# AutoAccept for CTIPort and RoutePoint

## Silent Monitoring Use Cases

A and TA are address and terminal of monitor target or recording initiator

B and TB are address and terminal of monitor initiator.

### Scenario One

Administrator enables monitoring capability for the user.

| Action                                       | Events                                                                                                                                       | Call info |
|----------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------|-----------|
|                                              | CiscoProviderCapabilityChangedEv<br>hasMonitorCapabilityChanged() on this event returns true<br>hasRecordingCapabilityChanged() returns true | NA        |
| ciscoProvider.getCapabilities().canMonitor() | JTAPI returns true                                                                                                                           | NA        |

### Scenario Two

Start and Stop monitor: A is monitor target, B is monitor initiator. X calls A, A answers the call GC1 (ci1). B calls start monitor using GC2. Application has call observer on both A and B. Application has monitoring capability enabled.

| Action                                                                                              | Events                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | Call info                                                                                                                                                                                                                             |

**Scenario Seven**

Snap Shot events for Monitor and recording: A is monitor target and has auto recording configured. B is monitor initiator. X calls A, A answers the call GC1 (ci1), B calls start monitor using GC2. Another application adds call observer on A after monitoring and recording sessions are established.

| Action | Events                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | Call info                                                                                                          |

# Use Cases for NuRD (Number Matching for Remote Destination)

## Prerequisites

Pre-conditions to nurd use cases, unless specified otherwise:

- Provider is in IN\_SERVICE state
- All addresses and terminals are already in service.
- Enable "Route calls to all remote destinations" checkbox for CTIRD1 and CTIRD2.
- Clusterwide service parameter "Reroute Remote Destination Calls to Enterprise Number" is set to true.
- ICT Trunk configured with Route pattern is 408XXXXX with no discard digits.
- SIP Trunk configured with Route pattern is 409XXXXX with no discard digits.
- ICT Trunk configured with Route pattern is 33.XXXX with discard digits pre-dot.
- CTIRD1 associated to user "Mobility1", dn = 2303
  - Remote destination 1 (Name: "RDD1", Number: "40822077")
  - Remote destination 2 (Name: "RDD2", Number: "40922078")
- CTIRD2 associated to user "Mobility2", dn = 9200
  - Remote destination 1 (Name: "RDD3", Number: "40812115")
  - Remote destination 2 (Name: "RDD4", Number: "40912116")
- CTIRD2 has a shared ip phone D
- RDP2 associated to user "Mobility2", dn = 9200 with display and Unicode name configured to be "RDP2".
  - Remote destination 1 (Name: "RDD3", Number: "40812115"). This is shared with CTIRD2.
  - Remote destination 2 (Name: "RDDP1", Number: "40922095")
- Device A (IP Phone - Name: "SEP2401C7824EA3", Line A1 (dn: 9000)).
- Device B (IP Phone - Name: "SEP2401C7824EAE", Line B1 (dn: 9001)).
- User1 has in its control list: Device A, B, CTIRD1 and CTIRD2. All devices and lines are observed.

## Basic Calls Initiated From Remote Destination

Table 285: Remote Destination Initiates Call with No Active RDD

| Action                                             | Events          | Call Info |
|----------------------------------------------------|-----------------|-----------|
| User1 opens Provider and adds a provider observer. | ProvInServiceEv |           |

| Action                                                                                         | Events                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | Call Info                                                                                                                                                                                    |

# Partition Support

Since the address hashing mechanism in JTAPI has changed, this feature is expected to have performance degradation in address lookup time and during load tests.

## Using getPartition() API

The example given below illustrates how getPartition(), will be used by JTAPI and applications, to differentiate between addresses having same DN but belonging to different partitions.

### Using getPartition() API

In this case, there are three addresses which belong to three different partitions: A(2001, P1), B(2001, P2) and C(2001, P3), where 2001 indicates DN and P1, P2, and P3 denote different partitions.

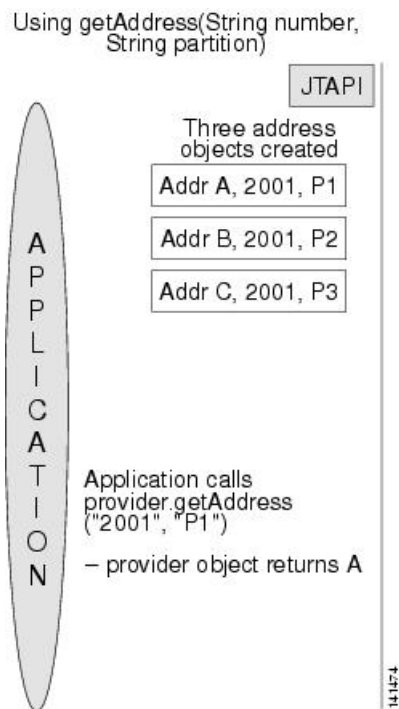

When JTAPI calls provider.getAddress(“2001”), the provider object will return an array of three address objects containing A, B and C, since all of them have the same DN.

The application and JTAPI will distinguish between the three addresses by using the getPartition() method of the address object.

## Using getAddress (String Number String Partition)

Consider the example shown below to see how JTAPI will use the getAddress (String number, String partition) API to retrieve the address object corresponding to a particular DN and partition when there are multiple addresses with same DN and different partitions.

**Using getAddress (String Number, String Partition)**

In this case, there are three addresses which belong to three different partitions. Let us denote them by A(2001, P1), B(2001, P2) and C(2001, P3), where 2001, indicates DN and P1, P2, P3 denote different partitions.

When JTAPI calls `provider.getAddress("2001", "P1")`, the provider object will return the address object which has the same DN i.e. 2001 and the same partition info, that is P1—as provided in the API. In this case, the address object A will be returned to the application.

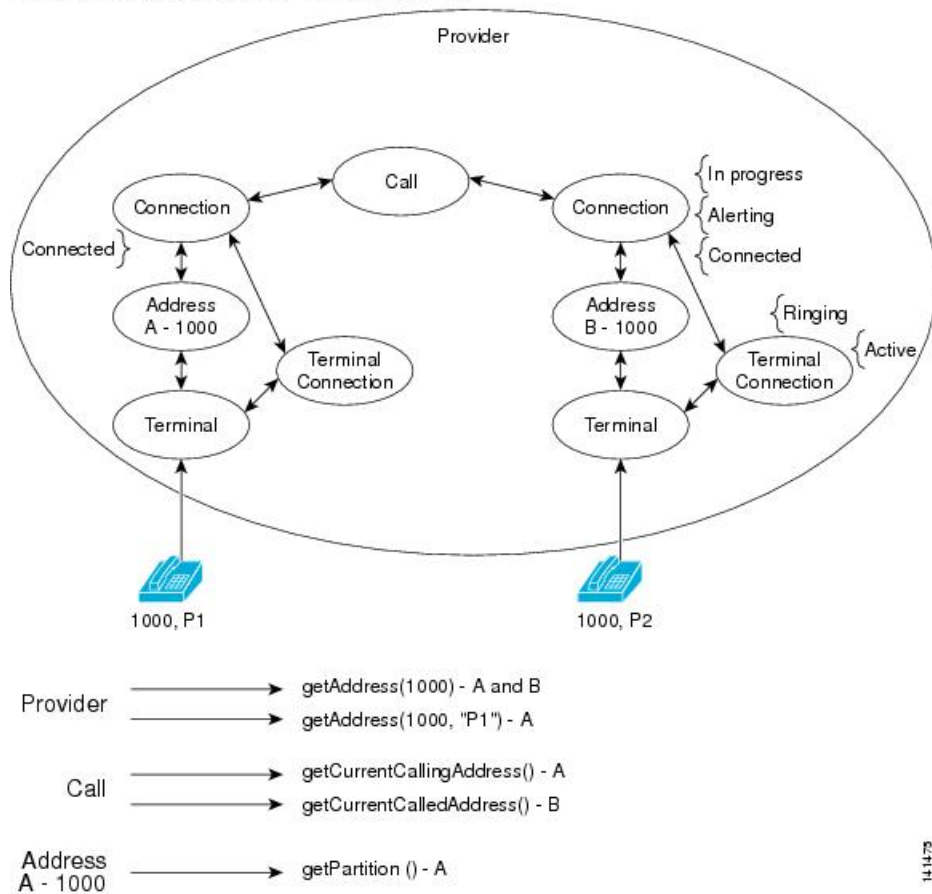

**Simple Call Scenario**

Consider the following scenario where A calls B. A has DN 1000 and calls B which also has DN 1000. A belongs to partition P1 and B belongs to partition P2. The following diagram illustrates the various events and the results of API calls pertaining to this scenario, which are relevant to partition support feature.

**Figure 20: Simple Call Scenario**

Scenario: Call from line x1000 :P1" to line x1000 "P2"

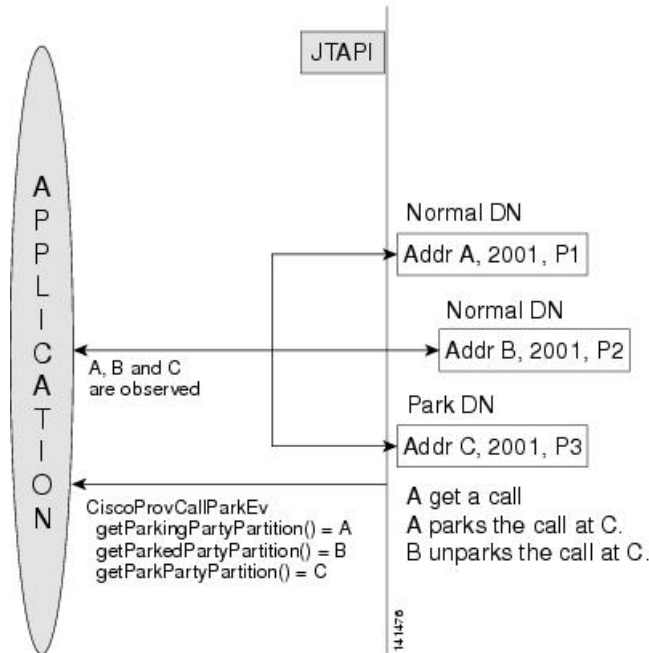

14-1179

## Park DN

Park DNs are also treated as addresses in JTAPI. Hence, the same treatment given to normal DN is also given to park DN. The following message flow illustrates how an application will use park DN partition information in a call where park DNs are involved.

### Park DN Scenario

CiscoProvCallParkEv - API Usage

When the application is monitoring park DN, it is possible to have the park DN to be the same as a regular DN (while both belong to different partitions).

In this case, C is a park DN having same DN value as A and B while belonging to a different partition.

A receives a call and parks the call at C. B un parks the call. While the call is parked, and unparked, CiscoProvCallParkEv is generated. The API

getParkingPartyPartition(), getParkedPartyPartition() and getParkPartyPartition() return the associated address objects as shown in the figure.

## Partition Change

Partition attribute is similar to the DN attribute of an address. Hence, whenever the partition attribute changes, the address object has to be destroyed and recreated. When the partition information of an address is changed, JTAPI will be restarted during which the current address objects will be deleted and new address objects will be created, reflecting the changed partition information.

### Change in Partition

Change in Partition Information

When the partition information of an address is changed, the address object will be destroyed and a new address object will be created.

The new address object will have the new partition information.

In the example given, Address A's partition string was changed to P4. Hence, the current address object of A will be deleted and a new address object will be created.

A query on the old address object using `A.getPartition()` will retrieve "P1", while the same query on the new object will return "P4".

When the address partition changes, applications should query the address objects to update their partition information.

## JTAPI Partition Support

The common assumption for all of the following use cases is that CTI provides partition information for all the lines which the JTAPI opens in the response message and JTAPI stores the partition information for every address it maintains.

| S.No. | Pre-Condition                                                                                                                                                                                 | Scenario                                                                                             | Expected Behavior                                                                                                                                                                                                                                      | Result                                                                                                              |
|-------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------|
| 1     | A and B are two addresses in the same cluster with same DN and different partitions (P1, P2) and in same cluster. A calls B. CSS of A has B's partition in it first.                          | Calls between addresses with same DN in different device but different partitions should go through. | Two address objects are created, one for A and one for B. All the appropriate call related events are delivered to both the addresses.                                                                                                                 | Call is established between A and B                                                                                 |
| 2     | A and B are two addresses with same DN in same device but different partitions (P1, P2) and in same cluster. A calls B. CSS of A has B's partition in it first.                               | Calls between addresses with same DN in same device but different partitions should go through.      | Two address objects are created, one for A and one for B. All the appropriate call related events are delivered to both the addresses.                                                                                                                 | Call is established between A and B.                                                                                |
| 3     | A, B, and C are three different addresses with different DN. (P1, P2, P3). A park DN is configured with same DN as C and different partition (P4).                                            | A calls B. B parks the call. C un parks the call from a park DN which is same as C's DN.             | JTAPI should allow C to un park the call from park DN.                                                                                                                                                                                                 | C is successfully able to un park the call from park DN.                                                            |
| 4     | A, B, and C are three different addresses having the same DN and different partitions (P1, P2, P3). A park DN is configured with same DN but belonging to a different partition (P4)          | A calls B, B parks call at park DN. C un parks the call.                                             | JTAPI should allow C to un park the call from park DN.                                                                                                                                                                                                 | A is able to call B. B should be able to park the call at the park DN.<br><br>C should be able to pick up the call. |
| 5     | A, B, and C are three different addresses with same DN and different partitions (P1, P2, and P3)                                                                                              | JTAPI calls getPartitionAddress(DN of A).                                                            | Three address objects are returned each corresponding to A, B and C.                                                                                                                                                                                   | JTAPI maintains the address objects based on partition info and DN.                                                 |
| 6     | A and B are addresses with same DN but belong to different partitions (P1, P2).                                                                                                               | Application calls getPartition() on the address objects of A and B.                                  |                                                                                                                                                                                                                                                        | Partition strings of the addresses are returned correctly.                                                          |
| 7     | A and B are two different addresses (different DNs) belonging to different partitions. A and B are in the control list of the same user. Provider open is completed and the lines are opened. | JTAPI supports old API to open lines when DN is different. There will be no change in behavior.      | Lines A and B will be opened, but since they have different DN, user need not specify the partition info. DN alone is sufficient to open the lines, but users can also give partition info and both modes of opening lines will be supported by JTAPI. | Address objects for A and B are created successfully.                                                               |

|-------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------|
| 8     | A is an address in the control list of user and is opened by the user. From the CM admin page the partition information of A is changed. The device is restarted after this. | Partition information of a DN is changed. JTAPI should reflect new partition information. | JTAPI will delete the current address object and create a new address object for A when it comes in service again. By querying the partition info of this address object, user should get changed partition info. | New partition information is reflected in the new address object. |

## Persistent Connection Use Cases

The following pre-conditions apply to all persistent call use cases, unless specified:

- The provider is in IN\_SERVICE state.
- All addresses and terminals are already in service.
- Device A (CTI Remote Device - Name: "CTIRDtapi", Line A1 (dn: 881000))  
Remote destination 1 (Name: "rd", Number: "78000")
- Device B (IP Phone - Name: "SEP001319ACCA26", Line B1 (dn: 1000))
- Device C (IP Phone - Name: "SEP00156247EE60", Line C1 (dn: 2000))
- User1 has in its control list: Devices A, B and C. All devices and lines are observed.

**Table 308: Call createPersistentCall() on an Address That Is Not Configured to a Remote Terminal Device, i.e. on an IP Phone**

| Action                                                                                             | Events                                                                                                                 | Call Info                                                                                                                                               |

## Play Announcement

### Prerequisites

Pre-conditions to all play announcement use cases, unless specified otherwise:

- Provider is in IN\_SERVICE state
- All addresses and terminals are already in service.
- Device A (CTI Remote Device - Name: "CTIRD3", Line A1 (dn: 9202))
  - o Remote destination 1 (Name: "C1\_CTIRD3\_RDD1", Number: "339006")
- Device B (IP Phone - Name: "SEP2401C7824EA3", Line B1 (dn: 9000))

- Announcement Identifier is Welcome Greeting Sample.
- User1 has in its control list: Devices A, and B. All devices and lines are observed.

## Basic Play Announcement Use Cases

### Basic Play Announcement Use Cases

**Table 328: Play Announcement on CTI Remote Device with Persistent Call**

| Action                                                                                                                  | Events                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | Call Info                                                                                                       |

## Play Zip Tone

A and B represents the terminals. TermConnB represents the Cisco terminal connection of Terminal B. TermConnCTI1 represents the Cisco terminal connection of terminal CTI1. CTI1 is a Cisco media terminal.

| SI.No | Scenario                                                                                                                      | Events/Response                                     |
|-------|-------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------|
| 1.    | A calls B. B answers the call and the application invokes TermConnB.playTone(CiscoTone.ZIPTONE, CiscoCall.PLAYTONE_LOCALONLY) | User on B hears the ZIP tone.                       |
| 2.    | A calls B. B answers the call and application invokes TermConnB.playTone(CiscoTone.ZIPTONE, CiscoCall.PLAYTONE_REMOTEONLY)    | User on A hears the ZIP tone.                       |
| 3.    | A calls B. B is alerting. Application calls TermConnB.playTone(CiscoTone.ZIPTONE, CiscoCall.PLAYTONE_LOCALONLY)               | Tone is heard by user B.                            |
| 4.    | A calls CTI1. Call is answered by CTI1. Application calls TermCTI.playTone(CiscoTone.ZIPTONE, CiscoCall.PLAYTONE_LOCALONLY)   | PlatformException is thrown to application request. |

| Sl.No | Scenario                                                                                                                          | Events/Response                                  |
|-------|-----------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------|
| 5.    | A calls CTI1. Call is answered by CTI1. Application calls TermConnCTI1.playTone(CiscoTone.ZIPTONE, CiscoCall.PLAYTONE_REMOTEONLY) | User on A hears the ZIP tone.                    |
| 6.    | A, B and CTI1 are in conference. Application calls TermConnB.playTone(CiscoTone.ZIPTONE, CiscoCall.PLAYTONE_LOCALONLY)            | User on B hears the ZIP tone.                    |
| 7.    | A, B and CTI1 are in conference. Application calls TermB.playTone(CiscoTone.ZIPTONE, CiscoCall.PLAYTONE_REMOTEONLY)               | None of the users on A, B and CTI hear the tone. |

## QoS Support

Figure 21: Call Flow Diagram for QoS Support

## JTAPI QoS

For QoS to work in Windows, complete the following steps:

1. Start Registry Editor (Regedt32.exe).
2. Go to the following key:

HKEY\_LOCAL\_MACHINE\System\CurrentControlSet\Services\Tcpip\Parameters\

**Note** The registry key is one path.

1. On the Edit menu, click Add Value.
2. Type DisableUserTOSSetting.
3. Click REG\_DWORD in the Data Type box.
4. Click OK.
5. Enter 0 in the prompt box.
6. Quit the Registry Editor.
7. Restart the computer.

For more information on this see <http://support.microsoft.com/default.aspx?scid=kb;en-us;248611>

| Scenario                                                                                                               | JTAPI Behavior                                                                                   |
|------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------|
| Application uses the JTAPI getPrecedenceValue() API to query for the new DSCP value, in CiscoRTPOutputStartedEvent.    | JTAPI returns the DSCP value received from CTI in StartTransmissionEvent to the application.     |
| Application uses the JTAPI getAppDSCPValue() API to query for the new DSCP value, when it gets ProviderInServiceEvent. | JTAPI returns the DSCP value received from CTI in ProviderOpenCompletedEvent to the application. |

## QSIG Path Replacement

The following table shows the JTAPI events that are delivered to applications when calls between PBXs that are connected by Q.Signaling (QSIG) trunks are transferred and forwarded. This table also shows the events that are delivered to applications when the real-time path (RTP) is optimized by the QSIG Path Replacement feature.

Calls going out on a QSIG trunk may not have a connection for the far end if any translation pattern is changing the pattern. In other words, when the application sees two calls in the trombone case, B may not serve as the common connection on the calls.

| No. | Action                                                                                                                                                                                                                                                                                                                                                       | Event                                                                                                                                                                                                                            |
|-----|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | <p>A registered with CM1, B is registered with CM2, and C registered with CM3.</p> <p>A calls B (GC1); B transfers the call to C. The application is monitors C. The PR feature replaces the path after the call gets connected to C.</p> <p>The same action applies to scenarios that involve call forward at B. (The called party transfers the call.)</p> | <p>These events get delivered to applications:</p> <p>CallCtrlConnectionEstablishedEv A</p> <p>CallCtrlConnectionDisconnectEv B</p> <p>OpenLogicalChannelEvent if C is a CTI device (Dynamically registered CTIPorts and RP)</p> |

| No. | Action                                                                                                                                                                                                                                                                         | Event                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| 2   | A registered with CM1, B registered with CM2, and C registered with CM3. B calls C; C answers; B transfers the call to A. A answers. The application is monitors only C. (The calling party transfers the call.)                                                               | <p>In this case, both A and C represent called parties when transfer completes. After the call is answered, PR replaces the path. In this case, A and C represent IP phones; the display will be updated as a part of PR feature operation, that makes either A or C as calling.</p> <p>JTAPI events:</p> <p>GC1: CallCtlConnEstablishedEv A<br/>GC1: CallCtlConnDisconnectedEv B</p>                                                                                                                                                                                                                                                                                |
| 3   | Trombone case: A registered to CM1, B registered to CM2, and C registered to CM1. A calls B (GC1); B answers and transfers the call to C (GC2). Path replacement connects A and C bypassing CM2. The application observes both A and C. (The called party transfers the call.) | <p>For GC1 Call Observer:</p> <p>GC1: CallCtlConnEstablishedEv C<br/>GC1: CallCtlConnDisconnected B</p> <p>Before the PR feature replaces the path, the application sees two calls: GC1 with connections to A and C (external) and GC2 with connections to C and A (external).</p> <p>When the PR feature replaces the path, either GC1 changes GC2, or GC2 changes to GC1.</p> <p>Assuming A's GCID changes from GC1 to GC2:</p> <p>GC1: CiscoCallChangedEv (oldGCID = GC1, newGCID = GC2)<br/>GC1: CallCtlConnDisconnected for A<br/>GC1: CallCtlConnDisconnected for C<br/>GC1: CallInValid<br/>GC2: TermConnTalkingEvent for TerminalA cause = CAUSE_QSIG_PR</p> |

| No. | Action                                                                                                                                                                                                                                                | Event                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 4   | Trombone case: A registered to CM1, B registered to CM2, and C registered to CM1. B calls A and transfers the call to C. Path replacement connects A and C, bypassing CM2. Application observes both A and C. (The calling party transfers the call.) | <p>Before the PR feature replaces the path, the application will see two calls: GC1 with connections to A and B (external) and GC2 with connections to C and B (external). In this case, the application will not see any transfer start events.</p> <p>When PR feature replaces the path, it updates the display of A and C and path gets replaced, resulting in a GCID change. Assuming A's GCID is changed and made the calling party, the following JTAPI events occur:</p> <p>GC1: CiscoCallChangedEv (GC1 to GC2)<br/>                     GC1: CallCtlConnDisconnected for A<br/>                     GC1: CallCtlConnDisconnected for C<br/>                     GC1: CallInvalid<br/>                     GC2: ConnCreatedEv A<br/>                     GC2: ConnConnectedEv A<br/>                     GC2: TermConnTalkingEvent for TerminalA cause = CAUSE_QSIG_PR</p> |
| 5   | A registered to CM1, B registered to CM2, and C registered to CM1. A calls B; B transfers the call to C. C answers and before path replacement completes, C invokes a feature (park, redirect, and so on).                                            | Path replacement gets abandoned.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 6   | In some conditions, call processing ignores feature requests (redirect, park, transfer, and so on). This happens when a setup request is sent out, and the local CM is waiting for connect from the other end.                                        | <p>JTAPI:</p> <p>Exception will be thrown from JTAPI for feature requests.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 7   | In some cases, the application could receive dead air when CM goes down when the PR feature is trying to switch the RTP path. This could happen to a previously connected call.                                                                       | <p>No events</p> <p>JTAPI Apps: Hang up the call</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

## Recording Use Cases

### Expose ClusterID in CiscoProvider Interface

| Actions                                                     | Events          | Call Info                         |
|-------------------------------------------------------------|-----------------|-----------------------------------|
| Start application and initialize JTAPI                      |                 |                                   |
| Add provider observer                                       | ProvInServiceEv |                                   |
| Application calls <code>ciscoProvider.getClusterID()</code> |                 | JTAPI returns 'StandAloneCluster' |

|                                                                                  |                                     |                                                                              |
|----------------------------------------------------------------------------------|-------------------------------------|------------------------------------------------------------------------------|
| Admin changes the clusterID to '3NodeClusterinSanJose' and restarts the services |                                     |                                                                              |
|                                                                                  | ProvOutOfService<br>ProvInServiceEv | Application calls getClusterID() - JTAPI returns '<br>3NodeClusterinSanJose' |

### Multi-Clusters Gateway Recording Use Cases

Test configurations Specification:

- Cluster 1 = SME Cluster with 1 PUB and 1 SUB (Note: Only use DN's 2xxx, 3xxx, 9xxx)
- Cluster 2 = External Cluster (Note: Only use DN's 1xxx, 4xxx)
- Cluster 3 = Leaf Cluster (Note: Only use DN's 5xxx, 6xxx)

Assumption: All devices have BIB enabled unless specified in the detailed test cases. CTIRD does not support BIB.

- Cluster 1 and Cluster 2 are connected thru SIP GW which is recording enabled.
- Cluster 1 and Cluster 3 are connected thru SIP trunk ICT.
- Cluster 2 and Cluster 3 are connected thru SIP trunk ICT.

On Cluster 1 Route-Patterns:

- 180.XXXX: SIP ICT trunk from cluster 1 to cluster 3, calledPartyTransformation: remove PreDot.
- 171.XXXX: SIP GW from cluster 1 to cluster 2, calledPartyTransformation: remove PreDot.

