF-8 encoded, depending on the certificate data.

Some helper macros with popular OIDs can be found in `gnutls/x509.h`. If raw flag is zero, this function will only return known OIDs as text. Other OIDs will be DER encoded, as described in RFC2253 – in hex format with a `\#` prefix. You can check about known OIDs using `gnutls_x509_dn_oid_known()`.

If `buf` is null then only the size will be filled.

Returns: `GNUTLS_E_SHORT_MEMORY_BUFFER` if the provided buffer is not long enough, and in that case the `*sizeof_buf` will be updated with the required size. On success 0 is returned.

`gnutls_x509_cert_get_dn_oid`

— Function: int `gnutls_x509_cert_get_dn_oid` (`gnutls_x509_cert_t cert`, int `indx`, void * `oid`, size_t * `sizeof_oid`)
`index-gnutls_005fx509_005fcrt_005fget_005fdn_005foid-414`

`cert`: should contain a `gnutls_x509_cert_t` structure

`indx`: This specifies which OID to return. Use zero to get the first one.

`oid`: a pointer to a buffer to hold the OID (may be null)

`sizeof_oid`: initially holds the size of `oid`

This function will extract the OIDs of the name of the Certificate subject specified by the given index.

If `oid` is null then only the size will be filled.

Returns: `GNUTLS_E_SHORT_MEMORY_BUFFER` if the provided buffer is not long enough, and in that case the `*sizeof_oid` will be updated with the required size. On success 0 is returned.

`gnutls_x509_cert_get_dn`

<p><var>indx</var>: In case multiple same OIDs exist in the RDN, this specifies which to send. Use zero to get the first one.

<p><var>raw_flag</var>: If non zero returns the raw DER data of the DN part.

<p><var>buf</var>: a pointer to a structure to hold the name (may be null)

<p><var>sizeof_buf</var>: initially holds the size of <code>buf</code>

<p>This function will extract the part of the name of the Certificate issuer specified by the given OID. The output, if the raw flag is not used, will be encoded as described in RFC2253. Thus a string that is ASCII or UTF-8 encoded, depending on the certificate data.

<p>Some helper macros with popular OIDs can be found in gnutls/x509.h
If raw flag is zero, this function will only return known OIDs as text. Other OIDs will be DER encoded, as described in RFC2253 – in hex format with a '#' prefix. You can check about known OIDs using <code>gnutls_x509_dn_oid_known()</code>.

<p>If <code>buf</code> is null then only the size will be filled.

<p>Returns: GNUTLS_E_SHORT_MEMORY_BUFFER if the provided buffer is not long enough, and in that case the *sizeof_buf will be updated with the required size. On success 0 is returned.

</p></blockquote></div>

gnutls_x509_cert_get_issuer_dn_oid

<p>

<div class="defun">

— Function: int gnutls_x509_cert_get_issuer_dn_oid (<var>gnutls_x509_cert_t cert, int indx, void * oid, size_t * sizeof_oid</var>)<var></var>

<blockquote><p><var>cert</var>: should contain a <code>gnutls_x509_cert_t</code> structure

<p><var>indx</var>: This specifies which OID to return. Use zero to get the first one.

<p><var>oid</var>: a pointer to a buffer to hold the OID (may be null)

<p><var>sizeof_oid</var>: initially holds the size of <code>oid</code>

<p>This function will extract the OIDs of the name of the Certificate issuer specified by the given index.

If `oid` is null then only the size will be filled.

Returns: GNUTLS_E_SHORT_MEMORY_BUFFER if the provided buffer is not long enough, and in that case the `*sizeof_oid` will be updated with the required size. On success 0 is returned.

gnutls_x509_cert_get_issuer_dn

[gnutls_005fx509_005fcrt_005fget_005fissuer_005fdn](#)

Function:

int **gnutls_x509_cert_get_issuer_dn** (`gnutls_x509_cert_t cert`, `char * buf`, `size_t * sizeof_buf`)
[index-gnutls_005fx509_005fcrt_005fget_005fissuer_005fdn-424](#)

`cert`: should contain a `gnutls_x509_cert_t` structure

`buf`: a pointer to a structure to hold the name (may be null)

`sizeof_buf`: initially holds the size of `buf`

This function will copy the name of the Certificate issuer in the provided buffer. The name will be in the form "C=xxx,O=yyy,CN=zzz" as described in RFC2253. The output string will be ASCII or UTF-8 encoded, depending on the certificate data.

If `buf` is null then only the size will be filled.

Returns: GNUTLS_E_SHORT_MEMORY_BUFFER if the provided buffer is not long enough, and in that case the `*sizeof_buf` will be updated with the required size. On success 0 is returned.

gnutls_x509_cert_get_issuer

[gnutls_005fx509_005fcrt_005fget_005fissuer](#)

Function:

int **gnutls_x509_cert_get_issuer** (`gnutls_x509_cert_t cert`, `gnutls_x509_dn_t * dn`)
[index-gnutls_005fx509_005fcrt_005fget_005fissuer-425](#)

`cert`: should contain a `gnutls_x509_cert_t` structure

`dn`: output variable with pointer to opaque DN

Return the Certificate's Issuer DN as an opaque data type. You may use `gnutls_x509_dn_get_rdn_ava()` to decode the DN.

Note that `dn` should be treated as constant. Because points

into the `cert` object, you may not deallocate `cert` and continue to access `dn`.

Returns: Returns 0 on success, or an error code.

gnutls_x509_cert_get_key_id

[gnutls_005fx509_005fcrt_005fget_005fkey_005fid](#)

Function: int `gnutls_x509_cert_get_key_id` (`gnutls_x509_cert_t` cert, unsigned int flags,

unsigned char * output_data, size_t * output_data_size) [index-gnutls_005fx509_005fcrt_005fget_005fkey_005fid-426](#)

`cert`: Holds the certificate

`flags`: should be 0 for now

`output_data`: will contain the key ID

`output_data_size`: holds the size of output_data (and will be replaced by the actual size of parameters)

This function will return a unique ID that depends on the public key parameters. This ID can be used in checking whether a certificate corresponds to the given private key.

If the buffer provided is not long enough to hold the output, then `output_data_size` is updated and `GNUTLS_E_SHORT_MEMORY_BUFFER` will be returned. The output will normally be a SHA-1 hash output, which is 20 bytes.

Return value: In case of failure a negative value will be returned, and 0 on success.

gnutls_x509_cert_get_key_purpose_oid

[gnutls_005fx509_005fcrt_005fget_005fkey_005fpurpose_005foid](#)

* oid, size_t * sizeof_oid, unsigned int * critical) [index-gnutls_005fx509_005fcrt_005fget_005fkey_005fpurpose_005foid-427](#)

`cert`: should contain a `gnutls_x509_cert_t` structure

`indx`: This specifies which OID to return. Use zero to get the first one.

<p><var>oid</var>: a pointer to a buffer to hold the OID (may be null)

<p><var>sizeof_oid</var>: initially holds the size of <code>oid</code>

<p><var>critical</var>: output flag to indicate criticality of extension

<p>This function will extract the key purpose OIDs of the Certificate specified by the given index. These are stored in the Extended Key Usage extension (2.5.29.37) See the GNUTLS_KP_* definitions for human readable names.

<p>If <code>oid</code> is null then only the size will be filled.

<p>Returns: <code>GNUTLS_E_SHORT_MEMORY_BUFFER</code> if the provided buffer is

not long enough, and in that case the *sizeof_oid will be updated with the required size. On success 0 is returned.

</p></blockquote></div>

<h4 class="subheading">gnutls_x509_cert_get_key_usage</h4>

<p>

<div class="defun">

— Function: int gnutls_x509_cert_get_key_usage (<var>gnutls_x509_cert_t cert, unsigned int * key_usage, unsigned int * critical</var>)<var></var>

<blockquote><p><var>cert</var>: should contain a <code>gnutls_x509_cert_t</code> structure

<p><var>key_usage</var>: where the key usage bits will be stored

<p><var>critical</var>: will be non zero if the extension is marked as critical

<p>This function will return certificate's key usage, by reading the keyUsage X.509 extension (2.5.29.15). The key usage value will

<p>ORed values of the: <code>GNUTLS_KEY_DIGITAL_SIGNATURE</code>, <code>GNUTLS_KEY_NON_REPUDIATION</code>, <code>GNUTLS_KEY_KEY_ENCIPHERMENT</code>, <code>GNUTLS_KEY_DATA_ENCIPHERMENT</code>, <code>GNUTLS_KEY_KEY_AGREEMENT</code>, <code>GNUTLS_KEY_KEY_CERT_SIGN</code>, <code>GNUTLS_KEY_CRL_SIGN</code>, <code>GNUTLS_KEY_ENCIPHER_ONLY</code>, <code>GNUTLS_KEY_DECIPHER_ONLY</code>.

<p>Returns: the certificate key usage, or a negative value in case of parsing error. If the certificate does not contain the keyUsage extension <code>GNUTLS_E_REQUESTED_DATA_NOT_AVAILABLE</code> will be returned.

</p></blockquote></div>

gnutls_x509_cert_get_pk_algorithm

[gnutls_005fx509_005fcrt_005fget_005fpk_005falgorithm](#)

Function: int `gnutls_x509_cert_get_pk_algorithm` (`gnutls_x509_cert_t` cert, unsigned int * bits)

`gnutls_x509_cert_t` cert: should contain a `gnutls_x509_cert_t` structure

`bits`: if bits is non null it will hold the size of the parameters' in bits

This function will return the public key algorithm of an X.509 certificate.

If bits is non null, it should have enough size to hold the parameters size in bits. For RSA the bits returned is the modulus. For DSA the bits returned are of the public exponent.

Returns: a member of the `gnutls_pk_algorithm_t` enumeration on success, or a negative value on error.

gnutls_x509_cert_get_pk_dsa_raw

[gnutls_005fx509_005fcrt_005fget_005fpk_005fdsa_005fraw](#)

Function: int `gnutls_x509_cert_get_pk_dsa_raw` (`gnutls_x509_cert_t` cert, `gnutls_datum_t` * p, `gnutls_datum_t` * q, `gnutls_datum_t` * g, `gnutls_datum_t` * y)

`cert`: Holds the certificate

`p`: will hold the p

`q`: will hold the q

`g`: will hold the g

`y`: will hold the y

This function will export the DSA public key's parameters found in the given certificate. The new parameters will be allocated using `gnutls_malloc()` and will be stored in the appropriate datum.

Returns: `GNUTLS_E_SUCCESS` on success, otherwise an error.

gnutls_x509_cert_get_pk_rsa_raw

[gnutls_005fx509_005fcrt_005fget_005fpk_005frsa_005fraw](#)

Function: int `gnutls_x509_cert_get_pk_rsa_raw` (`gnutls_x509_cert_t` cert, `gnutls_datum_t` * m,

`gnutls_datum_t` * e) `index-gnutls_005fx509_005fcrt_005fget_005fpk_005frsa_005fraw-431`

`cert`: Holds the certificate

`m`: will hold the modulus

`e`: will hold the public exponent

This function will export the RSA public key's parameters found in the given structure. The new parameters will be allocated using `gnutls_malloc` and will be stored in the appropriate datum.

Returns: `GNUTLS_E_SUCCESS` on success, otherwise an error.

gnutls_x509_cert_get_proxy

[gnutls_005fx509_005fcrt_005fget_005fproxy](#)

Function: int `gnutls_x509_cert_get_proxy` (`gnutls_x509_cert_t` cert, unsigned int * critical, int

* pathlen, char ** policyLanguage, char ** policy, size_t * sizeof_policy) `index-gnutls_005fx509_005fcrt_005fget_005fproxy-432`

`cert`: should contain a `gnutls_x509_cert_t` structure

`critical`: will be non zero if the extension is marked as critical

`pathlen`: pointer to output integer indicating path length (may be NULL), non-negative values indicate a present `pCPathLenConstraint` field and the actual value, -1 indicate that the field is absent.

`policyLanguage`: output variable with OID of policy language

`policy`: output variable with policy data

`sizeof_policy`: output variable size of policy data

This function will get information from a proxy certificate. It reads the ProxyCertInfo X.509 extension (1.3.6.1.5.5.7.1.14).

Returns: On success, `GNUTLS_E_SUCCESS` (zero) is returned,

otherwise an error code is returned.

gnutls_x509_cert_list_import

[gnutls_005fx509_005fcrt_005flist_005fimport](#)

Function:

int **gnutls_x509_cert_list_import** (gnutls_x509_cert_t * certs, unsigned int * cert_max, const gnutls_datum_t * data, gnutls_x509_cert_fmt_t format, unsigned int flags)

certs: The structures to store the parsed certificate. Must not be initialized.

cert_max: Initially must hold the maximum number of certs. It will be updated with the number of certs available.

data: The PEM encoded certificate.

format: One of DER or PEM.

flags: must be zero or an OR'd sequence of `gnutls_certificate_import_flags`.

This function will convert the given PEM encoded certificate list to the native `gnutls_x509_cert_t` format. The output will be stored in `certs`. They will be automatically initialized.

If the Certificate is PEM encoded it should have a header of "X509 CERTIFICATE", or "CERTIFICATE".

Returns: the number of certificates read or a negative error value.

gnutls_x509_cert_list_verify

[gnutls_005fx509_005fcrt_005flist_005fverify](#)

Function:

int **gnutls_x509_cert_list_verify** (const gnutls_x509_cert_t * cert_list, int cert_list_length, const gnutls_x509_cert_t * CA_list, int CA_list_length, const gnutls_x509_crl_t * CRL_list, int CRL_list_length, unsigned int flags, unsigned int * verify)

cert_list: is the certificate list to be verified

cert_list_length: holds the number of certificate in `cert_list`

CA_list: is the CA list which will be used in verification

CA_list_length: holds the number of CA certificate in `CA_list`

CRL_list: holds a list of CRLs.

<p><var>CRL_list_length</var>: the length of CRL list.

<p><var>flags</var>: Flags that may be used to change the verification algorithm. Use OR of the gnutls_certificate_verify_flags enumerations.

<p><var>verify</var>: will hold the certificate verification output.

<p>This function will try to verify the given certificate list and return its status. If no flags are specified (0), this function will use the basicConstraints (2.5.29.19) PKIX extension. This means that only a certificate authority is allowed to sign a certificate.

<p>You must also check the peer's name in order to check if the verified certificate belongs to the actual peer.

<p>The certificate verification output will be put in <code>verify</code> and will be one or more of the gnutls_certificate_status_t enumerated elements bitwise or'd. For a more detailed verification status use <code>gnutls_x509_cert_verify()</code> per list element.

<p>GNUTLS_CERT_INVALID: the certificate chain is not valid.

<p>GNUTLS_CERT_REVOKED: a certificate in the chain has been revoked.

<p>Returns: On success, <code>GNUTLS_E_SUCCESS</code> is returned, otherwise a negative error value and a negative value in case of an error.

</p></blockquote></div>

gnutls_x509_cert_print

<p>

<div class="defun">

— Function: int gnutls_x509_cert_print (<var>gnutls_x509_cert_t cert, gnutls_certificate_print_formats_t format, gnutls_datum_t * out</var>)<var></var>

<blockquote><p><var>cert</var>: The structure to be printed

<p><var>format</var>: Indicate the format to use

<p><var>out</var>: Newly allocated datum with zero terminated string.

<p>This function will pretty print a X.509 certificate, suitable for display to a human.

<p>If the format is <code>GNUTLS_CERT_PRINT_FULL</code> then all fields of the certificate will be output, on multiple lines. The

`GNUTLS_CRT_PRINT_ONELINE` format will generate one line with some selected fields, which is useful for logging purposes.

The output `out` needs to be deallocate using `gnutls_free()`.

Returns: On success, `GNUTLS_E_SUCCESS` is returned, otherwise a negative error value.

gnutls_x509_cert_set_activation_time

[gnutls_x509_cert_set_activation_time](#)

`defun`

Function: int `gnutls_x509_cert_set_activation_time` (`gnutls_x509_cert_t cert, time_t act_time`)
[index-gnutls_x509_cert_set_activation_time-450](#)

`cert`: a certificate of type `gnutls_x509_cert_t`

`act_time`: The actual time

This function will set the time this Certificate was or will be activated.

Returns: On success, `GNUTLS_E_SUCCESS` is returned, otherwise a negative error value.

gnutls_x509_cert_set_authority_key_id

[gnutls_x509_cert_set_authority_key_id](#)

`defun`

Function: int `gnutls_x509_cert_set_authority_key_id` (`gnutls_x509_cert_t cert, const void * id, size_t id_size`)
[index-gnutls_x509_cert_set_authority_key_id-451](#)

`cert`: a certificate of type `gnutls_x509_cert_t`

`id`: The key ID

`id_size`: Holds the size of the serial field.

This function will set the X.509 certificate's authority key ID extension. Only the keyIdentifier field can be set with this function.

Returns: On success, `GNUTLS_E_SUCCESS` is returned, otherwise a negative error value.

<p><var>raw_flag</var>: must be 0, or 1 if the data are DER encoded

<p><var>name</var>: a pointer to the name

<p><var>sizeof_name</var>: holds the size of <code>name</code>

<p>This function will set the part of the name of the Certificate issuer, specified by the given OID. The input string should be ASCII or UTF-8 encoded.

<p>Some helper macros with popular OIDs can be found in gnutls/x509.h With this function you can only set the known OIDs. You can test for known OIDs using <code>gnutls_x509_dn_oid_known</code>. For OIDs that are not known (by gnutls) you should properly DER encode your data, and call this function with <code>raw_flag</code> set.

<p>Normally you do not need to call this function, since the signing operation will copy the signer's name as the issuer of the certificate.

<p>Returns: On success, <code>GNUTLS_E_SUCCESS</code> is returned, otherwise a

negative error value.

gnutls_x509_cert_set_key_purpose_oid

– Function: int **gnutls_x509_cert_set_key_purpose_oid** (`gnutls_x509_cert_t cert, const void * oid, unsigned int critical`)

`cert`: a certificate of type `gnutls_x509_cert_t`

`oid`: a pointer to a null terminated string that holds the OID

`critical`: Whether this extension will be critical or not

This function will set the key purpose OIDs of the Certificate.

These are stored in the Extended Key Usage extension (2.5.29.37)

See the `GNUTLS_KP_*` definitions for human readable names.

Subsequent calls to this function will append OIDs to the OID list.

Returns: On success, `GNUTLS_E_SUCCESS` (zero) is returned, otherwise an error code is returned.

gnutls_x509_cert_set_key_usage

– Function: int **gnutls_x509_cert_set_key_usage** (`gnutls_x509_cert_t cert, unsigned int usage`)

`cert`: a certificate of type `gnutls_x509_cert_t`

`usage`: an ORed sequence of the `GNUTLS_KEY_*` elements.

This function will set the keyUsage certificate extension.

Returns: On success, `GNUTLS_E_SUCCESS` is returned, otherwise a negative error value.

gnutls_x509_cert_set_key

<div class="defun">

— Function: int gnutls_x509_cert_set_key (<var>gnutls_x509_cert_t cert, gnutls_x509_privkey_t key</var>)<var></var>
<blockquote><p><var>cert</var>: a certificate of type <code>gnutls_x509_cert_t</code>

<p><var>key</var>: holds a private key

<p>This function will set the public parameters from the given private key to the certificate. Only RSA keys are currently supported.

