CHAPTER 1

Introduction

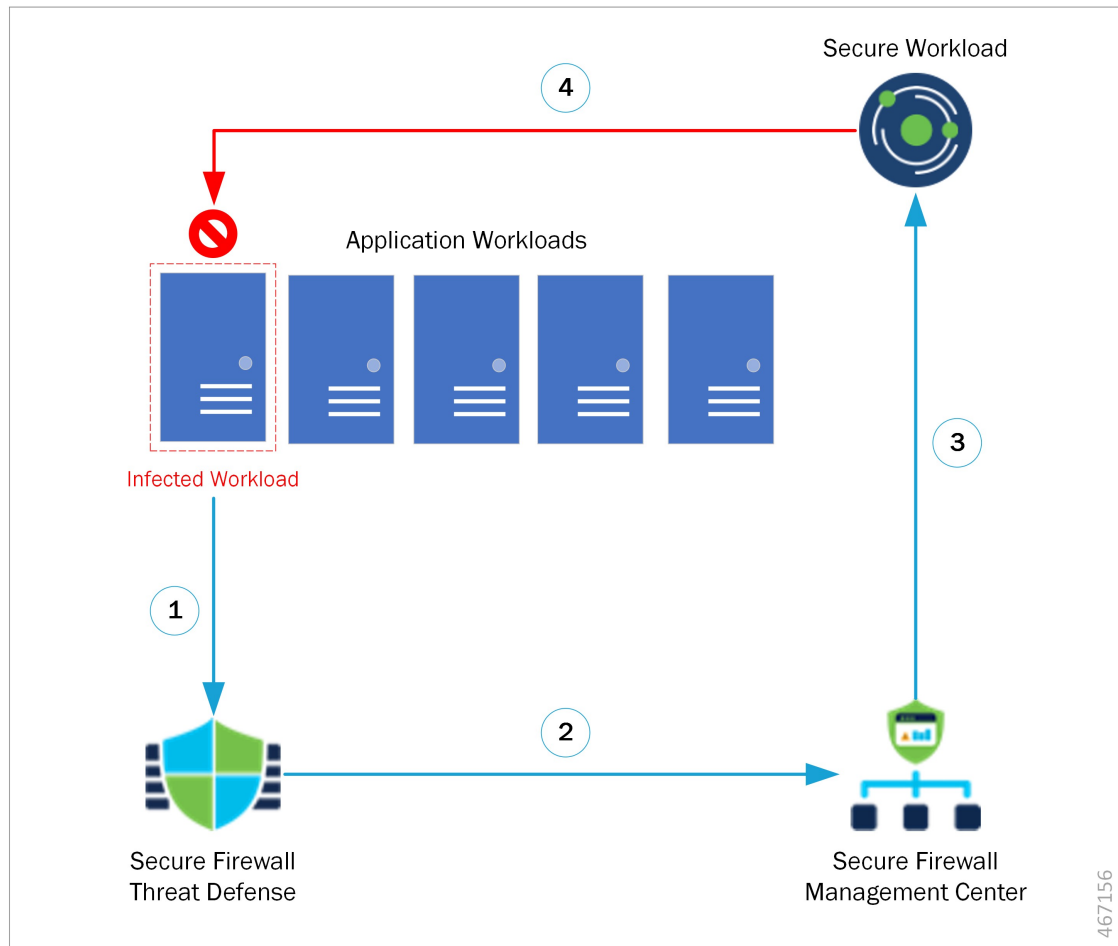

The Cisco Secure Firewall Management Center remediation module for Cisco Secure Workload (formerly known as Tetration) helps to create remediations that your Secure Firewall Management Center can automatically launch when conditions on your network violate the associated correlation policy. For example, to assess the host status, and quarantine an offending host with the Secure Workload enforcement agent, you can block traffic at a device on the source or destination IP address. If multiple rules in a policy trigger, the Secure Firewall Management Center can launch responses for each rule. A remediation module is the package of files you install on the Secure Firewall Management Center to perform the response.

- [Overview, on page 1](#)
- [Prerequisites, on page 3](#)
- [Related Documentation, on page 3](#)

Overview

With the Cisco Secure Firewall Management Center (FMC) Remediation Module for Cisco Secure Workload (formerly known as Tetration), when an attack on your network from an infected host is detected by the FMC, the offending host can be quarantined by a Secure Workload enforcement agent so that no further traffic is allowed to go in or out of that host. The following illustration shows the relationship between the FMC and Secure Workload when the remediation module is installed:

Figure 1: Secure Firewall Management Center to Secure Workload Rapid Threat Containment

①	Threat Defense detects malicious traffic from infected workload.
②	Threat Defense sends an event with malicious traffic details to the Management Center.
③	Remediation module is triggered to quarantine infected workload.
④	Secure Workload sends quarantine request to the enforcement agent on workload.