On Cluster 2 Route-Patterns:

- 172.XXXX: SIP GW from cluster 2 to cluster 1, calledPartyTransformation: remove PreDot.
- 172180.XXXX: SIP GW from cluster 2 to cluster 1 to cluster 3, calledPartyTransformation: remove PreDot.
- 180.XXXX: SIP ICT trunk from cluster 2 to cluster 3 directly, calledPartyTransformation: remove PreDot.

On Cluster 3 Route-Patterns:

- 172.XXXX: SIP ICT trunk from cluster 3 to cluster 1, calledPartyTransformation: remove PreDot.
- 172171.XXXX: SIP GW from cluster 3 to cluster 1 to cluster 2, calledPartyTransformation: remove PreDot.
- 171.XXXX: SIP ICT trunk from cluster 3 to cluster 2 directly, calledPartyTransformation: remove PreDot.

# Recording IP Phones

## Scenario 1

IP phones (Basic): Multi-Clusters Gateway preferred with auto recording

| Setup and Action                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | Events and Call Info                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

# Recording Fail Event

## Scenario 38

Failure Event: Hold Resume- auto recording on IP phone - devRD, A, C, D (SME) and RDD (cluster2)

| Setup and Action | Events and Call Info |
|------------------|----------------------|
|------------------|----------------------|

## Cluster 1 (SME):

- "Allow trunk use GW recording" is enabled
- Central recorder: 2000

## Cluster 2:

## Cluster 3 (leaf):

- "Allow trunk use GW recording" is enabled
- Branch recorder: 2000
- devRD (CTIRD1) on cluster 1 has line RD1 (2303) (active remote destination: 1711623 on cluster2) configured as:
  - selective recording enabled
  - GW preferred

## Remote Destination RDD on cluster 2.

- devA (SEP334F) on cluster 1 has line A1 (2206) configured as:
  - GW preferred
  - auto recording enabled
  - rec\_profile1: 2000
- devC (IP10) on cluster 1 has line C1 (3300) configured as:
  - GW preferred
  - auto recording enabled
  - rec\_profile1: 2000

- devD (SEP3925) on cluster 1 has line D1 (9002)

1. Open provider Prov1, Prov2, Prov3
2. Observe RD1, RDD1, A1, C1, and D1 in Prov1/Prov2/Prov3 accordingly
3. A1 call RD1
4. Remote destination answers, and then A1 answer
5. A1 put call on hold
6. C1 call D1, D1 answer
7. A1 resume

## Step 4- Check auto recording started on A1.

Check A1 get CiscoTermConnRecordingStartedEv and CiscoTermConnRecordingTargetInfoEv.

Check A1 TermConnection.getCiscoRecorderInfo():

.getRecordingType() = CALL\_RECORDING\_TYPE\_AUTOMATIC

.getTerminalName() = central recorder device name

.getAddress() = Recording profile (DN 2000)

.getMediaForkingDeviceType() =

CALL\_RECORDING\_MEDIA\_FORKING\_DEVICE\_TYPE\_GW

.getMediaForkingDeviceName() = SIP trunk device name - SIP GW

.getProtocolReferenceGUID() =

.getMediaForkingClusterID() = name of cluster1

Step 5- A1 put call on hold. Check A1 get CiscoTermConnRecordingEndedEv

## Step 6- Check auto recording started on C1.

Check C1 get CiscoTermConnRecordingStartedEv and CiscoTermConnRecordingTargetInfoEv.

Check C1 TermConnection.getCiscoRecorderInfo():

.getRecordingType() = CALL\_RECORDING\_TYPE\_AUTOMATIC

.getTerminalName() = central recorder device name

.getAddress() = Recording profile (DN 2000)

.getMediaForkingDeviceType() =

CALL\_RECORDING\_MEDIA\_FORKING\_DEVICE\_TYPE\_PHONE

.getMediaForkingDeviceName() = Device name of C

.getProtocolReferenceGUID() =

.getMediaForkingClusterID() = name of cluster1

Step 7- A1 resume. No CiscoTermConnRecordingFailedEv.

Step 8- C1 drop. Check C1 get CiscoTermConnRecordingEndedEv

## Step 10- Check auto recording started on A1.

Check A1 get CiscoTermConnRecordingStartedEv and CiscoTermConnRecordingTargetInfoEv.

Check A1 TermConnection.getCiscoRecorderInfo():

.getRecordingType() = CALL\_RECORDING\_TYPE\_AUTOMATIC

.getTerminalName() = central recorder device name

.getAddress() = Recording profile (DN 2000)

.getMediaForkingDeviceType() =

CALL\_RECORDING\_MEDIA\_FORKING\_DEVICE\_TYPE\_GW

|                            |                                                               |
|----------------------------|---------------------------------------------------------------|
| 8. C1 drop                 | .getMediaForkingDeviceName() = SIP trunk device name - SIP GW |
| 9. A1 put on hold          | .getProtocolReferenceGUID() =                                 |
| 10. A1 resume              | .getMediaForkingClusterID() = name of cluster1                |
| 11. A1 disconnect the call | Step 11- Check A1 get CiscoTermConnRecordingEndedEv           |

**Scenario 39**

Failure Event: Redirect- auto recording on CTI remote device - devRD, A, C, D, B, E (SME) and RDD (cluster2)

| Setup and Action | Events and Call Info |
|------------------|----------------------|
|------------------|----------------------|

## Cluster 1 (SME):

- "Allow trunk use GW recording" is enabled
- Central recorder: 2000

## Cluster 2:

## Cluster 3 (leaf):

- "Allow trunk use GW recording" is enabled
- Branch recorder: 2000
- devRD (CTIRD3) on cluster 1 has line RD1 (9008) (active remote destination: 1711681 on cluster2) configured as:
  - auto recording enabled
  - GW preferred

## Remote Destination RDD on cluster 2.

- devA (SEP334F) on cluster 1 has line A1 (2205) configured as:
  - GW preferred
  - selective recording enabled
  - rec\_profile1: 2000
- devC (IP10) on cluster 1 has line C1 (3300) configured as:
  - GW preferred
  - auto recording enabled
  - rec\_profile1: 2000
- devD (SEP3925) on cluster 1 has line D1 (9002)
- devB (SEPAB21) on cluster 1 has line B1 (9000)
- devE (IP9) on cluster 1 has line E1 (2302)

1. Open provider Prov1, Prov2, Prov3
2. Observe RD1, RDD1, A1, B1, C1, D1, and E1 in Prov1/Prov2/Prov3 accordingly
3. A1 call RD1
4. Remote destination answers
5. Drop call from recorder
6. C1 call D1, D1 answer

## Step 4- Check auto recording started on RD1.

Check RD1 get CiscoTermConnRecordingStartedEv and CiscoTermConnRecordingTargetInfoEv.

Check RD1 TermConnection.getCiscoRecorderInfo():

.getRecordingType() = CALL\_RECORDING\_TYPE\_AUTOMATIC

.getTerminalName() = central recorder device name

.getAddress() = Recording profile (DN 2000)

.getMediaForkingDeviceType() =

CALL\_RECORDING\_MEDIA\_FORKING\_DEVICE\_TYPE\_GW

.getMediaForkingDeviceName() = SIP trunk device name - SIP GW

.getProtocolReferenceGUID() =

.getMediaForkingClusterID() = name of cluster1

Step 5- Drop call from recorder. Check RD1 get CiscoTermConnRecordingEndedEv

## Step 6- Check auto recording started on C1.

Check C1 get CiscoTermConnRecordingStartedEv and CiscoTermConnRecordingTargetInfoEv.

Check C1 TermConnection.getCiscoRecorderInfo():

.getRecordingType() = CALL\_RECORDING\_TYPE\_AUTOMATIC

.getTerminalName() = central recorder device name

.getAddress() = Recording profile (DN 2000)

.getMediaForkingDeviceType() =

CALL\_RECORDING\_MEDIA\_FORKING\_DEVICE\_TYPE\_PHONE

.getMediaForkingDeviceName() = Device name of C

.getProtocolReferenceGUID() =

.getMediaForkingClusterID() = name of cluster1

Step 7-. A1 redirect and B1 answer. No CiscoTermConnRecordingFailedEv.

Step 9- C1 drop. Check C1 get CiscoTermConnRecordingEndedEv

## Step 10- Check auto recording started on RD1.

Check RD1 get CiscoTermConnRecordingStartedEv and CiscoTermConnRecordingTargetInfoEv.

Check RD1 TermConnection.getCiscoRecorderInfo():

.getRecordingType() = CALL\_RECORDING\_TYPE\_AUTOMATIC

.getTerminalName() = central recorder device name

.getAddress() = Recording profile (DN 2000)

.getMediaForkingDeviceType() =

CALL\_RECORDING\_MEDIA\_FORKING\_DEVICE\_TYPE\_GW

|                            |                                                               |
|----------------------------|---------------------------------------------------------------|
| 7. A1 redirect to B1       | .getMediaForkingDeviceName() = SIP trunk device name - SIP GW |
| 8. B1 answer               | .getProtocolReferenceGUID() =                                 |
| 9. C1 drop                 | .getMediaForkingClusterID() = name of cluster1                |
| 10. B1 redirect to E1      | Step 11- Check RD1 get CiscoTermConnRecordingEndedEv          |
| 11. E1 disconnect the call |                                                               |

**Scenario 40**

Failure Event: Transfer- auto recording on CTI remote device - devRD, A, C, D, B, E (SME) and RDD (cluster2)

| Setup and Action | Events and Call Info |
|------------------|----------------------|
|------------------|----------------------|

## Cluster 1 (SME):

- "Allow trunk use GW recording" is enabled
- Central recorder: 2000

## Cluster 2:

## Cluster 3 (leaf):

- "Allow trunk use GW recording" is enabled
- Branch recorder: 2000
- devRD (CTIRD3) on cluster 1 has line RD1 (9008) (active remote destination: 1711681 on cluster2) configured as:
  - auto recording enabled
  - GW preferred

## Remote Destination RDD on cluster 2.

- devA (SEP334F) on cluster 1 has line A1 (2205) configured as:
  - GW preferred
  - selective recording enabled
  - rec\_profile1: 2000
- devC (IP10) on cluster 1 has line C1 (3300) configured as:
  - GW preferred
  - auto recording enabled
  - rec\_profile1: 2000
- devD (SEP3925) on cluster 1 has line D1 (9002)
- devB (SEPAB21) on cluster 1 has line B1 (9000)
- devE (IP9) on cluster 1 has line E1 (2302)

1. Open provider Prov1, Prov2, Prov3
2. Observe RD1, RDD1, A1, B1, C1, D1, and E1 in Prov1/Prov2/Prov3 accordingly
3. A1 call RD1
4. Remote destination answers
5. Drop call from recorder
6. C1 call D1, D1 answer

## Step 4- Check auto recording started on RD1.

Check RD1 get CiscoTermConnRecordingStartedEv and CiscoTermConnRecordingTargetInfoEv.

Check RD1 TermConnection.getCiscoRecorderInfo():

.getRecordingType() = CALL\_RECORDING\_TYPE\_AUTOMATIC

.getTerminalName() = central recorder device name

.getAddress() = Recording profile (DN 2000)

.getMediaForkingDeviceType() =

CALL\_RECORDING\_MEDIA\_FORKING\_DEVICE\_TYPE\_GW

.getMediaForkingDeviceName() = SIP trunk device name - SIP GW

.getProtocolReferenceGUID() =

.getMediaForkingClusterID() = name of cluster1

Step 5- Drop call from recorder. Check RD1 get CiscoTermConnRecordingEndedEv

## Step 6- Check auto recording started on C1.

Check C1 get CiscoTermConnRecordingStartedEv and CiscoTermConnRecordingTargetInfoEv.

Check C1 TermConnection.getCiscoRecorderInfo():

.getRecordingType() = CALL\_RECORDING\_TYPE\_AUTOMATIC

.getTerminalName() = central recorder device name

.getAddress() = Recording profile (DN 2000)

.getMediaForkingDeviceType() =

CALL\_RECORDING\_MEDIA\_FORKING\_DEVICE\_TYPE\_PHONE

.getMediaForkingDeviceName() = Device name of C

.getProtocolReferenceGUID() =

.getMediaForkingClusterID() = name of cluster1

Step 9-. A1 complete transfer. No CiscoTermConnRecordingFailedEv.

Step 10- C1 drop. Check C1 get CiscoTermConnRecordingEndedEv

## Step 13- Check auto recording started on RD1.

Check RD1 get CiscoTermConnRecordingStartedEv and CiscoTermConnRecordingTargetInfoEv.

Check RD1 TermConnection.getCiscoRecorderInfo():

.getRecordingType() = CALL\_RECORDING\_TYPE\_AUTOMATIC

.getTerminalName() = central recorder device name

.getAddress() = Recording profile (DN 2000)

**Note** The specified event group may not be in the same order and might change depending on where parties are present in the cluster, on the load, and other conditions.

**Scenario Two**

- A, B, and C do not appear in the Control list, and
- D is in the application control list.
- A calls B.
- B redirects the call to D with C as preferredOriginalCalledParty.

The application will see following events for party D:

| Meta Event Cause   | Call  | Event                                                                                                                                                                      | Fields                                                                                          |
|--------------------|-------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------|

# Redirect to a Device

The following tables display message sequence charts for the Redirect enhancement that allows you to redirect calls to a specific device, even if that device is sharing a line with another device.

## CallRedirect to Shared Line with Device Name

In this use case devices A, B, C, and C' are IP phones where C and C' share a line. RP is the route point.

| Action                  | Events                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | CallInfo |

# Secure Icon Enhancements

Enable the callSecurityStatusChangedEv using JTAPI ini parameters or using the JTAPIProperties.

Cluster1 and Cluster2 are secured and User is also a secured user having a CAPF profile associated with it. Enable "SRTP Allowed" in the SIP trunk Configurations.

TermA is registered to Cluster1 with address A.  
 TermB is registered to Cluster2 with address B  
 TermC is registered to Cluster2 or Cluster1 as per Use case and has address C  
 SIP trunk is configured on Cluster1 to make calls to cluster2  
 A Route Pattern is configured on Cluster 1 to route the call to the SIP trunk

**Use Case One**

# Shared Line Support

The following diagrams illustrate the message flows for Shared Line support.

## AddressInService/AddressOutOfService Events

# Incoming Call to Shared Address

Scenario: 2005 is Shared line appearing on terminal SEP003094C25AFF (T1) and Terminal SEP003094C2A0B0(T2). 2000 makes calls to 2005. 2005-T2 answers the call

# Outgoing Call From Shared Address

# Shared Address Calling Itself

## Single Sign-On

Here are the list of use cases for this feature.

| Sl. No | Scenario                                                                                                                                                        | Result                                                                                    |
|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------|
| 1.     | Start the application (cucimoc) and getProvider(str) API is called by application specifying the singlesignon ticket.<br>Application calls getAddressess() API. | Returns provider to the application and all the addresses configured in the control list. |
| 2.     | Application specifies an invalid ticket but correct userid and password in API.                                                                                 | Throws a platform exception to getProvider() API.                                         |

| Sl. No | Scenario                                                                                                                                                                                                                                                   | Result                                                                                                                                                                                                                                                                                                |
|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 3.     | Start the application and it calls the <code>getProvider()</code> API with <code>singlesignon</code> ticket.<br><br>The network connectivity is lost.<br><br>Application gets a new <code>singlesignon</code> token and calls <code>getProvider()</code> . | Returns provider to the application.<br><br>Delivers <code>ProvOutOfServiceEv</code> to provider observer.<br><br>JTAPI connects and tries to authenticate the user which fails.<br><br>Delivers <code>ProvShutdownEv</code> to provider observer.<br><br>Returns provider object to the application. |
| 4.     | Start the application and <code>getProvider()</code> API is called by application with the <code>singlesignon</code> ticket. But the feature is not enabled on Cisco Unified Communications Manager.                                                       | Throws <code>PlatformException</code> and <code>getErrorCode()</code> returns <code>CiscoJTAPIException - CTIERR_SSO_DISABLED</code> .                                                                                                                                                                |
| 5.     | Start the application and <code>getProvider()</code> API is called by application with invalid <code>singlesignon</code> ticket.                                                                                                                           | Throws <code>PlatformException</code> and <code>getErrorCode()</code> returns <code>CiscoJTAPIException - CTIERR_DIRECTORY_LOGIN_FAILED</code> .                                                                                                                                                      |
| 6.     | Multiple providers:<br><br>Start the application and <code>getProvider()</code> on two nodes in the cluster with the same token.                                                                                                                           | Both <code>getProvider()</code> call is successful with the first provider.<br><br>Throws exception to the second <code>getProvider()</code> .                                                                                                                                                        |

## Single Step Transfer

Addresses A, B, and C appear in the control list, and the call between A and B is then gets transferred to C with B as the transfer controller. Applications will see the following events:

| Action                | Address A (5001)<br>Terminal CTIP1                                                                                                                                                                                                                                                                                                                                   | Address B (5002)<br>Terminal CTIP2                                                                                                                                                                                                                                                                                                                                                        | Address C (5003)<br>Terminal CTIP3                                                                                                                                                                                                                                                                                                                                                                                                                                   |

## SIP REPLACE

For the JTAPI events in the scenario described below, we have not shown Terminal events. It will be sent for all the observed Terminals as usual. Also events are shown with the assumption that only A, B, or C is observed; events would vary if combination of A, B, or C is observed.

| SN | Scenario                                                                                                                                                                                                                | Events at A                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | Events at B                                                                                                                                                                                                                                                                                                                                                                                                                      | Events at C                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

## SIP REFER

The following section describes the scenarios that might be encountered during a SIP REFER. There are two categories of REFER scenarios: IN-Dialog and OutOfDialog.

### IN-Dialog REFER Scenario

There are 11 scenarios (A through K) described in the sections that follow for IN-Dialog REFERs.

#### Scenario One

A (SIP UA in cluster/in control) is in a call with B.

A (referrer) REFERs B (Referee) to C (Refer to target), C is Ringing.

JTAPI moves A's Connect/CallControlConnection/TerminalConnection/  
CallControlTerminalConnection into the "UNKNOWN" state.

CAUSE\_CODE provided will be CAUSE\_NORMAL, new API provides REASON\_REFERER.

For C a new Connect/CallControlConnection/TerminalConnection/CallControlTerminalConnection would be created.

CallInfo at B and C would be as follows:

At B: Cgpn = B, Cdpn = C, Lrp = A OCdpn = C

At C: Cgpn = B, Cdpn = C, Lrp = A OCdpn = C

JTAPI Application observing B will see:

```
getCallingParty() = A
getCalledParty() = B
getCurrentCallingParty() = B
getCurrentCalledParty() = C
getLastRedirecting() = A
```

JTAPI Application observing C will see:

```
getCallingParty() = B
getCalledParty() = C
getCurrentCallingParty() = B
getCurrentCalledParty() = C
getLastRedirecting() = A
```

### Scenario Two

A(SIP UA in cluster/in control) is in a call with B.

A(referrer) REFERS B(Referee) to C(Refer to target), C Answers the Call.

JTAPI will Disconnect/Drop A's Connect/CallControlConnection/TerminalConnection/

CallControlTerminalConnection. CAUSE\_CODE provided will be CAUSE\_NORMAL and the new API would provide REASON\_REFERER.

For C Connect/CallControlConnection/TerminalConnection/CallControlTerminalConnection will move to the Connected/Established/Active/Talking state.

CallInfo at B and C will be as follows

At B: Cgpn = B, Cdpn = C, Lrp = A OCdpn = C

At C: Cgpn = B, Cdpn = C, Lrp = A OCdpn = C

JTAPI Application observing B will see:

```
getCallingParty() = A
getCalledParty() = B
getCurrentCallingParty() = B
getCurrentCalledParty() = C
getLastRedirecting() = A
```

JTAPI Application observing C will see:

getCallingParty() = B

getCalledParty() = C

getCurrentCallingParty() = B

getCurrentCalledParty() = C

getLastRedirecting() = A

### Scenario Three

A(SIP UA inside cluster) is in a call with B.

A(referrer) REFERS B(Referee) to C(Refer to target), C is ringing but C did not answer the call and has no forward configured. Refer fails, the original call between A and B is restored.

JTAPI will Disconnect/Drop the Connection/CallControlConnection/TerminalConnection/

CallControlTerminalConnection for C. CAUSE\_CODE provided will be CAUSE\_NORMAL and the new API will provide REASON\_REFER and move A's Connection/CallControlConnection/

TerminalConnection/CallControlTerminalConnection from the "Unknown" state to the Connected/Established/Active/Talking state.

CallInfo at A and B will be as follows

At A: Cgpn = A, Cdpn = B, Lrp = OCdpn = B

At B: Cgpn = A, Cdpn = B, Lrp = OCdpn = B

JTAPI Application observing A will see:

getCallingParty() = A

getCalledParty() = B

getCurrentCallingParty() = A

getCurrentCalledParty() = B

getLastRedirecting() = NULL

JTAPI Application observing B will see:

getCallingParty() = A

getCalledParty() = B

getCurrentCallingParty() = A

getCurrentCalledParty() = B

getLastRedirecting() = NULL

### Scenario Four

A(SIP UA outside cluster) is in call with B.

A(referrer) REFERS B(Referee) to C(Refer to target), C is ringing.

JTAPI will create Connection/CallControlConnection/TerminalConnection/

CallControlTerminalConnection for C and will drop A's Connection/CallControlConnection on getting CPIC at B, CAUSE\_CODE provided will be CAUSE\_NORMAL and the new API will provide REASON\_REFER.

CallInfo at B and C will be as follows:

At B: Cgpn = B, Cdpn = C, Lrp = A OCdpn = C

At C: Cgpn = B, Cdpn = C, Lrp = A OCdpn = C

JTAPI Application observing B will see:

getCallingParty() = A

getCalledParty() = B

getCurrentCallingParty() = B

getCurrentCalledParty() = C

getLastRedirecting() = A

JTAPI Application observing C will see:

getCallingParty() = B

getCalledParty() = C

getCurrentCallingParty() = B

getCurrentCalledParty() = C

getLastRedirecting() = A

### Scenario Five

A(SIP UA outside cluster) is in a call with B.

A(referrer) refers B(Referee) to C(Refer to target), C is ringing but C did not answer the call and has no forward configured. Refer fails, the original Call between A and B is restored.

JTAPI will create Connection/CallControlConnection for A again and drops Connection/

CallControlConnection/TerminalConnection/CallControlTerminalConnection for C.

CAUSE\_CODE provided will be CAUSE\_NORMAL and new API will provide REASON\_REFER.

CallInfo at A and B will be as follows

At A: Cgpn = A, Cdpn = B, Lrp = OCdpn = B

At B: Cgpn = A, Cdpn = B, Lrp = OCdpn = B

JTAPI Application observing A will see:

getCallingParty() = A

getCalledParty() = B

```

getCurrentCallingParty() = A
getCurrentCalledParty() = B
getLastRedirecting() = NULL
JTAPI Application observing C will see:
getCallingParty() = A
getCalledParty() = B
getCurrentCallingParty() = A
getCurrentCalledParty() = B
getLastRedirecting() = NULL

```

### Scenario Six

A(SIP UA in cluster/in control) is in a call with B.

A(referrer) REFERS B(Referee) to C(Refer to target), C answers the call.

JTAPI moves Connection/CallControlConnection/TerminalConnection/CallControlTerminalConnection for C to the Connected/Established/Active/Talking state. CAUSE\_CODE provided is CAUSE\_NORMAL and the new API will provide REASON\_REFER.

CallInfo at B and C will be as follows

At B: Cgpn = B, Cdpn = C, Lrp = A OCdpn = C

At C: Cgpn = B, Cdpn = C, Lrp = A OCdpn = C

JTAPI Application observing B will see:

```

getCallingParty() = A
getCalledParty() = B
getCurrentCallingParty() = B
getCurrentCalledParty() = C
getLastRedirecting() = A

```

JTAPI Application observing C will see:

```

getCallingParty() = B
getCalledParty() = C
getCurrentCallingParty() = B
getCurrentCalledParty() = C
getLastRedirecting() = A

```

### Scenario Seven

A(SIP UA in cluster/in control) is in a call with B.

A(referrer) REFERS B(Referee) to C(Refer to target), C forwardAll to D, D is ringing.

JTAPI creates Connection/CallControlConnection/TerminalConnection/CallControlTerminalConnection for D. CAUSE\_CODE provided will be CAUSE\_REDIRECT and the reason received from CTI would be ForwardAll.

CallInfo at B and D will be as follows

At B: Cgpn = B, Cdpn = D, Lrp = C OCdpn = C

At D: Cgpn = B, Cdpn = D, Lrp = C OCdpn = C

JTAPI Application observing B will see:

getCallingParty() = A

getCalledParty() = B

getCurrentCallingParty() = B

getCurrentCalledParty() = D

getLastRedirecting() = C

JTAPI Application observing D will see:

getCallingParty() = B

getCalledParty() = D

getCurrentCallingParty() = B

getCurrentCalledParty() = D

getLastRedirecting() = C

### Scenario Eight

A (SIP UA in cluster/in control) is in a call with B.

A(referrer) REFERS B(Referee) to C(Refer to target), C Redirect to D, D is ringing.

JTAPI creates Connection/CallControlConnection/TerminalConnection/CallControlTerminalConnection for D. CAUSE\_CODE provided will be CAUSE\_REDIRECT and the reason received from CTI in NewCallEvent at D will be Redirect.

Callinfo when Call is offered at C:

At B: Cgpn = B, Cdpn = C, Lrp = A OCdpn = C

At C: Cgpn = B, Cdpn = C, Lrp = A OCdpn = C

CallInfo in final Call:

At B: Cgpn = B, Cdpn = D, Lrp = C OCdpn = C

At D: Cgpn = B, Cdpn = D, Lrp = C OCdpn = C

JTAPI Application observing B will see in final Call:

getCallingParty() = A

```

getCalledParty() = B
getCurrentCallingParty() = B
getCurrentCalledParty() = D
getLastRedirecting() = C

```

JTAPI Application observing D will see:

```

getCallingParty() = B
getCalledParty() = D
getCurrentCallingParty() = B
getCurrentCalledParty() = D
getLastRedirecting() = C

```

### Scenario Nine

A(SIP UA in cluster/in control) is in a call with B.