<p>Returns: On success, <code>GNUTLS_E_SUCCESS</code> is returned, otherwise a negative error value.

</p></blockquote></div>

<h4 class="subheading">gnutls_x509_cert_set_proxy_dn</h4>

<p>

<div class="defun">

— Function: int gnutls_x509_cert_set_proxy_dn (<var>gnutls_x509_cert_t cert, gnutls_x509_cert_t eecrt, unsigned int raw_flag, const void * name, unsigned int sizeof_name</var>)<var></var>
<blockquote><p><var>cert</var>: a gnutls_x509_cert_t structure with the new proxy cert

<p><var>eecrt</var>: the end entity certificate that will be issuing the proxy

<p><var>raw_flag</var>: must be 0, or 1 if the CN is DER encoded

<p><var>name</var>: a pointer to the CN name, may be NULL (but MUST then be added later)

<p><var>sizeof_name</var>: holds the size of <code>name</code>

<p>This function will set the subject in <code>cert</code> to the end entity's <code>eecrt</code> subject name, and add a single Common Name component <code>name</code> of size <code>sizeof_name</code>. This corresponds to the required proxy certificate naming style. Note that if <code>name</code> is <code>NULL</code>, you MUST set it later by using <code>gnutls_x509_cert_set_dn_by_oid</code> or similar.

<p>Returns: On success, <code>GNUTLS_E_SUCCESS</code> is returned, otherwise a negative error value.

</p></blockquote></div>

<h4 class="subheading">gnutls_x509_cert_set_proxy</h4>

<p>

<div class="defun">

— Function: int **gnutls_x509_cert_set_proxy** (`gnutls_x509_cert_t cert`, int pathLenConstraint, const char * policyLanguage, const char * policy, size_t sizeof_policy)
`gnutls_x509_cert_set_proxy-466`
`cert`: a certificate of type `gnutls_x509_cert_t`

`pathLenConstraint`: non-negative values indicate maximum length of path, and negative values indicate that the pathLenConstraints field should not be present.

`policyLanguage`: OID describing the language of `policy`.

`policy`: opaque byte array with policy language, can be `NULL`

`sizeof_policy`: size of `policy`.

This function will set the proxyCertInfo extension.

Returns: On success, `GNUTLS_E_SUCCESS` is returned, otherwise a negative error value.

gnutls_x509_cert_set_serial

`gnutls_x509_cert_set_serial`

— Function: int **gnutls_x509_cert_set_serial** (`gnutls_x509_cert_t cert`, const void * serial, size_t serial_size)
`gnutls_x509_cert_set_serial-467`
`cert`: a certificate of type `gnutls_x509_cert_t`

`serial`: The serial number

`serial_size`: Holds the size of the serial field.

This function will set the X.509 certificate's serial number. Serial is not always a 32 or 64bit number. Some CAs use large serial numbers, thus it may be wise to handle it as something opaque.

Returns: On success, `GNUTLS_E_SUCCESS` is returned, otherwise a negative error value.

gnutls_x509_cert_set_subject_alt_name

`gnutls_x509_cert_set_subject_alt_name`

— Function: int **gnutls_x509 crt_set_subject_alt_name** (<var>gnutls_x509 crt_t crt, gnutls_x509_subject_alt_name_t type, const void * data, unsigned int data_size, unsigned int flags</var>)<var></var>
<blockquote><p><var>crt</var>: a certificate of type <code>gnutls_x509 crt_t</code>

<p><var>type</var>: is one of the gnutls_x509_subject_alt_name_t enumerations

<p><var>data</var>: The data to be set

<p><var>data_size</var>: The size of data to be set

<p><var>flags</var>: GNUTLS_FSAN_SET to clear previous data or GNUTLS_FSAN_APPEND to append.

<p>This function will set the subject alternative name certificate extension. It can set the following types:

<p>&GNUTLS_SAN_DNSNAME: as a text string

<p>&GNUTLS_SAN_RFC822NAME: as a text string

<p>&GNUTLS_SAN_URI: as a text string

<p>&GNUTLS_SAN_IPADDRESS: as a binary IP address (4 or 16 bytes)

<p>Other values can be set as binary values with the proper DER encoding.

<p>Returns: On success, <code>GNUTLS_E_SUCCESS</code> is returned, otherwise a negative error value.

<p>Since: 2.6.0</p></blockquote></div>

gnutls_x509 crt_set_subject_alternative_name

<p>

<div class="defun">

— Function: int **gnutls_x509 crt_set_subject_alternative_name** (<var>gnutls_x509 crt_t crt, gnutls_x509_subject_alt_name_t type, const char * data_string</var>)<var></var>
<blockquote><p><var>crt</var>: a certificate of type <code>gnutls_x509 crt_t</code>

<p><var>type</var>: is one of the gnutls_x509_subject_alt_name_t enumerations

<p><var>data_string</var>: The data to be set, a zero terminated string

<p>This function will set the subject alternative name certificate extension. This function assumes that data can be expressed as a null

terminated string.

<p>The name of the function is unfortunate since it is inconsistent with <code>gnutls_x509_cert_get_subject_alt_name()</code>.

<p>Returns: On success, <code>GNUTLS_E_SUCCESS</code> is returned, otherwise a negative error value.

</p></blockquote></div>

gnutls_x509_cert_set_subject_key_id</h4>

<p>

<div class="defun">

<p><var>format</var>: the format of output params. One of PEM or DER.

<p><var>output_data</var>: will contain a DN PEM or DER encoded

<p><var>output_data_size</var>: holds the size of output_data (and will be replaced by the actual size of parameters)

<p>This function will export the DN to DER or PEM format.

<p>If the buffer provided is not long enough to hold the output, then *<code>output_data_size</code> is updated and <code>GNUTLS_E_SHORT_MEMORY_BUFFER</code> will be returned.

<p>If the structure is PEM encoded, it will have a header of "BEGIN NAME".

<p>Returns: On success, <code>GNUTLS_E_SUCCESS</code> is returned, otherwise a negative error value.

</p></blockquote></div>

<h4 class="subheading">gnutls_x509_dn_get_rdn_ava</h4>

<p>

<div class="defun">

— Function: int gnutls_x509_dn_get_rdn_ava (<var>gnutls_x509_dn_t dn, int irdn, int iava, gnutls_x509_ava_st * ava</var>)<var></var>

<blockquote><p><var>dn</var>: input variable with opaque DN pointer

<p><var>irdn</var>: index of RDN

<p><var>iava</var>: index of AVA.

<p><var>ava</var>: Pointer to structure which will hold output information.

<p>Get pointers to data within the DN.

<p>Note that <code>ava</code> will contain pointers into the <code>dn</code> structure, so you should not modify any data or deallocate it. Note also that the DN

in turn points into the original certificate structure, and thus you may not deallocate the certificate and continue to access `dn`.

Returns: Returns 0 on success, or an error code.

gnutls_x509_dn_import

[gnutls_005fx509_005fdn_005fimport](#)

Function:

int `gnutls_x509_dn_import` (`gnutls_x509_dn_t dn`, const `gnutls_datum_t * data`)

`dn`: the structure that will hold the imported DN

`data`: should contain a DER encoded RDN sequence

This function parses an RDN sequence and stores the result to a `gnutls_x509_dn_t` structure. The structure must have been initialized with `gnutls_x509_dn_init()`. You may use `gnutls_x509_dn_get_rdn_ava()` to decode the DN.

Returns: On success, `GNUTLS_E_SUCCESS` is returned, otherwise a negative error value.

Since: 2.4.0

gnutls_x509_dn_init

[gnutls_005fx509_005fdn_005finit](#)

Function:

int `gnutls_x509_dn_init` (`gnutls_x509_dn_t * dn`)

`dn`: the object to be initialized

This function initializes a `gnutls_x509_dn_t` structure.

The object returned must be deallocated using `gnutls_x509_dn_deinit()`.

Returns: On success, `GNUTLS_E_SUCCESS` is returned, otherwise a negative error value.

Since: 2.4.0

gnutls_x509_dn_oid_known

[gnutls_005fx509_005fdn_005foid_005fknown](#)

Function: int `gnutls_x509_dn_oid_known` (`const char * oid`)

`—` `gnutls_x509_dn_oid_known` (`const char * oid`) ````

`oid`: holds an Object Identifier in a null terminated string

This function will inform about known DN OIDs. This is useful since functions like `gnutls_x509 crt_set_dn_by_oid()` use the information on known OIDs to properly encode their input. Object Identifiers that are not known are not encoded by these functions, and their input is stored directly into the ASN.1 structure. In that case of unknown OIDs, you have the responsibility of DER encoding your data.

Returns: 1 on known OIDs and 0 otherwise.

gnutls_x509_privkey_cpy

[gnutls_005fx509_005fprivkey_005fcpy](#)

Function: int `gnutls_x509_privkey_cpy` (`gnutls_x509_privkey_t dst`, `gnutls_x509_privkey_t src`)

`—` `gnutls_x509_privkey_cpy` (`gnutls_x509_privkey_t dst`, `gnutls_x509_privkey_t src`) ````

`dst`: The destination key, which should be initialized.

`src`: The source key

This function will copy a private key from source to destination key.

Returns: On success, `GNUTLS_E_SUCCESS` is returned, otherwise a negative error value.

gnutls_x509_privkey_deinit

[gnutls_005fx509_005fprivkey_005fdeinit](#)

Function: void `gnutls_x509_privkey_deinit` (`gnutls_x509_privkey_t key`)

`—` `gnutls_x509_privkey_deinit` (`gnutls_x509_privkey_t key`) ````

`key`: The structure to be initialized

This function will deinitialize a private key structure.

</p></blockquote></div>

<h4 class="subheading">gnutls_x509_privkey_export_dsa_raw</h4>

<p>

<div class="defun">

<p><var>signature</var>: will contain the signature

<p><var>signature_size</var>: holds the size of signature (and will be replaced by the new size)

<p>This function will sign the given data using a signature algorithm supported by the private key. Signature algorithms are always used together with a hash functions. Different hash functions may be used for the RSA algorithm, but only SHA-1 for the DSA keys.

<p>If the buffer provided is not long enough to hold the output, then *<code>signature_size</code> is updated and <code>GNUTLS_E_SHORT_MEMORY_BUFFER</code> will

be returned.

Returns: On success, `GNUTLS_E_SUCCESS` is returned, otherwise a negative error value.

gnutls_x509_privkey_sign_hash

Function: int **gnutls_x509_privkey_sign_hash** (`gnutls_x509_privkey_t key, const gnutls_datum_t * hash, gnutls_datum_t * signature`)
[index-gnutls_005fx509_005fprivkey_005fsign_005fhash-499](#)

`key`: Holds the key

`hash`: holds the data to be signed

`signature`: will contain newly allocated signature

This function will sign the given hash using the private key. Do not use this function directly unless you know what it is. Typical signing requires the data to be hashed and stored in special formats (e.g. BER Digest-Info for RSA).

Returns: On success, `GNUTLS_E_SUCCESS` is returned, otherwise a negative error value.

gnutls_x509_privkey_verify_data

Function: int **gnutls_x509_privkey_verify_data** (`gnutls_x509_privkey_t key, unsigned int flags, const gnutls_datum_t * data, const gnutls_datum_t * signature`)
[index-gnutls_005fx509_005fprivkey_005fverify_005fdata-500](#)

`key`: Holds the key

`flags`: should be 0 for now

`data`: holds the data to be signed

`signature`: contains the signature

This function will verify the given signed data, using the parameters in the private key.

Returns: In case of a verification failure 0 is returned, and 1 on success.

gnutls_x509_rdn_get_by_oid

Function: int **gnutls_x509_rdn_get_by_oid** (`const gnutls_datum_t * idn, const char * oid, int indx, unsigned int raw_flag, void * buf, size_t * sizeof_buf`)
`index-gnutls_005fx509_005frdn_005fget_005fby_005foid-501`

`idn`: should contain a DER encoded RDN sequence

`oid`: an Object Identifier

`indx`: In case multiple same OIDs exist in the RDN indicates which to send. Use 0 for the first one.

`raw_flag`: If non zero then the raw DER data are returned.

`buf`: a pointer to a structure to hold the peer's name

`sizeof_buf`: holds the size of `buf`

This function will return the name of the given Object identifier, of the RDN sequence. The name will be encoded using the rules from RFC2253.

Returns: On success, `GNUTLS_E_SUCCESS` is returned, or `GNUTLS_E_SHORT_MEMORY_BUFFER` is returned and `*sizeof_buf` is updated if the provided buffer is not long enough, otherwise a negative error value.

gnutls_x509_rdn_get_oid

Function: int **gnutls_x509_rdn_get_oid** (`const gnutls_datum_t * idn, int indx, void * buf, size_t * sizeof_buf`)
`index-gnutls_005fx509_005frdn_005fget_005foid-502`

`idn`: should contain a DER encoded RDN sequence

`indx`: Indicates which OID to return. Use 0 for the first one.

`buf`: a pointer to a structure to hold the peer's name OID

<p><var>sizeof_buf</var>: holds the size of <code>buf</code>

<p>This function will return the specified Object identifier, of the RDN sequence.

9.3 GnuTLS-extra Functions

[index-g_t_0040acronym_007bGnuTLS_002dextra_007d-functions-504](#)

These functions are only available in the GPLv3+ version of the library called `gnutls-extra`. The prototypes for this library lie in `gnutls/extra.h`.

gnutls_extra_check_version

[gnutls_005fextra_005fcheck_005fversion](#)

Function: `const char * gnutls_extra_check_version` (`const char *`

`req_version`)
`req_version`: version string to compare with, or `NULL`.

Check GnuTLS Extra Library version.

See `GNUTLS_EXTRA_VERSION` for a suitable `req_version` string.

Return value: Check that the version of the library is at minimum the one given as a string in `req_version` and return the actual version string of the library; return `NULL` if the condition is not met. If `NULL` is passed to this function no check is done and only the version string is returned.

gnutls_global_init_extra

[gnutls_005fglobal_005finit_005fextra](#)

Function: `int gnutls_global_init_extra` (`void`)

`gnutls_005fglobal_005finit_005fextra`

This function initializes the global state of gnutls-extra library to defaults.

Note that `gnutls_global_init()` has to be called before this function. If this function is not called then the gnutls-extra library will not be usable.

This function is not thread safe, see the discussion for `gnutls_global_init()` on how to deal with that.

Returns: On success, `GNUTLS_E_SUCCESS` (zero) is returned, otherwise an error code is returned.

```

<p>This funtion is used to load OpenPGP keys into the GnuTLS credentials structure. The files should only contain one key which

is not encrypted.

The special keyword "auto" is also accepted as `subkey_id`. In that case the `gnutls_openpgp_cert_get_auth_subkey()` will be used to retrieve the subkey.

Returns: On success, `GNUTLS_E_SUCCESS` is returned, otherwise a negative error value.

Since: 2.4.0

gnutls_certificate_set_openpgp_key_mem

[gnutls_005fcertificate_005fset_005fopenpgp_005fkey_005fmem](#)

Function:

int **gnutls_certificate_set_openpgp_key_mem** (`gnutls_certificate_credentials_t` res, const `gnutls_datum_t` * cert, const `gnutls_datum_t` * key, `gnutls_openpgp_cert_fmt_t` format)

`res`: the destination context to save the data.

`cert`: the datum that contains the public key.

`key`: the datum that contains the secret key.

`format`: the format of the keys

This function is used to load OpenPGP keys into the GnuTLS credential structure. The files should contain non encrypted keys.

Returns: On success, `GNUTLS_E_SUCCESS` is returned, otherwise a negative error value.

gnutls_certificate_set_openpgp_keyring_file

[gnutls_005fcertificate_005fset_005fopenpgp_005fkeyring_005ffile](#)

Function:

int **gnutls_certificate_set_openpgp_keyring_file** (`gnutls_certificate_credentials_t` c, const char * file, `gnutls_openpgp_cert_fmt_t` format)

`c`: A certificate credentials structure

`file`: filename of the keyring.

`format`: format of keyring.

The function is used to set keyrings that will be used internally by various OpenPGP functions. For example to find a key when it is needed for an operations. The keyring will also be used at the verification functions.

Returns: On success, `GNUTLS_E_SUCCESS` is returned, otherwise a negative error value.

gnutls_certificate_set_openpgp_keyring_mem

[gnutls_005fcertificate_005fset_005fopenpgp_005fkeyring_005fmem](#)

Function: int `gnutls_certificate_set_openpgp_keyring_mem`

(`gnutls_certificate_credentials_t c`, const opaque * `data`, size_t `dlen`, `gnutls_openpgp_cert_fmt_t`

`format`)
`index-gnutls_005fcertificate_005fset_005fopenpgp_005fkeyring_005fmem-513`

`c`: A certificate credentials structure

`data`: buffer with keyring data.

`dlen`: length of data buffer.

`format`: the format of the keyring

The function is used to set keyrings that will be used internally by various OpenPGP functions. For example to find a key when it is needed for an operations. The keyring will also be used at the verification functions.

Returns: On success, `GNUTLS_E_SUCCESS` is returned, otherwise a negative error value.

gnutls_certificate_set_openpgp_key

[gnutls_005fcertificate_005fset_005fopenpgp_005fkey](#)

gnutls_openpgp_keyring_deinit

[gnutls_005openpgp_005fkeyring_005fdeinit](#)

Function:

`void gnutls_openpgp_keyring_deinit(gnutls_openpgp_keyring_t keyring)`
`keyring`: The structure to be initialized

This function will deinitialize a keyring structure.

gnutls_openpgp_keyring_get_cert_count

[gnutls_005openpgp_005fkeyring_005fget_005fcrt_005fcount](#)

Function:

`int gnutls_openpgp_keyring_get_cert_count(gnutls_openpgp_keyring_t ring)`
`ring`: is an OpenPGP key ring

This function will return the number of OpenPGP certificates present in the given keyring.

Returns: the number of subkeys, or a negative value on error.

gnutls_openpgp_keyring_get_cert

[gnutls_005openpgp_005fkeyring_005fget_005fcrt](#)

Function:

`int gnutls_openpgp_keyring_get_cert(gnutls_openpgp_keyring_t ring, unsigned int idx, gnutls_openpgp_cert_t * cert)`
`idx`: the index of the certificate to export

`cert`: An uninitialized `gnutls_openpgp_cert_t` structure

This function will extract an OpenPGP certificate from the given keyring. If the index given is out of range

`GNUTLS_E_REQUESTED_DATA_NOT_AVAILABLE` will be returned. The returned structure needs to be deinit.

Returns: `GNUTLS_E_SUCCESS` on success, or an error code.

</p></blockquote></div>

9.5 <acronym>TLS</acronym> Inner Application (<acronym>TLS/IA</acronym>) Functions</h3>

<p>

The following functions are used for <acronym>TLS</acronym> Inner Application (<acronym>TLS/IA</acronym>). Their prototypes lie in <samp>gnutls/extra.h</samp>.

You need to link with <samp>libgnutls-extra</samp> to be able to use these functions (see GnuTLS-extra functions).

<p>The typical control flow in an TLS/IA client (that would not require an Application Phase for resumed sessions) would be similar to the following:

```
<pre class="example"> int client_avp (gnutls_session_t *session, void *ptr,
                const char *last, size_t lastlen,
                char **new, size_t *newlen)
{
...
}
...
int main ()
{
    gnutls_ia_client_credentials_t iacred;
...
    gnutls_init (&session, GNUTLS_CLIENT);
...
    /* Enable TLS/IA. */
    gnutls_ia_allocate_client_credentials(&iacred);
    gnutls_ia_set_client_avp_function(iacred, client_avp);
    gnutls_credentials_set (session, GNUTLS_CRD_IA, iacred);
...
    ret = gnutls_handshake (session);
    // Error handling...
...
    if (gnutls_ia_handshake_p (session))
    {
        ret = gnutls_ia_handshake (session);
    }
}
```

```
// Error handling...
...
</pre>
<p>See below for detailed descriptions of all the functions used above.
```

<p>The function `client_avp` would have to be implemented by your application. The function is responsible for handling the AVP data. See `gnutls_ia_set_client_avp_function` below for more information on how that function should be implemented.

<p>The control flow in a typical server is similar to the above, use `gnutls_ia_server_credentials_t` instead of `gnutls_ia_client_credentials_t`, and replace the call to the client functions with the corresponding server functions.

gnutls_ia_allocate_client_credentials

<div class="defun">
— Function: int **gnutls_ia_allocate_client_credentials** (`gnutls_ia_client_credentials_t *sc`)<var></var>

<blockquote><p><var>sc</var>: is a pointer to a `gnutls_ia_server_credentials_t` structure.

<p>This structure is complex enough to manipulate directly thus this helper function is provided in order to allocate it.

<p>Adding this credential to a session will enable TLS/IA, and will require an Application Phase after the TLS handshake (if the server support TLS/IA). Use `gnutls_ia_require_inner_phase()` to toggle the TLS/IA mode.

<p>Returns: On success, `GNUTLS_E_SUCCESS` (0) is returned, otherwise an error code is returned.

gnutls_ia_allocate_server_credentials

<div class="defun">
— Function: int **gnutls_ia_allocate_server_credentials** (`gnutls_ia_server_credentials_t *sc`)<var></var>

<blockquote><p><var>sc</var>: is a pointer to a `gnutls_ia_server_credentials_t` structure.

<p>This structure is complex enough to manipulate directly thus this helper function is provided in order to allocate it.

Adding this credential to a session will enable TLS/IA, and will require an Application Phase after the TLS handshake (if the client support TLS/IA). Use `gnutls_ia_require_inner_phase()` to toggle the TLS/IA mode.

Returns: On success, `GNUTLS_E_SUCCESS` (0) is returned, otherwise an error code is returned.

gnutls_ia_enable

Function: void `gnutls_ia_enable` (`gnutls_session_t session`, int `allow_skip_on_resume`)
`session`: is a `gnutls_session_t` structure.

`allow_skip_on_resume`: non-zero if local party allows to skip the TLS/IA application phases for a resumed session.

Specify whether we must advertise support for the TLS/IA extension during the handshake.

At the client side, we always advertise TLS/IA if `gnutls_ia_enable` was called before the handshake; at the server side, we also require that the client has advertised that it wants to run TLS/IA before including the advertisement, as required by the protocol.

Similarly, at the client side we always advertise that we allow TLS/IA to be skipped for resumed sessions if `allow_skip_on_resume` is non-zero; at the server side, we also require that the session is indeed resumable and that the client has also advertised that it allows TLS/IA to be skipped for resumed sessions.

After the TLS handshake, call `gnutls_ia_handshake_p()` to find out whether both parties agreed to do a TLS/IA handshake, before calling `gnutls_ia_handshake()` or one of the lower level `gnutls_ia_*` functions.

gnutls_ia_endphase_send

Function: int `gnutls_ia_endphase_send` (`gnutls_session_t session`, int `final_p`)

`session`: is a `gnutls_session_t` structure.

`final_p`: Set iff this should signal the final phase.

Send a TLS/IA end phase message.

In the client, this should only be used to acknowledge an end phase message sent by the server.

In the server, this can be called instead of `gnutls_ia_send()` if the server wishes to end an application phase.

Return value: Return 0 on success, or an error code.

gnutls_ia_extract_inner_secret

[gnutls_005fia_005fextract_005finner_005fsecret](#)

`gnutls_ia_extract_inner_secret`

Function: void `gnutls_ia_extract_inner_secret` (`gnutls_session_t session`, char * `buffer`)
[index-gnutls_005fia_005fextract_005finner_005fsecret-584](#)
`session`: is a `gnutls_session_t` structure.

`buffer`: pre-allocated buffer to hold 48 bytes of inner secret.

Copy the 48 bytes large inner secret into the specified buffer

This function is typically used after the TLS/IA handshake has concluded. The TLS/IA inner secret can be used as input to a PRF to derive session keys. Do not use the inner secret directly as a session key, because for a resumed session that does not include an application phase, the inner secret will be identical to the inner secret in the original session. It is important to include, for example, the client and server randomness when deriving a session key from the inner secret.

gnutls_ia_free_client_credentials

[gnutls_005fia_005ffree_005fclient_005fcredentials](#)

`gnutls_ia_free_client_credentials`

Function: void `gnutls_ia_free_client_credentials` (`gnutls_ia_client_credentials_t sc`)
[index-gnutls_005fia_005ffree_005fclient_005fcredentials-585](#)
`sc`: is a `gnutls_ia_client_credentials_t` structure.

This structure is complex enough to manipulate directly thus this

helper function is provided in order to free (deallocate) it.

gnutls_ia_free_server_credentials

– Function: void **gnutls_ia_free_server_credentials** (`gnutls_ia_server_credentials_t sc`)
`sc`: is a `gnutls_ia_server_credentials_t` structure.

This structure is complex enough to manipulate directly thus this helper function is provided in order to free (deallocate) it.

gnutls_ia_generate_challenge

– Function: int **gnutls_ia_generate_challenge** (`gnutls_session_t session`, `size_t buffer_size`, `char * buffer`)
`session`: is a `gnutls_session_t` structure.

`buffer_size`: size of output buffer.

`buffer`: pre-allocated buffer to contain `buffer_size` bytes of output.

Generate an application challenge that the client cannot control or predict, based on the TLS/IA inner secret.

Return value: Returns 0 on success, or an negative error code.

gnutls_ia_get_client_avp_ptr

– Function: void * **gnutls_ia_get_client_avp_ptr** (`gnutls_ia_client_credentials_t cred`)
`cred`: is a `gnutls_ia_client_credentials_t` structure.

Returns the pointer that will be provided to the TLS/IA callback function as the first argument.

Returns: The client callback data pointer.

</p></blockquote></div>

<h4 class="subheading">gnutls_ia_get_server_avp_ptr</h4>

<p>

<div class="defun">

— Function: void * gnutls_ia_get_server_avp_ptr (<var>gnutls_ia_server_credentials_t cred</var><var></var>
<blockquote><p><var>cred</var>: is a <code>gnutls_ia_client_credentials_t</code> structure.

<p>Returns the pointer that will be provided to the TLS/IA callback function as the first argument.

<p>Returns: The server callback data pointer.</p></blockquote></div>

<h4 class="subheading">gnutls_ia_handshake_p</h4>

<p>

<div class="defun">

— Function: int gnutls_ia_handshake_p (<var>gnutls_session_t session</var><var></var>
<blockquote><p><var>session</var>: is a <code>gnutls_session_t</code> structure.

<p>Predicate to be used after <code>gnutls_handshake()</code> to decide whether to invoke <code>gnutls_ia_handshake()</code>. Usable by both clients and servers.

<p>Return value: non-zero if TLS/IA handshake is expected, zero otherwise.</p></blockquote></div>

<h4 class="subheading">gnutls_ia_handshake</h4>

<p>

<div class="defun">

— Function: int gnutls_ia_handshake (<var>gnutls_session_t session</var><var></var>
<blockquote><p><var>session</var>: is a <code>gnutls_session_t</code> structure.

<p>Perform a TLS/IA handshake. This should be called after <code>gnutls_handshake()</code> iff <code>gnutls_ia_handshake_p()</code>.

<p>Returns: On success, <code>GNUTLS_E_SUCCESS</code> (zero) is returned, otherwise an error code is returned.</p></blockquote></div>

gnutls_ia_permute_inner_secret

[gnutls_005fia_005fpermute_005finner_005fsecret](#)

Function: int `gnutls_ia_permute_inner_secret` (`gnutls_session_t session`, `size_t session_keys_size`, `const char * session_keys`)

`gnutls_session_t session`, `size_t session_keys_size`, `const char * session_keys`

[index-gnutls_005fia_005fpermute_005finner_005fsecret-592](#)

`session`: is a `gnutls_session_t` structure.

`session_keys_size`: Size of generated session keys (0 if none).

`session_keys`: Generated session keys, used to permute inner secret (NULL if none).

Permute the inner secret using the generated session keys.

This can be called in the TLS/IA AVP callback to mix any generated session keys with the TLS/IA inner secret.

Return value: Return zero on success, or a negative error code.

gnutls_ia_rcv

[gnutls_005fia_005frcv](#)

Function: `ssize_t gnutls_ia_rcv` (`gnutls_session_t session`, `char * data`, `size_t sizeofdata`)

`gnutls_session_t session`, `char * data`, `size_t sizeofdata`

[index-gnutls_005fia_005frcv-593](#)

`session`: is a `gnutls_session_t` structure.

`data`: the buffer that the data will be read into, must hold ≥ 12 bytes.

`sizeofdata`: the number of requested bytes, must be ≥ 12 .

Receive TLS/IA data. This function has the similar semantics with `rcv()`. The only difference is that it accepts a GnuTLS session, and uses different error codes.

If the server attempt to finish an application phase, this function will return `GNUTLS_E_WARNING_IA_IPHF_RECEIVED` or `GNUTLS_E_WARNING_IA_FPHF_RECEIVED`. The caller should then invoke `gnutls_ia_verify_endphase()`, and if it runs the client side, also send an endphase message of its own using `gnutls_ia_endphase_send`.

If EINTR is returned by the internal push function (the default is

`code`{`recv()`}) then `GNUTLS_E_INTERRUPTED` will be returned. If `GNUTLS_E_INTERRUPTED` or `GNUTLS_E_AGAIN` is returned, you must call this function again, with the same parameters; alternatively you could provide a `NULL` pointer for data, and 0 for size.

Returns: The number of bytes received. A negative error code is returned in case of an error. The `GNUTLS_E_WARNING_IA_IPHF_RECEIVED` and `GNUTLS_E_WARNING_IA_FPHF_RECEIVED` errors are returned when an application phase finished message has been sent by the server.

gnutls_ia_send

[gnutls_005fia_005fsend](#)

Function:

ssize_t `gnutls_ia_send`(`gnutls_session_t session`, `const char * data`, `size_t sizeofdata`)

`session`: is a `gnutls_session_t` structure.

`data`: contains the data to send

`sizeofdata`: is the length of the data

Send TLS/IA application payload data. This function has the similar semantics with `send()`. The only difference is that it accepts a GnuTLS session, and uses different error codes.

The TLS/IA protocol is synchronous, so you cannot send more than one packet at a time. The client always send the first packet.

To finish an application phase in the server, use `gnutls_ia_endphase_send()`. The client cannot end an application phase unilaterally; rather, a client is required to respond with an endphase of its own if `gnutls_ia_recv` indicates that the server has sent one.

If the `EINTR` is returned by the internal push function (the default is `send()`) then `GNUTLS_E_INTERRUPTED` will be returned. If `GNUTLS_E_INTERRUPTED` or `GNUTLS_E_AGAIN` is returned, you must call this function again, with the same parameters; alternatively you could provide a `NULL` pointer for data, and 0 for size.

Returns: The number of bytes sent, or a negative error code.

gnutls_ia_set_client_avp_function

<p>

<div class="defun">

— Function: void gnutls_ia_set_client_avp_function (<var>gnutls_ia_client_credentials_t cred, gnutls_ia_avp_func avp_func</var>)<var></var>

<blockquote><p><var>cred</var>: is a <code>gnutls_ia_client_credentials_t</code> structure.

<p><var>avp_func</var>: is the callback function

<p>Set the TLS/IA AVP callback handler used for the session.

<p>The AVP callback is called to process AVPs received from the server, and to get a new AVP to send to the server.

<p>The callback's function form is:

```
int (*avp_func) (gnutls_session_t session, void *ptr,
const char *last, size_t lastlen,
char **next, size_t *nextlen);
```

<p>The <code>session</code> parameter is the <code>gnutls_session_t</code> structure corresponding to the current session. The <code>ptr</code> parameter is the application hook pointer, set through <code>gnutls_ia_set_client_avp_ptr</code>. The AVP received from the server is present in <code>last</code> of <code>lastlen</code> size, which will be <code>NULL</code> on the first invocation. The newly allocated output AVP to send to the server should be placed in *<code>next</code> of *<code>nextlen</code> size.

<p>The callback may invoke <code>gnutls_ia_permute_inner_secret</code> to mix any generated session keys with the TLS/IA inner secret.

<p>Return 0 (<code>GNUTLS_IA_APPLICATION_PAYLOAD</code>) on success, or a negative error code to abort the TLS/IA handshake.

<p>Note that the callback must use allocate the <code>next</code> parameter using <code>gnutls_malloc</code>, because it is released via <code>gnutls_free</code> by the TLS/IA handshake function.

<p></blockquote></div>

<h4 class="subheading">gnutls_ia_set_client_avp_ptr</h4>

<p>

<div class="defun">

— Function: void gnutls_ia_set_client_avp_ptr (<var>gnutls_ia_client_credentials_t cred, void *ptr</var>)<var></var>

<blockquote><p><var>cred</var>: is a <code>gnutls_ia_client_credentials_t</code> structure.

<p><var>ptr</var>: is the pointer

<p>Sets the pointer that will be provided to the TLS/IA callback function as the first argument.

</p></blockquote></div>

<h4 class="subheading">gnutls_ia_set_server_avp_function</h4>

<p>

<div class="defun">

— Function: void gnutls_ia_set_server_avp_function (<var>gnutls_ia_server_credentials_t cred, gnutls_ia_avp_func avp_func</var>)<var></var>

<blockquote><p><var>cred</var>: is a <code>gnutls_ia_server_credentials_t</code> structure.

<p>Set the TLS/IA AVP callback handler used for the session.

<p>The callback's function form is:

```
int (*avp_func) (gnutls_session_t session, void *ptr,
const char *last, size_t lastlen,
char **next, size_t *nextlen);
```

<p>The <code>session</code> parameter is the <code>gnutls_session_t</code> structure corresponding to the current session. The <code>ptr</code> parameter is the application hook pointer, set through <code>gnutls_ia_set_server_avp_ptr</code>. The AVP received from the client is present in <code>last</code> of <code>lastlen</code> size. The newly allocated output AVP to send to the client should be placed in *<code>next</code> of *<code>nextlen</code> size.

<p>The AVP callback is called to process incoming AVPs from the client, and to get a new AVP to send to the client. It can also be used to instruct the TLS/IA handshake to do go into the Intermediate or Final phases. It return a negative error code, or a <code>gnutls_ia_apptype_t</code> message type.

<p>The callback may invoke <code>gnutls_ia_permute_inner_secret</code> to mix any generated session keys with the TLS/IA inner secret.

<p>Specifically, return <code>GNUTLS_IA_APPLICATION_PAYLOAD</code> (0) to send another AVP to the client, return <code>GNUTLS_IA_INTERMEDIATE_PHASE_FINISHED</code> (1) to indicate that an IntermediatePhaseFinished message should be sent, and return <code>GNUTLS_IA_FINAL_PHASE_FINISHED</code> (2) to indicate that an FinalPhaseFinished message should be sent. In the last two cases, the contents of the <code>next</code> and <code>nextlen</code> parameter is not used.

Note that the callback must use allocate the `next` parameter using `gnutls_malloc()`, because it is released via `gnutls_free()` by the TLS/IA handshake function.

gnutls_ia_set_server_avp_ptr

[gnutls_005fia_005fset_005fserver_005favp_005fptr](#)

Function: void `gnutls_ia_set_server_avp_ptr` (`gnutls_ia_server_credentials_t cred`, void *`ptr`)

`ptr`: is a `gnutls_ia_client_credentials_t` structure.

`ptr`: is the pointer

Sets the pointer that will be provided to the TLS/IA callback function as the first argument.

gnutls_ia_verify_endphase

[gnutls_005fia_005fverify_005fendphase](#)

Function: int `gnutls_ia_verify_endphase` (`gnutls_session_t session`, const char *`checksum`)

`session`: is a `gnutls_session_t` structure.

`checksum`: 12-byte checksum data, received from `gnutls_ia_recv()`.

Verify TLS/IA end phase checksum data. If verification fails, the `GNUTLS_A_INNER_APPLICATION_VERIFICATION` alert is sent to the other side.

This function is called when `gnutls_ia_recv()` return `GNUTLS_E_WARNING_IA_IPHF_RECEIVED` or `GNUTLS_E_WARNING_IA_FPHF_RECEIVED`.

Return value: Return 0 on successful verification, or an error code. If the checksum verification of the end phase message fails, `GNUTLS_E_IA_VERIFY_FAILED` is returned.

<p>Some additional information regarding some of the algorithms:

<dl>

<dt><code>RSA</code><dd>RSA is public key cryptosystem designed by Ronald Rivest, Adi Shamir and Leonard Adleman. It can be used with any hash functions.

<dt><code>DSA</code><dd>DSA is the USA's Digital Signature Standard. It uses only the SHA-1 hash algorithm.

<dt><code>MD2</code><dd>MD2 is a cryptographic hash algorithm designed by Ron Rivest. It is optimized for 8-bit processors. Outputs 128 bits of data. There are no known weaknesses of this algorithm but since this algorithm is rarely used and not really studied it should not be used today.

<dt><code>MD5</code><dd>MD5 is a cryptographic hash algorithm designed by Ron Rivest. Outputs 128 bits of data. It is considered to be broken.

<dt><code>SHA-1</code><dd>SHA is a cryptographic hash algorithm designed by NSA. Outputs 160 bits of data. It is also considered to be broken, though no practical attacks have been found.

<dt><code>RMD160</code><dd>RIPEMD is a cryptographic hash algorithm developed in the framework of the EU project RIPE. Outputs 160 bits of data.

11 Guile Bindings

This chapter describes the GNU Guile Scheme programming interface to GnuTLS. The reader is assumed to have basic knowledge of the protocol and library. Details missing from this chapter may be found in the C API reference.

At this stage, not all the C functions are available from Scheme, but a large subset thereof is available.

Next: Guile API Conventions,
Up: Guile Bindings</p>

</div>

11.1 Guile Preparations

The GnuTLS Guile bindings are by default installed under the GnuTLS installation directory (e.g., typically

`/usr/local/share/guile/site/`). Normally Guile will not find the module there without help. You may experience something like this:

```
$ guile
guile> (use-modules (gnutls))
&lt;unnamed port>; no code for module (gnutls)
guile>
```

There are two ways to solve this. The first is to make sure that when building GnuTLS, the Guile bindings will be installed in the same place where Guile looks. You may do this by using the `--with-guile-site-dir` parameter as follows:

```
<pre class="example"> $ ./configure --with-guile-site-dir=no
</pre>
```

<p>This will instruct GnuTLS to attempt to install the Guile bindings where Guile will look for them. It will use `guile-config info pkgdatadir` to learn the path to use.

<p>If Guile was installed into `/usr`, you may also install GnuTLS using the same prefix:

```
<pre class="example"> $ ./configure --prefix=/usr
</pre>
```

<p>If you want to specify the path to install the Guile bindings you can also specify the path directly:

```
<pre class="example"> $ ./configure --with-guile-site-dir=/opt/guile/share/guile/site
</pre>
```

<p>The second solution requires some more work but may be easier to use if you do not have system administrator rights to your machine. You need to instruct Guile so that it finds the GnuTLS Guile bindings.

Either use the `GUILE_LOAD_PATH` environment variable as follows:

```
<pre class="example"> $ GUILE_LOAD_PATH="/usr/local/share/guile/site:$GUILE_LOAD_PATH" guile
  guile>; (use-modules (gnutls))
  guile>;
</pre>
```

<p>Alternatively, you can modify Guile's `%load-path` variable (see [Guile's run-time options](guile.html#Build-Config)).

<p>At this point, you might get an error regarding

<samp>libguile-gnutls-v-0</samp> similar to:

```
<pre class="example"> gnutls.scm:361:1: In procedure dynamic-link in expression (load-extension "libguile-
gnutls-v-0" "scm_init_gnutls"):
  gnutls.scm:361:1: file: "libguile-gnutls-v-0", message: "libguile-gnutls-v-0.so: cannot open shared object file: No
such file or directory"
</pre>
```

<p>In this case, you will need to modify the run-time linker path, for example as follows:

```
<pre class="example"> $ LD_LIBRARY_PATH=/usr/local/lib GUILE_LOAD_PATH=/usr/local/share/guile/site
guile
  guile>; (use-modules (gnutls))
  guile>;
</pre>
```

```

<h3 class="section">11.2 Guile API Conventions</h3>

<p>This chapter details the conventions used by Guile API, as well as specificities of the mapping of the C API to Scheme.