The process of quarantining the network attack is as follows:

- Step 1** An infected workload sends malicious traffic within the network. The malicious traffic is detected by Secure Firewall Threat Defense (FTD) running on a Secure Firewall device (physical or virtual).
- Step 2** An event that includes information about the malicious traffic is generated and reported to the FMC managing the FTD.

- Step 3** The action triggers the remediation module on the FMC to use the Secure Workload REST API to request that Secure Workload quarantine the infected workload.
- Step 4** Secure Workload quickly contains the infected workload by sending a quarantine request to the enforcement agent on the infected workload.
-

Prerequisites

- Pre-define absolute policies in Secure Workload to drop all traffic from and to any host annotated with 'quarantine.' If a partial quarantine is what you want, customize the policy in Secure Workload to deny only some, but not all, types of traffic. For more information, see [Related Documentation, on page 3](#).
- Secure Workload agents are software that runs within a host operating system, such as Linux or Windows. As enforcement agents, they have the capability to set firewall rules on installed hosts. Install enforcement agents on network hosts you want to protect. For more information, see [Related Documentation, on page 3](#).

CHAPTER 2

Downloading and Installing the Remediation Module

The following section provides the steps to download and install the FMC remediation module for Secure Workload (formerly Tetration).

- [Install the Remediation Module, on page 5](#)

Install the Remediation Module

Step 1 Use a web browser to download the remediation module:
<https://software.cisco.com/download/home/286259687/type>

Step 2 Install the remediation module onto the FMC:

- In the FMC web interface, navigate to **Policies > Actions > Modules**.
- In the **Install a new module** dialog box, click **Choose File**.
- Select the file for the remediation module that was downloaded in Step 1.
- Click **Install**.

Note If you receive an access error message, clear the error message and repeat Step 2.

When successfully installed, the Secure Firewall Management Center Remediation Module for Secure Workload is displayed in the list of installed remediation modules:

CHAPTER 3

Configuring the Remediation Module

The following section provides the steps for configuring the remediation module.

- [Configure, on page 7](#)

Configure

To configure the remediation module installed on the FMC, complete the following procedure:

-
- Step 1** In FMC, create an instance of the remediation module for each Secure Workload cluster in your network:
- Navigate to **Policies > Actions > Instances**.
 - Select the remediation module in the drop-down list, and click **Add**.
 - Enter an **Instance Name** (in this example, **fmc-dev-remediation**).
 - Enter the Secure Workload server's IP address, API key, API secret, and scope containing the potentially offending host. Click **Create**.
- Note** The API key and secret are not validated against the Secure Workload server at this point. The API key and secret must first be created in Secure Workload by a site admin, customer support, or a root scope owner role. Copy that information for use here. For more details, see [Related Documentation, on page 3](#).

Configured Remediations

Remediation Name	Remediation Type	Description
quarantine-fmc	Quarantine an IP on Secure Workload	
unquarantine-fmc	Unquarantine an IP on Secure Workload	

Add a new remediation of type: Quarantine an IP on Secure Wor

- e. Under **Configured Remediations**, select a type of remediation (in this example, **Quarantine an IP on Secure Workload**), and click **Add** to add a new remediation.
- f. Enter a **Remediation Name** (in this example, **quarantine-fmc**), and click **Create**.

Edit Remediation

Remediation Name: quarantine-fmc
Remediation Type: Quarantine an IP on Secure Workload
Description: To quarantine a host

Cancel Create

- g. The remediation you just configured then shows up in the table. Click **Save**.

Step 2 Configure an access control policy (in this example, **rem-policy**):

- a. Navigate to **Policies > Access Control** and click the **Edit** icon of the access control policy to add rules.
- b. Click **Add Rule** and enter a name (for example, **block-ssh-add-tag**).
- c. Select **Block** for the **Action**.
- d. On the **Ports** tab, select **SSH** from the list of protocols for the destination port.
- e. On the **Logging** tab, select **Log at Beginning of Connection**.

Important Ensure that logging is enabled on the access rule, so that the FMC receives event notifications, and click **Add**
- f. Click **Save**.