B consult transfer to D, A(Referrer) REFERS B(Referee) to C(Refer to target), C is ringing, B completes the transfer. Attempt to transfer will fail while C is ringing.

### Scenario Ten

A(SIP UA in cluster/in control) is in a call with B.

B consult transfer to D, A(Referrer) REFERS B(Referee) to C(Refer to target), C answers the call.

Refer will be successful. B completes the transfer, transfer will be successful, C and D will be in call.

JTAPI Disconnect/Drops A's Connect/CallControlConnection/TerminalConnection/

CallControlTerminalConnection. CAUSE\_CODE provided will be CAUSE\_NORMAL and the new API will provide REASON\_REFER.

For C, Connect/CallControlConnection/TerminalConnection/CallControlTerminalConnection will move to Connected/Established/Active/Talking state.

CallInfo at D and C would be as follows

At D: Cgpn = C, Cdpn = D, Lrp = B OCdpn = D

At C: Cgpn = C, Cdpn = D, Lrp = B OCdpn = D

JTAPI Application observing D will see:

```

getCallingParty() = B
getCalledParty() = D
getCurrentCallingParty() = C
getCurrentCalledParty() = D
getLastRedirecting() = B

```

JTAPI Application observing C will see:

```

getCallingParty() = B
getCalledParty() = C
getCurrentCallingParty() = C
getCurrentCalledParty() = D
getLastRedirecting() = B

```

### Scenario Eleven

B is in a call with D, B consults to A(SIP UA in cluster/in control).

A(Referrer) REFERS B(Referee) to C(Refer to target), C is ringing, B completes the transfer.

REFER would fail. Call at A will be dropped, transfer is successful, D is getting RingBack, C is ringing.

JTAPI Disconnect/Drops A's Connect/CallControlConnection/TerminalConnection/

CallControlTerminalConnection. CAUSE\_CODE provided will be CAUSE\_NORMAL and the new API would provide REASON\_REFER, Application will not know if REFER failed.

For C, Connect/CallControlConnection/TerminalConnection/CallControlTerminalConnection will move to Alerting/Alerting/Ringing/Ringing state.

CallInfo at D and C would be as follows:

At D: Cgpn = D, Cdpn = C, Lrp = B OCdpn = C

At C: Cgpn = D, Cdpn = C, Lrp = B OCdpn = C

JTAPI Application observing D will see:

```

getCallingParty() = B
getCalledParty() = D
getCurrentCallingParty() = D
getCurrentCalledParty() = C
getLastRedirecting() = B

```

JTAPI Application observing C will see:

```

getCallingParty() = B
getCalledParty() = C
getCurrentCallingParty() = D
getCurrentCalledParty() = C
getLastRedirecting() = B

```

## OutOfDialog Refer

SIP-UA A REFERS B(Referee) to C (Refer To Target)

B gets newcall with Cgpn = A, Cdpn = B, Lrp = , OCdpn = B.

JTAPI Application will get CallActive, Connection, CallCtlConnection, TerminalConnecton and CallCtlTerminalConnection created for B with CAUSE\_NORMAL, and the new API will return REASON\_REFER.

B's Connection/CallCtlConnection, TerminalConnection/CallCtlTerminalConnection will go into the Connected/Established/Active/Talking state. JTAPI creates Connection and CallCtlConnection for A in "UNKNOWN" state based on FarEndPointType\_ServerCall provided by CTI/CP.

B answers the call and is connected to A (at this point no RTPEvent will be sent).

B get CallPartyInfoChangedEv with Cgpn = B, Cdpn = C, Lrp = A, OCdpn = C, Reason = REFER.

C get NewCall offering with Cgpn = B, Cdpn = C, Lrp = A, OCdpn = C, Reason = REFER.

JTAPI Application will get Connection, CallControlConnection, TerminalConnecton and CallCtlTerminalConnection created for B with CAUSE\_NORMAL, and the new API will return REASON\_REFER.

C Accepts/Answers the call, B is connected to C (now Application receives RTP events).

C's Connection/CallCtlConnection, TerminalConnection/CallCtlTerminalConnection will go into the Connected/Established/Active/Talking state.

JTAPI Application observing B will see:

getCallingParty() = A

getCalledParty() = B

getCurrentCallingParty() = B

getCurrentCalledParty() = C

getLastRedirecting() = A

JTAPI Application observing C will see:

getCallingParty() = B

getCalledParty() = C

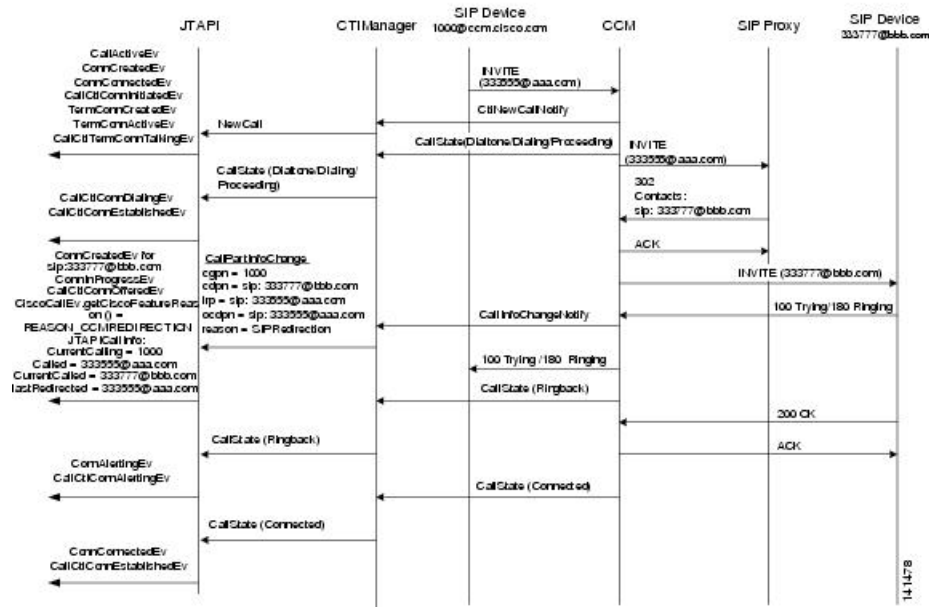

getCurrentCallingParty() = B

getCurrentCalledParty() = C

getLastRedirecting() = A

# SIP 3XX Redirection

## 3XX Redirection – 302 Moved Temporarily

JTAPI application monitors [1000@ccm.cisco.com](mailto:1000@ccm.cisco.com)

Cisco Unified Communications Manager user 1000 initiates a call to [333555@aaa.com](mailto:333555@aaa.com)

CTI reports NewCallNotify and CtiCallStateNotify (Dialtone/Dialing) based on INVITE.

JTAPI reports CallActiveEv and Connection and CallCtiConnection events for 1000

JTAPI reports CallCtiConnEstablishedEv

SIP proxy reports a 302 for [333555@aaa.com](mailto:333555@aaa.com). Based on the 302, the Cisco Unified Communications Manager initiates a call to the first contact in the Target list based on the q value to [333777@bbb.com](mailto:333777@bbb.com).

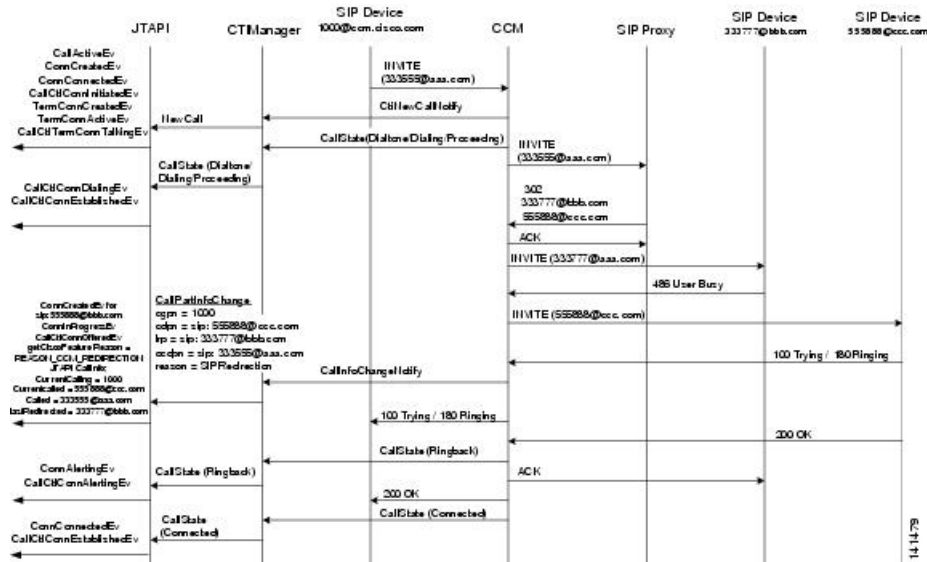

CallPartyInfoChange event is reported to application based on the SIPAlertInd from a Cisco Unified Communications Manager, if the called party information is changed.

JTAPI reports connection created events for [333777@bbb.com](mailto:333777@bbb.com)

CTI reports CtiCallStateNotify (Ringback) and CtiCallStateNotify (Connected).

JTAPI reports ConnAlertingEv and ConnEstablishedEv for far end.

### 3XX Redirection – Contact Busy

JTAPI CTI application monitors [1000@ccm.cisco.com](mailto:1000@ccm.cisco.com)

Cisco Unified Communications Manager user1000 initiates a call to [333555@aaa.com](mailto:333555@aaa.com)

CTI reports NewCallNotify and CtiCallStateNotify (Dialtone/Dialing) based on INVITE.

JTAPI reports CallActiveEv and Connection and CallCtiConnection events for 1000

CTI reports CtiCallStateNotify (Proceeding)

JTAPI reports CallCtiConnEstablishedEv

SIP proxy reports a 302 for [333555@aaa.com](mailto:333555@aaa.com). Based on the 302 the Cisco Unified Communications Manager initiates a call to the first contact in the Target list based on the q value to [333777@bbb.com](mailto:333777@bbb.com).

A 486 user busy response is reported by [333777@bbb.com](mailto:333777@bbb.com). Based on this response the Cisco Unified Communications Manager initiates a call to [555888@cisco.com](mailto:555888@cisco.com).

CallPartyInfoChange event is reported to application based on the SIPAlertInd from the Cisco Unified Communications Manager if the called party information is changed.

JTAPI reports connection created event for [555888@cisco.com](mailto:555888@cisco.com).

CTI also reports CtiCallStateNotify (Ringback) and CtiCallStateNotify (Connected).

JTAPI reports CallCtiConnAlertingEv and CallCtiConnEstablishedEv for the new party

### 3XX Redirection – Contact Does Not Answer

JTAPI application monitors [1000@ccm.cisco.com](mailto:1000@ccm.cisco.com)

Cisco Unified Communications Manager user1000 initiates a call to [333555@aaa.com](mailto:333555@aaa.com)

CTI reports NewCallNotify and CtiCallStateNotify (Dialtone/Dialing) based on INVITE.

JTAPI reports CallActiveEv and connection and terminalConnection events for 1000

CTI reports CtiCallStateNotify (Proceeding)

JTAPI reports CallCtiConnEstablishedEv for 1000

SIP proxy reports a 302 for [333555@aaa.com](mailto:333555@aaa.com). Based on the 302 the Cisco Unified Communications Manager initiates a call to the first contact in the Target list based on the q value to [333777@bbb.com](mailto:333777@bbb.com). The Cisco Unified Communications Manager starts the RNAR timer.

CallPartyInfoChange event is reported to application based on the SIPAlertInd from the Cisco Unified Communications Manager if the called party information is changed.

JTAPI reports connection created events for 333777

RNAR timer expires and based on this expiration the Cisco Unified Communications Manager initiates a call to [555888@cisco.com](mailto:555888@cisco.com).

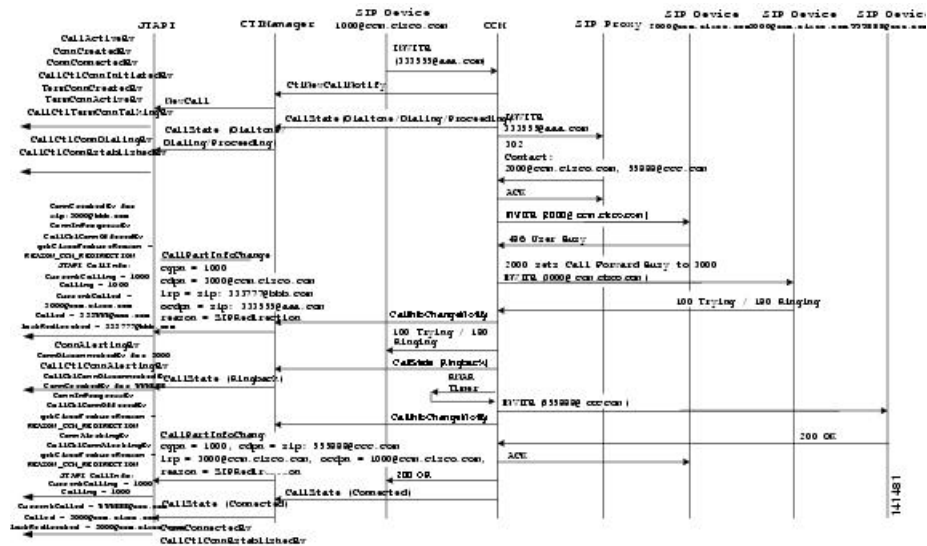

CallPartyInfoChange event is reported to application based on the SIPAlertInd/CcNotifyReq from the Cisco Unified Communications Manager if the called party information is changed.

JTAPI removes connection for 333777 and creates connection for 555888

CTI also reports CtiCallStateNotify (Connected).

JTAPI reports CallCtiConnEstablishedEv for 555888

### 3XX Redirection – Contact Within Cisco Unified Communications Manager Cluster Configured with Call Forward

JTAPI application monitors [1000@ccm.cisco.com](mailto:1000@ccm.cisco.com)

Cisco Unified Communications Manager user1000 initiates a call to [333555@aaa.com](mailto:333555@aaa.com)

CTI reports NewCallNotify and CtiCallStateNotify (Dialtone/Dialing) based on INVITE.

JTAPI reports CallActiveEv and connection and terminalConnection events for 1000

CTI reports CtiCallStateNotify (Proceeding)

JTAPI reports CallCtlConnEstablishedEv for 1000

SIP proxy reports a 302 for [333555@aaa.com](mailto:333555@aaa.com). Based on the 302 the Cisco Unified Communications Manager initiates a call to the first contact in the Target list based on the q value to [2000@ccm.cisco.com](mailto:2000@ccm.cisco.com).

A 486 user busy response is reported by [2000@ccm.cisco.com](mailto:2000@ccm.cisco.com). 2000 has Call Forward busy configured so the Cisco Unified Communications Manager initiates a call to [3000@ccm.cisco.com](mailto:3000@ccm.cisco.com). The Cisco Unified Communications Manager also starts the RNAR timer.

CallPartyInfoChange event is reported to application based on the SIPAlertInd from the Cisco Unified Communications Manager if the called party information is changed.

JTAPI reports connection created event for 3000

3000 does not answer and RNAR timer expires and based on this expiration the Cisco Unified Communications Manager initiates a call to [555888@cisco.com](mailto:555888@cisco.com).

CallPartyInfoChange event is reported to application based on the SIPAlertInd/CcNotifyReq from the Cisco Unified Communications Manager if the called party information is changed.

JTAPI destroys connection for 3000 and creates connection for 555888

CTI also reports CtiCallStateNotify (Connected).

JTAPI reports CallCtlConnEstablishedEv for 555888

### 3XX Redirection – Non-Available Target Member

JTAPI application monitors [1000@ccm.cisco.com](mailto:1000@ccm.cisco.com)

Cisco Unified Communications Manager user1000 initiates a call to [333555@aaa.com](mailto:333555@aaa.com)

CTI reports NewCallNotify and CtiCallStateNotify (Dialtone/Dialing) based on INVITE.

JTAPI reports CallActiveEv and connection and terminalConnection events for 1000

CTI reports CtiCallStateNotify (Proceeding)

JTAPI reports CallCtlConnEstablishedEv for 1000

SIP proxy reports a 302 for [333555@aaa.com](mailto:333555@aaa.com). 302 contains target list of [1212@ccm.cisco.com](mailto:1212@ccm.cisco.com) and [2000@ccm.cisco.com](mailto:2000@ccm.cisco.com). [1212@ccm.cisco.com](mailto:1212@ccm.cisco.com) is an invalid DN. The Cisco Unified Communications Manager tries to contact [1212@ccm.cisco.com](mailto:1212@ccm.cisco.com) first, but gets an invalid DN and so attempts to place the call to [2000@ccm.cisco.com](mailto:2000@ccm.cisco.com).

CallPartyInfoChange event is reported to application based on the SIPAlertInd from the Cisco Unified Communications Manager if the called party information is changed.

JTAPI reports connection created event for 2000

CTI also reports CtiCallStateNotify (Ringback/Connected).

JTAPI reports CallCtlConnAlertingEv and CallCtlConnEstablishedEv for 2000.

## SIP Support

| S.No | Scenario                                                                                                                                                                                   | Events                                                                                                                                                                                                                                                                                                                                                        |

### Scenario Three

Early offer call on a IPv4 mode. CTIPort or RP supports this feature. Application does not setPort in time. (Fail Call Over SIP Trunk if MTP Allocation Fails = false)

Application opens provider and adds address, terminal and call observers. (Device = TermA address = A )

### Scenario Eleven

Two Applications registering same CTIPort or RP with different values for registrationType (static).

| Action                                                                                                                                                                                 | Result                                              | Call information                                       |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------|--------------------------------------------------------|
| Application1 registers the terminal TermA statically using the new register() API and STATIC_MEDIA_REGISTRATION_FOR_GET_PORT_SUPPORT for registration type                             | CiscoTermInServiceEv<br>termACiscoAddrInServiceEv A |                                                        |
| Application2 registers the terminal TermA statically using the new register() API and passes something other than STATIC_MEDIA_REGISTRATION_FOR_GET_PORT_SUPPORT for registration type | PlatformException                                   | CTIERR_MEDIA_ALREADY_TERMINATED_STATIC_GETPORT_SUPPORT |
| Application3 registers the terminal TermA statically using the new register() API and passes STATIC_MEDIA_REGISTRATION_FOR_GET_PORT_SUPPORT for registration type                      | CiscoTermInServiceEv<br>termACiscoAddrInServiceEv A |                                                        |

## SRTP Key Material

If this feature is enabled, it is expected to degrade the performance of Cisco Unified JTAPI. Performance degradation is because of encrypted signaling between CTI and JTAPI and also because of encrypted media between end points.

### Scenario One

| Action                                                                                                                                                                                                         | Event                                                                                          |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------|
| App adds CallObserver on an Address 1 and initiates a call to address2 and involves in secure media conversation. If user is authorized, then CiscoRTPInputKeyEv and CiscoRTPOutputKeyEv contain key material. | CiscoRTPInputKeyEv<br>CiscoRTPInputStartedEv<br>CiscoRTPOutputKeyEv<br>CiscoRTPOutputStartedEv |

### Scenario Two

| Action                                                                                                                                                       | Event                                                                                                                        |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------|
| Application adds TerminalObserver by enabling snapshotEnabled filter. Device is already in a secure call and queries invokes CiscoTerminal.createSnapshot () | CiscoTermSnapshotEv using which applications can query getCiscoMediaCallSecurity () to find out if a call is secured or not. |

### Scenario Three

| Action                                                                                                                                            | Response                                                 |
|---------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------|
| Application does not have a TLS link and tries to register with secure media. CiscoMediaTerminal.register (ipAddr, portNum, mediaCaps, algorithm) | PrivilegeViolationException is thrown to the application |
| Application has a secure media and registers CiscoMediaTerminal.register (ipAddr, portNum, mediaCaps, algorithm)                                  | Request is successful                                    |

## Super Provider Message Flow

The application tries to create Terminal for CTIPort1 that has Addresses 2000 and 2001. The following events get sent to the application.

| No. | Action                                                                                                                                                                                         | Event                                                                                                                                                                                  |
|-----|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Application invokes CiscoProvider.CreateTerminal(CTIPort1) where CiscoProviderCapabilities.canObserveAnyTerminal() returns TRUE.                                                               | JTAPI would return CiscoTerminal object and the following events get sent:<br>CiscoTermCreatedEv CTIPort1<-----<br>CiscoAddrCreated 2000<-----<br>CiscoAddrCreated 2001<-----          |
| 2   | If the application already has a terminal where the 2001 address already exists, that is, 2001 is a SharedLine Address.<br>Now, the application invokes CiscoProvider.CreateTerminal(CTIPort1) | JTAPI would return CiscoTerminal object and the following events get sent<br>CiscoTermCreatedEv CTIPort1<-----<br>CiscoAddrCreated 2000<-----<br>CiscoAddrAddedToTerminalEv 2001<----- |
| 3   | Application invokes CiscoProvider.CreateTerminal(CTIPortX) where CTIPortX does not exist in Cisco Unified Communications Manager cluster.                                                      | JTAPI would throw an exception: InvalidArgumentException                                                                                                                               |
| 4   | Application invokes CiscoProvider.CreateTerminal(CTIPort1) where CiscoProviderCapabilities.canObserveAnyTerminal() returns FALSE.                                                              | JTAPI would throw an exception: PrivilegeViolationException                                                                                                                            |

## SuperProvider and Change Notification Enhancements Use Cases

New events have been added to JTAPI, which will be sent to applications in order to handle new failover scenario and change notification. This enhances JTAPI to handle failover scenarios and the time required to shift between Superprovider and normal user modes.

**Scenario One**

Superprovider user opens provider and opens a few devices in Superprovider mode which are not in control list. From admin pages, Superprovider privilege is removed.

Application receives CiscoProviderCapabilityChangedEvent event. JTAPI sends CiscoTermRemovedEv all the devices which are opened / acquired and are not in the control list. JTAPI will send provider OOS to application, CiscoTermRemovedEv to devices not in control list and will reopen connection to CTI. When connect succeeds, JTAPI will send provider in service event to the application. Else, it will close the provider.

**Scenario Two**

Normal user opens provider and opens a few devices in control list. From admin pages, Superprovider privilege is added to the user.

Application receives CiscoProviderCapabilityChangedEvent event. User will now be able to acquire/open devices not in its control list.

**Scenario Three**

Normal user opens provider and opens a few park DNs. From admin pages, park DN monitor privilege is removed for the user.

Application receives CiscoProviderCapabilityChangedEvent event. JTAPI will cleanup all park DN addresses.

**Scenario Four**

Normal user opens provider. From admin pages, park DN monitor privilege is added for the user.

Application receives CiscoProviderCapabilityChangedEvent event. Application registers the park DN monitoring feature and is able to monitor park DN.

**Scenario Five**

Normal user opens provider. From admin pages, “modify calling party” privilege is removed for the user.

Application receives CiscoProviderCapabilityChangedEvent event. Application is not able to change the calling party number during redirect. JTAPI will throw error if application tries to do this.

**Scenario Six**

Normal user opens provider. From admin pages, “modify calling party” privilege is added for the user.

Application receives CiscoProviderCapabilityChangedEvent event. Application is able to change the calling party number in a call during redirect.

**Scenario Seven**

Superprovider user opens provider and acquires a device not in control list. From admin pages, the device is deleted.

Application receives CiscoTermRemovedEv event. Device is closed from JTAPI perspective.

# Support for Cisco Unified IP Phone 6901

## Scenario 1

Phone A is a Cisco Unified IP Phone 6901 and phone B is a normal SCCP/SIP phone. Application is observing the devices A and B. Phone A is off-hook and application initiates a call through createCall() API from phone A to phone B.

Configuration:

- Phone A – Cisco Unified IP Phone 6901
- Phone B – SCCP/SIP Device

| Action                                                                              | Result                                                                                                                                                                                                                                                                                                                                           | Call info                     |

**Scenario 11**

Application is observing the devices A, B and C. Phone A is a normal SCCP/SIP phone, B and C are Cisco Unified IP Phone 6901 models. Application initiates a call from phone A to phone B. B goes off-hook and answers the call. B redirects the call to C from the application.

Configuration:

- Phone A – SCCP/SIP Device
- Phones B and C – Aleta Device

**Scenario 15**

Application is observing the devices A, B and C. Phone A is a normal SCCP/SIP phone, B and C are Cisco Unified IP Phone 6901. CFA is set to C at phone B. Application initiates a call from phone A to phone B. Due to CFA set to C, call goes to C. C goes off-hook and answers the call.

Configuration:

- Phone A – SCCP/SIP Device
- Phone B and C – Cisco Unified IP Phone 6901

| Action                                                                            | Result                                                                                                                                                                                                                            | Call info                                                       |

## TLS Security

Message flow for updating certificate and establishing TLS certificate is illustrated in the following two figures.

Figure 22: CTI/API Security Approach

Figure 23: CTI/API Security Approach (Continued)

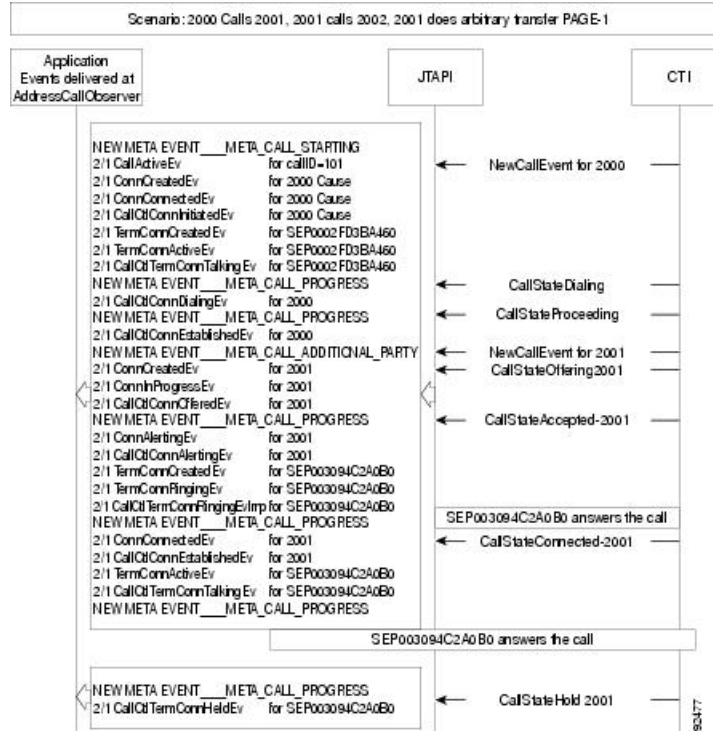

## Transfer and Direct Transfer

The following diagrams illustrate the message flows for Transfer and Direct Transfer.