<ul class="menu">

Enumerates and Constants: Representation of C-side constants.

Procedure Names: Naming conventions.

Representation of Binary Data: Binary data buffers.

Input and Output: Input and output.

Exception Handling: Exceptions.

<div class="node">

<p><hr>

Next: Procedure Names,

Up: Guile API Conventions

</div>

<h4 class="subsection">11.2.1 Enumerates and Constants</h4>

<p>

Lots of enumerates and constants are used in the GnuTLS C API. For each C enumerate type, a disjoint Scheme type is used—thus, enumerate values and constants are not represented by Scheme symbols nor by integers. This makes it impossible to use an enumerate value of the wrong type on the Scheme side: such errors are automatically detected by type-checking.

<p>The enumerate values are bound to variables exported by the <code>(gnutls)</code> and <code>(gnutls extra)</code> modules. These variables are named according to the following convention:

All variable names are lower-case; the underscore <code>_</code> character used in the C API is replaced by hyphen <code>-</code>.

All variable names are prepended by the name of the enumerate type and the slash <code>/</code> character.

In some cases, the variable name is made more explicit than the one of the C API, e.g., by avoid abbreviations.

Consider for instance this C-side enumerate:

```
typedef enum
{
    GNUTLS_CRD_CERTIFICATE = 1,
    GNUTLS_CRD_ANON,
    GNUTLS_CRD_SRP,
    GNUTLS_CRD_PSK,
    GNUTLS_CRD_IA
} gnutls_credentials_type_t;
```

The corresponding Scheme values are bound to the following variables exported by the `(gnutls)` module:

```
credentials/certificate
credentials/anonymous
credentials/srp
credentials/psk
credentials/ia
```

Hopefully, most variable names can be deduced from this convention.

Scheme-side “enumerate” values can be compared using `eq?` (see [equality predicates](guile.html#Equality)). Consider the following example:

[index-session_002dcipher-604](#)

```
(let ((session (make-session connection-end/client)))
```

```
;;
;; ...
;;
```

```
;; Check the ciphering algorithm currently used by SESSION.
```

```
(if (eq? cipher/arcfour (session-cipher session))
```

```
    (format #t "We're using the ARCFOUR algorithm")))
```

In addition, all enumerate values can be converted to a human-readable string, in a type-specific way. For instance, `(cipher->string cipher/arcfour)` yields `"ARCFOUR 128"`, while `(key-usage->string key-usage/digital-signature)` yields `"digital-signature"`. Note that these strings may not be sufficient for use in a user interface since they are fairly concise and not internationalized.

```
<div class="node">
<a name="Procedure-Names"></a>
<p><hr>
Next:&nbsp;<a rel="next" accesskey="n" href="#Representation-of-Binary-Data">Representation of Binary
Data</a>,
Previous:&nbsp;<a rel="previous" accesskey="p" href="#Enumerates-and-Constants">Enumerates and
Constants</a>,
Up:&nbsp;<a rel="up" accesskey="u" href="#Guile-API-Conventions">Guile API Conventions</a>

</div>
```

<h4 class="subsection">11.2.2 Procedure Names</h4>

<p>Unlike C functions in GnuTLS, the corresponding Scheme procedures are named in a way that is close to natural English. Abbreviations are also avoided. For instance, the Scheme procedure corresponding to <code>gnutls_certificate_set_dh_params</code> is named <code>set-certificate-credentials-dh-parameters!</code>. The <code>gnutls_</code> prefix is always omitted from variable names since a similar effect can be achieved using Guile's nifty binding renaming facilities, should it be needed (see Using Guile Modules).

<p>Often Scheme procedure names differ from C function names in a way that makes it clearer what objects they operate on. For example, the Scheme procedure named <code>set-session-transport-port!</code> corresponds to <code>gnutls_transport_set_ptr</code>, making it clear that this procedure applies to session.

```
<div class="node">
<a name="Representation-of-Binary-Data"></a>
<p><hr>
Next:&nbsp;<a rel="next" accesskey="n" href="#Input-and-Output">Input and Output</a>,
Previous:&nbsp;<a rel="previous" accesskey="p" href="#Procedure-Names">Procedure Names</a>,
Up:&nbsp;<a rel="up" accesskey="u" href="#Guile-API-Conventions">Guile API Conventions</a>

</div>
```

<h4 class="subsection">11.2.3 Representation of Binary Data</h4>

<p>Many procedures operate on binary data. For instance, <code>pkcs3-import-dh-parameters</code> expects binary data as input and, similarly, procedures like <code>pkcs1-export-rsa-parameters</code> return binary data.

<p>
Binary data is represented on the Scheme side using SRFI-4 homogeneous vectors (see SRFI-4).
Although any type of homogeneous vector may be used, <code>u8vector</code>s

(i.e., vectors of bytes) are highly recommended.

As an example, generating and then exporting RSA parameters in the PEM format can be done as follows:

```
<p><a name="index-make_002drsa_002dparameters-607"></a><a name="index-pkcs1_002dexport_002drsa_002dparameters-608"></a><a name="index-x509_002dcertificate_002dformat_002fpem-609"></a>
<pre class="example"> (let* ((rsa-params (make-rsa-parameters 1024))
  (raw-data
    (pkcs1-export-rsa-parameters rsa-params
      x509-certificate-format/pem)))
  (uniform-vector-write raw-data (open-output-file "some-file.pem"))))
</pre>
```

For an example of OpenPGP key import from a file, see [Importing OpenPGP Keys Guile Example](#).

```
<div class="node">
<a name="Input-and-Output"></a>
<p><hr>
Next:&nbsp;<a rel="next" accesskey="n" href="#Exception-Handling">Exception Handling</a>,
Previous:&nbsp;<a rel="previous" accesskey="p" href="#Representation-of-Binary-Data">Representation of Binary
Data</a>,
Up:&nbsp;<a rel="up" accesskey="u" href="#Guile-API-Conventions">Guile API Conventions</a>
</div>
```

11.2.4 Input and Output

[set-session-transport-port](#) and [set-session-transport-fd](#)

The underlying transport of a TLS session can be any Scheme input/output port (see [Ports and File Descriptors](#)). This has to be specified using

```
set-session-transport-port!
```

However, for better performance, a raw file descriptor can be specified, using `set-session-transport-fd!`. For instance, if the transport layer is a socket port over an OS-provided socket, you can use the `port->fdes` or `fileno` procedure to obtain the underlying file descriptor and pass it to `set-session-transport-fd!` (see [Ports and File Descriptors](#) `port->fdes` and `fileno`). This would work as follows:

```
pre class="example"> (let ((socket (socket PF_INET SOCK_STREAM 0))
  (session (make-session connection-end/client)))
```

```
::
```

```
:: Establish a TCP connection...
```

```
::
```

```
:: Use the file descriptor that underlies SOCKET.
```

```
(set-session-transport-fd! session (fileno socket)))
```

```
</pre>
```

```
<p><a name="index-session_002drecord_002dport-612"></a>
```

Once a TLS session is established, data can be communicated through it

(i.e., *via* the TLS record layer) using the port returned by

```
<code>session-record-port</code>:
```

```
<pre class="example"> (let ((session (make-session connection-end/client)))
```

```
::
```

```
:: Initialize the various parameters of SESSION, set up
```

```
:: a network connection, etc...
```

```
::
```

```
(let ((i/o (session-record-port session)))
```

```
(write "Hello peer!" i/o)
```

```
(let ((greetings (read i/o)))
```

```
:: ...
```

```
(bye session close-request/rdwr))))
```

```
</pre>
```

```
<p><a name="index-record_002dsend-613"></a><a name="index-record_002dreceive_0021-614"></a>
```

A lower-level I/O API is provided by `record-send` and

`record-receive!` which take an SRFI-4 vector to represent the

data sent or received. While it might improve performance, it is much

less convenient than the above and should rarely be needed.

```
<div class="node">

```
g_t_0040code_007bgnutls_002derror_007d-617"></a><a name="index-error_002d_003estring-618"></a>
```

GnuTLS errors are implemented as Scheme exceptions (see [exceptions in Guile](#)). Each

time a GnuTLS function returns an error, an exception with key

```
<code>gnutls-error</code> is raised. The additional arguments that are
```

thrown include an error code and the name of the GnuTLS procedure that raised the exception. The error code is pretty much like an enumerate value: it is one of the `error/` variables exported by the `(gnutls)` module (see [Enumerates and Constants](#Enumerates-and-Constants)). Exceptions can be turned into error messages using the `error->string` procedure.

The following examples illustrates how GnuTLS exceptions can be handled:

```

<pre class="example"> (let ((session (make-session connection-end/server)))

;;
;; ...
;;

(catch 'gnutls-error
  (lambda ()
    (handshake session)
    (lambda (key err function . currently-unused)
      (format (current-error-port)
        "a GnuTLS error was raised by `~a': ~a~%"
        function (error->string err))))))
</pre>

```

Again, error values can be compared using `eq?`:

```

<pre class="example"> ;; `gnutls-error' handler.
(lambda (key err function . currently-unused)
  (if (eq? err error/fatal-alert-received)
      (format (current-error-port)
        "a fatal alert was caught!~%" )
      (format (current-error-port)
        "something bad happened: ~a~%"
        (error->string err))))
</pre>

```

Note that the `catch` handler is currently passed only 3 arguments but future versions might provide it with additional arguments. Thus, it must be prepared to handle more than 3 arguments, as in this example.

Next: OpenPGP Authentication Guile Example,

Up: Guile Examples

</div>

<h4 class="subsection">11.3.1 Anonymous Authentication Guile Example</h4>

<p><dfn>Anonymous authentication</dfn> is very easy to use. No certificates are needed by the communicating parties. Yet, it allows them to benefit from end-to-end encryption and integrity checks.

<p>The client-side code would look like this (assuming <var>some-socket</var> is bound to an open socket port):

<p>

<pre class="example"> ;; Client-side.

```
(let ((client (make-session connection-end/client)))
```

```
;; Use the default settings.
```

```
(set-session-default-priority! client)
```

```
;; Don't use certificate-based authentication.
```

```
(set-session-certificate-type-priority! client '())
```

```
;; Request the "anonymous Diffie-Hellman" key exchange method.
```

```
(set-session-kx-priority! client (list kx/anon-dh))
```

```

;; Specify the underlying socket.
(set-session-transport-fd! client (fileno some-socket))

;; Create anonymous credentials.
(set-session-credentials! client
  (make-anonymous-client-credentials))

;; Perform the TLS handshake with the server.
(handshake client)

;; Send data over the TLS record layer.
(write "hello, world!" (session-record-port client))

;; Terminate the TLS session.
(bye client close-request/rdwr))
</pre>
<p>The corresponding server would look like this (again, assuming
<var>some-socket</var> is bound to a socket port):

<p><a name="index-connection_002dend_002fserver-622"></a>
<pre class="example">  ;; Server-side.

(let ((server (make-session connection-end/server)))
  (set-session-default-priority! server)
  (set-session-certificate-type-priority! server '())
  (set-session-kx-priority! server (list kx/anon-dh))

  ;; Specify the underlying transport socket.
  (set-session-transport-fd! server (fileno some-socket))

  ;; Create anonymous credentials.
  (let ((cred (make-anonymous-server-credentials))
        (dh-params (make-dh-parameters 1024)))
    ;; Note: DH parameter generation can take some time.
    (set-anonymous-server-dh-parameters! cred dh-params)
    (set-session-credentials! server cred))

  ;; Perform the TLS handshake with the client.
  (handshake server)

  ;; Receive data over the TLS record layer.
  (let ((message (read (session-record-port server))))
    (format #t "received the following message: ~a~%"
      message)

    (bye server close-request/rdwr)))
</pre>
<p>This is it!
```

```

<div class="node">

</div>

```

11.3.2 OpenPGP Authentication Guile Example

GnuTLS allows users to authenticate using OpenPGP certificates. The relevant procedures are provided by the `(gnutls extra)` module. Using OpenPGP-based authentication is not more complicated than using anonymous authentication. It requires a bit of extra work, though, to import the OpenPGP public and private key of the client/server. Key import is omitted here and is left as an exercise to the reader (see [Importing OpenPGP Keys Guile Example](#Importing-OpenPGP-Keys-Guile-Example)).

Assuming `some-socket` is bound to an open socket port and `pub` and `sec` are bound to the client's OpenPGP public and secret key, respectively, client-side code would look like this:

```

<p><a name="index-certificate_002dtype_002fopenpgp-623"></a>
<pre class="example">  ;; Client-side.

```

```

(define %certs (list certificate-type/openpgp))

(let ((client (make-session connection-end/client))
      (cred (make-certificate-credentials)))
  (set-session-default-priority! client)

  ;; Choose OpenPGP certificates.
  (set-session-certificate-type-priority! client %certs)

  ;; Prepare appropriate client credentials.
  (set-certificate-credentials-openpgp-keys! cred pub sec)
  (set-session-credentials! client cred)

  ;; Specify the underlying transport socket.
  (set-session-transport-fd! client (fileno some-socket))

  (handshake client)
  (write "hello, world!" (session-record-port client))
  (bye client close-request/rdwr))

```

```
</pre>
```

<p>Similarly, server-side code would be along these lines:

```
<pre class="example"> ;; Server-side.
```

```
(define %certs (list certificate-type/openpgp))

(let ((server (make-session connection-end/server))
      (rsa (make-rsa-parameters 1024))
      (dh (make-dh-parameters 1024)))
  (set-session-default-priority! server)

  ;; Choose OpenPGP certificates.
  (set-session-certificate-type-priority! server %certs)

  (let ((cred (make-certificate-credentials)))
    ;; Prepare credentials with RSA and Diffie-Hellman parameters.
    (set-certificate-credentials-dh-parameters! cred dh)
    (set-certificate-credentials-rsa-export-parameters! cred rsa)
    (set-certificate-credentials-openpgp-keys! cred pub sec)
    (set-session-credentials! server cred))

  (set-session-transport-fd! server (fileno some-socket))

  (handshake server)
  (let ((msg (read (session-record-port server))))
    (format #t "received: ~a~%" msg)

    (bye server close-request/rdwr)))
```

```
</pre>
```

<p>In practice, generating RSA parameters (and Diffie-Hellman parameters) can take a long time. Thus, you may want to generate them once and store them in a file for future re-use (see [<code>pkcs1-export-rsa-parameters</code>](#Core-Interface) and [<code>pkcs1-import-rsa-parameters</code>](#Core-Interface)).

```
<div class="node">

<h4 class="subsection">11.3.3 Importing OpenPGP Keys Guile Example</h4>
```

<p>The following example provides a simple way of importing
“ASCII-armored” OpenPGP keys from files, using the

`import-openpgp-certificate` and `import-openpgp-private-key` procedures provided by the `(gnutls extra)` module.

```
<p><a name="index-openpgp_002dcertificate_002dformat_002fbase64-624"></a><a name="index-openpgp_002dcertificate_002dformat_002fraw-625"></a>
<pre class="example"> (use-modules (srfi srfi-4)
                          (gnutls extra))
```

```
(define (import-key-from-file import-proc file)
  ;; Import OpenPGP key from FILE using IMPORT-PROC.
```

```
  ;; Prepare a u8vector large enough to hold the raw
  ;; key contents.
```

```
(let* ((size (stat:size (stat path)))
       (raw (make-u8vector size)))
```

```
  ;; Fill in the u8vector with the contents of FILE.
  (uniform-vector-read! raw (open-input-file file))
```

```
  ;; Pass the u8vector to the import procedure.
  (import-proc raw openpgp-certificate-format/base64)))
```

```
(define (import-public-key-from-file file)
  (import-key-from-file import-openpgp-certificate file))
```

```
(define (import-private-key-from-file file)
  (import-key-from-file import-openpgp-private-key file))
```

```
</pre>
```

The procedures `import-public-key-from-file` and `import-private-key-from-file` can be passed a file name. They return an OpenPGP public key and private key object, respectively (see [OpenPGP key objects](#Extra-Interface)).

<h2 class="chapter">12 Internal Architecture of GnuTLS</h2>

<p>

This chapter is to give a brief description of the way <acronym>GnuTLS</acronym> works. The focus is to give an idea to potential developers and those who want to know what happens inside the black box.

<ul class="menu">

The TLS Protocol

TLS Handshake Protocol

TLS Authentication Methods

TLS Extension Handling

Cryptographic Backend

<div class="node">

<p><hr>

Next: TLS Handshake Protocol,&br/>Up: Internal architecture of
GnuTLS

</div>

12.1 The TLS Protocol</h3>

<p>The main needs for the TLS protocol to be used are shown in the image below.

<div class="block-image"></div>

<p>This is being accomplished by the following object diagram.

Note that since <acronym>GnuTLS</acronym> is being developed in C object are just structures with attributes. The operations listed are functions that require the first parameter to be that object.

<div class="node">

<p><hr>

Next: TLS Authentication Methods,&br/>Previous: The TLS Protocol,&br/>Up: Internal architecture of
GnuTLS

</div>

12.2 TLS Handshake Protocol</h3>

<p>The <acronym>GnuTLS</acronym> handshake protocol is implemented as a state machine that waits for input or returns immediately when the non-blocking transport layer functions are used. The main idea is shown in the following figure.

<div class="block-image"></div>

<p>Also the way the input is processed varies per ciphersuite. Several implementations of the internal handlers are available and

gnutls_handshake only multiplexes the input to the appropriate

handler. For example a `PSK` ciphersuite has a different implementation of the `process_client_key_exchange` than a certificate ciphersuite.