Default Action Access Control:Block all traffic

Displaying 1 - 1 of 1 rules Page 1 of 1 Rules per page: 100

Step 3

Configure a correlation rule:

- a. Navigate to **Policies > Correlation > Rule Management**.
- b. Click **Create Rule**.
- c. Enter a **Rule Name** (in this example, **quaran-rule1**) and description (optional).
- d. In the **Select the type of event for this rule** section, select a **connection event occurs** and **at either the beginning or the end of the connection**.
- e. Click **Add condition**, and change the operator from **OR** to **AND**.
- f. In the drop-down list, select **Access Control Rule Name**, **is**, and enter the name of the access control rule that you previously configured in Step 2 (in this example, **block-ssh-add-tag**).

g. Click **Save**.

Step 4 Associate the instance of the remediation module as a response with a correlation rule:

- a. Navigate to **Policies > Correlation > Policy Management**.
- b. Click **Create Policy**.
- c. Enter a **Policy Name** (in this example, **correlation-policy**) and description (optional).
- d. From the **Default Priority** drop-down list, select a priority for the policy. Select **None** to use rule priorities only.
- e. Click **Add Rules**, select the correlation rule you previously configured in Step 3 (in this example, **quaran-rule1**), and click **Add**.
- f. Click the **Responses** icon next to the rule and assign a response (in this example, **test_rem**) to the rule. Click **Update**.

Rule	Responses	Priority
quaran-rule1	test_rem (Remediation)	Default

g. Click **Save**.

CHAPTER 4

Verifying Remediation

The following section provides the steps to verify if the remediation process is successful.

- [Verify Remediation, on page 11](#)

Verify Remediation

Because remediations can fail for various reasons, perform the following steps to verify that a remediation is successful.

Step 1 After the remediation module is triggered by an associated correlation rule, check the status of the remediation execution. In the FMC web interface, navigate to **Analysis > Correlation > Status**.

Step 2 In the Remediation Status table, find the row for your policy and view the result message.

The screenshot shows the Cisco Firepower Management Center (FMC) web interface. The breadcrumb navigation is **Analysis > Correlation > Status**. The page title is "Table View of Remediations". Below the title is a search bar and a "Jump to..." field. The main table has the following columns: Time, Remediation Name, Policy, Rule, Result Message, and Domain. A single row is displayed with the following data:

Time	Remediation Name	Policy	Rule	Result Message	Domain
2022-03-31 14:56:34	quarantine-fmc	correlation-policy	quaran-rule-1	Successful completion of remediation	Global \ DC-North-South

At the bottom of the table, there are navigation controls: "Page 1 of 1" and "Displaying row 1 of 1 rows". Below the table are buttons for "View", "Delete", "View All", and "Delete All".

- Step 3** Once the remediation is complete, perform the following steps:
- In the Secure Workload user interface, navigate to **Visibility > Inventory Search**.
 - Enter the IP address of the infected hosts, and click **Search**.
 - In User Annotations, you should see **quarantine = yes** annotated to the IP address of the infected hosts.

192.168.10.35	DC		yes

What to do next

Once you clean the quarantined host and it is no longer infected, you can perform either of the following actions to remove the quarantine annotation:

- **(Recommended)** Use Secure Workload to change the **quarantine = yes** annotation back to **quarantine = no**.
 1. For example, if the quarantined host that is no longer infected is 172.21.208.11 and within the **Default** scope, create a CSV file such as:

```
IP,VRF,quarantine
172.21.208.11,Default,no
```
 2. Navigate to **Applications > Inventory Upload**, and then upload the CSV file to Secure Workload. For more information on how to upload a CSV file to Secure Workload, see the [Related Documentation, on page 3](#) section.
- Use FMC Remediation Module to remove the quarantine annotation.

Important This method is not recommended in production networks due to security concerns.

1. (In the Configure section, see Step 1) Add a new remediation that uses the un-quarantine type of remediation. Edit the same instance, and under **Configured Remediations**, select and add the un-quarantine type of remediation (in this example, **unquarantine-fmc**).

Configured Remediations

Remediation Name	Remediation Type	Description	
quarantine-fmc	Quarantine an IP on Secure Workload		 
unquarantine-fmc	Unquarantine an IP on Secure Workload		 

Add a new remediation of type

2. (In the Configure section, see Step 2) Add an access control rule (For example, **remove-tag**) to the same policy (For example, **rem-policy**) which can be used to trigger the un-quarantine remediation.
3. (In the Configure section, see Step 3) Add a correlation rule (For example, **unquaran-rule1**) that uses the access control rule (in this example, **remove-tag**).
4. (In the Configure section, see Step 4b) Assign the un-quarantine response (For example, **un-quaran-rem**) to the correlation rule (For example, **unquaran-rule1**).
5. After the rule is matched, the un-quarantine remediation will be triggered to remove the quarantine annotation.