# DirectTransfer/Arbitrary Transfer Scenario

# Direct Transfer/Arbitrary Transfer-Page 2

## Consult Transfer

The message flow for Consult Transfer acts the same as the flow for Arbitrary Transfer.

# Unicode Support

## Unicode Display Name Scenario

| Scenario                                                                                                                                                                           | Events Delivered to JTAPI Applications                                                                                                                                                                                               |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| A line is configured on IP phone A with no ASCII name and a Unicode name in Japanese. IP phone B is configured with ASCII name and no Unicode name. A calls B. Only B is observed. | Call info should contain:<br>getCurrentCalledPartyDisplayName = asciiNameB<br>getCurrentCalledPartyUnicodeDisplayName = null<br>getCurrentCallingPartyDisplayName = null<br>getCurrentCallingPartyUnicodeDisplayName = japaneseNameA |
| A, B and C are in conference.                                                                                                                                                      | DisplayName does not apply. Applications should consider “conference” as the called party.                                                                                                                                           |
| Shared lines – A and B are shared lines with different locales. A calls C. C is unobserved.                                                                                        | Calling party Unicode display name can change between A and B.                                                                                                                                                                       |

## GetLocale and UniCodeCapabilities of Terminal

| Scenario                                                                                                                                                                                          | Events delivered to JTAPI applications                                                                                                                                                                      |

# Unrestricted Unified CM

## Use Case One

The application tries to register with an insecure CTI Port to the unrestricted Cisco Unified Communications Manager.

| Action                                                                                                                                             | Result                                                                                                               | Call information |
|----------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------|------------------|
| Application opens a provider with the unrestricted Cisco Unified Communications Manager and tries to register with an insecure phone CTI Port 'A'. | [Term A] CiscoTermOutOfService[A]<br>CiscoAddrOutOfServiceEv[Term A]<br>CiscoTermInServiceEv[A] CiscoAddrInServiceEv |                  |

**Variance**

Application tries to register with an insecure route point to the unrestricted Cisco Unified Communications Manager.

**Use Case Two**

Restricted Cisco Unified Communications Manager is upgraded to unrestricted Cisco Unified Communications Manager. The application tries to register with a secure phone after the upgrade.

In some of the scenarios, where the application registers a device in a secure mode, the registration is successful but eventually can be rejected with a new error code - CiscoTermRegistrationFailedEv.

**Variance**

Application tries to register a secure Route Point after an upgrade from a restricted Cisco Unified Communications Manager to unrestricted Cisco Unified Communications Manager.

## Video Capabilities and Multi-Media Information

The following sections describe use cases that are related to video capabilities and multi-media information feature.

### Scenario One

Phone A is video capable, telepresence capable, with 1 screen and a camera, and in registered state. User1 has phone A in the control list. User queries for multimedia capabilities before adding a terminal observer.

| Action                                                                                                 | Events          | Call Info                                                                                                                       |
|--------------------------------------------------------------------------------------------------------|-----------------|---------------------------------------------------------------------------------------------------------------------------------|
| User1 Opens Provider and adds a provider observer                                                      | ProvInServiceEv |                                                                                                                                 |
| User1 invokes CiscoTerminal.i<br>getCiscoMultiMediaCapabilityInfo()<br>.getVideoCapability() on termA  |                 | termA. getCiscoMultiMediaCapabilityInfo().getVideoCapability() = CiscoMultiMediaCapabilityInfo.ENABLED                          |
| User1 invokes CiscoTerminal.i<br>getCiscoMultiMediaCapabilityInfo()<br>.getTelepresenceInfo() on termA |                 | termA. getCiscoMultiMediaCapabilityInfo().getTelepresenceInfo() = CiscoMultiMediaCapabilityInfo.TELEPRESENC<br>EINTEROP_ENABLED |
| User1 invokes CiscoTerminal.i<br>getCiscoMultiMediaCapabilityInfo()<br>.getScreenCount() on termA      |                 | termA. getCiscoMultiMediaCapabilityInfo().getScreenCount() = 1                                                                  |

## Scenario Two

Phone A is a video disabled SIP Phone (In Cisco Unified CM Administration Phone page, Video Capabilities field is “Disabled”). Phone A is in a registered state.

| Action                                                                                                           | Events                                             | Call Info                                                                                                              |
|------------------------------------------------------------------------------------------------------------------|----------------------------------------------------|------------------------------------------------------------------------------------------------------------------------|
| User1 Opens Provider and adds a provider observer                                                                | ProvInServiceEv                                    |                                                                                                                        |
| User1 invokes CiscoTerminal.<br>getCiscoMultiMediaCapabilityInfo().<br>getVideoCapability() on termA             |                                                    | termA.getCiscoMultiMediaCapabilityInfo().<br>getVideoCapability() =<br>CiscoMultiMediaCapabilityInfo.<br>DISABLED      |
| In Device Configuration Cisco Unified CM Administration pages- Video Capabilities field is changed to “Enabled”  | CiscoProvTerminalMulti<br>MediaCapabilityChangedEv | termA.<br>getCiscoMultiMediaCapabilityInfo().<br>getVideoCa pability() =<br>CiscoMultiMediaCapabilityInfo.<br>ENABLED  |
| User1 invokes CiscoTerminal.<br>getCiscoMultiMediaCapabilityInfo().<br>getVideoCapability() on termA             |                                                    | termA.<br>getCiscoMultiMediaCapabilityInfo().<br>getVideoCa pability() =<br>CiscoMultiMediaCapabilityInfo.<br>ENABLED  |
| In Device Configuration Cisco Unified CM Administration pages- Video Capabilities field is changed to “Disabled” | CiscoProvTerminalMulti<br>MediaCapabilityChangedEv | termA.<br>getCiscoMultiMediaCapabilityInfo().<br>getVideoCa pability() =<br>CiscoMultiMediaCapabilityInfo.<br>DISABLED |

## Scenario Three

Phone A is a video disabled SCCP Phone (In Cisco Unified CM Administration Phone page, Video Capabilities field is “Disabled”). Phone A is in a registered state.

| Action                                                                                               | Events          | Call Info                                                                                                             |
|------------------------------------------------------------------------------------------------------|-----------------|-----------------------------------------------------------------------------------------------------------------------|
| User1 Opens Provider and adds a provider observer                                                    | ProvInServiceEv |                                                                                                                       |
| User1 invokes CiscoTerminal.<br>getCiscoMultiMediaCapabilityInfo().<br>getVideoCapability() on termA |                 | termA.<br>getCiscoMultiMediaCapabilityInfo().<br>getVideoCapability() =<br>CiscoMultiMediaCapabilityInfo.<br>DISABLED |

Scenario Four

| Action                                                                                                           | Events                                                                                                                                                                                                                      | Call Info                                                                                                             |
|------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------|
| In Device Configuration Cisco Unified CM Administration pages- Video Capabilities field is changed to “Enabled”  | CiscoProvTerminalMultiMediaCapabilityChangedEv                                                                                                                                                                              | termA.<br>getCiscoMultiMediaCapabilityInfo().<br>getVideoCapability() =<br>CiscoMultiMediaCapabilityInfo.<br>ENABLED  |
| User1 invokes CiscoTerminal.<br>getCiscoMultiMediaCapabilityInfo().<br>getVideoCapability() on termA             |                                                                                                                                                                                                                             | termA.<br>getCiscoMultiMediaCapabilityInfo().<br>getVideoCapability() =<br>CiscoMultiMediaCapabilityInfo.<br>ENABLED  |
| In Device Configuration Cisco Unified CM Administration pages- Video Capabilities field is changed to “Disabled” | CiscoProvTerminalMultiMediaCapabilityChangedEv will not be delivered to applications, as the device will unregister and register back. In this case applications can query video capability after the device is registered. | termA.<br>getCiscoMultiMediaCapabilityInfo().<br>getVideoCapability() =<br>CiscoMultiMediaCapabilityInfo.<br>DISABLED |

## Scenario Four

Phone A is video capable, telepresence capable, has 1 screen, has a camera, and is in an unregistered state. User1 has phone A in the control list. User queries for multimedia capabilities before adding a terminal observer.

| Action                                                                                            | Events          | Call Info                                                   |
|---------------------------------------------------------------------------------------------------|-----------------|-------------------------------------------------------------|
| User1 Opens Provider and adds a provider observer                                                 | ProvInServiceEv |                                                             |
| User1 invokes CiscoTerminal.<br>getCiscoMultiMediaCapabilityInfo().getVideoCapability() on termA  |                 | InvalidStateException: Terminal is not in registered state. |
| User1 invokes CiscoTerminal.<br>getCiscoMultiMediaCapabilityInfo().getTelepresenceInfo() on termA |                 | InvalidStateException: Terminal is not in registered state. |
| User1 invokes CiscoTerminal.<br>getCiscoMultiMediaCapabilityInfo().getScreenCount() on termA      |                 | InvalidStateException: Terminal is not in registered state. |

## Scenario Five

Phone A is video capable, telepresence capable, with 1 screen and a camera. User1 has phone A in the control list. Application queries for mutlimedia capabilities on CiscoTerminal.

| Action                                                                                                  | Events                                          | Call Info                                                                                                                          |
|---------------------------------------------------------------------------------------------------------|-------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------|
| User1 Opens Provider and adds a provider observer                                                       | ProvInServiceEv                                 |                                                                                                                                    |
| User1 opens termA                                                                                       | CiscoTermOutOfServiceEv<br>CiscoTermInServiceEv | termA. getCiscoMultiMediaCapabilityInfo().getVideoCapability() = NONE                                                              |
| User1 invokes CiscoTerminal.<br>getCiscoMultiMediaCapabilityInfo().<br>getVideoCapability() on termA    |                                                 | termA. getCiscoMultiMediaCapabilityInfo().<br>getVideoCapability() =<br>CiscoMultiMediaCapabilityInfo.ENABLED                      |
| User1 invokes CiscoTerminal. i<br>getCiscoMultiMediaCapabilityInfo().<br>getTelepresenceInfo() on termA |                                                 | termA. getCiscoMultiMediaCapabilityInfo().<br>getTelepresenceInfo() =<br>CiscoMultiMediaCapabilityInfo.TELEPRESENCEINTEROP_ENABLED |
| User1 invokes CiscoTerminal. i<br>getCiscoMultiMediaCapabilityInfo().<br>getScreenCount() on termA      |                                                 | termA. getCiscoMultiMediaCapabilityInfo(). getScreenCount () = 1                                                                   |

## Scenario Six

Phone A is a CTI Port or RoutePoint. User1 has phone A in the control list. The user invokes CiscoTerminal.getCiscoMultiMediaCapabilityInfo().getVideoCapability().

| Action                                                                                                  | Events                                          | Call Info                                                                                                      |
|---------------------------------------------------------------------------------------------------------|-------------------------------------------------|----------------------------------------------------------------------------------------------------------------|
| User1 Opens Provider and adds a provider observer                                                       | ProvInServiceEv                                 |                                                                                                                |

## Scenario Eight

Basic Video call: Phone A is video enabled, Telepresence Enabled and has 1 screen. Phone B has video  
disabled, Telepresence Disabled and has 0 screens. Both phones are in User1's control list.

## Scenario Fifteen

Negotiated video capability will be reported to the called party across a cluster call (over SIP – ICT trunk) using early offer (Phone A is a video disabled SIP Phone in cluster 1 and Phone B is a video enabled SIP Phone in cluster 2). User1 has Phone A in the control list, Phone A is observed.

## Video On Hold

Pre-conditions to all video on hold use cases, unless specified otherwise:

- Provider is in IN\_SERVICE state
- All addresses and terminals are already in service.
- Device A (IP Phone – Name: “SEP2401C7824EA3”, Line A1 (dn: 9000))
- Device B (IP Phone – Name: “SEP2401C7824EAE”, Line B1 (dn: 9001))
- The content id corresponding to VoH stream is contentID1.
- User1 has in its control list: Devices A and B. All devices and lines are observed.

### Scenario One

Invoke hold() on basic call between two ip phones to stream video to the held party

| Action                                                                            | Events                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | Call information / Notes |

## Verification Involving PSTN Reachability

### Scenario 1

A calls B in other cluster ( Normal Call ); application is observing A

| Action              | Result                                                                                                                                                                                                                                                                                | Call info |
|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------|
| A dials B, B rings. | GC1:<br>CallActiveEv<br>ConnCreatedEv -A<br>ConnConnectedEv - A<br>CallCtlConnDialingEv - A<br>TermConnCreatedEv - TA<br>TermConnActiveEv -TA<br>CallCtlTermConnTalkingEv - TA<br>ConnCreatedEv B<br>ConnConnectedEv B<br>CallCtlConnNetworkReachedEv<br>CallCtlConnNetworkAlertingEv |           |

### Scenario 2

A calls B in other cluster (VIPR Call - Call gets routed through IP trunk); application is observing A

| Action             | Result                                                                                                                                                                                                                                                                                | Call info |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------|

**Scenario 3**

A calls B, within same cluster. B redirects the call to external party C, the redirected call goes through IP Trunk due to VIPR feature; application is observing both A and B.

| Action                        | Result                                                                                                                                                                                                                                                                                                                                                                        | Call info |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------|
| A calls B withis same cluster | GC1:<br>CallActiveEv<br>ConnCreatedEv A<br>ConnConnectedEv A<br>CallCtlConnInitiatedEv A<br>TermConnCreatedEv TA<br>TermConnActiveEv TA<br>CallCtlTermConnTalkingEv TA<br>CallCtlConnEstablishedEv A<br>ConnCreatedEv B<br>CallCtlConnOfferedEv B<br>ConnAlertingEv B<br>CallCtlConnAlertingEv B<br>TermConnCreatedEv TB<br>TermConnRinginEv TB<br>CallCtlTermConnRinginEv TB |           |

**Scenario 6**

A calls B, within the same cluster. B has CFA set to Forward all the calls to external party C, the forwarded call goes through IP Trunk due to VIPR feature. Application is observing A.

# Whisper Coaching

**Use Case One - Monitoring with Mode as WHISPER**

Start and Stop Whisper monitor: A is monitor target, B is monitor initiator. X calls A, A answers the call GC1 (CI1). B calls start monitor using GC2. The application has a call observer on both A and B. The monitoring capability enabled.

| Action        | Events                                                                                                                                                                                                                                                                                                                                              | Call information                                                                       |

**Use Case Two - Snapshot Use Case for Whisper Monitoring**

- A is monitor target. B is monitor initiator. X calls A, A answers the call GC1 (ci1). B calls start monitor using GC2. Another application adds call observer on A after monitoring session is established.

| Action | Events                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | Call information                                                                       |

**Use Case Three**

Start Silent Monitoring then update the monitorType to Whisper mode followed by redirect and the updateMonitorType back to Silent monitor.

Whisper monitor: A is monitor target, B is monitor initiator. X calls A, A answers the call GC1 (ci1). B calls start monitor using GC2(mode = silent). Application has call observer on both A and B. Application has monitoring capability enabled. App updates the monitor mode to Whisper. B redirects the monitoring call to observed party C. App updates the monitor mode to silent and later drops monitoring call to stop monitoring.

**Use Case Four**

Secured Whisper Monitoring followed by redirect to non-secured supervisor

Whisper monitor: A is monitor target, B is monitor initiator. Both A and B are Encrypted devices. X calls A, A answers the call GC1 (ci1). B calls start monitor using GC2(mode = whisper). Application has call observer on both A and B. Application has monitoring capability enabled. B redirects to observed party C which is non-secured.

**Use Case Five**

Agent greeting is played and the application initiates the monitoring request (Silent/Whisper).

JTAPI throws InvalidStateException with error "CTIERR\_RESOURCE\_NOT\_AVAILABLE" when the application sends a monitor request and when an agent greeting is played at that time.

**Use Case Six - Tone Direction Interaction Use Cases**

1. Service Parameter = PLAYTONE\_NOLOCAL\_OR\_REMOTE; API Request (startMonitor/updateMonitorType) = PLAYTONE\_NOLOCAL\_OR\_REMOTE
  - If Mode is Silent, then Effective Tone Direction = PLAYTONE\_NOLOCAL\_OR\_REMOTE

- If Mode is Whisper, then Effective Tone Direction = PLAYTONE\_NOLOCAL\_OR\_REMOTE
2. Service Parameter = PLAYTONE\_NOLOCAL\_OR\_REMOTE; API Request (startMonitor/updateMonitorType) = PLAYTONE\_LOCALONLY
    - If Mode is Silent, then Effective Tone Direction = PLAYTONE\_LOCALONLY
    - If Mode is Whisper, then Effective Tone Direction = PLAYTONE\_NOLOCAL\_OR\_REMOTE
  3. Service Parameter = PLAYTONE\_NOLOCAL\_OR\_REMOTE; API Request (startMonitor/updateMonitorType) = PLAYTONE\_REMOTEONLY
    - If Mode is Silent, then Effective Tone Direction = PLAYTONE\_REMOTEONLY
    - If Mode is Whisper, then Effective Tone Direction = PLAYTONE\_REMOTEONLY
  4. Service Parameter = PLAYTONE\_NOLOCAL\_OR\_REMOTE; API Request (startMonitor/updateMonitorType) = PLAYTONE\_BOTHLOCALANDREMOTE
    - If Mode is Silent, then Effective Tone Direction = PLAYTONE\_BOTHLOCALANDREMOTE
    - If Mode is Whisper, then Effective Tone Direction = PLAYTONE\_REMOTEONLY
  5. Service Parameter = PLAYTONE\_LOCALONLY; API Request (startMonitor/updateMonitorType) = PLAYTONE\_NOLOCAL\_OR\_REMOTE
    - If Mode is Silent, then Effective Tone Direction = PLAYTONE\_LOCALONLY
    - If Mode is Whisper, then Effective Tone Direction = PLAYTONE\_NOLOCAL\_OR\_REMOTE
  6. Service Parameter = PLAYTONE\_LOCALONLY; API Request (startMonitor/updateMonitorType) = PLAYTONE\_LOCALONLY
    - If Mode is Silent, then Effective Tone Direction = PLAYTONE\_LOCALONLY
    - If Mode is Whisper, then Effective Tone Direction = PLAYTONE\_NOLOCAL\_OR\_REMOTE
  7. Service Parameter = PLAYTONE\_LOCALONLY; API Request (startMonitor/updateMonitorType) = PLAYTONE\_REMOTEONLY
    - If Mode is Silent, then Effective Tone Direction = PLAYTONE\_BOTHLOCALANDREMOTE
    - If Mode is Whisper, then Effective Tone Direction = PLAYTONE\_REMOTEONLY
  8. Service Parameter = PLAYTONE\_LOCALONLY; API Request (startMonitor/updateMonitorType) = PLAYTONE\_BOTHLOCALANDREMOTE
    - If Mode is Silent, then Effective Tone Direction = PLAYTONE\_BOTHLOCALANDREMOTE
    - If Mode is Whisper, then Effective Tone Direction = PLAYTONE\_REMOTEONLY
  9. Service Parameter = PLAYTONE\_REMOTEONLY; API Request (startMonitor/updateMonitorType) = PLAYTONE\_NOLOCAL\_OR\_REMOTE
    - If Mode is Silent, then Effective Tone Direction = PLAYTONE\_REMOTEONLY
    - If Mode is Whisper, then Effective Tone Direction = PLAYTONE\_REMOTEONLY
  10. Service Parameter = PLAYTONE\_REMOTEONLY; API Request (startMonitor/updateMonitorType) = PLAYTONE\_LOCALONLY
    - If Mode is Silent, then Effective Tone Direction = PLAYTONE\_BOTHLOCALANDREMOTE
    - If Mode is Whisper, then Effective Tone Direction = PLAYTONE\_REMOTEONLY
  11. Service Parameter = PLAYTONE\_REMOTEONLY; API Request (startMonitor/updateMonitorType) = PLAYTONE\_REMOTEONLY

- If Mode is Silent, then Effective Tone Direction = PLAYTONE\_REMOTEONLY
  - If Mode is Whisper, then Effective Tone Direction = PLAYTONE\_REMOTEONLY
12. Service Parameter = PLAYTONE\_REMOTEONLY; API Request (startMonitor/updateMonitorType) = PLAYTONE\_BOTHLOCALANDREMOTE
- If Mode is Silent, then Effective Tone Direction = PLAYTONE\_BOTHLOCALANDREMOTE
  - If Mode is Whisper, then Effective Tone Direction = PLAYTONE\_REMOTEONLY
13. Service Parameter = PLAYTONE\_BOTHLOCALANDREMOTE; API Request (startMonitor/updateMonitorType) = Any tone
- If Mode is Silent, then Effective Tone Direction = PLAYTONE\_BOTHLOCALANDREMOTE
  - If Mode is Whisper, then Effective Tone Direction = PLAYTONE\_REMOTEONLY

**Use Case Seven**

Supervisor B is a shared line and supervisor updates monitorType from silent to whisper. Address B is a shared line configured on terminal T1(initiator) and T2.

Whisper monitor: A is monitor target, B(T1) is monitor initiator. X calls A, A answers the call GC1 (ci1). B(T1) calls start monitor using GC2(mode = silent). Application has call observer on all A, B(T1) and B(T2). Application has monitoring capability enabled. App updates the monitor type to Whisper and later drops monitoring call to stop monitoring.

**Use Case Eight**

Agent is shared line. After monitoring Agent holds and its shared line resumes.

A(T1) is monitor target and shares a line with Terminal T2 , B is monitor initiator. X calls A, A answers the call GC1 (ci1). B calls start monitor using GC2. Application has call observer on all A(T1), A(T2) and B. Application has monitoring capability enabled.