```

```
Up:&nbsp;<a rel="up" accesskey="u" href="#Internal-architecture-of-GnuTLS">Internal architecture of GnuTLS</a>
```

```
</div>
```

12.3 TLS Authentication Methods

In `GnuTLS` authentication methods can be implemented quite easily. Since the required changes to add a new authentication method affect only the handshake protocol, a simple interface is used. An authentication method needs only to implement the functions as seen in the figure below.

```
<div class="block-image"></div>
```

The functions that need to be implemented are the ones responsible for interpreting the handshake protocol messages. It is common for such functions to read data from one or more `credentials_t` structures [¹⁷](#fn-17) and write data, such as certificates, usernames etc. to `auth_info_t` structures.

Simple examples of existing authentication methods can be seen in `auth_psk.c` for PSK ciphersuites and `auth_srp.c` for SRP ciphersuites. After implementing these functions the structure holding its pointers has to be registered in `gnutls_algorithms.c` in the `_gnutls_kx_algorithms` structure.

```
<div class="node">
```

```
<a name="TLS-Extension-Handling"></a>
```

```
<p><hr>
```

```

```
Up:&nbsp;<a rel="up" accesskey="u" href="#Internal-architecture-of-GnuTLS">Internal architecture of GnuTLS</a>
```

```
</div>
```

12.4 TLS Extension Handling

As with authentication methods, the TLS extensions handlers can be implemented using the following interface.

Here there are two functions, one for receiving the extension data and one for sending. These functions have to check internally whether they operate in client or server side.

A simple example of an extension handler can be seen in `ext_srp.c`. After implementing these functions, together with the extension number they handle, they have to be registered in `gnutls_extensions.c` in the `_gnutls_extensions` structure.

12.4.1 Adding a New TLS Extension

Adding support for a new TLS extension is done from time to time, and the process to do so is not difficult. Here are the steps you need to follow if you wish to do this yourself. For sake of discussion, let's consider adding support for the hypothetical TLS extension `foobar`.

-

- Modify `configure.in` to add `--enable-foobar` or `--disable-foobar`.

Which to chose depends on whether you intend to make the extension be enabled by default. Look at existing checks (i.e., SRP, authz) for how to model the code. For example:

```
AC_MSG_CHECKING([whether to disable foobar support])
AC_ARG_ENABLE(foobar,
  AS_HELP_STRING([--disable-foobar],
    [disable foobar support]),
  ac_enable_foobar=no)
if test x$ac_enable_foobar != xno; then
  AC_MSG_RESULT(no)
  AC_DEFINE(ENABLE_FOOBAR, 1, [enable foobar])
else
  ac_full=0
  AC_MSG_RESULT(yes)
fi
AM_CONDITIONAL(ENABLE_FOOBAR, test "$ac_enable_foobar" != "no")
```

- Add IANA extension value to `extensions_t` in `gnutls_int.h`.

<p>A good name for the value would be GNUTLS_EXTENSION_FOOBAR. Check with http://www.iana.org/assignments/tls-extensiontype-values

for allocated values. For experiments, you could pick a number but remember that some consider it a bad idea to deploy such modified version since it will lead to interoperability problems in the future when the IANA allocates that number to someone else, or when the foobar protocol is allocated another number.

Add an entry to <code>_gnutls_extensions</code> in <code>gnutls_extensions.c</code>.

<p>A typical entry would be:

```
<pre class="example">    #if ENABLE_FOOBAR
    GNUTLS_EXTENSION_ENTRY (GNUTLS_EXTENSION_FOOBAR,
        _gnutls_foobar_recv_params,
        _gnutls_foobar_send_params),
    #endif
</pre>
```

<p>The GNUTLS_EXTENSION_FOOBAR is the integer value you added to <code>gnutls_int.h</code> earlier. The two functions are new functions that you will need to implement, most likely you'll need to add an <code>#include "ext_foobar.h"</code> as well.

Add new files <code>ext_foobar.c</code> and <code>ext_foobar.h</code> that implements the extension.

<p>The functions you are responsible to add are those mentioned in the previous step. As a starter, you could add this:

```
<pre class="example">    int
    _gnutls_foobar_recv_params (gnutls_session_t session,
        const opaque * data,
        size_t data_size)
    {
        return 0;
    }

    int
    _gnutls_foobar_send_params (gnutls_session_t session,
        opaque * data,
        size_t _data_size)
    {
        return 0;
    }
</pre>
```

<p>The <code>_gnutls_foobar_recv_params</code> function is responsible for parsing incoming extension data (both in the client and server).

<p>The <code>_gnutls_foobar_send_params</code> function is responsible for sending extension data (both in the client and server).

<p>If you receive length fields that doesn't match, return <code>GNUTLS_E_UNEXPECTED_PACKET_LENGTH</code>. If you receive invalid data, return <code>GNUTLS_E_RECEIVED_ILLEGAL_PARAMETER</code>. You can use other error codes too. Return 0 on success.

<p>The function typically store some information in the <code>session</code> variable for later usage. If you need to add new fields there, check <code>tls_ext_st</code> in <code>gnutls_int.h</code> and compare with existing TLS extension specific variables.

<p>Recall that both the client and server both send and receives parameters, and your code most likely will need to do different things depending on which mode it is in. It may be useful to make this distinction explicit in the code. Thus, for example, a better template than above would be:

```
<pre class="example">    int
    _gnutls_foobar_rcv_params (gnutls_session_t session,
                              const opaque * data,
                              size_t data_size)
    {
        if (session-&gt;security_parameters.entity == GNUTLS_CLIENT)
            return foobar_rcv_client (session, data, data_size);
        else
            return foobar_rcv_server (session, data, data_size);
    }

    int
    _gnutls_foobar_send_params (gnutls_session_t session,
                               opaque * data,
                               size_t data_size)
    {
        if (session-&gt;security_parameters.entity == GNUTLS_CLIENT)
            return foobar_send_client (session, data, data_size);
        else
            return foobar_send_server (session, data, data_size);
    }
</pre>
```

<p>The functions used would be declared as <code>static</code> functions, of the appropriate prototype, in the same file.

<p>When adding the files, you'll need to add them to <code>Makefile.am</code> as well, for example:

```
<pre class="example">    if ENABLE_FOOBAR
    OBJECTS += ext_foobar.c
    HFILES += ext_foobar.h
    endif
</pre>
```

Add API functions to enable/disable the extension.

<p>Normally the client will have one API to request use of the extension, and setting some extension specific data. The server will have one API to let the library know that it is willing to accept the extension, often this is implemented through a callback but it doesn't have to.

<p>The APIs need to be added to <code>includes/gnutls/gnutls.h</code> or <code>includes/gnutls/extra.h</code> as appropriate. It is recommended that if you don't have a requirement to use the LGPLv2.1+ license for your extension, that you place your work under the GPLv3+ license and thus in the libgnutls-extra library.

<p>You can implement the API function in the <code>ext_foobar.c</code> file, or if that file ends up becoming rather larger, add a <code>gnutls_foobar.c</code> file.

<h3 class="section">12.5 Certificate Handling</h3>

<p>What is provided by the certificate handling functions is summarized in the following diagram.

<div class="block-image"></div>

<div class="node">

<p><hr>

Previous: TLS Extension Handling,&br/>Up: Internal architecture of
GnuTLS

</div>

</div>

<h3 class="section">12.6 Cryptographic Backend</h3>

<p>Several new systems provide hardware assisted cryptographic algorithm implementations that offer implementations some orders of magnitude faster than the software. For this reason in current releases of GnuTLS it is possible to override parts of the crypto backend or the whole. It is possible to override them both at runtime and compile time, however

here we will discuss the runtime possibility. The API available for this functionality is in `gnutls/crypto.h` header file.

12.6.1 Override specific algorithms

When an optimized implementation of a single algorithm is available, say a hardware assisted version of `AES-CBC` then the following functions can be used to register those algorithms.

-

- [gnutls_crypto_single_cipher_register2](#)

To register a cipher algorithm.

- [gnutls_crypto_single_mac_register2](#)

To register a MAC algorithm.

-

- [gnutls_crypto_single_digest_register2](#)

To register a digest (hash) algorithm.

Those registration functions will only replace the specified algorithm and leave the rest of subsystem intact.

12.6.2 Override parts of the backend

In some systems, such as embedded ones, it might be desirable to override big parts of the cryptographic backend, or even all of them. For this reason the following functions are provided.

-

- [gnutls_crypto_cipher_register2](#)

To override the cryptographic algorithms backend.

- [gnutls_crypto_mac_register2](#)

To override the MAC algorithms backend.

- [gnutls_crypto_digest_register2](#)

To override the digest algorithms backend.

- [gnutls_crypto_rnd_register2](#)

To override the random number generator backend.

- [gnutls_crypto_bigint_register2](#)

To override the big number number operations backend.

[gnutls_crypto_pk_register2](#)
To override the public key encryption backend. This is tight to the big number operations so either both of them should be updated or care must be taken to use the same format.

If all of them are used then GnuTLS will no longer use libgcrypt.

pre class="display"> Copyright © 2000, 2001, 2002, 2007, 2008 Free Software Foundation, Inc.

<http://fsf.org/>

Everyone is permitted to copy and distribute verbatim copies of this license document, but changing it is not allowed.

</pre>

<ol type=1 start=0>

PREAMBLE

<p>The purpose of this License is to make a manual, textbook, or other functional and useful document <dfn>free</dfn> in the sense of freedom: to assure everyone the effective freedom to copy and redistribute it, with or without modifying it, either commercially or noncommercially. Secondly, this License preserves for the author and publisher a way to get credit for their work, while not being considered responsible for modifications made by others.

<p>This License is a kind of “copyleft”, which means that derivative works of the document must themselves be free in the same sense. It complements the GNU General Public License, which is a copyleft license designed for free software.

<p>We have designed this License in order to use it for manuals for free software, because free software needs free documentation: a free program should come with manuals providing the same freedoms that the software does. But this License is not limited to software manuals; it can be used for any textual work, regardless of subject matter or whether it is published as a printed book. We recommend this License principally for works whose purpose is instruction or reference.

APPLICABILITY AND DEFINITIONS

<p>This License applies to any manual or other work, in any medium, that contains a notice placed by the copyright holder saying it can be distributed under the terms of this License. Such a notice grants a world-wide, royalty-free license, unlimited in duration, to use that work under the conditions stated herein. The “Document”, below, refers to any such manual or work. Any member of the public is a licensee, and is addressed as “you”. You accept the license if you copy, modify or distribute the work in a way requiring permission under copyright law.

<p>A “Modified Version” of the Document means any work containing the Document or a portion of it, either copied verbatim, or with modifications and/or translated into another language.

<p>A “Secondary Section” is a named appendix or a front-matter section of the Document that deals exclusively with the relationship of the publishers or authors of the Document to the Document's overall

subject (or to related matters) and contains nothing that could fall directly within that overall subject. (Thus, if the Document is in part a textbook of mathematics, a Secondary Section may not explain any mathematics.) The relationship could be a matter of historical connection with the subject or with related matters, or of legal, commercial, philosophical, ethical or political position regarding them.

<p>The “Invariant Sections” are certain Secondary Sections whose titles are designated, as being those of Invariant Sections, in the notice that says that the Document is released under this License. If a section does not fit the above definition of Secondary then it is not allowed to be designated as Invariant. The Document may contain zero Invariant Sections. If the Document does not identify any Invariant Sections then there are none.

<p>The “Cover Texts” are certain short passages of text that are listed, as Front-Cover Texts or Back-Cover Texts, in the notice that says that the Document is released under this License. A Front-Cover Text may be at most 5 words, and a Back-Cover Text may be at most 25 words.

<p>A “Transparent” copy of the Document means a machine-readable copy, represented in a format whose specification is available to the general public, that is suitable for revising the document straightforwardly with generic text editors or (for images composed of pixels) generic paint programs or (for drawings) some widely available drawing editor, and that is suitable for input to text formatters or for automatic translation to a variety of formats suitable for input to text formatters. A copy made in an otherwise Transparent file format whose markup, or absence of markup, has been arranged to thwart or discourage subsequent modification by readers is not Transparent. An image format is not Transparent if used for any substantial amount of text. A copy that is not “Transparent” is called “Opaque”.

<p>Examples of suitable formats for Transparent copies include plain ascii without markup, Texinfo input format, LaTeX input format, <acronym>SGML</acronym> or <acronym>XML</acronym> using a publicly available <acronym>DTD</acronym>, and standard-conforming simple <acronym>HTML</acronym>, PostScript or <acronym>PDF</acronym> designed for human modification. Examples of transparent image formats include <acronym>PNG</acronym>, <acronym>XCF</acronym> and <acronym>JPG</acronym>. Opaque formats include proprietary formats that can be read and edited only by proprietary word processors, <acronym>SGML</acronym> or <acronym>XML</acronym> for which the <acronym>DTD</acronym> and/or processing tools are not generally available, and the machine-generated <acronym>HTML</acronym>, PostScript or <acronym>PDF</acronym> produced by some word processors for output purposes only.

<p>The “Title Page” means, for a printed book, the title page itself,

plus such following pages as are needed to hold, legibly, the material this License requires to appear in the title page. For works in formats which do not have any title page as such, "Title Page" means the text near the most prominent appearance of the work's title, preceding the beginning of the body of the text.

<p>The "publisher" means any person or entity that distributes copies of the Document to the public.

<p>A section "Entitled XYZ" means a named subunit of the Document whose title either is precisely XYZ or contains XYZ in parentheses following text that translates XYZ in another language. (Here XYZ stands for a specific section name mentioned below, such as "Acknowledgements", "Dedications", "Endorsements", or "History") To "Preserve the Title" of such a section when you modify the Document means that it remains a section "Entitled XYZ" according to this definition.

<p>The Document may include Warranty Disclaimers next to the notice which states that this License applies to the Document. These Warranty Disclaimers are considered to be included by reference in this License, but only as regards disclaiming warranties: any other implication that these Warranty Disclaimers may have is void and has no effect on the meaning of this License.

VERBATIM COPYING

<p>You may copy and distribute the Document in any medium, either commercially or noncommercially, provided that this License, the copyright notices, and the license notice saying this License applies to the Document are reproduced in all copies, and that you add no other conditions whatsoever to those of this License. You may not use technical measures to obstruct or control the reading or further copying of the copies you make or distribute. However, you may accept compensation in exchange for copies. If you distribute a large enough number of copies you must also follow the conditions in section 3.

<p>You may also lend copies, under the same conditions stated above, and you may publicly display copies.

COPYING IN QUANTITY

<p>If you publish printed copies (or copies in media that commonly have printed covers) of the Document, numbering more than 100, and the Document's license notice requires Cover Texts, you must enclose the copies in covers that carry, clearly and legibly, all these Cover Texts: Front-Cover Texts on the front cover, and Back-Cover Texts on the back cover. Both covers must also clearly and legibly identify

you as the publisher of these copies. The front cover must present the full title with all words of the title equally prominent and visible. You may add other material on the covers in addition. Copying with changes limited to the covers, as long as they preserve the title of the Document and satisfy these conditions, can be treated as verbatim copying in other respects.

<p>If the required texts for either cover are too voluminous to fit legibly, you should put the first ones listed (as many as fit reasonably) on the actual cover, and continue the rest onto adjacent pages.

<p>If you publish or distribute Opaque copies of the Document numbering more than 100, you must either include a machine-readable Transparent copy along with each Opaque copy, or state in or with each Opaque copy a computer-network location from which the general network-using public has access to download using public-standard network protocols a complete Transparent copy of the Document, free of added material. If you use the latter option, you must take reasonably prudent steps, when you begin distribution of Opaque copies in quantity, to ensure that this Transparent copy will remain thus accessible at the stated location until at least one year after the last time you distribute an Opaque copy (directly or through your agents or retailers) of that edition to the public.

<p>It is requested, but not required, that you contact the authors of the Document well before redistributing any large number of copies, to give them a chance to provide you with an updated version of the Document.

MODIFICATIONS

<p>You may copy and distribute a Modified Version of the Document under the conditions of sections 2 and 3 above, provided that you release the Modified Version under precisely this License, with the Modified Version filling the role of the Document, thus licensing distribution and modification of the Modified Version to whoever possesses a copy of it. In addition, you must do these things in the Modified Version:

<ol type=A start=1>

Use in the Title Page (and on the covers, if any) a title distinct from that of the Document, and from those of previous versions (which should, if there were any, be listed in the History section of the Document). You may use the same title as a previous version if the original publisher of that version gives permission.

List on the Title Page, as authors, one or more persons or entities responsible for authorship of the modifications in the Modified Version, together with at least five of the principal authors of the

Document (all of its principal authors, if it has fewer than five), unless they release you from this requirement.

State on the Title page the name of the publisher of the Modified Version, as the publisher.

Preserve all the copyright notices of the Document.

Add an appropriate copyright notice for your modifications adjacent to the other copyright notices.

Include, immediately after the copyright notices, a license notice giving the public permission to use the Modified Version under the terms of this License, in the form shown in the Addendum below.

Preserve in that license notice the full lists of Invariant Sections and required Cover Texts given in the Document's license notice.

Include an unaltered copy of this License.

Preserve the section Entitled “History”, Preserve its Title, and add to it an item stating at least the title, year, new authors, and publisher of the Modified Version as given on the Title Page. If there is no section Entitled “History” in the Document, create one stating the title, year, authors, and publisher of the Document as given on its Title Page, then add an item describing the Modified Version as stated in the previous sentence.

Preserve the network location, if any, given in the Document for public access to a Transparent copy of the Document, and likewise the network locations given in the Document for previous versions it was based on. These may be placed in the “History” section. You may omit a network location for a work that was published at least four years before the Document itself, or if the original publisher of the version it refers to gives permission.

For any section Entitled “Acknowledgements” or “Dedications”, Preserve the Title of the section, and preserve in the section all the substance and tone of each of the contributor acknowledgements and/or dedications given therein.

Preserve all the Invariant Sections of the Document, unaltered in their text and in their titles. Section numbers or the equivalent are not considered part of the section titles.

Delete any section Entitled “Endorsements”. Such a section may not be included in the Modified Version.

Do not retitle any existing section to be Entitled “Endorsements” or to conflict in title with any Invariant Section.

Preserve any Warranty Disclaimers.

<p>If the Modified Version includes new front-matter sections or appendices that qualify as Secondary Sections and contain no material copied from the Document, you may at your option designate some or all of these sections as invariant. To do this, add their titles to the list of Invariant Sections in the Modified Version's license notice. These titles must be distinct from any other section titles.

<p>You may add a section Entitled “Endorsements”, provided it contains nothing but endorsements of your Modified Version by various parties—for example, statements of peer review or that the text has been approved by an organization as the authoritative definition of a standard.

<p>You may add a passage of up to five words as a Front-Cover Text, and a passage of up to 25 words as a Back-Cover Text, to the end of the list of Cover Texts in the Modified Version. Only one passage of Front-Cover Text and one of Back-Cover Text may be added by (or through arrangements made by) any one entity. If the Document already includes a cover text for the same cover, previously added by you or by arrangement made by the same entity you are acting on behalf of, you may not add another; but you may replace the old one, on explicit permission from the previous publisher that added the old one.

<p>The author(s) and publisher(s) of the Document do not by this License give permission to use their names for publicity for or to assert or imply endorsement of any Modified Version.

COMBINING DOCUMENTS

<p>You may combine the Document with other documents released under this License, under the terms defined in section 4 above for modified versions, provided that you include in the combination all of the Invariant Sections of all of the original documents, unmodified, and list them all as Invariant Sections of your combined work in its license notice, and that you preserve all their Warranty Disclaimers.

<p>The combined work need only contain one copy of this License, and multiple identical Invariant Sections may be replaced with a single copy. If there are multiple Invariant Sections with the same name but different contents, make the title of each such section unique by adding at the end of it, in parentheses, the name of the original author or publisher of that section if known, or else a unique number.

Make the same adjustment to the section titles in the list of Invariant Sections in the license notice of the combined work.

<p>In the combination, you must combine any sections Entitled “History” in the various original documents, forming one section Entitled “History”; likewise combine any sections Entitled “Acknowledgements”, and any sections Entitled “Dedications”. You must delete all sections Entitled “Endorsements.”

COLLECTIONS OF DOCUMENTS

<p>You may make a collection consisting of the Document and other documents released under this License, and replace the individual copies of this License in the various documents with a single copy that is included in the collection, provided that you follow the rules of this License for verbatim copying of each of the documents in all other respects.

<p>You may extract a single document from such a collection, and distribute it individually under this License, provided you insert a copy of this License into the extracted document, and follow this License in all other respects regarding verbatim copying of that document.

AGGREGATION WITH INDEPENDENT WORKS

<p>A compilation of the Document or its derivatives with other separate and independent documents or works, in or on a volume of a storage or distribution medium, is called an “aggregate” if the copyright resulting from the compilation is not used to limit the legal rights of the compilation's users beyond what the individual works permit. When the Document is included in an aggregate, this License does not apply to the other works in the aggregate which are not themselves derivative works of the Document.

<p>If the Cover Text requirement of section 3 is applicable to these copies of the Document, then if the Document is less than one half of the entire aggregate, the Document's Cover Texts may be placed on covers that bracket the Document within the aggregate, or the electronic equivalent of covers if the Document is in electronic form. Otherwise they must appear on printed covers that bracket the whole aggregate.

TRANSLATION

<p>Translation is considered a kind of modification, so you may distribute translations of the Document under the terms of section 4. Replacing Invariant Sections with translations requires special permission from their copyright holders, but you may include translations of some or all Invariant Sections in addition to the

original versions of these Invariant Sections. You may include a translation of this License, and all the license notices in the Document, and any Warranty Disclaimers, provided that you also include the original English version of this License and the original versions of those notices and disclaimers. In case of a disagreement between the translation and the original version of this License or a notice or disclaimer, the original version will prevail.

<p>If a section in the Document is Entitled “Acknowledgements”, “Dedications”, or “History”, the requirement (section 4) to Preserve its Title (section 1) will typically require changing the actual title.

TERMINATION

<p>You may not copy, modify, sublicense, or distribute the Document except as expressly provided under this License. Any attempt otherwise to copy, modify, sublicense, or distribute it is void, and will automatically terminate your rights under this License.

<p>However, if you cease all violation of this License, then your license from a particular copyright holder is reinstated (a) provisionally, unless and until the copyright holder explicitly and finally terminates your license, and (b) permanently, if the copyright holder fails to notify you of the violation by some reasonable means prior to 60 days after the cessation.

<p>Moreover, your license from a particular copyright holder is reinstated permanently if the copyright holder notifies you of the violation by some reasonable means, this is the first time you have received notice of violation of this License (for any work) from that copyright holder, and you cure the violation prior to 30 days after your receipt of the notice.

<p>Termination of your rights under this section does not terminate the licenses of parties who have received copies or rights from you under this License. If your rights have been terminated and not permanently reinstated, receipt of a copy of some or all of the same material does not give you any rights to use it.

FUTURE REVISIONS OF THIS LICENSE

<p>The Free Software Foundation may publish new, revised versions of the GNU Free Documentation License from time to time. Such new versions will be similar in spirit to the present version, but may differ in detail to address new problems or concerns. See <http://www.gnu.org/copyleft/>.

Each version of the License is given a distinguishing version number. If the Document specifies that a particular numbered version of this License or any later version applies to it, you have the option of following the terms and conditions either of that specified version or of any later version that has been published (not as a draft) by the Free Software Foundation. If the Document does not specify a version number of this License, you may choose any version ever published (not as a draft) by the Free Software Foundation. If the Document specifies that a proxy can decide which future versions of this License can be used, that proxy's public statement of acceptance of a version permanently authorizes you to choose that version for the Document.

RELICENSING

“Massive Multiauthor Collaboration Site” (or “MMC Site”) means any World Wide Web server that publishes copyrightable works and also provides prominent facilities for anybody to edit those works. A public wiki that anybody can edit is an example of such a server. A “Massive Multiauthor Collaboration” (or “MMC”) contained in the site means any set of copyrightable works thus published on the MMC site.

“CC-BY-SA” means the Creative Commons Attribution-Share Alike 3.0 license published by Creative Commons Corporation, a not-for-profit corporation with a principal place of business in San Francisco, California, as well as future copyleft versions of that license published by that same organization.

“Incorporate” means to publish or republish a Document, in whole or in part, as part of another Document.

An MMC is “eligible for relicensing” if it is licensed under this License, and if all works that were first published under this License somewhere other than this MMC, and subsequently incorporated in whole or in part into the MMC, (1) had no cover texts or invariant sections, and (2) were thus incorporated prior to November 1, 2008.

The operator of an MMC Site may republish an MMC contained in the site under CC-BY-SA on the same site at any time before August 1, 2009, provided the MMC is eligible for relicensing.

ADDENDUM: How to use this License for your documents

To use this License in a document you have written, include a copy of the License in the document and put the following copyright and

license notices just after the title page:

```
<pre class="smallexample">   Copyright (C) <var>year</var> <var>your name</var>.
   Permission is granted to copy, distribute and/or modify this document
   under the terms of the GNU Free Documentation License, Version 1.3
   or any later version published by the Free Software Foundation;
   with no Invariant Sections, no Front-Cover Texts, and no Back-Cover
   Texts. A copy of the license is included in the section entitled ``GNU
   Free Documentation License".
```

</pre>

<p>If you have Invariant Sections, Front-Cover Texts and Back-Cover Texts, replace the “with<small class="dots">...</small>Texts.” line with this:

```
<pre class="smallexample">   with the Invariant Sections being <var>list their titles</var>, with
   the Front-Cover Texts being <var>list</var>, and with the Back-Cover Texts
   being <var>list</var>.
```

</pre>

<p>If you have Invariant Sections without Cover Texts, or some other combination of the three, merge those two alternatives to suit the situation.

<p>If your document contains nontrivial examples of program code, we recommend releasing these examples in parallel under your choice of free software license, such as the GNU General Public License, to permit their use in free software.

<!-- The GNU Lesser General Public License. -->

<div align="center">Version 2.1, February 1999</div>

<!-- This file is intended to be included within another document, -->

<!-- hence no sectioning command or @node. -->

<pre class="display"> Copyright © 1991, 1999 Free Software Foundation, Inc.
51 Franklin Street, Fifth Floor, Boston, MA 02110-1301, USA

Everyone is permitted to copy and distribute verbatim copies
of this license document, but changing it is not allowed.

[This is the first released version of the Lesser GPL. It also counts
as the successor of the GNU Library Public License, version 2, hence the
version number 2.1.]

</pre>

<h4 class="subheading">Preamble</h4>

<p>The licenses for most software are designed to take away your
freedom to share and change it. By contrast, the GNU General Public
Licenses are intended to guarantee your freedom to share and change
free software—to make sure the software is free for all its users.

<p>This license, the Lesser General Public License, applies to some
specially designated software—typically libraries—of the Free
Software Foundation and other authors who decide to use it. You can use
it too, but we suggest you first think carefully about whether this
license or the ordinary General Public License is the better strategy to
use in any particular case, based on the explanations below.

<p>When we speak of free software, we are referring to freedom of use,
not price. Our General Public Licenses are designed to make sure that
you have the freedom to distribute copies of free software (and charge
for this service if you wish); that you receive source code or can get
it if you want it; that you can change the software and use pieces of it
in new free programs; and that you are informed that you can do these
things.

<p>To protect your rights, we need to make restrictions that forbid
distributors to deny you these rights or to ask you to surrender these
rights. These restrictions translate to certain responsibilities for
you if you distribute copies of the library or if you modify it.

<p>For example, if you distribute copies of the library, whether gratis
or for a fee, you must give the recipients all the rights that we gave
you. You must make sure that they, too, receive or can get the source
code. If you link other code with the library, you must provide
complete object files to the recipients, so that they can relink them
with the library after making changes to the library and recompiling
it. And you must show them these terms so they know their rights.

<p>We protect your rights with a two-step method: (1) we copyright the
library, and (2) we offer you this license, which gives you legal

permission to copy, distribute and/or modify the library.

<p>To protect each distributor, we want to make it very clear that there is no warranty for the free library. Also, if the library is modified by someone else and passed on, the recipients should know that what they have is not the original version, so that the original author's reputation will not be affected by problems that might be introduced by others.

<p>Finally, software patents pose a constant threat to the existence of any free program. We wish to make sure that a company cannot effectively restrict the users of a free program by obtaining a restrictive license from a patent holder. Therefore, we insist that any patent license obtained for a version of the library must be consistent with the full freedom of use specified in this license.

<p>Most GNU software, including some libraries, is covered by the ordinary GNU General Public License. This license, the GNU Lesser General Public License, applies to certain designated libraries, and is quite different from the ordinary General Public License. We use this license for certain libraries in order to permit linking those libraries into non-free programs.

<p>When a program is linked with a library, whether statically or using a shared library, the combination of the two is legally speaking a combined work, a derivative of the original library. The ordinary General Public License therefore permits such linking only if the entire combination fits its criteria of freedom. The Lesser General Public License permits more lax criteria for linking other code with the library.

<p>We call this license the <dfn>Lesser</dfn> General Public License because it does Less to protect the user's freedom than the ordinary General Public License. It also provides other free software developers Less of an advantage over competing non-free programs. These disadvantages are the reason we use the ordinary General Public License for many libraries. However, the Lesser license provides advantages in certain special circumstances.

<p>For example, on rare occasions, there may be a special need to encourage the widest possible use of a certain library, so that it becomes a de-facto standard. To achieve this, non-free programs must be allowed to use the library. A more frequent case is that a free library does the same job as widely used non-free libraries. In this case, there is little to gain by limiting the free library to free software only, so we use the Lesser General Public License.

<p>In other cases, permission to use a particular library in non-free

programs enables a greater number of people to use a large body of free software. For example, permission to use the GNU C Library in non-free programs enables many more people to use the whole GNU operating system, as well as its variant, the GNU/Linux operating system.

Although the Lesser General Public License is less protective of the users' freedom, it does ensure that the user of a program that is linked with the Library has the freedom and the wherewithal to run that program using a modified version of the Library.

The precise terms and conditions for copying, distribution and modification follow. Pay close attention to the difference between a "work based on the library" and a "work that uses the library". The former contains code derived from the library, whereas the latter must be combined with the library in order to run.

TERMS AND CONDITIONS FOR COPYING, DISTRIBUTION AND MODIFICATION

-

This License Agreement applies to any software library or other program which contains a notice placed by the copyright holder or other authorized party saying it may be distributed under the terms of this Lesser General Public License (also called "this License"). Each licensee is addressed as "you".

A "library" means a collection of software functions and/or data prepared so as to be conveniently linked with application programs (which use some of those functions and data) to form executables.

The "Library", below, refers to any such software library or work which has been distributed under these terms. A "work based on the Library" means either the Library or any derivative work under copyright law: that is to say, a work containing the Library or a portion of it, either verbatim or with modifications and/or translated straightforwardly into another language. (Hereinafter, translation is included without limitation in the term "modification".)

"Source code" for a work means the preferred form of the work for making modifications to it. For a library, complete source code means all the source code for all modules it contains, plus any associated interface definition files, plus the scripts used to control compilation and installation of the library.

Activities other than copying, distribution and modification are not covered by this License; they are outside its scope. The act of running a program using the Library is not restricted, and output from

such a program is covered only if its contents constitute a work based on the Library (independent of the use of the Library in a tool for writing it). Whether that is true depends on what the Library does and what the program that uses the Library does.

You may copy and distribute verbatim copies of the Library's complete source code as you receive it, in any medium, provided that you conspicuously and appropriately publish on each copy an appropriate copyright notice and disclaimer of warranty; keep intact all the notices that refer to this License and to the absence of any warranty; and distribute a copy of this License along with the Library.

<p>You may charge a fee for the physical act of transferring a copy, and you may at your option offer warranty protection in exchange for a fee.

You may modify your copy or copies of the Library or any portion of it, thus forming a work based on the Library, and copy and distribute such modifications or work under the terms of Section 1 above, provided that you also meet all of these conditions:

<ol type=a start=1>

The modified work must itself be a software library.

You must cause the files modified to carry prominent notices stating that you changed the files and the date of any change.

You must cause the whole of the work to be licensed at no charge to all third parties under the terms of this License.

If a facility in the modified Library refers to a function or a table of data to be supplied by an application program that uses the facility, other than as an argument passed when the facility is invoked, then you must make a good faith effort to ensure that, in the event an application does not supply such function or table, the facility still operates, and performs whatever part of its purpose remains meaningful.

<p>(For example, a function in a library to compute square roots has a purpose that is entirely well-defined independent of the application. Therefore, Subsection 2d requires that any application-supplied function or table used by this function must be optional: if the application does not supply it, the square root function must still compute square roots.)

<p>These requirements apply to the modified work as a whole. If

identifiable sections of that work are not derived from the Library, and can be reasonably considered independent and separate works in themselves, then this License, and its terms, do not apply to those sections when you distribute them as separate works. But when you distribute the same sections as part of a whole which is a work based on the Library, the distribution of the whole must be on the terms of this License, whose permissions for other licensees extend to the entire whole, and thus to each and every part regardless of who wrote it.

<p>Thus, it is not the intent of this section to claim rights or contest your rights to work written entirely by you; rather, the intent is to exercise the right to control the distribution of derivative or collective works based on the Library.

<p>In addition, mere aggregation of another work not based on the Library with the Library (or with a work based on the Library) on a volume of a storage or distribution medium does not bring the other work under the scope of this License.

You may opt to apply the terms of the ordinary GNU General Public License instead of this License to a given copy of the Library. To do this, you must alter all the notices that refer to this License, so that they refer to the ordinary GNU General Public License, version 2, instead of to this License. (If a newer version than version 2 of the ordinary GNU General Public License has appeared, then you can specify that version instead if you wish.) Do not make any other change in these notices.

<p>Once this change is made in a given copy, it is irreversible for that copy, so the ordinary GNU General Public License applies to all subsequent copies and derivative works made from that copy.

<p>This option is useful when you wish to copy part of the code of the Library into a program that is not a library.

You may copy and distribute the Library (or a portion or derivative of it, under Section 2) in object code or executable form under the terms of Sections 1 and 2 above provided that you accompany it with the complete corresponding machine-readable source code, which must be distributed under the terms of Sections 1 and 2 above on a medium customarily used for software interchange.

<p>If distribution of object code is made by offering access to copy from a designated place, then offering equivalent access to copy the source code from the same place satisfies the requirement to distribute the source code, even though third parties are not compelled to copy the source along with the object code.

A program that contains no derivative of any portion of the Library, but is designed to work with the Library by being compiled or linked with it, is called a “work that uses the Library”. Such a work, in isolation, is not a derivative work of the Library, and therefore falls outside the scope of this License.

<p>However, linking a “work that uses the Library” with the Library creates an executable that is a derivative of the Library (because it contains portions of the Library), rather than a “work that uses the library”. The executable is therefore covered by this License. Section 6 states terms for distribution of such executables.

<p>When a “work that uses the Library” uses material from a header file that is part of the Library, the object code for the work may be a derivative work of the Library even though the source code is not. Whether this is true is especially significant if the work can be linked without the Library, or if the work is itself a library. The threshold for this to be true is not precisely defined by law.

<p>If such an object file uses only numerical parameters, data structure layouts and accessors, and small macros and small inline functions (ten lines or less in length), then the use of the object file is unrestricted, regardless of whether it is legally a derivative work. (Executables containing this object code plus portions of the Library will still fall under Section 6.)

<p>Otherwise, if the work is a derivative of the Library, you may distribute the object code for the work under the terms of Section 6. Any executables containing that work also fall under Section 6, whether or not they are linked directly with the Library itself.

As an exception to the Sections above, you may also combine or link a “work that uses the Library” with the Library to produce a work containing portions of the Library, and distribute that work under terms of your choice, provided that the terms permit modification of the work for the customer's own use and reverse engineering for debugging such modifications.

<p>You must give prominent notice with each copy of the work that the Library is used in it and that the Library and its use are covered by this License. You must supply a copy of this License. If the work during execution displays copyright notices, you must include the copyright notice for the Library among them, as well as a reference directing the user to the copy of this License. Also, you must do one of these things:

<ol type=a start=1>

Accompany the work with the complete corresponding machine-readable source code for the Library including whatever changes were used in the work (which must be distributed under Sections 1 and 2 above); and, if the work is an executable linked with the Library, with the complete machine-readable “work that uses the Library”, as object code and/or source code, so that the user can modify the Library and then relink to produce a modified executable containing the modified Library. (It is understood that the user who changes the contents of definitions files in the Library will not necessarily be able to recompile the application to use the modified definitions.)

Use a suitable shared library mechanism for linking with the Library. A suitable mechanism is one that (1) uses at run time a copy of the library already present on the user's computer system, rather than copying library functions into the executable, and (2) will operate properly with a modified version of the library, if the user installs one, as long as the modified version is interface-compatible with the version that the work was made with.

Accompany the work with a written offer, valid for at least three years, to give the same user the materials specified in Subsection 6a, above, for a charge no more than the cost of performing this distribution.

If distribution of the work is made by offering access to copy from a designated place, offer equivalent access to copy the above specified materials from the same place.

Verify that the user has already received a copy of these materials or that you have already sent this user a copy.

<p>For an executable, the required form of the “work that uses the Library” must include any data and utility programs needed for reproducing the executable from it. However, as a special exception, the materials to be distributed need not include anything that is normally distributed (in either source or binary form) with the major components (compiler, kernel, and so on) of the operating system on which the executable runs, unless that component itself accompanies the executable.

<p>It may happen that this requirement contradicts the license restrictions of other proprietary libraries that do not normally accompany the operating system. Such a contradiction means you cannot use both them and the Library together in an executable that you distribute.

You may place library facilities that are a work based on the Library side-by-side in a single library together with other library facilities not covered by this License, and distribute such a combined library, provided that the separate distribution of the work based on the Library and of the other library facilities is otherwise permitted, and provided that you do these two things:

<ol type=a start=1>

Accompany the combined library with a copy of the same work based on the Library, uncombined with any other library facilities. This must be distributed under the terms of the Sections above.

Give prominent notice with the combined library of the fact that part of it is a work based on the Library, and explaining where to find the accompanying uncombined form of the same work.

You may not copy, modify, sublicense, link with, or distribute the Library except as expressly provided under this License. Any attempt otherwise to copy, modify, sublicense, link with, or distribute the Library is void, and will automatically terminate your rights under this License. However, parties who have received copies, or rights, from you under this License will not have their licenses terminated so long as such parties remain in full compliance.

You are not required to accept this License, since you have not signed it. However, nothing else grants you permission to modify or distribute the Library or its derivative works. These actions are prohibited by law if you do not accept this License. Therefore, by modifying or distributing the Library (or any work based on the Library), you indicate your acceptance of this License to do so, and all its terms and conditions for copying, distributing or modifying the Library or works based on it.

Each time you redistribute the Library (or any work based on the Library), the recipient automatically receives a license from the original licensor to copy, distribute, link with or modify the Library subject to these terms and conditions. You may not impose any further restrictions on the recipients' exercise of the rights granted herein. You are not responsible for enforcing compliance by third parties with this License.

If, as a consequence of a court judgment or allegation of patent infringement or for any other reason (not limited to patent issues), conditions are imposed on you (whether by court order, agreement or otherwise) that contradict the conditions of this License, they do not excuse you from the conditions of this License. If you cannot

distribute so as to satisfy simultaneously your obligations under this License and any other pertinent obligations, then as a consequence you may not distribute the Library at all. For example, if a patent license would not permit royalty-free redistribution of the Library by all those who receive copies directly or indirectly through you, then the only way you could satisfy both it and this License would be to refrain entirely from distribution of the Library.

<p>If any portion of this section is held invalid or unenforceable under any particular circumstance, the balance of the section is intended to apply, and the section as a whole is intended to apply in other circumstances.

<p>It is not the purpose of this section to induce you to infringe any patents or other property right claims or to contest validity of any such claims; this section has the sole purpose of protecting the integrity of the free software distribution system which is implemented by public license practices. Many people have made generous contributions to the wide range of software distributed through that system in reliance on consistent application of that system; it is up to the author/donor to decide if he or she is willing to distribute software through any other system and a licensee cannot impose that choice.

<p>This section is intended to make thoroughly clear what is believed to be a consequence of the rest of this License.

If the distribution and/or use of the Library is restricted in certain countries either by patents or by copyrighted interfaces, the original copyright holder who places the Library under this License may add an explicit geographical distribution limitation excluding those countries, so that distribution is permitted only in or among countries not thus excluded. In such case, this License incorporates the limitation as if written in the body of this License.

The Free Software Foundation may publish revised and/or new versions of the Lesser General Public License from time to time. Such new versions will be similar in spirit to the present version, but may differ in detail to address new problems or concerns.

<p>Each version is given a distinguishing version number. If the Library specifies a version number of this License which applies to it and “any later version”, you have the option of following the terms and conditions either of that version or of any later version published by the Free Software Foundation. If the Library does not specify a license version number, you may choose any version ever published by the Free Software Foundation.

If you wish to incorporate parts of the Library into other free

programs whose distribution conditions are incompatible with these, write to the author to ask for permission. For software which is copyrighted by the Free Software Foundation, write to the Free Software Foundation; we sometimes make exceptions for this. Our decision will be guided by the two goals of preserving the free status of all derivatives of our free software and of promoting the sharing and reuse of software generally.

BECAUSE THE LIBRARY IS LICENSED FREE OF CHARGE, THERE IS NO WARRANTY FOR THE LIBRARY, TO THE EXTENT PERMITTED BY APPLICABLE LAW. EXCEPT WHEN OTHERWISE STATED IN WRITING THE COPYRIGHT HOLDERS AND/OR OTHER PARTIES PROVIDE THE LIBRARY "AS IS" WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. THE ENTIRE RISK AS TO THE QUALITY AND PERFORMANCE OF THE LIBRARY IS WITH YOU. SHOULD THE LIBRARY PROVE DEFECTIVE, YOU ASSUME THE COST OF ALL NECESSARY SERVICING, REPAIR OR CORRECTION.

IN NO EVENT UNLESS REQUIRED BY APPLICABLE LAW OR AGREED TO IN WRITING WILL ANY COPYRIGHT HOLDER, OR ANY OTHER PARTY WHO MAY MODIFY AND/OR REDISTRIBUTE THE LIBRARY AS PERMITTED ABOVE, BE LIABLE TO YOU FOR DAMAGES, INCLUDING ANY GENERAL, SPECIAL, INCIDENTAL OR CONSEQUENTIAL DAMAGES ARISING OUT OF THE USE OR INABILITY TO USE THE LIBRARY (INCLUDING BUT NOT LIMITED TO LOSS OF DATA OR DATA BEING RENDERED INACCURATE OR LOSSES SUSTAINED BY YOU OR THIRD PARTIES OR A FAILURE OF THE LIBRARY TO OPERATE WITH ANY OTHER SOFTWARE), EVEN IF SUCH HOLDER OR OTHER PARTY HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

How to Apply These Terms to Your New Libraries

If you develop a new library, and you want it to be of the greatest possible use to the public, we recommend making it free software that everyone can redistribute and change. You can do so by permitting redistribution under these terms (or, alternatively, under the terms of the ordinary General Public License).

To apply these terms, attach the following notices to the library. It is safest to attach them to the start of each source file to most effectively convey the exclusion of warranty; and each file should have at least the "copyright" line and a pointer to where the full notice is found.