## APPENDIX **B**

# Cisco Unified JTAPI Classes and Interfaces

---

This appendix contains a listing of all classes and interfaces that are available in the Cisco Unified JTAPI implementation:

- [Cisco Unified JTAPI Version 1.2 Classes and Interfaces, on page 1603](#), which lists all the JTAPI v 1.2 classes and methods. The supported classes and methods have a check mark in the Cisco Unified JTAPI Support column.
- [Cisco Unified JTAPI Extension Classes and Interfaces, on page 1621](#), which lists the Cisco Unified JTAPI extension classes and methods.
- [Cisco Trace Logging Classes and Interfaces, on page 1626](#), which lists the error tracing classes and methods.
- [Cisco Unified JTAPI Version 1.2 Classes and Interfaces, on page 1603](#)
- [Cisco Unified JTAPI Extension Classes and Interfaces, on page 1621](#)
- [Cisco Trace Logging Classes and Interfaces, on page 1626](#)

## Cisco Unified JTAPI Version 1.2 Classes and Interfaces

This section includes the following:

- [Core Package, on page 1604](#)
- [Call Center Package, on page 1607](#)
- [Call Center Capabilities Package, on page 1609](#)
- [Call Center Events Package, on page 1610](#)
- [Call Control Package, on page 1612](#)
- [Call Control Capabilities Package, on page 1614](#)
- [Call Control Events Package, on page 1616](#)
- [Capabilities Package, on page 1617](#)
- [Events Package, on page 1618](#)
- [Media Package, on page 1619](#)
- [Media Capabilities Package, on page 1620](#)

- [Media Events Package, on page 1620](#)
- [Unsupported Packages, on page 1620](#)

## Core Package

The following table lists each JTAPI interface in the JTAPI Core Package followed by the associated method (s) and whether the classes are supported by the Cisco Unified JTAPI implementation.

| Class names     | Method names           | CiscoUnified JTAPI support | Comments                                                                                                                           |
|-----------------|------------------------|----------------------------|------------------------------------------------------------------------------------------------------------------------------------|
| Address         | addCallObserver        | Yes                        |                                                                                                                                    |
|                 | addressObserver        | Yes                        |                                                                                                                                    |
|                 | getAddressCapabilities | Yes                        |                                                                                                                                    |
|                 | getCallObservers       | Yes                        |                                                                                                                                    |
|                 | getCapabilities        | Yes                        |                                                                                                                                    |
|                 | getConnections         | Yes                        |                                                                                                                                    |
|                 | getName                | Yes                        |                                                                                                                                    |
|                 | getObservers           | Yes                        |                                                                                                                                    |

## Call Center Package

The following table lists each JTAPI interface in the JTAPI Call Center Package followed by the associated method(s) and whether the classes are supported by the Cisco Unified JTAPI implementation.

| Class names        | Method names         | CiscoUnifiedJTAPI support |
|--------------------|----------------------|---------------------------|
| ACDAddress         | getACDManagerAddress |                           |
|                    | getLoggedOnAgents    |                           |
|                    | getNumberQueued      |                           |
|                    | getOldestCallQueued  |                           |
|                    | getQueueWaitTime     |                           |
|                    | getRelativeQueueLoad |                           |
| ACDAddressObserver |                      |                           |

| Class names            | Method names            | CiscoUnifiedJTAPI support |
|------------------------|-------------------------|---------------------------|
| ACDConnection          | getACDManagerConnection |                           |
| ACDManagerAddress      | getACDAddresses         |                           |
| ACDManagerConnection   | getACDConnections       |                           |

|               | selectRoute             | Yes                       |

## Call Center Capabilities Package

The following table lists each JTAPI interface in the JTAPI Call Center Capabilities Package followed by the associated method(s), and whether the classes are supported by the Cisco Unified JTAPI implementation.

| Class names                      | Method names               | CiscoUnifiedJTAPI support |
|----------------------------------|----------------------------|---------------------------|
| ACDAddressCapabilities           | canGetACDManagerAddress    |                           |
|                                  | canGetLoggedOnAgents       |                           |
|                                  | canGetNumberQueued         |                           |
|                                  | canGetOldestCallQueued     |                           |
|                                  | canGetQueueWaitTime        |                           |
|                                  | canGetRelativeQueueLoad    |                           |
| ACDConnectionCapabilities        | canGetACDManagerConnection |                           |
| ACDManagerAddressCapabilities    | canGetACDAddresses         |                           |
| ACDManagerConnectionCapabilities | canGetACDCConnections      |                           |
| AgentTerminalCapabilities        | canHandleAgents            |                           |

| Class names                    | Method names              | CiscoUnifiedJTAPI support |
|--------------------------------|---------------------------|---------------------------|
| CallCenterAddressCapabilities  | canAddCallObserver        |                           |
| CallCenterCallCapabilities     | canConnectPredictive      |                           |
|                                | canGetTrunks              |                           |
|                                | canHandleApplicationData  |                           |
| CallCenterProviderCapabilities | canGetACDAddresses        | Yes                       |
|                                | canGetACDManagerAddresses | Yes                       |
|                                | canGetRouteableAddresses  | Yes                       |
| RouteAddressCapabilities       | canRouteCalls             | Yes                       |

## Call Center Events Package

The following table lists each JTAPI interface in the JTAPI Call Center Events Package followed by the associated method(s), and whether the classes are supported by the Cisco Unified JTAPI implementation.

| Class names           | Method names     | CiscoUnifiedJTAPI support |
|-----------------------|------------------|---------------------------|
| ACDAddrBusyEv         |                  |                           |
| ACDAddrEv             | getAgent         |                           |
|                       | getAgentAddress  |                           |
|                       | getAgentTerminal |                           |
|                       | getState         |                           |
|                       | getTrunks        |                           |
| ACDAddrLoggedOffEv    |                  |                           |
| ACDAddrLoggedOnEv     |                  |                           |
| ACDAddrNotReadyEv     |                  |                           |
| ACDAddrReadyEv        |                  |                           |
| ACDAddrUnknownEv      |                  |                           |
| ACDAddrWorkNotReadyEv |                  |                           |
| ACDAddrWorkReadyEv    |                  |                           |
| AgentTermBusyEv       |                  |                           |
| AgentTermEv           | getACDAddress    |                           |

| Class names              | Method names             | CiscoUnifiedJTAPI support |
|--------------------------|--------------------------|---------------------------|
|                          | getAgent                 |                           |
|                          | getAgentAddress          |                           |
|                          | getAgentID               |                           |
|                          | getState                 |                           |
| AgentTermLoggedOffEv     |                          |                           |
| AgentTermLoggedOnEv      |                          |                           |
| AgentTermNotReadyEv      |                          |                           |
| AgentTermReadyEv         |                          |                           |

## Call Control Capabilities Package

The following table lists each JTAPI interface in the JTAPI Call Control Capabilities Package followed by the associated method(s) and whether the classes are supported by the Cisco Unified JTAPI implementation.

| Class names                    | Method names         | CiscoUnifiedJTAPI support |
|--------------------------------|----------------------|---------------------------|
| CallControlAddressCapabilities | canCancelForwarding  | Yes                       |
|                                | canGetDoNotDisturb   | Yes                       |
|                                | canGetForwarding     | Yes                       |
|                                | canGetMessageWaiting | Yes                       |

|                                           | canUnhold          | Yes                       |

## Call Control Events Package

The following table lists each JTAPI interface in the JTAPI Call Control Events Package followed by the associated method(s) and whether the classes are supported by the Cisco Unified JTAPI implementation.

| Class names                  | Method names             | CiscoUnifiedJTAPI support | Comments |
|------------------------------|--------------------------|---------------------------|----------|
| CallCtlAddrDoNotDisturbEv    | getDoNotDisturbState     |                           |          |
| CallCtlAddrEv                |                          |                           |          |
| CallCtlAddrForwardEv         | getForwarding            | Yes                       |          |
| CallCtlAddrMessageWaitingEv  | getMessageWaitingState   |                           |          |
| CallCtlCallEv                | getCalledState           | Yes                       |          |
|                              | getCallingAddress        | Yes                       |          |
|                              | getCallingTerminal       | Yes                       |          |
|                              | getLastRedirectedAddress | Yes                       |          |
| CallCtlConnAlertingEv        |                          | Yes                       |          |
| CallCtlConnDialingEv         | getDigits                | Yes                       |          |
| CallCtlConnDisconnectedEv    |                          | Yes                       |          |
| CallCtlConnEstablishedEv     |                          | Yes                       |          |
| CallCtlConnEv                |                          | Yes                       |          |
| CallCtlConnFailedEv          |                          | Yes                       |          |
| CallCtlConnInitiatedEv       |                          | Yes                       |          |
| CallCtlConnNetworkAlertingEv |                          | Yes                       |          |
| CallCtlConnNetworkReachedEv  |                          | Yes                       |          |
| CallCtlConnOfferedEv         |                          | Yes                       |          |

| Class names               | Method names        | CiscoUnifiedJTAPI support | Comments |
|---------------------------|---------------------|---------------------------|----------|
| CallCtlConnQueuedEv       | getNumberInQueue    | Yes                       |          |
| CallCtlConnUnknownEv      |                     | Yes                       |          |
| CallCtlEv                 | getCallControlCause | Yes                       |          |
| CallCtlTermConnBridgedEv  |                     |                           |          |
| CallCtlTermConnDroppedEv  |                     | Yes                       |          |
| CallCtlTermConnEv         |                     | Yes                       |          |
| CallCtlTermConnHeldEv     |                     | Yes                       |          |
| CallCtlTermConnInUseEv    |                     |                           |          |
| CallCtlTermConnRingingEv  |                     | Yes                       |          |
| CallCtlTermConnTalkingEv  |                     | Yes                       |          |
| CallCtlTermConnUnknownEv  |                     | Yes                       |          |

## Capabilities Package

The following table lists each JTAPI interface in the JTAPI Capabilities Package followed by the associated method(s) and whether the classes are supported by the Cisco Unified JTAPI implementation.

| Class names                    | Method names  | CiscoUnifiedJTAPI support | Comments |
|--------------------------------|---------------|---------------------------|----------|
| AddressCapabilities            | isObservable  | Yes                       |          |
| CallCapabilities               | canConnect    | Yes                       |          |
|                                | isObservable  | Yes                       |          |
| ConnectionCapabilities         | canDisconnect | Yes                       |          |
| ProviderCapabilities           | isObservable  | Yes                       |          |
| TerminalCapabilities           | isObservable  | Yes                       |          |
| TerminalConnectionCapabilities | canAnswer     | Yes                       |          |

## Events Package

The following table lists each JTAPI interface in the JTAPI Events Package followed by the associated method(s) and whether the classes are supported by the Cisco Unified JTAPI Implementation.

| Class names            | Method names   | CiscoUnifiedJTAPI support |
|------------------------|----------------|---------------------------|
| AddrEv                 | getAddress     | Yes                       |
| AddrObservationEndedEv |                | Yes                       |
| CallActiveEv           |                | Yes                       |
| CallEv                 | getCall        | Yes                       |
| CallInvalidEv          |                | Yes                       |
| CallObservationEndedEv | getEndedObject | Yes                       |
| ConnAlertingEv         |                | Yes                       |
| ConnConnectedEv        |                | Yes                       |
| ConnCreatedEv          |                | Yes                       |
| ConnDisconnectedEv     |                | Yes                       |
| ConnEv                 | getConnection  | Yes                       |
| ConnFailedEv           |                | Yes                       |
| ConnInProgressEv       |                | Yes                       |
| ConnUnknownEv          |                | Yes                       |
| Ev                     | getCause       | Yes                       |
|                        | getID          | Yes                       |
|                        | getMetaCode    | Yes                       |
|                        | getObserved    | Yes                       |
|                        | isNewMetaEvent | Yes                       |
| ProvEv                 | getProvider    | Yes                       |
| ProvInServiceEv        |                | Yes                       |
| ProvObservationEndedEv |                | Yes                       |
| ProvOutOfServiceEv     |                | Yes                       |
| ProvShutdownEv         |                | Yes                       |
| TermConnActiveEv       |                | Yes                       |

| Class names                     | Method names | CiscoUnifiedJTAPI support |
|---------------------------------|--------------|---------------------------|
| TermConnCreatedEv               |              | Yes                       |
| TermConnDroppedEv               |              | Yes                       |
| TermConnEvgetTerminalConnection |              | Yes                       |
| TermConnPassiveEv               |              |                           |
| TermConnRingingEv               |              | Yes                       |
| TermConnUnknownEv               |              | Yes                       |
| TermEv                          | getTerminal  | Yes                       |
| TermObservationEndedEv          |              | Yes                       |

## Media Package

The following table lists each JTAPI interface from the JTAPI Media Package followed by the associated method(s) and whether the classes are supported by the Cisco Unified JTAPI implementation.

| Class names             | Method names         | CiscoUnifiedJTAPI support | Comments |
|-------------------------|----------------------|---------------------------|----------|
| MediaCallObserver       |                      | Yes                       |          |
| MediaTerminalConnection | generateDtmf         | Yes                       |          |
|                         | getMediaAvailability |                           |          |

## Media Capabilities Package

The following table lists each JTAPI interface in the JTAPI Media Capabilities Package followed by the associated method(s) and whether the classes are supported by the Cisco Unified JTAPI implementation.

| Class names                          | Method names            | CiscoUnifiedJTAPI support | Comments |
|--------------------------------------|-------------------------|---------------------------|----------|
| MediaTerminalConnection Capabilities | canDetectDtmf           | Yes                       |          |
|                                      | canGenerateDtmf         | Yes                       |          |
|                                      | canStartPlaying         | Yes                       |          |
|                                      | canStartRecording       | Yes                       |          |
|                                      | canStopPlaying          | Yes                       |          |
|                                      | canStopRecording        | Yes                       |          |
|                                      | canUseDefaultMicrophone | Yes                       |          |
|                                      | canUseDefaultSpeaker    | Yes                       |          |
|                                      | canUsePlayURL           | Yes                       |          |
|                                      | canUseRecordURL         | Yes                       |          |

## Media Events Package

The following table lists each JTAPI interface in the JTAPI Media Events Package followed by the associated method(s) and whether the classes are supported by the Cisco Unified JTAPI implementation.

| Class names                | Method names  | CiscoUnifiedJTAPI support | Comments |
|----------------------------|---------------|---------------------------|----------|
| MediaEv                    | getMediaCause | Yes                       |          |
| MediaTermConnAvailableEv   |               |                           |          |
| MediaTermConnDtmfEv        | getDtmfDigit  | Yes                       |          |
| MediaTermConnEv            |               | Yes                       |          |
| MediaTermConnStateEv       | getMediaState |                           |          |
| MediaTermConnUnavailableEv |               |                           |          |

## Unsupported Packages

The following table shows the JTAPI packages that are not supported by the Cisco Unified JTAPI implementation.

| Unsupported JTAPI packages              |
|-----------------------------------------|
| JTAPI Phone Package                     |
| JTAPI Phone Capabilities Package        |
| JTAPI Phone Events Package              |
| JTAPI Private Data Package              |
| JTAPI Private Data Capabilities Package |
| JTAPI Private Data Events Package       |

## Cisco Unified JTAPI Extension Classes and Interfaces

### Cisco Unified JTAPI Extension Classes

Table 355: Cisco Unified JTAPI Extension Classes

| Cisco extension classes  | Method names                                              |
|--------------------------|-----------------------------------------------------------|
| CiscoMediaCapability     | getMaxFramesPerPacket()<br>getPayloadType()<br>toString() |
| CiscoG711MediaCapability |                                                           |
| CiscoG723MediaCapability | getBitRate()<br>toString()                                |
| CiscoGSMMediaCapability  |                                                           |
| RegistrationException    |                                                           |
| UnregistrationException  |                                                           |

### Cisco Unified JTAPI Extension Interfaces

Table 356: Cisco Unified JTAPI Extension Interfaces and Their Methods

| Cisco extension interfaces | Method names |
|----------------------------|--------------|
| CiscoAddrCreatedEv         | getAddress() |
| CiscoAddress               | getType()    |

| Cisco extension interfaces | Method names                                                                                                                                                                                                                                            |
|----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CiscoAddressObserver       |                                                                                                                                                                                                                                                         |
| CiscoAddrEv                |                                                                                                                                                                                                                                                         |
| CiscoAddrInService         |                                                                                                                                                                                                                                                         |
| CiscoAddrOutOfService      |                                                                                                                                                                                                                                                         |

## APPENDIX **C**

# Troubleshooting Cisco Unified JTAPI

This appendix contains CTI Error Codes, CiscoEvent IDs, and other information to assist with troubleshooting efforts.

- [CTI Error Codes, on page 1629](#)
- [CiscoEventIDs, on page 1639](#)
- [Reason Codes, on page 1643](#)
- [Cause Codes, on page 1644](#)
- [Additional Troubleshooting Information, on page 1649](#)

## CTI Error Codes

| Error code                        | Description                                                                                                                                        |
|-----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| ASSOCIATED_LINE_NOT_OPEN          | This error indicates that the request is issued on a line, which is not open                                                                       |
| CALL_ALREADY_EXISTS               | This error indicates that another call already exists on the line                                                                                  |
| CALL_DROPPED                      | The call dropped after the feature request (hold, unhold, transfer, or conference) but before the request was completed.                           |
| CALLHANDLE_NOTINCOMINGCALL        | This error indicates that an attempt is made to answer a call that either does not exist or is not in the correct state                            |
| CALLHANDLE_UNKNOWN_TO_LINECONTROL | This error indicates that attempt to redirect call that was unknown to line control                                                                |
| CANNOT_OPEN_DEVICE                | This error indicates that device open failed because the associated device is unregistering                                                        |
| CANNOT_TERMINATE_MEDIA_ON_PHONE   | This error indicates that media cannot be terminated by an application when the device is a physical phone (the phone always terminates the media) |
| CFWDALL_ALREADY_SET               | This error indicates that attempt to set CFWALL while it is already set                                                                            |

| Error code                                     | Description                                                                                                              |
|------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------|
| CFWDALL_DESTN_INVALID                          | This error indicates that attempt to CFWALL to an invalid destination                                                    |
| CLUSTER_LINK_FAILURE                           | This error indicates that link to one of the cisco unified communications managers failed in the cluster (network error) |
| COMMAND_NOT_IMPLEMENTED_ON_DEVICE              | This error indicates that device does not support the command.                                                           |
| CONFERENCE_ALREADY_PRESENT                     | This error indicates that attempt to conference a party that is already in conference                                    |
| CONFERENCE_FAILED                              | This error indicates that conference completion was not successful.                                                      |
| CONFERENCE_FULL                                | This error indicates that all conference bridges are busy.                                                               |
| CONFERENCE_INACTIVE                            | This error indicates that attempt to complete conference while consult conference is not active                          |
| CONFERENCE_INVALID_PARTICIPANT                 | This error indicates that an attempt to conference to self or an invalid participant                                     |
| CTIERR_ACCESS_TO_DEVICE_DENIED                 | This error indicates that the access to device is denied.                                                                |
| CTIERR_APP_SOFTKEYS_ALREADY_CONTROLLED         | This error indicates that the application softkeys are already controlled by another application                         |
| CTIERR_APPLICATION_DATA_SIZE_EXCEEDED          | This error indicates that application data size has exceeded limit                                                       |
| CTIERR_BIB_NOT_CONFIGURED                      | This error indicates built in bridge is not configured                                                                   |
| CTIERR_BIB_RESOURCE_NOT_AVAILABLE              | This error indicates that built in bridge resource not available                                                         |
| CTIERR_CALL_MANAGER_NOT_AVAILABLE              | This error indicates that Communications Manager is not available currently                                              |
| CTIERR_CALL_NOT_EXISTED                        | This error indicates that call does not exist                                                                            |
| CTIERR_CALL_PARK_NO_DN                         | This error indicates no call park DN                                                                                     |
| CTIERR_CALL_REQUEST_ALREADY_OUTSTANDING        | This error indicates call request already outstanding                                                                    |
| CTIERR_CALL_UNPARK_FAILED                      | This error indicates that call unpark did not succeed                                                                    |
| CTIERR_CAPABILITIES_DO_NOT_MATCH               | This error indicates that capabilities do not match                                                                      |
| CTIERR_CLOSE_DELAY_NOT_SUPPORTED_WITH_REG_TYPE | This error indicates that the close delay is not supported with this registration type                                   |
| CTIERR_CONFERENCE_ALREADY_EXISTED              | This error indicates that conference already exists                                                                      |
| CTIERR_CONFERENCE_NOT_EXISTED                  | This error indicates that conference does not exist                                                                      |
| CTIERR_CONNECTION_ON_INVALID_PORT              | This error indicates application is trying to connect to invalid port                                                    |

| Error code                                                | Description                                                                                                                                                                                                    |
|-----------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CTIERR_CONSULT_CALL_FAILURE                               | This error indicates consult call failure                                                                                                                                                                      |
| CTIERR_CONSULTCALL_ALREADY_OUTSTANDING                    | This error indicates that consult call already outstanding                                                                                                                                                     |
| CTIERR_CREATE_PERSISTENT_CALL_FAILED                      | This error indicates that there is an issue with creating a persistent call.                                                                                                                                   |
| CTIERR_CRYPTOCAPABILITY_MISMATCH                          | This error indicates that device registration failed as device crypto algorithms does not match with current device registration                                                                               |
| CTIERR_CTIHANDLER_PROCESS_CREATION_FAILED                 | This error indicates that CTIHandler process creation failed                                                                                                                                                   |
| CTIERR_DB_INITIALIZATION_ERROR                            | This error indicates DB initialization error                                                                                                                                                                   |
| CTIERR_DEVICE_ALREADY_OPENED                              | This error indicates that device is already opened                                                                                                                                                             |
| CTIERR_DEVICE_ALREADY_REGISTERED_NONEXTEND                | Device registration failed as device is already registered in Non-Extend mode.                                                                                                                                 |
| CTIERR_DEVICE_NOT_OPENED_YET                              | This error indicates that device is not yet opened                                                                                                                                                             |
| CTIERR_DEVICE_OWNER_ALIVE_TIMER_STARTED                   | This error indicates that there is a device registration failure                                                                                                                                               |
| CTIERR_DEVICE_REGISTRATION_FAILED_NOT_SUPPORTED_MEDIATYPE | This error indicates an invalid media type, CTIPort need to be registered with Dynamic media port registration if it has an intercom line                                                                      |
| CTIERR_DEVICE_RESTRICTED                                  | This error indicates that the device is restricted                                                                                                                                                             |
| CTIERR_DEVICE_SHUTTING_DOWN                               | This error indicates that device is shutting down                                                                                                                                                              |
| CTIERR_DIRECTORY_LOGIN_TIMEOUT                            | This error indicates that there is a directory login time out                                                                                                                                                  |
| CTIERR_DISCONNECT_PERSISTENT_CALL_FAILED_CALL_ACTIVE      | This error indicates that the request to disconnect the persistent call failed because there is an active customer call. Only when there are no active calls present, can the persistent call be disconnected. |
| CTIERR_DUPLICATE_CALL_REFERENCE                           | This error indicates duplicate call reference                                                                                                                                                                  |
| CTIERR_DUPLICATE_REMOTE_DESTINATION_NUMBER                | Duplicated Remote Destination Number with an existing Remote Destination Number.                                                                                                                               |
| CTIERR_DYNREG_IPADDRMODE_MISMATCH                         | This indicates registration failure when Cisco Media/Route Terminal is already registered with different Addressing mode                                                                                       |
| CTIERR_ENDUSER_NOT_ASSOCIATED_WITH_DEVICE                 | Enduser is not associated with the device.                                                                                                                                                                     |
| CTIERR_FAC_CMC_REASON_CMC_INVALID                         | Client Matter Code (CMC) entered is invalid                                                                                                                                                                    |
| CTIERR_FAC_CMC_REASON_CMC_NEEDED                          | CMC is required to offer the call                                                                                                                                                                              |
| CTIERR_FAC_CMC_REASON_FAC_CMC_NEEDED                      | Forced Authorization Code (FAC) and CMC are required to offer call                                                                                                                                             |

| CTIERR_INVALID_MONITOR_DESTN              | This error indicates monitoring request failed due to invalid monitoring destination                                               |
| CTIERR_INVALID_MONITOR_DN_TYPE            | This error indicates an invalid monitor DN type                                                                                    |
| CTIERR_INVALID_MONITORMODE                | This error indicates monitor request failed due to an invalid monitor mode                                                         |
| CTIERR_INVALID_PARAMETER                  | This error indicates that the parameter is not valid                                                                               |
| CTIERR_INVALID_PARK_DN                    | This error indicates that the DN is an invalid park DN                                                                             |
| CTIERR_INVALID_PARK_REGISTRATION_HANDLE   | This error indicates that the handle is an invalid park registration handle                                                        |
| CTIERR_PERSISTENT_CALL_EXISTS             | This error indicates that a persistent call already exists.                                                                        |
| CTIERR_INVALID_REMOTE_DESTINATION_NAME    | This error indicates an Invalid Remote Destination Name.                                                                           |
| CTIERR_INVALID_REMOTE_DESTINATION_NUMBER  | This error indicates an Invalid Remote Destination Number.                                                                         |
| CTIERR_INVALID_RESOURCE_TYPE              | This error indicates an invalid resource type                                                                                      |
| CTIERR_IPADDRMODE_MISMATCH                | This indicates the registration failure due to IP Addressing Mode mismatch.                                                        |
| CTIERR_LINE_OUT_OF_SERVICE                | This error indicates that line is out of service.                                                                                  |
| CTIERR_LINE_RESTRICTED                    | This error indicates that the line is restricted                                                                                   |
| CTIERR_MAXCALL_LIMIT_REACHED              | This error indicates that maximum call limit has reached                                                                           |
| CTIERR_MEDIA_ALREADY_TERMINATED_DYNAMIC   | This error indicates that device registration failed as device is registered with Dynamic media termination                        |
| CTIERR_MEDIA_ALREADY_TERMINATED_EXTEND    | Device registration failed as device is already registered in Extend mode.                                                         |
| CTIERR_MEDIA_ALREADY_TERMINATED_NONE      | This error indicates that device registration failed as device is already registered with media termination none                   |
| CTIERR_MEDIA_ALREADY_TERMINATED_STATIC    | This error indicates that device registration failed as device is registered with Static media termination                         |
| CTIERR_MEDIA_CAPABILITY_MISMATCH          | This error indicates that device registration failed as media capability of device does not match with current device registration |
| CTIERR_MEDIA_RESOURCE_NAME_SIZE_EXCEEDED  | This error indicates that media resource name size has exceeded limit                                                              |
| CTIERR_MEDIAREGISTRATIONTYPE_DO_NOT_MATCH | This error indicates that media registration types do not match                                                                    |

| Error code                                      | Description                                                                                     |
|-------------------------------------------------|-------------------------------------------------------------------------------------------------|
| CTIERR_MESSAGE_TOO_BIG                          | This error indicates that message is too big                                                    |
| CTIERR_MORE_ACTIVE_CALLS_THAN_RESERVED          | This error indicates that there are more active calls than reserved                             |
| CTIERR_NO_EXISTING_CALLS                        | This error indicates there are no existing calls                                                |
| CTIERR_NO_EXISTING_CONFERECE                    | This error indicates that there is no existing conference                                       |
| CTIERR_NO_RECORDING_SESSION                     | This error indicates recording request failed as there is no recording session                  |
| CTIERR_NO_RESPONSE_FROM_MP                      | This error indicates no response from media resource                                            |
| CTIERR_NOT_PRESERVED_CALL                       | This error indicates that the call is not preserved                                             |
| CTIERR_OPERATION_FAILED_QUIETCLEAR              | This error indicates that feature unavailable for this call due to temporary failure            |
| CTIERR_OPERATION_NOT_ALLOWED                    | This error indicates that this operation is not allowed                                         |
| CTIERR_OPERATION_NOT_ALLOWED_ON_PERSISTENT_CALL | This indicates that the specified operation is not allowed on a persistent call.                |
| CTIERR_OUT_OF_BANDWIDTH                         | This error indicates out of bandwidth error                                                     |
| CTIERR_OWNER_NOT_ALIVE                          | This error indicates a failure during registering the device                                    |
| CTIERR_PENDING_ACCEPT_OR_ANSWER_REQUEST         | This error indicates that there is a pending accept or answer request                           |
| CTIERR_PENDING_START_MONITORING_REQUEST         | This error indicates there is a pending start monitoring request                                |
| CTIERR_PENDING_START_RECORDING_REQUEST          | This error indicates there is a pending start recording request                                 |
| CTIERR_PENDING_STOP_RECORDING_REQUEST           | This error indicates there is a pending stop recording request                                  |
| CTIERR_PERSISTENT_CALL_BEING_SETUP              | This error indicates that the request failed because a persistent call is already being set up. |
| CTIERR_PRIMARY_CALL_INVALID                     | This error indicates that primary call in monitoring request in invalid or gone idle            |
| CTIERR_PRIMARY_CALL_STATE_INVALID               | This error indicates that primary call in monitoring request is in invalid state                |
| CTIERR_RECORDING_ALREADY_INPROGRESS             | This error indicates recording request failed that recording is already in progress             |
| CTIERR_RECORDING_CONFIG_NOT_MATCHING            | This error indicates recording configuration does not match                                     |
| CTIERR_RECORDING_INVOCATION_TYPE_NOT_MATCHING   | Stop recording failed because the recording invocation type did not match.                      |
| CTIERR_RECORDING_SESSION_INACTIVE               | This error indicates recording request failed because recording session is inactive             |

| Error code                                            | Description                                                                                            |
|-------------------------------------------------------|--------------------------------------------------------------------------------------------------------|
| CTIERR_REDIRECT_UNAUTHORIZED_COMMAND_USAGE            | This error indicates a redirect unauthorized command usage                                             |
| CTIERR_REGISTER_FEATURE_ACTIVATION_FAILED             | This error indicates that register feature activation failed                                           |
| CTIERR_REGISTER_FEATURE_APP_ALREADY_REGISTERED        | Register feature application was already registered                                                    |
| CTIERR_REGISTER_FEATURE_PROVIDER_NOT_REGISTERED       | Register feature provider was not registered.                                                          |
| CTIERR_REMOTE_DEVICE_REQUEST_FAILED_ACTIVE_RD_NOT_SET | The active remote destination is not set.                                                              |
| CTIERR_REMOTEDESTINATION_LIMIT_EXCEEDED               | The number of Remote Destinations has exceeded the max number limit.                                   |
| CTIERR_RESOURCE_NOT_AVAILABLE                         | This error indicates that resource is not available to fulfill the request                             |
| CTIERR_START_MONITORING_FAILED                        | This error indicates that start monitoring request failed                                              |
| CTIERR_START_RECORDING_FAILED                         | This error indicates that start recording request failed                                               |
| CTIERR_STATION_SHUT_DOWN                              | This error indicates that there is a station shutdown                                                  |
| CTIERR_SYSTEM_ERROR                                   | This error indicates CTI system error                                                                  |
| CTIERR_UDP_PASS_THROUGH_NOT_SUPPORTED                 | This error indicates UDP data passthrough not supported                                                |
| CTIERR_UNKNOWN_EXCEPTION                              | This error indicates an unknown exception occurred                                                     |
| CTIERR_UNSUPPORTED_CALL_PARK_TYPE                     | This error indicates that call park type is not supported                                              |
| CTIERR_UNSUPPORTED_CFWD_TYPE                          | This error indicates that the call forward type is unsupported                                         |
| CTIERR_USER_NOT_AUTH_FOR_SECURITY                     | This error indicates user is not authorized for secure connection                                      |
| DARES_INVALID_REQ_TYPE                                | This error indicates that there is an internal call processing error: DaRes invalid request type       |
| DATA_SIZE_LIMIT_EXCEEDED                              | This error indicates that XML data object size is bigger than allowed.                                 |
| DB_ERROR                                              | This error indicates that the device query contained an illegal device type                            |
| DB_ILLEGAL_DEVICE_TYPE                                | This error indicates illegal device type in DB                                                         |
| DB_NO_MORE_DEVICES                                    | This error is no longer used.                                                                          |
| DESTINATION_BUSY                                      | This error indicates that destination is busy                                                          |
| DESTINATION_UNKNOWN                                   | This error indicates that destination is not found                                                     |
| DEVICE_ALREADY_REGISTERED                             | This error indicates that device registration attempt failed, because the device is already registered |

| Error code                           | Description                                                                                                              |
|--------------------------------------|--------------------------------------------------------------------------------------------------------------------------|
| DEVICE_NOT_OPEN                      | This error indicates that an attempt to open a line failed, as the device is not opened or the device is not registered. |
| DEVICE_OUT_OF_SERVICE                | This error indicates that device is out of service.                                                                      |
| DIGIT_GENERATION_ALREADY_IN_PROGRESS | This error indicates that digit generation is already in progress.                                                       |
| DIGIT_GENERATION_CALLSTATE_CHANGED   | This error indicates that call state is invalid to continue.                                                             |
| DIGIT_GENERATION_WRONG_CALL_HANDLE   | This error indicates that call handle is invalid and call may be gone.                                                   |
| DIGIT_GENERATION_WRONG_CALL_STATE    | This error indicates that call state is not valid to generate digits.                                                    |
| DIRECTORY_LOGIN_FAILED               | This error indicates that directory login failed: directory not initialized                                              |
| DIRECTORY_LOGIN_NOT_ALLOWED          | This error indicates that directory login failed                                                                         |
| DIRECTORY_TEMPORARY_UNAVAILABLE      | This error indicates that directory is temporarily unavailable.                                                          |
| EXISTING_FIRSTPARTY                  | This error indicates that there is already a device controlling media.                                                   |
| HOLDFAILED                           | This error indicates that the hold was rejected by line control or call control layers                                   |
| ILLEGAL_CALLINGPARTY                 | This error indicates that an attempt was made to originate call using a calling party that is not on the device          |
| ILLEGAL_CALLSTATE                    | This error indicates line is not in a legal state to invoke the request                                                  |
| ILLEGAL_HANDLE                       | This error indicates the handle is not valid                                                                             |
| ILLEGAL_MESSAGE_FORMAT               | This error indicates that there is a QBE protocol error                                                                  |
| INCOMPATIBLE_PROTOCOL_VERSION        | This error indicates that JTAPI and CTI versions are not compatible : CTI Error Protocol version not supported           |
| INVALID_LINE_HANDLE                  | This error indicates that attempt to perform a line operation on an invalid line handle.                                 |
| INVALID_RING_OPTION                  | This error indicates that the ring option is invalid                                                                     |
| LINE_GREATER_THAN_MAX_LINE           | This error indicates that line is greater than the maximum available lines on this device                                |
| LINE_INFO_DOES_NOT_EXIST             | This error indicates that line information does not exist in the database.                                               |
| LINE_NOT_PRIMARY                     | This error indicates that internal error returned from call control.                                                     |
| LINECONTROL_FAILURE                  | This error indicates line control refuses to allow a new call to be initiated because of its current state.              |

| Error code                                 | Description                                                                                                             |
|--------------------------------------------|-------------------------------------------------------------------------------------------------------------------------|
| MAX_NUMBER_OF_CTI_CONNECTIONS_REACHED      | The maximum number of CTI connections was reached.                                                                      |
| MSGWAITING_DESTN_INVALID                   | This error indicates that attempt to set message waiting lamp for an invalid DN; Message Waiting Destination not found. |
| NO_ACTIVE_DEVICE_FOR_THIRDPARTY            | This error indicates there is no active device for thirdparty                                                           |
| NO_CONFERECE_BRIDGE                        | This error indicates that no conference bridge available                                                                |
| NOT_INITIALIZED                            | This error indicates that attempt is made to open a provider before CTI initialization completes                        |
| PROTOCOL_TIMEOUT                           | Internal error returned from call control                                                                               |
| PROVIDER_ALREADY_OPEN                      | This error indicates that an attempt is made to reopen provider                                                         |
| PROVIDER_CLOSED                            | This error indicates an attempt to close provider while it is already closed                                            |
| PROVIDER_NOT_OPEN                          | This error indicates that device list incomplete or device list query timeout or query aborted                          |
| REDIRECT_CALL_CALL_TABLE_FULL              | This error indicates that internal error is returned from call control                                                  |
| REDIRECT_CALL_DESTINATION_BUSY             | This error indicates that the redirect destination is busy                                                              |
| REDIRECT_CALL_DESTINATION_OUT_OF_ORDER     | This error indicates that redirect destination is out of order                                                          |
| REDIRECT_CALL_DIGIT_ANALYSIS_TIMEOUT       | This error indicates a digit analyss time out, this is an internal error returned from call control                     |
| REDIRECT_CALL_DOES_NOT_EXIST               | This error indicates that an attempt is made to redirect a call that does not exist or is not longer active             |
| REDIRECT_CALL_INCOMPATIBLE_STATE           | This error indicates that internal error is returned from call control                                                  |
| REDIRECT_CALL_MEDIA_CONNECTION_FAILED      | This error indicates media connection failure, this is an internal error returned from call control                     |
| REDIRECT_CALL_NORMAL_CLEARING              | This error indicates that redirect failed because of normal call clearing                                               |
| REDIRECT_CALL_ORIGINATOR_ABANDONED         | This error indicates that far end hung up on the call being redirected                                                  |
| REDIRECT_CALL_PARTY_TABLE_FULL             | This error indicates that internal error is returned from call control                                                  |
| REDIRECT_CALL_PENDING_REDIRECT_TRANSACTION | This error indicates that internal error is returned from call control                                                  |
| REDIRECT_CALL_PROTOCOL_ERROR               | This error indicates a protocol error, this is an internal error returned from call control                             |
| REDIRECT_CALL_UNKNOWN_DESTINATION          | This error indicates that an attempt is made to redirect to an unknown destination                                      |

| Error code                             | Description                                                                                                                                                                                            |
|----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| REDIRECT_CALL_UNKNOWN_ERROR            | This error indicates that internal error is returned from call control                                                                                                                                 |
| REDIRECT_CALL_UNKNOWN_PARTY            | This error indicates an unknown party is detected, this is an internal error returned from call control                                                                                                |
| REDIRECT_CALL_UNRECOGNIZED_MANAGER     | This error indicates that internal error is returned from call control                                                                                                                                 |
| REDIRECT_CALLINFO_ERR                  | This error indicates that internal error is returned from call control                                                                                                                                 |
| REDIRECT_ERR                           | This error indicates that internal error is returned from call control                                                                                                                                 |
| RETRIEVEFAILED                         | This error indicates that retrieval of call was rejected by line control or call control                                                                                                               |
| RETRIEVEFAILED_ACTIVE_CALL_ON_LINE     | This error indicates that error occurred in retrieving held call; because there is already another active call on the line                                                                             |
| SSAPI_NOT_REGISTERED                   | This error indicates that the redirect command was issued when the internal supporting interface was not initialized; either CTI has not yet finished its initialization or an internal error occurred |
| TIMEOUT                                | This error indicates that the request has timed out.                                                                                                                                                   |
| TRANSFER_INACTIVE                      | This error indicates that attempt to complete transfer, while consult transfer is not there                                                                                                            |
| TRANSFERFAILED                         | This error indicates that the transfer failed probably because one of the call legs was hung up or disconnected from the far end                                                                       |
| TRANSFERFAILED_CALLCONTROL_TIMEOUT     | This error indicates that expected response from call control not received during a transfer                                                                                                           |
| TRANSFERFAILED_DESTINATION_BUSY        | This error indicates that an attempt is made to transfer call to a busy destination                                                                                                                    |
| TRANSFERFAILED_DESTINATION_UNALLOCATED | This error indicates an attempt is made to to transfer call to a directory number that is not registered                                                                                               |
| TRANSFERFAILED_OUTSTANDING_TRANSFER    | This error indicates that existing transfer is still in progress                                                                                                                                       |
| UNDEFINED_LINE                         | This error indicates that the line that was specified, is not found on the device                                                                                                                      |
| UNKNOWN_GLOBAL_CALL_HANDLE             | This error indicates that the global call handle is unknown                                                                                                                                            |
| UNRECOGNIZABLE_PDU                     | This error indicates that there is a QBE protocol error                                                                                                                                                |
| UNSPECIFIED                            | This error indicates that an unspecified error has occurred.                                                                                                                                           |

# CiscoEventIDs

This section includes the following events:

- [Provider Events, on page 1639](#)
- [Terminal Events, on page 1640](#)
- [Address Events, on page 1640](#)
- [Call Events, on page 1641](#)
- [RTP Events, on page 1642](#)
- [TermConn Events, on page 1642](#)

## Provider Events

| Event name                                     | Event number |
|------------------------------------------------|--------------|
| CiscoProvFeatureUnRegisteredEv                 | 0x40000008   |
| CiscoRestrictedEv                              | 0x40000009   |
| CiscoAddrRestrictedEv                          | 0x40000010   |
| CiscoTermRestrictedEv                          | 0x40000011   |
| CiscoAddrActivatedEv                           | 0x40000012   |
| CiscoTermActivatedEv                           | 0x40000013   |
| CiscoAddrActivatedOnTerminalEv                 | 0x40000014   |
| CiscoAddrRestrictedOnTerminalEv                | 0x40000015   |
| CiscoProviderCapabilityChangedEv               | 0x40000016   |
| CiscoProvTerminalCapabilityChangedEv           | 0x40000017   |
| CiscoProvTerminalRegisteredEv                  | 0x40000018   |
| CiscoProvTerminalUnRegisteredEv                | 0x40000019   |
| CiscoProvTerminalRemoteDestinationChangedEv    | 0x40000020   |
| CiscoProvTerminalIPAddressChangedEv            | 0x40000021   |
| CiscoProvTerminalMultiMediaCapabilityChangedEv | 0x40000022   |

## Terminal Events

| Event name                      | Event number |
|---------------------------------|--------------|
| CiscoTermCreatedEv              | 0x40001001   |
| CiscoTermDataEv                 | 0x40001002   |
| CiscoTermInServiceEv            | 0x40001003   |
| CiscoTermOutOfServiceEv         | 0x40001004   |
| CiscoTermRemovedEv              | 0x40001005   |
| CiscoTermDeviceActiveStatusEv   | 0x40001006   |
| CiscoTermDeviceAlertingStatusEv | 0x40001007   |
| CiscoTermDeviceHoldStatusEv     | 0x40001008   |
| CiscoTermDeviceIdleStatusEv     | 0x40001009   |
| CiscoTermButtonPressedEv        | 0x40001010   |
| CiscoTermRegistraionFailedEv    | 0x40001011   |
| CiscoTermDNDDStatusChangedEv    | 0x40001014   |
| CiscoTermDeviceStateWhisperEv   | 0x40001015   |
| CiscoTermDNDOptionChangedEv     | 0x40001016   |
| CiscoMultiMediaStreamsInfoEv    | 0x40001017   |

## Address Events

| Event name                         | Event number |
|------------------------------------|--------------|
| CiscoAddrCreatedEv                 | 0x40002001   |
| CiscoAddrInServiceEv               | 0x40002002   |
| CiscoAddrOutOfServiceEv            | 0x40002003   |
| CiscoAddrRemovedEv                 | 0x40002004   |
| CiscoOutOfServiceEv                | 0x40002005   |
| CiscoAddrAddedToTerminalEv         | 0x40002006   |
| CiscoAddrRemovedFromTerminalEv     | 0x40002007   |
| CiscoAddrAutoAcceptStatusChangedEv | 0x40002008   |

| Event name                               | Event number |
|------------------------------------------|--------------|
| CiscoAddrIntercomInfoChangedEv           | 0x40002009   |
| CiscoAddrIntercomInfoRestorationFailedEv | 0x40002010   |
| CiscoAddrRecordingConfigChangedEv        | 0x40002011   |
| CiscoAddrParkStatusEv                    | 0x40002012   |
| CiscoAddrVoiceMailPilotChangedEv         | 0x40002013   |
| CiscoAddrPickupGroupChangedEv            | 0x40002014   |
| CiscoAddrMonitoringTerminatedEv          | 0x4000200A   |

## Call Events

| Event name                                      | Event number |
|-------------------------------------------------|--------------|
| CiscoProvCallParkEv                             | 0x40003001   |
| CiscoConferenceEndEv                            | 0x40003002   |
| CiscoConferenceStartEv                          | 0x40003003   |
| CiscoConsultCallActiveEv                        | 0x40003004   |
| CiscoTransferEndEv                              | 0x40003005   |
| CiscoTransferStartEv                            | 0x40003006   |
| CiscoToneChangedEv                              | 0x40003007   |
| CiscoCallChangedEv                              | 0x40003008   |
| CiscoConferenceChainAddedEv                     | 0x40003009   |
| CiscoConferenceChainRemovedEv                   | 0x40003010   |
| CiscoCallSecurityStatusChangedEv                | 0x40003011   |
| CiscoCallFeatureCancelledEv                     | 0x40003012   |
| CiscoProvPickupCallAlertEv                      | 0x40003013   |
| CiscoProvPickupNotificationRegistrationClosedEv | 0x40003014   |
| CiscoCallInfoChangedEv                          | 0x40003015   |
| CiscoProvAuthenticationInfoEv                   | 0x40003016   |

## RTP Events

| Event name                     | Event number |
|--------------------------------|--------------|
| CiscoRTPInputStartedEv         | 0x40004001   |
| CiscoRTPInputStoppedEv         | 0x40004002   |
| CiscoRTPOutputStartedEv        | 0x40004003   |
| CiscoRTPOutputStoppedEv        | 0x40004004   |
| CiscoMediaOpenLogicalChannelEv | 0x40004005   |
| CiscoRTPInputKeyEv             | 0x40004006   |
| CiscoRTPOutputKeyEv            | 0x40004007   |
| CiscoMediaOpenIPPortEv         | 0x40004008   |

## TermConn Events

| Event name                          | Event number |
|-------------------------------------|--------------|
| CiscoTermConnPrivacyChangedEv       | 0x40005001   |
| CiscoCallCtlTermConnHeldReversionEv | 0x40005002   |
| CiscoTermConnSelectChangedEv        | 0x40005003   |
| CiscoTermConnRecordingStartEv       | 0x40005004   |
| CiscoTermConnRecordingEndEv         | 0x40005005   |
| CiscoTermConnRecordingFailedEv      | 0x4000500E   |
| CiscoTermConnMonitoringStartEv      | 0x40005006   |
| CiscoTermConnMonitoringEndEv        | 0x40005007   |
| CiscoTermConnRecordingTargetInfoEv  | 0x40005008   |
| CiscoTermConnMonitorInitiatorInfoEv | 0x40005009   |
| CiscoTermConnMonitorTargetInfoEv    | 0x4000500A   |
| CiscoTermConnMonitorUpdatedEv       | 0x4000500B   |
| CiscoMediaStreamStartedEv           | 0x4000500C   |
| CiscoMediaStreamEndedEv             | 0x4000500D   |

## Conn Events

| Event name                       | Event number |
|----------------------------------|--------------|
| CiscoConnectionUniqueIDChangedEv | 0x40006001   |
| CiscoHuntConnCreatedEv           | 0x40006002   |

## Reason Codes

The following codes are defined in CiscoFeatureReason interface.

| Reason code name       | Reason code |
|------------------------|-------------|
| REASON_TRANSFER        | 2           |
| REASON_FORWARDNOANSWER | 3           |
| REASON_FORWARDBUSY     | 4           |
| REASON_FORWARDALL      | 5           |
| REASON_REDIRECT        | 6           |
| REASON_BLINDTRANSFER   | 7           |
| REASON_CONFERENCE      | 9           |
| REASON_PARK            | 10          |
| REASON_CALLPICKUP      | 11          |
| REASON_NORMAL          | 12          |
| REASON_PARKREMINDER    | 15          |
| REASON_UNPARK          | 16          |
| REASON_BARGE           | 20          |
| REASON_IMMDIVERT       | 21          |
| REASON_FAC_CMC         | 22          |
| REASON_QSIG_PR         | 23          |
| REASON_REFERER         | 24          |
| REASON_REPLACE         | 25          |
| REASON_CCM_REDIRECTION | 26          |
| REASON_DPARK_CALLPARK  | 27          |

| Reason code name             | Reason code |
|------------------------------|-------------|
| REASON_DPARK_REVERSION       | 28          |
| REASON_DPARK_UNPARK          | 29          |
| REASON_SILENTMONITORING      | 31          |
| REASON_MOBILITY              | 33          |
| REASON_MOBILITY_IVR          | 34          |
| REASON_MOBILITY_CELLPICKUP   | 35          |
| REASON_MOBILITY_HANDIN       | 36          |
| REASON_MOBILITY_HANDOUT      | 37          |
| REASON_MOBILITY_FOLLOWME     | 38          |
| REASON_CLICK_TO_CONFERENCE   | 39          |
| REASON_FORWARD_NO_RETRIEVE   | 40          |
| REASON_EXTERNALCALLCONTROL   | 42          |
| REASON_SAF_CCD_PSTN_FAILOVER | 43          |
| REASON_MEDIA_STREAMING       | 44          |

## Cause Codes

| Cause code name             | Cause code |
|-----------------------------|------------|
| CAUSE_NOERROR               | 0X00 (0)   |
| CAUSE_UNALLOCATEDNUMBER     | 0X01 (1)   |
| CAUSE_NOROUTETOTRANSITNET   | 0X02 (2)   |
| CAUSE_NOROUTETODDESTINATION | 0X03 (3)   |
| CAUSE_CHANUNACCEPTABLE      | 0X06 (6)   |
| CAUSE_CALLBEINGDELIVERED    | 0X07 (7)   |
| CAUSE_CTIPREEMPTNOREUSE     | 0X08 (8)   |
| CAUSE_CTIPREEMPTFORREUSE    | 0X09 (9)   |
| CAUSE_NORMALCALLCLEARING    | 0X10 (16)  |
| CAUSE_USERBUSY              | 0X11 (17)  |

| Cause code name                    | Cause code |
|------------------------------------|------------|
| CAUSE_NOUSERRESPONDING             | 0X12 (18)  |

## Additional Troubleshooting Information

### Viewing JTAPI Debug Output

To view JTAPI debug output, use the JTPREFS application to change the trace settings. The JTPREFS application allows you to enable or disable various kinds of tracing.

JTPREFS is installed in the %SystemRoot%\java\lib directory along with the JTAPI classes. Cisco JTAPI Preferences is installed by default in Program Files\JTAPITools.

To open the Cisco JTAPI Preferences utility, choose **Start > Programs > Cisco JTAPI > JTAPI Preferences**.

The following trace levels are defined:

- WARNING - warning events
- INFORMATIONAL - status events
- DEBUG - debugging events

If DEBUG is enabled, JTPREFS allows you to enable or disable various debugging levels.

The following debugging levels are defined:

- TAPI\_DEBUGGING - to trace JTAPI methods and events
- TAPI\_IMPLDEBUGGING - internal JTAPI implementation trace
- CTI\_DEBUGGING - to trace Cisco Unified Communications Manager events that are sent to the JTAPI implementation
- CTIIMPL\_DEBUGGING - internal CTICLIENT implementation trace
- PROTOCOL\_DEBUGGING - full CTI protocol decoding
- MISC\_DEBUGGING - miscellaneous low-level debug trace

Traces can be directed to a specific path and folder rather than to the application directory by default. The same trace folder could be used for successive or more than one simultaneous launch of JTAPI. Different launches of JTAPI would also send the traces to different folders. This allows simultaneous JTAPI instances to maintain independent trace destinations

**Note** Traces can be directed to a specific path and folder rather than to the application directory by default. The same trace folder could be used for successive or more than one simultaneous launch of JTAPI. Different launches of JTAPI would also send traces to different folders. This allows simultaneous JTAPI instances to maintain independent trace destinations. The application directory in this case is not that of the JTAPI client itself, but of the application that is integrating/using the JTAPI client.

## Log Files for JTAPI Client Installer

In order to detect the error which might occur during the installation and uninstallation process, two log files will be generated. These files will be in the same location from which the installer is executed.

- ismpInstall.log – to track events during installation.
- ismpUninstall.log – to track events during uninstallation.

The error messages will contain the information about the wizard beans that were executed as a part of the install procedure and if there were any exceptions.

## Troubleshooting Tips for ISMP Installer

| SN | Problem Description                                                                | Cause                                                                    | Solution                                                                                                                                                                                 |
|----|------------------------------------------------------------------------------------|--------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1  | ISMP Uninstall does not remove the target directories installed.                   | Directory from which uninstaller is invoked.                             | The uninstaller needs to be invoked from at least one level above the install directory.                                                                                                 |
| 2  | Proper language details are not displayed during installation                      | Locale Files not proper.                                                 | Please report this problem immediately to the support personnel to suggest the change or error in message.                                                                               |
| 3  | Uninstaller/Installer throws error.                                                | The JVM has been either removed or replaced with an incompatible version | The installer comes with a built in JVM which also gets installed if the target machine does not have a JVM. In case you face this error - manual removal of the files needs to be done. |
| 4  | Installer goes through fine, but the files have not been copied.                   | Permissions                                                              | Ensure that proper write permissions are there for the destination folder. This problem can occur on UNIX platforms.                                                                     |
| 5  | Installer/Uninstaller throws exception or crashes during the installation process. | version name problem / folder name problem.                              | Refer to the log files generated to get an idea of which step caused the error.                                                                                                          |

| SN | Problem Description                                                                | Cause                  | Solution                                                                                                                                                                                                                                                                                                                                                                                         |
|----|------------------------------------------------------------------------------------|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 6  | Upgrade does not show “upgrade” message during installation of an upgrade version. | .jtapiver.ini missing. | This file is where the current jtapi install details are located. If this is accidentally removed then, upgrade/reinstall will have display issues. In the case of an upgrade/reinstall or downgrade failure, the user will have to manually remove the files from the .jtapi/bin and .jtapi/lib folders and then try the installer in order to ensure proper installation during the next time. |

## Unable to Create Provider Directory Login Timeout

This error occurs when there is no authentication response from CTI for the ProviderOpenRequest. It could fail because of:

- LDAP connectivity problems
- Database delays
- The CTIManager being busy for some other reason and therefore unable to honor the request

The solution is that the application must try again. If the ProviderOpenRequest fails on repeated attempts, modify the ProviderOpenRequest.

# APPENDIX **D**

## Cisco Unified JTAPI Operations by Release

This section lists supported, unsupported, changed, and “under consideration or review” features for Cisco Unified JTAPI by Cisco Unified Communications Manager release. The details can be found in the Cisco Unified Communications Manager JTAPI Developers Guide at [http://www.cisco.com/en/US/products/sw/voicesw/ps556/products\\_programming\\_reference\\_guides\\_list.html](http://www.cisco.com/en/US/products/sw/voicesw/ps556/products_programming_reference_guides_list.html).

# APPENDIX E

## CTI Supported Devices

The following table provides information about CTI supported devices.

You can see the latest list of Cisco CTI Supported Devices at <http://developer.cisco.com/web/jtapi/wikidocs>

- [CTI Supported Devices Table, on page 1659](#)

## CTI Supported Devices Table

Table legend:

✔: supported, ✘: not supported, NA: Not Applicable.