```
one line to give the library's name and an idea of what it does.  
Copyright (C) year name of author
```

This library is free software; you can redistribute it and/or modify it under the terms of the GNU Lesser General Public License as published by

the Free Software Foundation; either version 2.1 of the License, or (at your option) any later version.

This library is distributed in the hope that it will be useful, but WITHOUT ANY WARRANTY; without even the implied warranty of MERCHANTABILITY or FITNESS FOR A PARTICULAR PURPOSE. See the GNU Lesser General Public License for more details.

You should have received a copy of the GNU Lesser General Public License along with this library; if not, write to the Free Software Foundation, Inc., 51 Franklin Street, Fifth Floor, Boston, MA 02110-1301, USA.

```
</pre>
```

```
<p>Also add information on how to contact you by electronic and paper mail.
```

```
<p>You should also get your employer (if you work as a programmer) or your school, if any, to sign a &ldquo;copyright disclaimer&rdquo; for the library, if necessary. Here is a sample; alter the names:
```

```
<pre class="smallexample">  Yoyodyne, Inc., hereby disclaims all copyright interest in the library
  `Frob' (a library for tweaking knobs) written by James Random Hacker.

</pre>

<h3 class="heading">Preamble</h3>

<p>The GNU General Public License is a free, copyleft license for software and other kinds of works.

<p>The licenses for most software and other practical works are designed to take away your freedom to share and change the works. By contrast, the GNU General Public License is intended to guarantee your freedom to share and change all versions of a program—to make sure it remains free software for all its users. We, the Free Software Foundation, use the GNU General Public License for most of our software; it applies also to any other work released this way by its authors. You can apply it to your programs, too.

<p>When we speak of free software, we are referring to freedom, not price. Our General Public Licenses are designed to make sure that you have the freedom to distribute copies of free software (and charge for them if you wish), that you receive source code or can get it if you want it, that you can change the software or use pieces of it in new free programs, and that you know you can do these things.

<p>To protect your rights, we need to prevent others from denying you these rights or asking you to surrender the rights. Therefore, you have certain responsibilities if you distribute copies of the software, or if you modify it: responsibilities to respect the freedom of others.

<p>For example, if you distribute copies of such a program, whether gratis or for a fee, you must pass on to the recipients the same freedoms that you received. You must make sure that they, too, receive or can get the source code. And you must show them these terms so they know their rights.

<p>Developers that use the GNU GPL protect your rights with two steps: (1) assert copyright on the software, and (2) offer you this License giving you legal permission to copy, distribute and/or modify it.

<p>For the developers' and authors' protection, the GPL clearly explains that there is no warranty for this free software. For both users' and authors' sake, the GPL requires that modified versions be marked as changed, so that their problems will not be attributed erroneously to authors of previous versions.

<p>Some devices are designed to deny users access to install or run modified versions of the software inside them, although the

manufacturer can do so. This is fundamentally incompatible with the aim of protecting users' freedom to change the software. The systematic pattern of such abuse occurs in the area of products for individuals to use, which is precisely where it is most unacceptable. Therefore, we have designed this version of the GPL to prohibit the practice for those products. If such problems arise substantially in other domains, we stand ready to extend this provision to those domains in future versions of the GPL, as needed to protect the freedom of users.

Finally, every program is threatened constantly by software patents. States should not allow patents to restrict development and use of software on general-purpose computers, but in those that do, we wish to avoid the special danger that patents applied to a free program could make it effectively proprietary. To prevent this, the GPL assures that patents cannot be used to render the program non-free.

The precise terms and conditions for copying, distribution and modification follow.

TERMS AND CONDITIONS

- Definitions.

"This License" refers to version 3 of the GNU General Public License.

"Copyright" also means copyright-like laws that apply to other kinds of works, such as semiconductor masks.

"The Program" refers to any copyrightable work licensed under this License. Each licensee is addressed as "you", "Licensees" and "recipients" may be individuals or organizations.

To "modify" a work means to copy from or adapt all or part of the work in a fashion requiring copyright permission, other than the making of an exact copy. The resulting work is called a "modified version" of the earlier work or a work "based on" the earlier work.

A "covered work" means either the unmodified Program or a work based on the Program.

To "propagate" a work means to do anything with it that, without permission, would make you directly or secondarily liable for infringement under applicable copyright law, except executing it on a computer or modifying a private copy. Propagation includes copying, distribution (with or without modification), making available to the public, and in some countries other activities as well.

<p>To “convey” a work means any kind of propagation that enables other parties to make or receive copies. Mere interaction with a user through a computer network, with no transfer of a copy, is not conveying.

<p>An interactive user interface displays “Appropriate Legal Notices” to the extent that it includes a convenient and prominently visible feature that (1) displays an appropriate copyright notice, and (2) tells the user that there is no warranty for the work (except to the extent that warranties are provided), that licensees may convey the work under this License, and how to view a copy of this License. If the interface presents a list of user commands or options, such as a menu, a prominent item in the list meets this criterion.

Source Code.

<p>The “source code” for a work means the preferred form of the work for making modifications to it. “Object code” means any non-source form of a work.

<p>A “Standard Interface” means an interface that either is an official standard defined by a recognized standards body, or, in the case of interfaces specified for a particular programming language, one that is widely used among developers working in that language.

<p>The “System Libraries” of an executable work include anything, other than the work as a whole, that (a) is included in the normal form of packaging a Major Component, but which is not part of that Major Component, and (b) serves only to enable use of the work with that Major Component, or to implement a Standard Interface for which an implementation is available to the public in source code form. A “Major Component”, in this context, means a major essential component (kernel, window system, and so on) of the specific operating system (if any) on which the executable work runs, or a compiler used to produce the work, or an object code interpreter used to run it.

<p>The “Corresponding Source” for a work in object code form means all the source code needed to generate, install, and (for an executable work) run the object code and to modify the work, including scripts to control those activities. However, it does not include the work's System Libraries, or general-purpose tools or generally available free programs which are used unmodified in performing those activities but which are not part of the work. For example, Corresponding Source includes interface definition files associated with source files for the work, and the source code for shared libraries and dynamically linked subprograms that the work is specifically designed to require, such as by intimate data communication or control flow between those

subprograms and other parts of the work.

<p>The Corresponding Source need not include anything that users can regenerate automatically from other parts of the Corresponding Source.

<p>The Corresponding Source for a work in source code form is that same work.

Basic Permissions.

<p>All rights granted under this License are granted for the term of copyright on the Program, and are irrevocable provided the stated conditions are met. This License explicitly affirms your unlimited permission to run the unmodified Program. The output from running a covered work is covered by this License only if the output, given its content, constitutes a covered work. This License acknowledges your rights of fair use or other equivalent, as provided by copyright law.

<p>You may make, run and propagate covered works that you do not convey, without conditions so long as your license otherwise remains in force. You may convey covered works to others for the sole purpose of having them make modifications exclusively for you, or provide you with facilities for running those works, provided that you comply with the terms of this License in conveying all material for which you do not control copyright. Those thus making or running the covered works for you must do so exclusively on your behalf, under your direction and control, on terms that prohibit them from making any copies of your copyrighted material outside their relationship with you.

<p>Conveying under any other circumstances is permitted solely under the conditions stated below. Sublicensing is not allowed; section 10 makes it unnecessary.

Protecting Users' Legal Rights From Anti-Circumvention Law.

<p>No covered work shall be deemed part of an effective technological measure under any applicable law fulfilling obligations under article 11 of the WIPO copyright treaty adopted on 20 December 1996, or similar laws prohibiting or restricting circumvention of such measures.

<p>When you convey a covered work, you waive any legal power to forbid circumvention of technological measures to the extent such circumvention is effected by exercising rights under this License with respect to the covered work, and you disclaim any intention to limit operation or modification of the work as a means of enforcing, against the work's users, your or third parties' legal rights to forbid circumvention of technological measures.

Conveying Verbatim Copies.

<p>You may convey verbatim copies of the Program's source code as you receive it, in any medium, provided that you conspicuously and appropriately publish on each copy an appropriate copyright notice; keep intact all notices stating that this License and any non-permissive terms added in accord with section 7 apply to the code; keep intact all notices of the absence of any warranty; and give all recipients a copy of this License along with the Program.

<p>You may charge any price or no price for each copy that you convey, and you may offer support or warranty protection for a fee.

Conveying Modified Source Versions.

<p>You may convey a work based on the Program, or the modifications to produce it from the Program, in the form of source code under the terms of section 4, provided that you also meet all of these conditions:

<ol type=a start=1>

The work must carry prominent notices stating that you modified it, and giving a relevant date.

The work must carry prominent notices stating that it is released under this License and any conditions added under section 7. This requirement modifies the requirement in section 4 to "keep intact all notices";

You must license the entire work, as a whole, under this License to anyone who comes into possession of a copy. This License will therefore apply, along with any applicable section 7 additional terms, to the whole of the work, and all its parts, regardless of how they are packaged. This License gives no permission to license the work in any other way, but it does not invalidate such permission if you have separately received it.

If the work has interactive user interfaces, each must display Appropriate Legal Notices; however, if the Program has interactive interfaces that do not display Appropriate Legal Notices, your work need not make them do so.

<p>A compilation of a covered work with other separate and independent works, which are not by their nature extensions of the covered work, and which are not combined with it such as to form a larger program, in or on a volume of a storage or distribution medium, is called an

“aggregate” if the compilation and its resulting copyright are not used to limit the access or legal rights of the compilation's users beyond what the individual works permit. Inclusion of a covered work in an aggregate does not cause this License to apply to the other parts of the aggregate.

Conveying Non-Source Forms.

<p>You may convey a covered work in object code form under the terms of sections 4 and 5, provided that you also convey the machine-readable Corresponding Source under the terms of this License, in one of these ways:

<ol type=a start=1>

Convey the object code in, or embodied in, a physical product (including a physical distribution medium), accompanied by the Corresponding Source fixed on a durable physical medium customarily used for software interchange.

Convey the object code in, or embodied in, a physical product (including a physical distribution medium), accompanied by a written offer, valid for at least three years and valid for as long as you offer spare parts or customer support for that product model, to give anyone who possesses the object code either (1) a copy of the Corresponding Source for all the software in the product that is covered by this License, on a durable physical medium customarily used for software interchange, for a price no more than your reasonable cost of physically performing this conveying of source, or (2) access to copy the Corresponding Source from a network server at no charge.

Convey individual copies of the object code with a copy of the written offer to provide the Corresponding Source. This alternative is allowed only occasionally and noncommercially, and only if you received the object code with such an offer, in accord with subsection 6b.

Convey the object code by offering access from a designated place (gratis or for a charge), and offer equivalent access to the Corresponding Source in the same way through the same place at no further charge. You need not require recipients to copy the Corresponding Source along with the object code. If the place to copy the object code is a network server, the Corresponding Source may be on a different server (operated by you or a third party) that supports equivalent copying facilities, provided you maintain clear directions next to the object code saying where to find the Corresponding Source. Regardless of what server hosts the Corresponding Source, you remain obligated to ensure that it is available for as long as needed to satisfy these requirements.

- Convey the object code using peer-to-peer transmission, provided you inform other peers where the object code and Corresponding Source of the work are being offered to the general public at no charge under subsection 6d.

A separable portion of the object code, whose source code is excluded from the Corresponding Source as a System Library, need not be included in conveying the object code work.

A "User Product" is either (1) a "consumer product", which means any tangible personal property which is normally used for personal, family, or household purposes, or (2) anything designed or sold for incorporation into a dwelling. In determining whether a product is a consumer product, doubtful cases shall be resolved in favor of coverage. For a particular product received by a particular user, "normally used" refers to a typical or common use of that class of product, regardless of the status of the particular user or of the way in which the particular user actually uses, or expects or is expected to use, the product. A product is a consumer product regardless of whether the product has substantial commercial, industrial or non-consumer uses, unless such uses represent the only significant mode of use of the product.

"Installation Information" for a User Product means any methods, procedures, authorization keys, or other information required to install and execute modified versions of a covered work in that User Product from a modified version of its Corresponding Source. The information must suffice to ensure that the continued functioning of the modified object code is in no case prevented or interfered with solely because modification has been made.

If you convey an object code work under this section in, or with, or specifically for use in, a User Product, and the conveying occurs as part of a transaction in which the right of possession and use of the User Product is transferred to the recipient in perpetuity or for a fixed term (regardless of how the transaction is characterized), the Corresponding Source conveyed under this section must be accompanied by the Installation Information. But this requirement does not apply if neither you nor any third party retains the ability to install modified object code on the User Product (for example, the work has been installed in ROM).

The requirement to provide Installation Information does not include a requirement to continue to provide support service, warranty, or updates for a work that has been modified or installed by the

recipient, or for the User Product in which it has been modified or installed. Access to a network may be denied when the modification itself materially and adversely affects the operation of the network or violates the rules and protocols for communication across the network.

<p>Corresponding Source conveyed, and Installation Information provided, in accord with this section must be in a format that is publicly documented (and with an implementation available to the public in source code form), and must require no special password or key for unpacking, reading or copying.

Additional Terms.

<p>“Additional permissions” are terms that supplement the terms of this License by making exceptions from one or more of its conditions. Additional permissions that are applicable to the entire Program shall be treated as though they were included in this License, to the extent that they are valid under applicable law. If additional permissions apply only to part of the Program, that part may be used separately under those permissions, but the entire Program remains governed by this License without regard to the additional permissions.