**Table 360: CTI Supported Device Matrix**

| Device/Phone model | SCCP | SIP | Comments                                                                                                                         |
|--------------------|------|-----|----------------------------------------------------------------------------------------------------------------------------------|
| Analog Phone       | ✔    | ✘   | You can find information on the limitations of this device in Cisco JTAPI Developer Guide for Cisco Unified CallManager 4.1(3) . |
| Cisco 30 SP+       | ✔    | ✘   | End of Software Maintenance Release 2001                                                                                         |
| Cisco 6901         | ✔    | ✔   | SIP devices require firmware update 9.1(1) available on Cisco.com                                                                |
| Cisco 6911         | ✔    | ✔   | SIP devices require firmware update 9.1(1) available on Cisco.com                                                                |
| Cisco 6921         | ✔    | ✔   | PhoneSetDisplay() interface is not supported. SIP devices require firmware update 9.1(1) available on Cisco.com.                 |

| Device/Phone model   | SCCP | SIP | Comments                                                                                                                                 |
|----------------------|------|-----|------------------------------------------------------------------------------------------------------------------------------------------|
| Cisco 6941           | ✓    | ✓   | PhoneSetDisplay() interface is not supported. SIP devices require firmware update 9.1(1) available on Cisco.com.                         |
| Cisco 6945           | ✓    | ✓   | PhoneSetDisplay() interface is not supported. SIP devices require firmware update 9.1(1) available on Cisco.com.                         |
| Cisco 6961           | ✓    | ✓   | PhoneSetDisplay() interface is not supported. SIP devices require firmware update 9.1(1) available on Cisco.com.                         |
| Cisco 7906           | ✓    | ✓   |                                                                                                                                          |
| Cisco 7911           | ✓    | ✓   |                                                                                                                                          |
| Cisco 7914 Sidecar   | ✓    | ✗   | End of Software Maintenance Release 2010                                                                                                 |

## APPENDIX **F**

# Constant Field Values

---

This appendix lists the static final fields and their values.

- [com.cisco.\\*](#), on page 1665

## **com.cisco.\***

### **CiscoAddrActivatedEv**

|                                                        |    |            |
|--------------------------------------------------------|----|------------|
| <b>com.cisco.jtapi.extensions.CiscoAddrActivatedEv</b> |    |            |
| public static final int                                | ID | 1073741842 |

### **CiscoAddrActivatedOnTerminalEv**

|                                                                  |    |            |
|------------------------------------------------------------------|----|------------|
| <b>com.cisco.jtapi.extensions.CiscoAddrActivatedOnTerminalEv</b> |    |            |
| public static final int                                          | ID | 1073741844 |

### **CiscoAddrAddedToTerminalEv**

|                                                              |    |            |
|--------------------------------------------------------------|----|------------|
| <b>com.cisco.jtapi.extensions.CiscoAddrAddedToTerminalEv</b> |    |            |
| public static final int                                      | ID | 1073750022 |

### **CiscoAddrAutoAcceptStatusChangedEv**

|                                                                      |    |            |
|----------------------------------------------------------------------|----|------------|
| <b>com.cisco.jtapi.extensions.CiscoAddrAutoAcceptStatusChangedEv</b> |    |            |
| public static final int                                              | ID | 1073750024 |

## CiscoAddrCreatedEv

| com.cisco.jtapi.extensions.CiscoAddrCreatedEv |    |            |
|-----------------------------------------------|----|------------|
| public static final int                       | ID | 1073750017 |

## CiscoAddress

| com.cisco.jtapi.extensions.CiscoAddress |                           |   |
|-----------------------------------------|---------------------------|---|
| public static final int                 | AUTO_RECORDING            | 1 |
| public static final int                 | AUTOACCEPT_OFF            | 0 |

## APPENDIX **G**

### Caveats

---

This appendix provides details of the JTAPI caveats that are common across releases and those that are release-specific.

- [Caveats for All Releases, on page 1705](#)
- [Caveats for Release 9.1\(1\), on page 1710](#)
- [Caveats for Release 8.6\(1\), on page 1712](#)
- [Caveats for Release 8.5\(1\), on page 1712](#)
- [Caveats for Release 8.0\(1\), on page 1714](#)
- [Caveats for Release 7.0.1, on page 1715](#)
- [Caveats for Release 6.0.1, on page 1717](#)
- [Caveats for Release 5.0, on page 1717](#)
- [Caveats for Release 4.1, on page 1721](#)
- [Caveats for 4.0, on page 1722](#)

### Caveats for All Releases

This section lists the caveats that are common for all JTAPI releases and contains these topics:

- [Translation Pattern Support, on page 1707](#)
- [DT24+ Limitation with PRI NI2 Trunk, on page 1707](#)
- [Connection for Park Number Not Created, on page 1708](#)
- [Inconsistency Between SIP and SCCP Phone, on page 1708](#)
- [Failure to Route Calls Across Destinations, on page 1708](#)
- [Incorrect Return Value for getCallingAddress\(\), on page 1708](#)
- [Call Fails to Disconnect Held Shared Line, on page 1709](#)
- [Limitation with sendData\(\) API on CiscoTerminal, on page 1709](#)
- [Limitation in Using ; \(Semi-Colon\) and = \(Equal\) in User ID and Password, on page 1709](#)
- [Connection to Unknown Address When Unparking a Conference Call, on page 1709](#)
- [CTI Redirect to Voice Mail Wont Work with QSIG, on page 1710](#)

- [Unsupported CTI Events for SIP Phones, on page 1710](#)

## Single Versus Multiple CallObserver Clarification

There are two primary ways to observe addresses with Cisco JTAPI's CallObservers: an application can observe all of the addresses with a single CallObserver object or it can have a separate CallObserver object for each of address. These two approaches cause slightly different events to be seen, mostly with regard to reason codes.

When an application uses a single CallObserver to observe all the addresses, they are connected with one object. When A calls B, both the events at A and at B are sent to the same CallObserver object. If B redirects to C, and C was observed with the same object, all its events are delivered to the same observer. The application observes the CallCtlConnOfferedEv to C with reason REDIRECT, because the observer at C knew all about the previous events on the call.

Conversely, when an application uses an independent CallObserver for each Address, this information is not so easily shared. When A calls B, call events of A go to the observer for A, and B's go to the observer for B. They each know about the other end, for example A will know that B is ringing, but they are no longer the same observer. When B redirects the call to C, the observer at C knows absolutely nothing about the call. The observer at C was not involved in the original call at all, and does not know who is on it, what events had happened previously. This information has to be made up by JTAPI to build an accurate call model at C. All the call events for a basic call between A and B have to be simulated so that the call model, from C's perspective makes sense.

This is done by using a snapshot event. JTAPI looks at the call, in this case the one between A and B, and figures out what events have to have happened for the call to exist the way it does. This makes up the basic call events required, and give them to the observer on C, so that it can build a proper call model.

Since this event set is made up by JTAPI, the reason codes are not available. For example, if A had originally called D, and D redirected to B, the made up snapshot event set would not be concerned with the redirect at all. JTAPI does not store this information anywhere, and when it generates a snapshot, it creates the simplest event set possible to recreate the call model, and reports all the events with reason NORMAL.

So, when A calls B, and then B redirects to C, the observer on C gets a snapshot event that allows it to recreate the call model for a basic call from A to B. Also in this snapshot event is the CallCtlConnOfferedEv for C. As part of the snapshot, this event comes in with reason NORMAL, even though it is the result of a redirect. CallObservers on A or B will see the CallCtlConnOfferedEv for C with reason REDIRECT, but there is no way for the observer at C to know that.

This creates a noticeable difference in the reason codes available to applications depending on how they implement their CallObservers. There have not been any issues regarding this from the customer side.

This is the way it has been since Cisco JTAPI's inception and this is a clarification of the existing behavior.

## SIP and SCCP Dialing Differences with Overlapping Directory Number Patterns

An overlapping Directory Number Pattern is when one Directory Number is a part of a longer Directory Number. For example, a Directory Number 1000 overlaps a Directory Number 10001. Cisco Unified Communications Manager (Cisco Unified CM) and JTAPI both support overlapping Directory Number patterns, but there are some important things to note regarding this.

When you dial 1000 from a normal phone, there is a delay. The Cisco Unified CM does not know if you want to dial 1000 or 10001, so it waits for you to make a choice. This Digit Analyzer waits for 15 seconds if you press nothing else. During this time, nothing happens, no call is extended, and it just sounds like a dead call

for the calling party. This can be short circuited by hitting # to let Cisco Unified CM know that you actually intend to call 1000. The 15 second wait is a configurable service parameter, known as T302 Timer, and can be set as low as 3 seconds.

JTAPI using SCCP phones avoid the Digit Analyzer entirely by communicating directly with Cisco Unified CM. JTAPI sends the intended Directory Number when it is making a call, and if it sends 1000, it means only that, and Cisco Unified CM knows it will not be dialing any more digits.

JTAPI using SIP phones is quite different. JTAPI communicates with the phone, which then communicates with the Cisco Unified CM. The phone takes care of the dialing, and JTAPI will pass it the digits 1000 to dial. Due to this, JTAPI cannot avoid the Digit Analyzer, and is subject to the T302 wait outlined above. JTAPI sits idly and waits while the Digit Analyzer figures out that the SIP phone actually wants to dial 1000.

Apart from this, by default the JTAPI CTI Postcondition value is also set to 15 seconds. This means that when JTAPI sends a request to the CTI layer, it waits for 15 seconds before it assumes something has gone wrong, and throws a timeout exception. This means that the delay for Digit Analysis for overlapping DN patterns is very likely to cause JTAPI to time out.

The Digit Analysis delay cannot be completely removed for SIP phones, but this problem can be greatly mitigated through the use of service or jtapi.ini parameters. As noted above, the T302 Timer for Digit Analysis can be set as low as three seconds, which is much lower than the 15 it takes JTAPI to time out. You can also increase the JTAPI CTI Postcondition timeout to 20 seconds in the jtapi.ini file. This issue can also be avoided by not having overlapping DNs.

## Translation Pattern Support

If the callingparty transformation mask is configured for a Translation Pattern that is applied to the controlled addresses of JTAPI application, the application may observe some extra connections being created and disconnected when the application observes both calling and called party. Otherwise, a connection is created for the transformed callingparty and `CiscoCall.getCurrentCallingParty()` returns the transformed calling party address when the application observes only the called party. In general, JTAPI has a problem in creating an appropriate call connection and may not be able to provide correct callinfo such as `currentCalling`, `currentCalled`, `calling`, `called`, and `lastRedirecting` parties. For example, Translation Pattern X is configured with calling party transformation mask Y and calledparty transformation mask B; A calls X, and call goes to B. In this scenario:

- If the application observes only B, JTAPI creates connection for Y and B, and `CiscoCall.getCurrentCallingParty()` returns Address Y.
- If the application observes both A and B, connections for A and B are created, connection for Y is temporarily created and dropped, and `CiscoCall.getCurrentCallingParty()` returns Address Y.

Other inconsistencies could occur in callinfo if more features are used for basic call. It is recommended that you do not configure callingparty transformation mask for Translation Pattern which might get applied to JTAPI Application controlled Addresses.

## DT24+ Limitation with PRI NI2 Trunk

When a PRI NI2 trunk used by DT24+ gateway is involved in a call scenario between two clusters, for example, A from cluster-1 calls B in cluster-2 via DT24+ PRI NI2 trunk, the `LastRedirectAddress` and `CalledAddress` may not be accurate on B's side. Besides, if there are any changes for A's side of the call in cluster-1 due to redirect, transfer, or forward, the changed information is not propagated to B's side due to protocol limitation of PRI NI2 truck.

## Connection for Park Number Not Created

JTAPI does not create a Queued state connection for Park Number if the call is parked across the gateway. There are two possibilities here:

1. If CLI is configured, application sees an Unknown connection
2. If CLI is not configured, the calling does not see any Unknown connection.

For Example, If A calls B across gateway (with CLI configured) and B parks the call then A sees an unknown connection instead of a connection (with STATE = QUEUED) for Park Number.

But, if A calls B across gateway (with no CLI configured) and B parks the call then A does not see any new connection.

## Inconsistency Between SIP and SCCP Phone

sendData() API on CiscoTerminal is used to send data to the phone. In case of SIP phones, if invalid byte data is sent by the application, the method throws PlatformException. However, in case of SCCP phones, the byte data sent in the request is not validated, and would return successfully without throwing an exception.

## Failure to Route Calls Across Destinations

When a call is redirected to a device outside the cluster over an H323 gateway that is out of service, before call control can determine the Out-of-Service status of H323 gateway, the call is disconnected. This is because the default value of the service parameter CTI NewCallAccept timer is four seconds where as call control takes five seconds to determine that the gateway is out of service, so calls are disconnected due to expiration of CTI NewCallAccept timeout.

Implications of the above behavior is seen in JTAPI selectRoute() API which internally uses CTI redirect API to route the call. If applications specify multiple destinations with selectRoute() and the first destination is across an out-of-service H323 gateway, the call fails before JTAPI can route the call to the second destination. Hence JTAPI, cannot route the call to the second route specified in selectRoute() interface call.

To avoid this, the value of CTI New Call Accept Timer service parameter can be set as greater than H225 TCP Timer service parameter.

## Incorrect Return Value for getCallingAddress()

In a transfer scenario, where caller and transferController are not observed, that is, where A calls B and transfers the call to C and the application is observing only C then before the transfer, JTAPI will not have any information about the first call (that is, call from A to B). So, when the transfer feature is invoked, the calling and called address are B and C respectively. On completing the transfer, application updates callInfo and JTAPI exposes the correct parties through getCurrentCallingAddress(), getCurrentCalledAddress(), getModifiedCallingAddress(), and getModifiedCalledAddress(). However, getCallingAddress() API which should return the original calling address still reports B, that is, the original calling party of B to C call.

To avoid this issue, application can observe the controller as well, so that JTAPI expose the correct party (that is A, in this case) with getCallingAddress() API.

## Call Fails to Disconnect Held Shared Line

In a scenario where A calls B (B is a shared line present on terminals T1 and T2); privacy is set as ON for T1 and initially CUCM service parameter Enforce Privacy Settings on held calls is set to True. B(T1) answers and goes to Talking state while B(T2) goes to Passive state (TermConn = Passive; CallCtlTermConn = InUse). B(T1) puts the call on hold, since Enforce Privacy Setting on held calls is set to True, B(T2) remains in passive state (TermConn = Passive; CallCtlTermConn = InUse). Now the service parameter Enforce Privacy Settings on held calls is set to False. This does not trigger any change in the state of TerminalConnection, so B(T2) still remains Passive-InUse (TermConn = Passive; CallCtlTermConn = InUse). At this point, if the application sets the requestController as B(T1) and disconnects the call at B, the connection of B is not disconnected and call does not go IDLE. Even on the phones, the call on A remains in Established state while the other party in call is B(T2) which remains in Passive-InUse (TermConn = Passive; CallCtlTermConn = InUse) state. Call is cleared when A disconnects the call.

## Limitation with sendData() API on CiscoTerminal

If JTAPI applications make simultaneous back to back requests for sendData() API on the same CiscoTerminal, without any delay between requests, then some of these requests may fail. Applications cannot determine whether a request was successful or not, as Cisco JTAPI API returns successfully as soon as the phone receives data and does not wait for a response from the phone. Also, the IP phone might display a blank screen on sending simultaneous requests to send data.

To avoid these issues, JTAPI applications should ensure some time delay between two successive sendData() requests while pushing XSI data to the IP phones via Cisco JTAPI.

## Limitation in Using ; (Semi-Colon) and = (Equal) in User ID and Password

Sun JTAPI 1.2 specification does not support use of the semicolon ';' and equals '=' characters when populating the Host Name, UserID, and Password fields in string used as parameter in getProvider() method. If ';' or '=' are used in these fields, items such as 'pass = word' or 'pass;word' are treated as 'pass' and your request could fail and you must not use these characters in userid and password fields.

## Connection to Unknown Address When Unparking a Conference Call

When a conference call is parked, JTAPI call will have connection to the remaining parties in the call. When this call is unparked using the UnPark API or connect API, connections to unknown address will be temporarily created. This connection to unknown address will be disconnected when un park is completed.

The following will be seen in JTAPI traces:

```
2002 : (P1-InProv) 103023/1 ConnCreatedEv Unknown:null:4 187 Cause:100 CallCtlCause:0 CiscoCause:31
FeatReason:10 CAUSE_NORMAL
```

....

```
2002 : (P1-InProv) 103023/1 ConnDisconnectedEv Unknown:null:4 187 Cause:100 CallCtlCause:0
CiscoCause:31 FeatReason:10 CAUSE_NORMAL
```

## CTI Redirect to Voice Mail Wont Work with QSIG

When applications redirect a call to voice mail through a QSIG trunk, voice mail will not play the voice prompt of the redirecting party. A generic prompt asking the user to enter the voice mail box is played. This is due to the fact that CTI redirect doesn't pass correct original called party and redirecting party to the voice mail system. Applications can work around this by using a SIP trunk.

Phone A calls Phone B (CUCILYNC in Deskphone mode). Toast popup of "envelope" appears for incoming call.

User clicks on the envelope, redirecting the call across an H.323 trunk with QSIG tunneling. Unity/Unity Connection won't recognize original called party, so call will not go to user's voice mailbox. This is because Re-direct/Original Called Party information not carried across the trunk when CTI redirect is used.

## CiscoAddress.getForwarding() Returns Correct Value Only for In-Service Addresses

Although the Sun JTAPI 1.2 specification does not specify any preconditions for `CallControlAddress.getForwarding()`, the implementation of this method in Cisco JTAPI will return a correct value only if the address is in service. When invoked on an out of service address this method will just return a NULL value.

## Unsupported CTI Events for SIP Phones

The following CTI events are not generated for SIP phones. Third party applications that expect these call events should use SCCP phones:

- `CallOpenLogicalChannelEvent`
- `CallRingEvent`
- `DeviceLampModeChangedEvent`
- `DeviceModeChangedEvent`
- `DeviceDisplayChangedEvent`
- `DeviceFeatureButtonPressedEvent`
- `DeviceKeyPressedEvent`
- `DeviceLampModeChangedEvent`
- `DeviceRingModeChangedEvent`

## Caveats for Release 9.1(1)

This section lists the JTAPI caveats for Release 9.1(1).

- [Connection for Park DN While UnPark, on page 1711](#)

## Connection for Park DN While UnPark

Cisco JTAPI will no longer create the temporary connections for the Park/DPark number in the final call when a parked call is unparked.

This change in behavior will be seen in and above the following Cisco JTAPI versions - 8.5.1.10000-10, 8.6.1.10000-4, 8.6.2.10000-2 and 8.6.2.98000-2

Scenario:

GC1: A calls B, B parks a call is parked at 1000

GC2: B unparks

“Preserve globalCallId for Parked Calls” is set to false

Previous behavior on unpark:

```
GC2 CallActiveEvGC2 ConnCreatedEv B
GC2 ConnCreatedEv 1000
GC2 CallCtlConnEstablishedEv B
GC2 ConnCreatedEv A
GC2 ConnDisconnectedEv 1000
GC2 CallCtlConnEstablishedEv A
GC1 CallChangedEv
GC1 ConnDisconenctedEv 1000
GC1 ConnDisconenctedEv A
GC1 CallInvalidEv
```

Current behavior on unpark: Connection for 1000 will not be created in GC2

```
GC2 CallActiveEvGC2 ConnCreatedEv B
GC2 CallCtlConnEstablishedEv B
GC2 ConnCreatedEv A
GC2 CallCtlConnEstablishedEv A
GC1 CallChangedEv
GC1 ConnDisconenctedEv 1000
GC1 ConnDisconenctedEv A
GC1 CallInvalidEv
```

"Preserve globalCallId for Parked Calls" is set to true

Previous behavior on unpark:

```
GC2 CallActiveEvGC2 ConnCreatedEv B
GC2 ConnCreatedEv 1000
GC2 CallCtlConnEstablishedEv B
Gc2 CallChangedEv
GC2 ConnDisconnectedEv 1000
GC2 CallCtlConnDisconnectedEv 1000
GC2 ConnDisconnectedEv B
GC2 CallCtlConnDisconnectedEv B
GC2 CallInvalidEv
GC1 ConnCreatedEv 1000
GC1 ConnCreatedEv B
Gc2 ConnDisconnectedEv 1000
GC1 CallCtlConnEstablishedEv B
```

Current behavior on unpark: Connection for 1000 will not be created in GC1

```

GC2 CallActiveEvGC2 ConnCreatedEv B
GC2 CallCtlConnEstablishedEv B
GC1 ConnDisconnectedEv 1000
GC1 CallCtlConnDisconnectedEv 1000
Gc2 CallChangedEv
GC1 ConnCreatedEv B
GC1 ConnConnectedEv B
GC1 CallCtlCallEstablishedEv B
GC2 ConnDisconnectedEv B
GC2 CallCtlConnDisconnectedEv B
GC2 CallInvalidEv

```

## Caveats for Release 8.6(1)

This section lists the JTAPI caveats for Release 8.6(1).

- [Limitation While Using a Cisco Telepresence MCU, on page 1712](#)

### Limitation While Using a Cisco Telepresence MCU

In scenarios, where a conference chaining is done across cluster, the number of connection seen by the application might not be correct and application may not see the connection for the external conference bridge getting created.

Example:

```

A, B and B' are in Cluster 1D is in cluster 2
Application is observing D
GC1: A calls D; Call offered on D and D answers
GC2: D consults B; B answers
B' CBarges into the call
D completes conference - GC1.conference(GC2)

```

After the conference is complete the application will see only the connection for A and D but not that of the conference bridge.

## Caveats for Release 8.5(1)

This section lists the JTAPI caveats for Release 8.5(1).

- [Discouraged Use of JTAPIProperties.updateCertificate\(\), on page 1712](#)
- [Delete SecurityProperties Before Re-Use, on page 1713](#)
- [No ConnDisconnectedEv Event When Call Is Rejected, on page 1713](#)

### Discouraged Use of JTAPIProperties.updateCertificate()

Applications are encouraged to move away from using the JTAPIProperties.updateCertificate() method to download certificates. The JTAPIProperties.setSecurityPropertyForInstance() method is superior for most applications, as it will store the security information in the jtapi.ini file, giving all the information to JTAPI

whenever the application chooses to connect securely later. This information is critical for JTAPI to use the correct settings to create a secure connection, and if an application chooses to use the `JTAPIProperties.updateCertificate()` method, then the information will not be stored in the `jtapi.ini` file.

Applications that have no reason not to, should move to `setSecurityPropertyForInstance()`.

If an application is intentionally using the `updateCertificate()` method to avoid the use of `jtapi.ini` configurations, then the application must provide the information in the JTAPI Provider String, when it is first initializing JTAPI.

The required fields are:

- InstanceID
- CertStorePassphrase
- CAPF
- CAPFPort
- TFTP
- TFTPPort
- CertPath

If an application chooses to use the `updateCertificate()` method and chooses not to provide the required security information in the Provider String, the behavior of JTAPI is not guaranteed.

## Delete SecurityProperties Before Re-Use

The `JTAPIProperties.setSecurityPropertyForInstance()` method downloads certificates to disk, and stores security information related to them in the `jtapi.ini` file. If an application is interested in downloading new certificates to disk, changing the security information for the certificates, or both, is it recommended that they invoke `JTAPIProperties.deleteSecurityPropertyForInstance()` before doing so. This method will delete the certificates from disk, and remove the related `SecurityProperty` from the `jtapi.ini` file.

This will ensure a fresh start for the new set of certificates, and help to eliminate any errors that could arise from "stale" certificates lingering around on disk.

## No ConnDisconnectedEv Event When Call Is Rejected

For CUCM version 8.5.1 and later versions, when a call is made from A (observed) to B (unobserved) from application and if call is rejected for any reason, application will get the `ConnFailedEv/CallCtlConnFailedEv` events for the calling party, but there might be just one connection created in JTAPI for the calling party and there might not be any `ConnDisconnectedEv/CallCtlConnDisconnectedEv` events for called party. In addition, the `ConnDisconnectedEv/CallCtlConnDisconnectedEv` events for the calling party would be generated only after the calling party device/phone clears the call which itself can take 30 secs or more. Therefore, if application does not want to wait for the Disconnect events, upon getting the Failed events, it can simply clear the call directly after catching the failure from its `call.connect()` request as 'PlatformExceptionImpl caught: Could not meet post conditions of connect()'.

## Caveats for Release 8.0(1)

This section lists the JTAPI caveats for Release 8.0(1).

- [Globalized Calling Party Number, on page 1714](#)
- [Conference Interaction with Chaperone Results in Unsupported Conference Chaining, on page 1714](#)
- [Wildcard Routepoint Interaction, on page 1715](#)
- [Inconsistent Address Type of ModifiedCalledAddress When a Call Is Made to a Hunt Pilot, on page 1715](#)

### Globalized Calling Party Number

This caveat is a further clarification for Globalized Calling Party Number. With 8.0(1), there have been changes to the Call Processing and CTI layers that reflect the globalized calling party values that you see on the station more accurately. There are still some serious limitations with globalized parties:

- The Globalized Calling Party Number is available on the called side.
- The Globalized Calling Party Number is determined only when the call is offered. This applies to basic calls and for calls involving features.
  - The Globalized Calling Party Number does not change, even if the calling party changes. This is a clarification for the existing caveat Globalized Calling Party Number.
- Globalized Calling Party will be applicable if the call is redirected, whether performed prior to call being connected or after call is connected.
- Globalized Calling Party will not be provided after the these features are completed: Transfer, Conference, Unpark, Auto Call Pickup.

### Conference Interaction with Chaperone Results in Unsupported Conference Chaining

If both caller and Chaperone complete conference, where caller completes conference before chaperone then the scenario results in Conference Chaining. As of release 8.0(1), such scenarios are not supported by JTAPI and currently connections for all the parties along with ConferenceChain connection are shown in a single call.

For example, A calls B; call is intercepted by Chaperone (C1) which further consults B for conference. Before Chaperone completes conference, Caller(A) goes ahead and consults X for conference and completes the conference. After this, Chaperone(C1) completes the conference. This scenario would result in unexpected behavior from JTAPI Perspective. JTAPI could send CiscoConferenceStartedEv along with CiscoChainAddedEv. Also, after the conference, JTAPI shows connections for two Conference chains, A(caller), B, X, and C1(Chaperone) in the same call.

This will be fixed in future releases by having connections of caller and X in one call which is chained to a different call with connections for C1 and B. The fix requires changes in multiple components which are tracked with CDETS: CSCtc76213(CTI), CSCtc76222(TSP), CSCtc76223(Conference)

## Wildcard Routepoint Interaction

Before 8.0(1), Wildcard Routepoint scenarios were not supported by JTAPI. This behavior is maintained in this release, in the spirit of Backward Compatibility, but is still unsupported. A new Service Parameter has been introduced in 8.0(1), WildCardDN as Called Party, which fixes several issues in the call model for Wildcard Routepoint scenarios. When this service parameter is turned on, Wildcard Routepoints are fully supported by JTAPI.

## Inconsistent Address Type of ModifiedCalledAddress When a Call Is Made to a Hunt Pilot

When a call is made to a Hunt Pilot, although the API call `getCurrentCallingAddress()` will return an address of type `CiscoAddress.HUNT_PILOT`, the address type of the address returned by the API call `getModifiedCalledAddress()` will not be `CiscoAddress.HUNT_PILOT`.

This is because the modified address, as the name suggests, might be modified by application and `getType()` on modified address would return `CiscoAddress.UNKNOWN` or `CiscoAddress.INTERNAL` and JTAPI currently has no way to determine if that corresponds to a Hunt Pilot or not.

## Caveats for Release 7.0.1

This section lists the JTAPI caveats for Release 7.0.1.

- [Inconsistency in `getModifiedCallingAddress\(\)`, on page 1715](#)
- [Conference Behavior for Selected and Active Calls, on page 1715](#)
- [Change in `GlobalizedCallingParty` Behavior, on page 1716](#)

## Inconsistency in `getModifiedCallingAddress()`

When a call is made to a shared DN (Address shared) on two Terminals (A and B), configured with different Calling Party Transformation CSS, and try to transform the Calling Party differently through two different Calling Party Transformation Patterns, then JTAPI does not provide `modifiedCallingParty` consistently. In such a scenario, both devices send localization signals to call control to transform the calling party number and the one picked by call control first is used to transform the same and JTAPI returns that through `getModifiedCallingAddress()`.

For Example, +918055552222 (Globalized Calling Party) calls JTAPI observed shared Line 3100 on Terminals A and B. Device A is configured to transform the calling party by removing International escape character where as, B is configured to transform the calling party by removing International Escape Character and country code 91. Then JTAPI cannot guarantee whether `getModifiedCallingAddress()`, that is, the Localized Calling Party, will return 918055552222 or 8055552222.

## Conference Behavior for Selected and Active Calls

Following is the behavior when application issues conference request but selected and active calls are not part of the conference request:

Active Call on a Terminal is always added to the resulting conference when conference is invoked on a call on any address on that terminal.

Consider B1 and B2 are addresses on same terminal

A --> B1- GC1

C --> B1- GC2

D --> B2- GC3 (active call)

The application invokes GC1.conference(GC2) and results in A-B1-C-D in conference with GC1, although call with D was not part of the conference request.

Active conference call on a terminal is added to the resulting conference when conference is invoked on a call on any line on that terminal. In this case, the active conference call becomes the surviving final call (provided the application specified primary call is not a conference call). In this scenario, the application specified primary call is cleared after the conference. It is possible that the application specified primary call may not join the resulting conference and in that case the call is not cleared after conference is over.

Consider B1 and B2 are addresses on the same terminal and conf1 is a conference call with A-B1-C in conference with B1 as the controller

B1 --> D - GC1 (on hold)

conf1 - GC2 (active call)

B2 --> E - GC3 (on hold)

The application invokes GC1.conference(GC2, GC3).

This results in A-B1-C-D-E in conference with GC2 as the surviving call. Although application had specified GC1 to be the primary call, GC1 does not survive after the conference.

The same behavior applies for user selected calls that are not part of the conference request, but become part of the resulting conference as mentioned above.

The same behavior would apply to a regular conference with common controller. Consider A, B, C, D as lines on different terminals

A-->B - GC1

C-->B - GC2

D-->B - GC3 (active call)

The application requests GC1.conference(GC2). This results in A-B-C-D in conference with GC1. Although direct call with D was not part of the conference request, D will join the conference

## Change in GlobalizedCallingParty Behavior

getGlobalizedCallingParty() returns the correct globalized calling number only in case of a basic call. In a scenario where A calls B, B answers. A and B are connected. In this case, if application requests for getGlobalizedCallingParty(), the API returns the globalized number for A. In case of features such as transfer or redirect where any of the party gets updated, getGlobalizedCallingParty() may not return the correct globalized number.

## Caveats for Release 6.0.1

This section lists the JTAPI caveats for Release 6.0.1:

- [Call History Might Get Lost When AAR Routes Over QSIG Trunk](#), on page 1717
- [Different Event Order If Consult Call Initiated on SIP Device](#), on page 1717

### Call History Might Get Lost When AAR Routes Over QSIG Trunk

When a call is forwarded due to insufficient bandwidth (Call Forward No Bandwidth - CFNB) to another cluster over a trunk or gateway using QSIG, call history might get lost. If Phone A calls Phone B, which is in a low bandwidth location, with CFNB set to forward calls to Phone C, which is in a different cluster, and the QSIG protocol is used on the trunk/gateway, then the original called party and the last redirecting party might not get passed to the destination party.

### Different Event Order If Consult Call Initiated on SIP Device

Scenario: Terminal A initiates a call to the shared line B/B' and which Initiates a consult call to Terminal C.

- If the Shared Line is SIP device then the call events are :
  - B (active) receives: **CallCtlTermConnHeldEv > CiscoTermConnSelectChangedEv > CallActive**
  - B' (remote-in-use) receives: **CiscoTermConnSelectChangedEv > CallActive > CallCtlTermConnHeldEv**
- If the Shared Line is SCCP device then the call events are:
  - **CiscoTermConnSelectChangedEv > CallCtlTermConnHeldEv > CallActive** on both the Terminals.

## Caveats for Release 5.0

This section lists the JTAPI caveats for Release 5.0:

- [SRTP Support](#), on page 1718
- [Partition Support](#), on page 1718
- [TLS Security](#), on page 1718
- [CiscoFeatureReason](#), on page 1718
- [Unicode Issue in Calls Involving SIP Trunks](#), on page 1718
- [Join Across Lines: Conference Two or More Addresses on Same Terminal](#), on page 1719
- [JTAPI Exposes Incorrect Information with getCallingAddress\(\) and getCalledAddress\(\)](#), on page 1720

## SRTP Support

The default sRTP policy used by IPPhones is different from the one published (standard) as part of libSRTP code. libSRTP code is a free download, available at <http://srtp.sourceforge.net/download.html>. If the correct srtp policy is not used, the end result is no audio at both ends.

The srtp\_policy is used by media terminating endpoint to create a crypto context. It should match to encrypt and decrypt packets sent/received by IPPhones/CTIPorts. Phone is using one hardcoded srtp\_policy for all phone types including sip phones.

```
policy->cipher_type = AES_128_ICM;policy->cipher_key_len = 30;
policy->auth_type = HMAC_SHA1;
policy->auth_key_len = 20;
policy->auth_tag_len = 4 ; // changed to 4 from 10;
policy->sec_serv = sec_serv_conf_and_auth;
```

JTAPI clients doing their own media termination with SRTP, must use the above policy to create a crypto context. The default policy published as part of libSRTP (the standard policy documented as part of RFC) is not same as used by Cisco Unified IP Phone. Phones use the modified one to optimize the bandwidth. The sRTP policy must be part of negotiation between the endpoints but right now only one is supported and ccm does not support the negotiation, hence applications need to use the above policy to terminate media.

## Partition Support

When same Directory Number with different partitions exist in a CallManager, getAddress(String number) API in JTAPI normally returns the first matching Address object which has the same Directory Number. This is done to maintain BWC in case of no partitions configured in the system.

## TLS Security

When client certificate is installed, server certificates are also downloaded from CallManager TFTP server. However, server certificate is only verified for correct signature and server trust is not established. Hence it is recommended that first time download of certificate is done in trusted network.

## CiscoFeatureReason

When a call redirected across a GW is offered at an address, getCiscoFeatureReason() returns REASON\_FORWARDNOANSWER.

Within the same cluster when a call is redirected, the redirect destination sees REASON\_REDIRECT as the CiscoFeatureReason. However, when a call is redirected across a cluster, through a Q.931 trunk, at the redirect destination getCiscoFeatureReason() returns REASON\_FORWARDNOANSWER(as per Q.931 standard).

Scenario: A, B and C are registered to 3 clusters. A calls B, B answers and redirects the call to C. When call is offered at C, getCiscoFeatureReason() will return REASON\_FORWARDNOANSWER.

## Unicode Issue in Calls Involving SIP Trunks

In SIP call scenarios, where the call comes back to the call manager from the SIP proxy over a SIP trunk, since the call manager is totally dependent on the SIP, messages to populate any names and since the SIP protocol has no way of populating both ASCII and Unicode, the passed-in name is just ASCII and the same

gets sent to JTAPI. Hence, in such call scenarios, the user will not be able to see Unicode names since this is not under the control of JTAPI.

As a result the following APIs on CiscoCall interface will return only ASCII values instead of Unicode in such scenarios.

```
public String getCurrentCalledPartyUnicodeDisplayName();public String
getCurrentCallingPartyUnicodeDisplayName();
```

For SIP phone specific issues please refer to differences in SIP support section.

## Join Across Lines: Conference Two or More Addresses on Same Terminal

For Unified Communications Manager releases 6.x and 5.x, if applications try to conference two or more addresses on the same terminal, based on the order of participants in the request, application may receive `CiscoJtapiException.CONFERENCE_INVALID_PARTICIPANT` for the conference request and later the conference may be created successfully with some of the participants. In such a case, there is no guarantee which one of them joins the conference. But the conference is created with only one of the address on a terminal and others are ignored. This depends on how this feature request is processed in different CUCM releases.

Below are the details of two scenarios affected:

---

**Note** This issue has been resolved in 7.x using CSCsj06488 and CSCsj06533.

---

1. Consider B1 and B2 are different address on the same terminal TB.

A ->B1 - GC1

A ->B2 - GC2

A ->C - GC3

Application issues a conference request `GC1.conference(GC2, GC3)`

In 5.x and 6.x, application will receive `CiscoJtapiException.CONFERENCE_INVALID_PARTICIPANT`, however A, B1, C come into conference, and the normal set of events delivered in a conference scenario are seen like mentioned below:

GC1 CiscoConferenceStartEv

GC2 TermConnDroppedEv TB

GC2 CallCtlTermConnDroppedEv TB

GC2 ConnDisconnectedEv B1

GC2 CallCtlConnDisconnectedEv B1

GC1 CallCtlTermConnTalkingEv TB

GC2 CiscoCallChangedEv

GC1 ConnCreatedEv C

GC1 ConnConnectedEv C

GC1 CallCtlConnEstablishedEv C  
 GC1 TermConnCreatedEv TC  
 GC1 TermConnActiveEv TC  
 GC1 CallCtlTermConnTalkingEv TC  
 GC2 TermConnDroppedEv TC  
 GC2 CallCtlTermConnDroppedEv TC  
 GC2 ConnDisconnectedEv C  
 GC2 CallCtlConnDisconnectedEv C  
 GC2 CallInvalidEv  
 GC1 CiscoConferenceEndEv

2. Consider B1 and B2 are different address on the same terminal TB.

A ->B1 - GC1

A ->B2 - GC2

A ->C - GC3

Application issues a conference request `GC3.conference(GC1, GC2)`

In 5.x, Application will not receive any exception and the request would be processed successfully. A, C, B1 would be in conference along with the regular set of conference events.

In 6.x, Application will receive `CiscoJtapiException.CONFERENCE_INVALID_PARTICIPANT`, however A, C, B1 come into conference, and the normal set of events delivered in a conference

## JTAPI Exposes Incorrect Information with `getCallingAddress()` and `getCalledAddress()`

In some scenarios where feature works on multiple calls (pickup, transfer, conference and so on) depending on Event Order or the parties observed, JTAPI may end up reporting incorrect call information to the applications. These scenarios are ones where surviving call is initially not there in JTAPI's provider domain or in scenarios where `SurvivingCall` goes invalid and is recreated in the middle of the feature operation. For such survivingCalls, JTAPI does not report correct information with `getCallingAddress()` and `getCalledAddress()`. Some of these scenarios are:

1. Transfer - A calls B; B transfers the call to C and application is observing only C
2. HuntList Transfer - In 8.x release if transfer is done, then surviving call can go invalid and recreated if caller is not observed.
3. Pickup scenario where `survivingCall` goes invalid and is recreated in middle of the feature
4. UnPark scenarios where caller is not observed and service parameter, `Preserve globalCallId for Parked Calls`, is set to true.

In general, this issue can happen with scenario where `survivingCall` is not in provider's domain initially or if is there and goes Invalid(`CallInvalidEv` is sent) and is recreated(`CallActiveEv` is sent) during the feature operation.

# Caveats for Release 4.1

This section lists the JTAPI caveats for Release 4.1:

- [FAC-CMC, on page 1721](#)
- [setConferenceController, on page 1721](#)
- [Interval During DTMF Digits, on page 1722](#)
- [Shared Lines Support, on page 1722](#)
- [CP Requires Previous Calls on the Device to Be in Connected Call State , on page 1722](#)
- [CallInfo for Calls on QSIG Trunk, on page 1722](#)

## FAC-CMC

1. Forwarding should not be configured to a DN that requires FAC-CMC code. Forwarding requests will be successful, but calls will not be forwarded to these DNs and will be rejected.
2. Application should always terminate the code with #, otherwise system waits for T302 timer before extending the call. For these cases, application could get `postConditionTimeout` exception for `call.connect()` or `call.consult()` but call may actually be offered. If apps need to avoid this, either all the digits with # terminated string are entered with post condition timeout (which is by default 15 sec in JTAPI Prefs UI) in the `PlatformException` or increase the postcondition timeout.
3. Two identical `CiscoToneChangedEvents` are sent to applications and second one needs to be ignored if both the codes are entered with # separated upon receiving the first event.

## setConferenceController

The party that starts a conference by adding a new party acts as the original conference controller. Only the original conference controller can add new parties into the conference. If the original conference controller drops out of the conference, no other party in that particular conference call can add a new party. Although the conference controller cannot be changed while a conference call is going on, applications can determine which `TerminalConnection` acts as the conference controller when initially setting up a conference call via the `CallControlCall.setConferenceController()` method. The `CallControlCall.getConferenceController()` method returns the current conference controller, or null if there is none. If no conference controller is set, the implementation chooses a suitable `TerminalConnection` when the conferencing feature is invoked."

Consider the following scenario as an example:

A, B, C, and D belong to a conference call and all are in the TALKING state. A acts as the conference controller. A attempts to use the `SetConferenceController` API to change the conference controller to B, gets no error, and drops out of the conference. B then tries to add a new party, E, into the conference but cannot do so.

```
conference(Call[])
```

Applications can control which `TerminalConnection` acts as the conference controller when setting up a conference call via the `CallControlCall.setConferenceController()` method. The `CallControlCall.getConferenceController()` method returns the current conference controller, or null if there is none. If no conference controller is set initially, the implementation chooses a suitable `TerminalConnection`

when the conferencing feature is invoked. Only the original conference controller can add new parties to a conference call. Attempting to change the conference controller while a conference is going on will not take effect; however, no error gets thrown in the `setConferenceController` API

## Interval During DTMF Digits

As per fix for CSCef05359, Change `PlayDTMF` to allow applications specify the time delay, now applications can configure the time delay during DTMF digits through Admin page, Service parameter, generate DTMF delay, for call Manager.

## Shared Lines Support

Cisco JTAPI does not support configuration of same Directory Number from different partitions on the same or any device but configuration of different Directory Number from different partitions on the same device as well as different devices is supported.

## CP Requires Previous Calls on the Device to Be in Connected Call State

CP requires previous calls on the device to be in connected call state before answering further calls on the same device. If calls are answered without checking for the call state of previous calls on the same device, then CTI might return a successful answer response but the call will not go to connected state and needs to be answered again. See DDTS CSCee17001 for more details.

## CallInfo for Calls on QSIG Trunk

Call info on a call across a QSIG gateway is not consistent. Due to the limitations in the protocol, application would see inconsistent values for `call.getLastRedirectingAddress()` and `call.getCalledAddress()` for calls across QSIG trunks.

Refer to CSCee74730, CSCee59084, CSCee70747 and CSCsk62441 for details.

## Caveats for 4.0

This section lists the JTAPI caveats for Release 4.0:

- [Extra Connection with Wild Card DN, on page 1723](#)
- [CallInfo in Barge Scenario, on page 1723](#)
- [CallInfo Issues When Caller Redirects Call, on page 1723](#)
- [Translation Pattern and Presentation Indication Interaction, on page 1723](#)
- [Extra TermConnHeld Events, on page 1723](#)
- [Transfer and Conference Interaction, on page 1723](#)
- [Dropping a Call on Shared Lines, on page 1724](#)
- [Barge Call, on page 1724](#)

- [Null lastRedirectingAddress, on page 1724](#)
- [Devices Configured with Same CLI, on page 1724](#)
- [Current Called Address, on page 1725](#)

## Extra Connection with Wild Card DN

JTAPI may create extra connection when Call is made wild card DN. See the release note of DDTs CSCeb57849 for scenarios.

## CallInfo in Barge Scenario

CallInfo is not updated when Barge Initiator Drops the Call. See the release note of DDTs CSCec23359 for scenarios.

## CallInfo Issues When Caller Redirects Call

In this scenario A calls B, A redirects to C and application is monitoring only C, the calling and called address would be B and C and the calling terminal would be terminal A.

## Translation Pattern and Presentation Indication Interaction

JTAPI has `getCalledAddressPI` and `getCurrentCalledAddressPi` interfaces to receive the PIs of the originalCalled and Called parties. While making a call through a Translation Pattern, if the pattern modifies the PIs of the CalledParty, the `getCalledAddressPI` continues to reflect the earlier PI while the `getCurrentCalledAddressPI` shows the PI as set at the pattern. Refer DDTs CSCec58085 for more details.

## Extra TermConnHeld Events

Applications may some times see an extra `TermConnHeld` Event on Controller during Transfer and Conference scenario. For transfer scenario this extra `TermConnHeldEvent` is sent on controller before `TermConnDropped` is sent. For conference scenario, for primary controller which remains in the call, this event is sent before `TermConnTalking` is sent, and for controller which is dropped from conference, it is sent before `TermConnDropped` is sent. Refer DDTs CSCec55257 for more details.

## Transfer and Conference Interaction

- 9.1.6.1—in JTAPI whenever transfer is done to connect a normal call to a `ConferenceCall`, the `GlobalCallId` of Conference Call always survives irrespective of how the transfer is performed (whether on `Call1` or `Call2`).
- 9.1.6.2—during transferring of conference scenario, it is possible External Connection creation events are delivered before `CiscoTransferStartedEv`, however, Call Merge events are still delivered within `CiscoTransferStart` and `CiscoTransferEnd` boundary.
- 9.1.6.3—during transferring of conference scenario, if transfer-destination is not observed by the JTAPI Application, the `LastRedirectingParty` is not updated. For example, if A, B, C are in conference, C (Transfer controller) transfers call to D, and D (Transfer-destination) is not observed by JTAPI, then

LastRedirectingParty of the call remains unchanged after Transfer is completed. Ideally after Transfer is completed, LastRedirectingParty is updated to Transfer controller.

## Dropping a Call on Shared Lines

If there is heldCall on SharedAddress (SharedLine) and application is not observing all the terminals of SharedLine, then Connection.disconnect() using SharedAddress's connection does not drop the call. The is left with connections of OtherParty in the call. To drop the call, the application must use either Call.drop() or manually disconnect call from non observed terminals. In other words, if there is HeldCall on SharedAddress, then for the terminals that is not in Application's control, call must be dropped manually. For details, refer DDTS CSCed06910.

## Barge Call

In a Barge Call, when

1. Barge target holds
2. Barge target does a consult conference or arbitrary Conference
3. The OtherParty drops the call
4. Barge target initiate transfer, arbitrary transfer or BlindTransfer
5. Barge target parks the call
6. Barge target Idiverts the call
7. Barge target redirects call

Then, Initiators TerminalConnection/CallCtlTerminalConnection is dropped as result of above operations. However, CallCtlCause for these TermConnDropp/CallCtlTermConnDrop would be Cause\_Normal. JTAPI is unable to provide specific cause such as Cause\_Redirect for #7 above.

---

**Note** Initiator is the party that presses the Barge key to barge into a call. Target is where Initiator Barges, OtherParty is address which not Initiator/Target. For details, refer DDTS CSCed07230.

---

## Null lastRedirectingAddress

Call.getLastRedirectingAdress() returns null when only the redirecting address is observed. The call goes to INVALID state after redirect request and if application calls the above interface after redirecting the call it would see null. For details, refer CSCee92111.

## Devices Configured with Same CLI

In a conference scenario, where conference controller is observed by JTAPI and other two calls are from devices configured with same the CLI (Directory Number), JTAPI creates one connection. So, when conference is completed, it has only two connections in the call instead of three. If the conference is completed using conference() API, a post condition timeout exception is thrown. For details, refer DDTS CSCeh05723.

## Current Called Address

CiscoCall.getCurrentCalledAddress() returns null before the call is offered to the called address. In earlier releases, this used to return Unknown address. Applications must handle null or Unknown address returned for CiscoCall.getCurrentCalledAddress().

## APPENDIX **H**

# Deprecated API

This appendix lists the APIs, fields, and methods that have been deprecated. A deprecated API is not recommended for use, generally due to improvements, and a replacement API is usually given. Deprecated APIs may be removed in future implementations.

- [Deprecated Interfaces, on page 1727](#)
- [Deprecated Fields, on page 1727](#)
- [Deprecated Methods, on page 1728](#)

## Deprecated Interfaces

`com.cisco.jtapi.extensions.CiscoRouteAddress`

This interface has not been implemented.

## Deprecated Fields

### Deprecated fields

`com.cisco.jtapi.extensions.CiscoAddress.APPLICATION_CONTROLLED_RECORDING`

`com.cisco.jtapi.extensions.CiscoAddress.DEVICE_CONTROLLED_RECORDING`

These constants are deprecated. Applications that upgrade to Release 9.0 or later releases should use the new `SELECTIVE_RECORDING` constant and not the deprecated `APPLICATION_CONTROLLED_RECORDING` and `DEVICE_CONTROLLED_RECORDING` constants. In Release 9.0 or later releases Unified CM and JTAPI never return the `DEVICE_CONTROLLED_RECORDING` constant.

`com.cisco.jtapi.extensions.CiscoProviderCapabilityChangedEv.MODIFY_CGPN`

This constant is not returned by any interface, should not be used by application.

`com.cisco.jtapi.extensions.CiscoProviderCapabilityChangedEv.MONITOR_PARKDN`

This constant is not returned by any interface, should not be used by application.

`com.cisco.jtapi.extensions.CiscoProvCallParkEv.REASON_CALLPARKREMAINDER`

This interface is deprecated due to a spelling error. Use the new interface `REASON_CALLPARKREMINDER`.

**Deprecated fields**

com.cisco.jtapi.extensions.CiscoFeatureReason.REASON\_PARKREMAINDER

Use REASON\_PARKREMINDER.

com.cisco.jtapi.extensions.CiscoProviderCapabilityChangedEv.SUPERPROVIDER

This constant is not returned by any interface, should not be used by application.

## Deprecated Methods

**Deprecated methods**

com.cisco.jtapi.extensions.CiscoTermDataEv.getData()

Use byte[] getTermData

com.cisco.jtapi.extensions.CiscoJtapiException.getErrorDescription(int)

Use String getErrorDescription (); instead.

com.cisco.jtapi.extensions.CiscoJtapiException.getErrorMessage(int)

Use String getErrorMessage (); instead.

com.cisco.jtapi.extensions.CiscoConsultCallActiveEv.getHeldTerminalConnection()

Replaced by CiscoConsultCall.getConsultingTerminalConnection()

com.cisco.jtapi.extensions.CiscoCall.getLastRedirectingPartyInfo()

- use getLastRedirectedPartyInfo();

com.cisco.jtapi.extensions.CiscoAddress.getRegistrationState()

This method has been replaced by the getState() method.

com.cisco.jtapi.extensions.CiscoTerminal.getRegistrationState()

This method has been replaced by the getState() method.

com.cisco.jtapi.extensions.CiscoMediaTerminal.register(InetAddress, int)

com.cisco.jtapi.extensions.CiscoTerminal.sendData(String)

com.cisco.jtapi.extensions.CiscoJtapiProperties.setSecurityPropertyForInstance(String, String, String, String, String, String, String, String, boolean)

This method is replaced by overloaded method setSecurityPropertyForInstance which takes an extra parameter certStorePassphrase, a passphrase for java key store. This method might have some security vulnerability.

com.cisco.services.tracing.TraceManager.setSubFacilities(String[])

and replaced with TraceManager.addSubFacilities method

**Deprecated methods**

`com.cisco.services.tracing.implementation.TraceManagerImpl.setSubFacilities(String[])`

replaced by `addSubFacilities(String[])`

`com.cisco.services.tracing.TraceManager.setSubFacility(String)`

and replaced with `TraceManager.addSubFacility` method

`com.cisco.services.tracing.implementation.TraceManagerImpl.setSubFacility(String)`

replaced by `addSubFacility(String)`

`com.cisco.jtapi.extensions.CiscoJtapiProperties.updateCertificate(String, String, String, String, String, String, String, String)`

This method is replaced by overloaded method `updateCertificate` which takes an extra parameter `certStorePassphrase`, a passphrase for java key store. This method might have some security vulnerability.

`com.cisco.jtapi.extensions.CiscoJtapiProperties.updateServerCertificate(String, String, String, String, String)`

This method is replaced by overloaded method `updateServerCertificate` which takes an extra parameter `certStorePassphrase`, a passphrase for java key store. This method might have some security vulnerability.