<p>When you convey a copy of a covered work, you may at your option remove any additional permissions from that copy, or from any part of it. (Additional permissions may be written to require their own removal in certain cases when you modify the work.) You may place additional permissions on material, added by you to a covered work, for which you have or can give appropriate copyright permission.

<p>Notwithstanding any other provision of this License, for material you add to a covered work, you may (if authorized by the copyright holders of that material) supplement the terms of this License with terms:

<ol type=a start=1>

Disclaiming warranty or limiting liability differently from the terms of sections 15 and 16 of this License; or

Requiring preservation of specified reasonable legal notices or author attributions in that material or in the Appropriate Legal Notices displayed by works containing it; or

Prohibiting misrepresentation of the origin of that material, or requiring that modified versions of such material be marked in reasonable ways as different from the original version; or

Limiting the use for publicity purposes of names of licensors or authors of the material; or

Declining to grant rights under trademark law for use of some trade names, trademarks, or service marks; or

Requiring indemnification of licensors and authors of that material by anyone who conveys the material (or modified versions of it) with contractual assumptions of liability to the recipient, for any liability that these contractual assumptions directly impose on those licensors and authors.

<p>All other non-permissive additional terms are considered “further restrictions” within the meaning of section 10. If the Program as you received it, or any part of it, contains a notice stating that it is governed by this License along with a term that is a further restriction, you may remove that term. If a license document contains a further restriction but permits relicensing or conveying under this License, you may add to a covered work material governed by the terms of that license document, provided that the further restriction does not survive such relicensing or conveying.

<p>If you add terms to a covered work in accord with this section, you must place, in the relevant source files, a statement of the additional terms that apply to those files, or a notice indicating where to find the applicable terms.

<p>Additional terms, permissive or non-permissive, may be stated in the form of a separately written license, or stated as exceptions; the above requirements apply either way.

Termination.

<p>You may not propagate or modify a covered work except as expressly provided under this License. Any attempt otherwise to propagate or modify it is void, and will automatically terminate your rights under this License (including any patent licenses granted under the third paragraph of section 11).

<p>However, if you cease all violation of this License, then your license from a particular copyright holder is reinstated (a) provisionally, unless and until the copyright holder explicitly and finally terminates your license, and (b) permanently, if the copyright holder fails to notify you of the violation by some reasonable means prior to 60 days after the cessation.

<p>Moreover, your license from a particular copyright holder is reinstated permanently if the copyright holder notifies you of the violation by some reasonable means, this is the first time you have

received notice of violation of this License (for any work) from that copyright holder, and you cure the violation prior to 30 days after your receipt of the notice.

<p>Termination of your rights under this section does not terminate the licenses of parties who have received copies or rights from you under this License. If your rights have been terminated and not permanently reinstated, you do not qualify to receive new licenses for the same material under section 10.

Acceptance Not Required for Having Copies.

<p>You are not required to accept this License in order to receive or run a copy of the Program. Ancillary propagation of a covered work occurring solely as a consequence of using peer-to-peer transmission to receive a copy likewise does not require acceptance. However, nothing other than this License grants you permission to propagate or modify any covered work. These actions infringe copyright if you do not accept this License. Therefore, by modifying or propagating a covered work, you indicate your acceptance of this License to do so.

Automatic Licensing of Downstream Recipients.

<p>Each time you convey a covered work, the recipient automatically receives a license from the original licensors, to run, modify and propagate that work, subject to this License. You are not responsible for enforcing compliance by third parties with this License.

<p>An “entity transaction” is a transaction transferring control of an organization, or substantially all assets of one, or subdividing an organization, or merging organizations. If propagation of a covered work results from an entity transaction, each party to that transaction who receives a copy of the work also receives whatever licenses to the work the party's predecessor in interest had or could give under the previous paragraph, plus a right to possession of the Corresponding Source of the work from the predecessor in interest, if the predecessor has it or can get it with reasonable efforts.

<p>You may not impose any further restrictions on the exercise of the rights granted or affirmed under this License. For example, you may not impose a license fee, royalty, or other charge for exercise of rights granted under this License, and you may not initiate litigation (including a cross-claim or counterclaim in a lawsuit) alleging that any patent claim is infringed by making, using, selling, offering for sale, or importing the Program or any portion of it.

Patents.

<p>A “contributor” is a copyright holder who authorizes use under this License of the Program or a work on which the Program is based. The work thus licensed is called the contributor's “contributor version”.

<p>A contributor's “essential patent claims” are all patent claims owned or controlled by the contributor, whether already acquired or hereafter acquired, that would be infringed by some manner, permitted by this License, of making, using, or selling its contributor version, but do not include claims that would be infringed only as a consequence of further modification of the contributor version. For purposes of this definition, “control” includes the right to grant patent sublicenses in a manner consistent with the requirements of this License.

<p>Each contributor grants you a non-exclusive, worldwide, royalty-free patent license under the contributor's essential patent claims, to make, use, sell, offer for sale, import and otherwise run, modify and propagate the contents of its contributor version.

<p>In the following three paragraphs, a “patent license” is any express agreement or commitment, however denominated, not to enforce a patent (such as an express permission to practice a patent or covenant not to sue for patent infringement). To “grant” such a patent license to a party means to make such an agreement or commitment not to enforce a patent against the party.

<p>If you convey a covered work, knowingly relying on a patent license, and the Corresponding Source of the work is not available for anyone to copy, free of charge and under the terms of this License, through a publicly available network server or other readily accessible means, then you must either (1) cause the Corresponding Source to be so available, or (2) arrange to deprive yourself of the benefit of the patent license for this particular work, or (3) arrange, in a manner consistent with the requirements of this License, to extend the patent license to downstream recipients. “Knowingly relying” means you have actual knowledge that, but for the patent license, your conveying the covered work in a country, or your recipient's use of the covered work in a country, would infringe one or more identifiable patents in that country that you have reason to believe are valid.

<p>If, pursuant to or in connection with a single transaction or arrangement, you convey, or propagate by procuring conveyance of, a covered work, and grant a patent license to some of the parties receiving the covered work authorizing them to use, propagate, modify or convey a specific copy of the covered work, then the patent license you grant is automatically extended to all recipients of the covered work and works based on it.

<p>A patent license is “discriminatory” if it does not include within the scope of its coverage, prohibits the exercise of, or is conditioned on the non-exercise of one or more of the rights that are specifically granted under this License. You may not convey a covered work if you are a party to an arrangement with a third party that is in the business of distributing software, under which you make payment to the third party based on the extent of your activity of conveying the work, and under which the third party grants, to any of the parties who would receive the covered work from you, a discriminatory patent license (a) in connection with copies of the covered work conveyed by you (or copies made from those copies), or (b) primarily for and in connection with specific products or compilations that contain the covered work, unless you entered into that arrangement, or that patent license was granted, prior to 28 March 2007.

<p>Nothing in this License shall be construed as excluding or limiting any implied license or other defenses to infringement that may otherwise be available to you under applicable patent law.

No Surrender of Others' Freedom.

<p>If conditions are imposed on you (whether by court order, agreement or otherwise) that contradict the conditions of this License, they do not excuse you from the conditions of this License. If you cannot convey a covered work so as to satisfy simultaneously your obligations under this License and any other pertinent obligations, then as a consequence you may not convey it at all. For example, if you agree to terms that obligate you to collect a royalty for further conveying from those to whom you convey the Program, the only way you could satisfy both those terms and this License would be to refrain entirely from conveying the Program.

Use with the GNU Affero General Public License.

<p>Notwithstanding any other provision of this License, you have permission to link or combine any covered work with a work licensed under version 3 of the GNU Affero General Public License into a single combined work, and to convey the resulting work. The terms of this License will continue to apply to the part which is the covered work, but the special requirements of the GNU Affero General Public License, section 13, concerning interaction through a network will apply to the combination as such.

Revised Versions of this License.

<p>The Free Software Foundation may publish revised and/or new versions of the GNU General Public License from time to time. Such new versions will be similar in spirit to the present version, but may

differ in detail to address new problems or concerns.

<p>Each version is given a distinguishing version number. If the Program specifies that a certain numbered version of the GNU General Public License “or any later version” applies to it, you have the option of following the terms and conditions either of that numbered version or of any later version published by the Free Software Foundation. If the Program does not specify a version number of the GNU General Public License, you may choose any version ever published by the Free Software Foundation.

<p>If the Program specifies that a proxy can decide which future versions of the GNU General Public License can be used, that proxy's public statement of acceptance of a version permanently authorizes you to choose that version for the Program.

<p>Later license versions may give you additional or different permissions. However, no additional obligations are imposed on any author or copyright holder as a result of your choosing to follow a later version.

Disclaimer of Warranty.

<p>THERE IS NO WARRANTY FOR THE PROGRAM, TO THE EXTENT PERMITTED BY APPLICABLE LAW. EXCEPT WHEN OTHERWISE STATED IN WRITING THE COPYRIGHT HOLDERS AND/OR OTHER PARTIES PROVIDE THE PROGRAM “AS IS” WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. THE ENTIRE RISK AS TO THE QUALITY AND PERFORMANCE OF THE PROGRAM IS WITH YOU. SHOULD THE PROGRAM PROVE DEFECTIVE, YOU ASSUME THE COST OF ALL NECESSARY SERVICING, REPAIR OR CORRECTION.

Limitation of Liability.

<p>IN NO EVENT UNLESS REQUIRED BY APPLICABLE LAW OR AGREED TO IN WRITING WILL ANY COPYRIGHT HOLDER, OR ANY OTHER PARTY WHO MODIFIES AND/OR CONVEYS THE PROGRAM AS PERMITTED ABOVE, BE LIABLE TO YOU FOR DAMAGES, INCLUDING ANY GENERAL, SPECIAL, INCIDENTAL OR CONSEQUENTIAL DAMAGES ARISING OUT OF THE USE OR INABILITY TO USE THE PROGRAM (INCLUDING BUT NOT LIMITED TO LOSS OF DATA OR DATA BEING RENDERED INACCURATE OR LOSSES SUSTAINED BY YOU OR THIRD PARTIES OR A FAILURE OF THE PROGRAM TO OPERATE WITH ANY OTHER PROGRAMS), EVEN IF SUCH HOLDER OR OTHER PARTY HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

Interpretation of Sections 15 and 16.

<p>If the disclaimer of warranty and limitation of liability provided

above cannot be given local legal effect according to their terms, reviewing courts shall apply local law that most closely approximates an absolute waiver of all civil liability in connection with the Program, unless a warranty or assumption of liability accompanies a copy of the Program in return for a fee.

<h3 class="heading">END OF TERMS AND CONDITIONS</h3>

<h3 class="heading">How to Apply These Terms to Your New Programs</h3>

<p>If you develop a new program, and you want it to be of the greatest possible use to the public, the best way to achieve this is to make it free software which everyone can redistribute and change under these terms.

<p>To do so, attach the following notices to the program. It is safest to attach them to the start of each source file to most effectively state the exclusion of warranty; and each file should have at least the “copyright” line and a pointer to where the full notice is found.

```
<pre class="smallexample">  <var>one line to give the program's name and a brief idea of what it does.</var>
  Copyright (C) <var>year</var> <var>name of author</var>
```

This program is free software: you can redistribute it and/or modify it under the terms of the GNU General Public License as published by the Free Software Foundation, either version 3 of the License, or (at your option) any later version.

This program is distributed in the hope that it will be useful, but WITHOUT ANY WARRANTY; without even the implied warranty of MERCHANTABILITY or FITNESS FOR A PARTICULAR PURPOSE. See the GNU General Public License for more details.

You should have received a copy of the GNU General Public License along with this program. If not, see http://www.gnu.org/licenses/.

</pre>
<p>Also add information on how to contact you by electronic and paper mail.

<p>If the program does terminal interaction, make it output a short notice like this when it starts in an interactive mode:

```
<pre class="smallexample">  <var>program</var> Copyright (C) <var>year</var> <var>name of author</var>
  This program comes with ABSOLUTELY NO WARRANTY; for details type &lsquo;<samp><span
class="samp">show w</span></samp>&rsquo;.
```

This is free software, and you are welcome to redistribute it under certain conditions; type ‘<samp>show c</samp>’ for details.

```
</pre>
<p>The hypothetical commands show w and show c should show the appropriate parts of the General Public License. Of course, your program's commands might be different; for a GUI interface, you would use an about box.
```

You should also get your employer (if you work as a programmer) or school, if any, to sign a "copyright disclaimer" for the program, if necessary. For more information on this, and how to apply and follow the GNU GPL, see <http://www.gnu.org/licenses/>.

The GNU General Public License does not permit incorporating your program into proprietary programs. If your program is a subroutine library, you may consider it more useful to permit linking proprietary applications with the library. If this is what you want to do, use the GNU Lesser General Public License instead of this License. But first, please read <http://www.gnu.org/philosophy/why-not-lgpl.html>.

</div>

<h2 class="unnumbered">Concept Index</h2>

<ul class="index-cp" compact>

Alert protocol: The TLS Alert Protocol

Anonymous authentication: Anonymous authentication

Bad record MAC: On Record Padding

Callback functions: Callback functions

Certificate authentication: More on certificate authentication

Certificate requests: PKCS #10 certificate requests

certtool: Invoking certtool

Ciphersuites: All the supported ciphersuites in GnuTLS

Client Certificate authentication: The TLS Handshake Protocol

Compression algorithms: Compression algorithms used in the record layer

constant: Enumerates and Constants

Contributing: Contributing

debug server: Invoking gnutls-serv

Digital signatures: Digital signatures

Download: Downloading and Installing

enumerate: Enumerates and Constants

Error codes: Error codes and descriptions

errors: Exception Handling

Example programs: How to use GnuTLS in applications

exceptions: Exception Handling

Exporting Keying Material: Keying Material Exporters

FDL, GNU Free Documentation License: GNU Free Documentation License

Function reference: Function reference

gnutls-cli: Invoking gnutls-cli

gnutls-cli-debug: Invoking gnutls-cli-debug

<code>gnutls-error</code>: Exception Handling

<acronym>GnuTLS-extra</acronym> functions: GnuTLS-extra functions

gnutls-serv: Invoking gnutls-serv

GPL, GNU General Public License: GNU GPL

Hacking: Contributing

Handshake protocol: The TLS Handshake Protocol

homogeneous vector: Representation of Binary Data

HTTPS server: Invoking gnutls-serv

Inner Application (<acronym>TLS/IA</acronym>) functions: TLS Inner Application (TLS/IA) functions

Installation: Downloading and Installing

Internal architecture: Internal architecture of GnuTLS

key sizes: Selecting cryptographic key sizes

Keying Material Exporters: Keying Material Exporters

LGPL, GNU Lesser General Public License: GNU LGPL

License, GNU GPL: GNU GPL

License, GNU LGPL: GNU LGPL

Maximum fragment length: TLS Extensions

Netconf: Example client PSK connection

Opaque PRF Input: Opaque PRF Input TLS Extension

<acronym>OpenPGP</acronym> functions: OpenPGP functions

<acronym>OpenPGP</acronym> Keys: The OpenPGP trust model

[<acronym>OpenPGP</acronym> Keys](#index-g_t_0040acronym_007bOpenPGP_007d-Keys-27): [Certificate authentication](#Certificate-authentication)
 <acronym>OpenPGP</acronym> Server: Echo Server with OpenPGP authentication
 OpenSSL: Compatibility with the OpenSSL library
 PCT: On SSL 2 and older protocols
 <acronym>PKCS</acronym> #10: PKCS #10 certificate requests
 <acronym>PKCS</acronym> #12: PKCS #12 structures
 <acronym>PSK</acronym> authentication: Authentication using PSK
 PSK client: Example client PSK connection
 PSK server: Example server PSK connection
 psktool: Invoking psktool
 Record padding: On Record Padding
 Record protocol: The TLS record protocol
 Reporting Bugs: Bug Reports
 Resuming sessions: The TLS Handshake Protocol
 Server name indication: TLS Extensions
 SRFI-4: Representation of Binary Data
 <acronym>SRP</acronym> authentication: Authentication using SRP
 srptool: Invoking srptool
 SSL 2: On SSL 2 and older protocols
 Symmetric encryption algorithms: Encryption algorithms used in the record layer
 TLS Extensions: TLS Extensions
 <acronym>TLS</acronym> Inner Application (<acronym>TLS/IA</acronym>) functions: TLS Inner Application (TLS/IA) functions
 TLS Layers: TLS layers
 Transport protocol: The transport layer
 Verifying certificate paths: <a href="#Verifying-

X_002e509-certificate-paths">Verifying X.509 certificate paths

- <acronym>X.509</acronym> certificates: The X.509 trust model
- <acronym>X.509</acronym> certificates: Certificate authentication
- <acronym>X.509</acronym> Functions: X.509 certificate functions

<div class="footnote">

<h4>Footnotes</h4><p class="footnote"><small>[1]</small> http://www.openssl.org/</p>

<p class="footnote"><small>[2]</small> ftp://ftp.gnupg.org/gcrypt/alpha/gnutls/libtasn1/</p>

<p class="footnote"><small>[3]</small> ftp://ftp.gnupg.org/gcrypt/alpha/gnutls/openssl/</p>

<p class="footnote"><small>[4]</small> ftp://ftp.gnupg.org/gcrypt/alpha/libgcrypt/</p>

<p class="footnote"><small>[5]</small> On current versions of GnuTLS it is possible to override the default crypto backend. Check see Cryptographic Backend for details</p>

<p class="footnote"><small>[6]</small> The first message in a <acronym>TLS</acronym> handshake</p>

<p class="footnote"><small>[7]</small> IETF, or Internet Engineering Task Force, is a large open international community of network designers, operators, vendors, and researchers concerned with the evolution of the Internet architecture and the smooth operation of the Internet. It is open to any interested individual.</p>

<p class="footnote"><small>[8]</small> AES, or Advanced Encryption Standard, is actually the RIJNDAEL algorithm. This is the algorithm that replaced DES.</p>

<p class="footnote"><small>[9]</small> <code>ARCFOUR_128</code> is a compatible algorithm with RSA's RC4 algorithm, which is considered to be a trade secret.</p>

<p class="footnote"><small>[10]</small> You should use gnutls_handshake_set_private_extensions

to enable private extensions.</p>

<p class="footnote"><small>11</small> MAC stands for Message Authentication Code. It can be described as a keyed hash algorithm. See RFC2104.</p>

<p class="footnote"><small>12</small> It really depends on the group used. Primes with lesser bits are always faster, but also easier to break. Values less than 768 should not be used today</p>

<p class="footnote"><small>13</small> <acronym>SRP</acronym> is described in [RFC2945] (see Bibliography</p>

<p class="footnote"><small>14</small> See also the Server Name Indication extension on serverind.</p>

<p class="footnote"><small>15</small> See LDAP, IMAP etc.</p>

<p class="footnote"><small>16</small> in <acronym>SRP</acronym> authentication</p>

<p class="footnote"><small>17</small> such as the <code>gnutls_certificate_credentials_t</code> structures</p>
